As I've previously discussed, during World War II and in its immediate aftermath, America experienced its own Great Purge of our academic and journalistic elites—left, right, and center—with many of our most prominent figures permanently disappearing from public visibility, and Stoddard was among those who fell. For two decades he had been among America's leading public intellectuals, but when he died in 1950, no obituary appeared in the pages of the *New York Times*.

## The Anthropology of Madison Grant Dethroned by the Boasian Revolution

*Madison Grant*

Stoddard's own writings had focused primarily upon history and politics, but his world-view had been shaped by the ideas of his mentor Madison Grant, a hugely influential figure in racial theories, eugenics, and natural conservation efforts.

Although a lawyer by training, Grant never practiced in the field, and

instead gained fame with the 1916 publication of his book *The Passing of the Great Race*, which argued for the division of European populations into three primary races of Nordics, Alpines, and Mediterraneans, with the first of these playing the overarching role in world history and the creation of dynamic civilizations. Late twentieth century critics such as Harvard's Stephen Jay Gould denounced the book as America's most influential work of "scientific racism," and noted that Adolf Hitler had written Grant a fan-letter in which he described it as his "Bible."

Early American anthropology was heavily dominated by Anglo-Saxon racialists, and Grant's views were widespread within that field. Drawing upon a Darwinian world-view, these scientists heavily focused upon physical and psychological racial differences, certainly including those within the white population, and they were often aligned with political movements aimed at sharply curtailing continued large-scale immigration, especially from Southern and Eastern Europe. They also tended to be either right-wing or apolitical in their views.

The opposing ideological camp in the early field of anthropology was overwhelmingly the creation of a German-Jewish immigrant named Franz Boas, who held strongly left-leaning political views. Becoming a professor of anthropology at Columbia University in 1899, he began strongly challenging existing notions of race and racial differences, and focused much more on cultural rather than biological explanations for the behavior of different human societies.

In those pre-DNA days, the classification of different racial groups

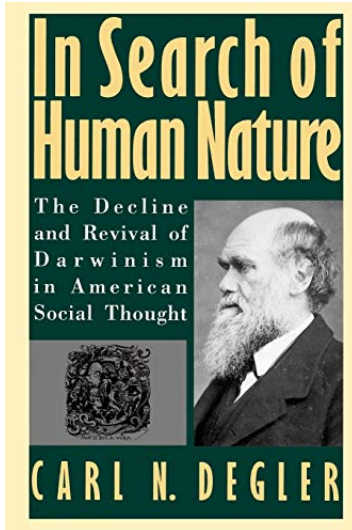
relied heavily upon physical measurements, with the shape of the skull being a key means of separating European populations into the purported Nordic, Alpine, and Mediterranean races. Boas's greatest early claim to fame was his landmark 1911 study demonstrating that European groups who immigrated to America rapidly changed the shapes of their skulls, apparently due to shifts in diet or other environmental factors, thereby seeming to transform themselves into a different racial group, an astonishing discovery that shocked most of his scientific colleagues.

When I first read that account, I found myself extremely skeptical of such a result, since we know that skull-shape is overwhelmingly determined by genetic factors rather than by diet or sunshine. And indeed, it does appears that Boas's conclusions were entirely false, and apparently even fraudulent, though perhaps unintentionally so, being a product of his ideological zeal in debunking existing racial dogma. Over the years, quite a number of ultra-high-profile frauds in the field of anthropology have come to light, almost all of them falling upon a particular side of the ideological isle. Perhaps the most famous recent example was that of Boas disciple Margaret Mead and her bestseller on the sexual customs of Samoa.

From his Columbia University base, Boas began minting large numbers of anthropology Ph.D.'s, and his former students soon began founding new departments throughout the country, gradually shifting the entire field towards their much less hereditarian perspective on human behavior. By the late 1920s they had gained the upper hand over their academic rivals in this hidden institutional conflict, and a Darwinian framework for understanding human behavior had largely been expelled from the academic social sciences. Even the basic notion of biological race—once almost universally accepted—had become much less of a subject of discussion, with fewer and fewer academics focusing upon the differences between human groups, let alone among European whites.

The victory of Boasian anthropology became overwhelming around the time of the Second World War, and for decades thereafter any notion of applying Darwinism to the understanding of human activity was confined to the margins of academia. This situation only began to change in the mid-1970s with the rise of sociobiology, and the large-scale mappings of the human genome around the end of the century finally began restoring race to its proper place near the center of anthropology. Many of Boas's intellectual heirs ferociously resisted this revival of a Darwinist and hereditarian framework, sometimes with improper means. The serious scientific fraud at the center of

Stephen Jay Gould's influential book *The Mismeasure of Man* is a notorious example of this.



The fascinating story of this hidden decades-long struggle over the control of anthropology and its relationship to Darwinism is very effectively told in Carl Degler's 1991 book *In Search of Human Nature*, which carries the descriptive subtitle "The Decline and Revival of Darwinism in American Social Thought."

As a Pulitzer Prize-winning former president of the American Historical Association, Degler certainly had stellar academic credentials for the task. For decades, he had been a strong champion of feminist and anti-racialist causes, firmly embracing the "culturalist" model of human history, and as he explained both in his Preface and in a subsequent interview, he had begun his investigation assuming that the Boasian victory had come about primarily on the basis of objective scientific facts. But his years of archival research had eventually led him to conclude that the motives had mostly been ideological, and that the bulk of the evidence had always actually remained to the contrary.

The *Times* gave his important book the lead position in its *Sunday Book Review*, with the very favorable discussion running nearly 3,000 words, including an appended interview in which the scholar recognized that his longtime colleagues would issue "a sigh of regret that Carl Degler, who has been working all this time writing against racism and sexism, has been converted to the other side." Notwithstanding his shift into the sociobiological camp, when he died

a quarter-century later, the *Times* obituary honored him with the headline "Carl N. Degler, Scholarly Champion of the Oppressed in America, Dies at 93."

## Carleton Putnam and the Battle Over School Desegration

A few years after Stoddard's unnoticed 1950 death, racial issues moved to the forefront of American society. The 1954 Supreme Court decision *Brown vs. Board of Education* unanimously overturned more than a half-century of legal precedent by striking down state laws for public school segregation. Reaction to *Brown* was fierce throughout the South, but although President Eisenhower seems to have had misgivings about the decision, he dispatched the troops of the 101st Airborne to forcibly integrate Little Rock high school.

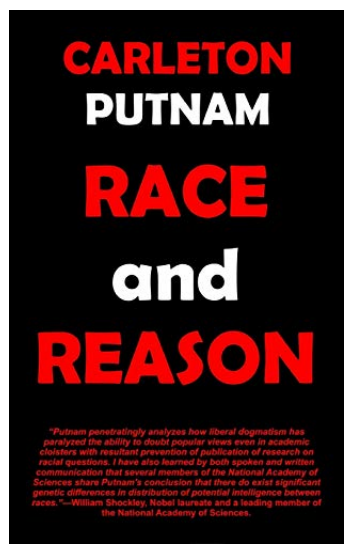
The massive resistance of the South to these new racial policies continued, and periodically reached the national media. According to his later account, Carleton Putnam happened to read a 1958 column in *Life Magazine* by a Southern journalist defending segregation, and he was soon drawn into the ongoing political battle.

Like Stoddard, Putnam had deep New England Puritan ancestry, but after graduating from Princeton and earning his law degree at Columbia, he had chosen to pursue a business career. In the mid-1930s he had become a pioneer in commercial aviation and started his own small airline, which following various expansions and mergers eventually became Delta, the nation's largest carrier, with Putnam serving as chairman for 15 years. While still in his early 50s, he had retired from active business involvement and begun work on an intended four volume biography of Theodore Roosevelt, a distant relative, with the first volume appearing in 1958 to widespread critical praise. But that project was soon abandoned as he gradually began devoting all his efforts to the campaign to maintain racial segregation, first by writing a series of public letters and newspaper columns, and later by launching a public speaking tour, writing books and organizing legal efforts to overturn *Brown*.

Putnam had paid little attention to political or scientific developments during the two decades he had been absorbed in the business world, but was stunned when he discovered the ideological changes that had swept through the academy during that period, which eventually laid

the intellectual basis for the legal and political decisions that overturned legal segregation. From his perspective, the major biological differences between blacks and whites had long been recognized, with the substantial African inferiority in mind and temperament fully acknowledged by most scientists. But in less than a single generation, the theories of Franz Boas and his coterie of academic disciples had captured anthropology and related sciences, proclaiming the doctrine of racial equality and marginalizing those who maintained the old beliefs. Eventually, this new scientific consensus was given the strength of law by the Supreme Court.

In Putnam's opinion, the great danger of desegregation was that it might eventually lead to racial miscegenation, and the admixture of African ancestry into America's white population would severely degrade the citizenry, leading to a large and permanent decline in mental ability and social behavior. To a considerable extent, he believed that biology was destiny, and the mixture of black with white would destroy our nation's future.



CARLETON
PUTNAM
RACE
and
REASON
"Putnam penetratingly analyzes how liberal dogmatism has paralyzed the ability to doubt popular views even in academic cloisters with resultant prevention of publication of research on racial questions. I have also learned by both spoken and written communication that several members of the National Academy of Sciences share Putnam's conclusion that there do exist significant genetic differences in distribution of potential intelligence between races."—William Shockley, Nobel laureate and a leading member of the National Academy of Sciences.

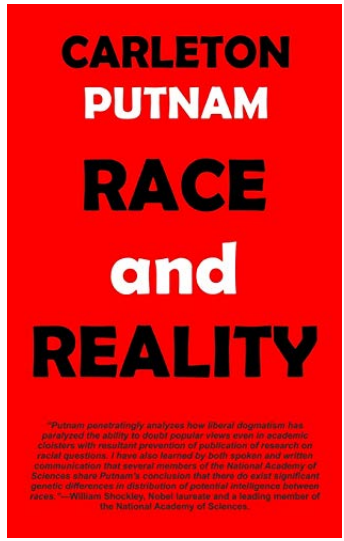
During the 1950s, the battles over racial integration were almost entirely confined to the South, which contained the overwhelming majority of our black population, and as a New England Yankee and prominent business executive Putnam's energetic involvement in the cause drew considerable attention. In 1961 he collected together his writings on the subject, much of which were based upon his extensive correspondence with various critics, and published *Race and Reason*, a short book setting forth his views which became a major bestseller, having 150,000 copies in print. Several of the world's leading scientific experts who supported his position contributed a Foreword

to his book, which also received the strong endorsement of several high-ranking Southern senators, who distributed copies to their followers and local newspaper editors.

- Race and Reason
  *A Yankee View*
  Carleton Putnam • 1961 • 46,000 Words

As a prominent voice in the national campaign to maintain segregation, Putnam argued that the leading figures in his political movement were pursuing an ineffectual strategy, staking their claim on the constitutional doctrine of "states' rights" while they avoided raising the scientific reality of the large biological differences between blacks and whites, which he believed should have been their main issue. He claimed that these individuals all privately acknowledged those racial facts, but as members of the Southern elite they had been closely associated for generations with the families of their black household domestics and other retainers, and considered it impossible to publicly discuss the biological differences that they so readily acknowledged in private. Thus, for cultural reasons they were foregoing their strongest political weapon, and Putnam believed his own work was necessary to remedy that lack. He also claimed that numerous prominent scientists privately endorsed his scientific views about race but were too fearful of academic or financial retaliation to acknowledge those facts in public.

According to Putnam, the unchallenged sociological and psychological evidence that had helped sway the Supreme Court to overturn segregation was largely fraudulent, and his project culminated in an important 1963 challenge to *Brown*, in which he and his legal team successfully introduced the contrary testimony of several scientific experts. But although they won at trial, that verdict was subsequently overturned at the appellate level, and the high court refused to hear an appeal.

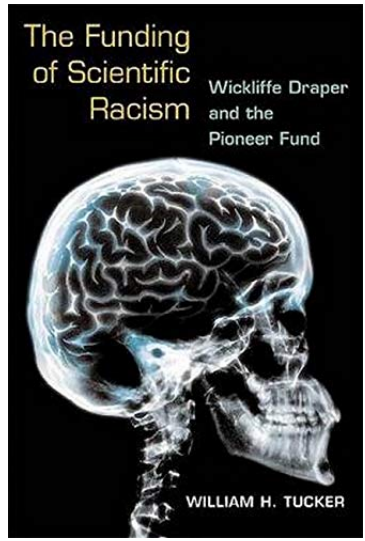


CARLETON
PUTNAM
RACE
and
REALITY
"Putnam penetratingly analyzes how liberal dogmatism has paralyzed the ability to doubt popular views even in academic cloisters with resultant prevention of publication of research on racial questions. I have also learned by both spoken and written communication that several members of the National Academy of Sciences share Putnam's conclusion that there do exist significant genetic differences in distribution of potential intelligence between races."—William Shockley, Nobel laureate and a leading member of the National Academy of Sciences.

In 1967 he published his sequel *Race and Reality*, which received a glowing endorsement from physics Nobel Laureate William Shockley who had recently become notorious for voicing similar views. Around the same time or a few years later, leading psychometric scholars such as Arthur Jensen of Berkeley, Hans Eysenck of University College London, and Richard J. Herrnstein of Harvard had focused upon the large and seemingly innate racial gaps in IQ, with intellectually-elite publications such as the *Harvard Educational Review* and *The Atlantic* presenting their long articles on the subject. But the political tide in American society was never reversed, and Putnam eventually abandoned his efforts.

Despite his controversial and strongly racialist public writings, when Putnam died in 1998 at the age of 96, he received a rather long and favorable obituary in the *Times*, certainly emphasizing his segregationist efforts and even mentioning that his books had inspired a young David Duke to become a leader of the Ku Klux Klan, but written in a surprisingly detached and even friendly tone, suggesting that Putnam had managed to retain lifelong credibility among our East Coast elites.

## Wickliffe Draper, the Pioneer Fund, and *Mankind Quarterly*



Much of the hidden backstory of Putnam's pro-segregation effort was later revealed in a 2002 book by William H. Tucker of Rutgers. *The Funding of Scientific Racism* recounted the origins and activities of the Pioneer Fund, for many decades the leading financial backer of numerous American racialist projects. Prof. Tucker had his origins in the academic New Left of the late 1960s and was intensely hostile to the ideological positions of his subjects, but his three years of archival research and numerous personal interviews provide a wealth of information that otherwise would have remained hidden.

Although the Pioneer Fund only became an occasional subject of media scrutiny during the 1990s, its origins actually stretched back to the early decades of the 20th century and a millionaire named Wickliffe Draper, who funded and established the organization. Like Stoddard, Grant, and Putnam, Draper himself was of New England Puritan stock, the group that had provided a hugely disproportionate share of America's intellectual elites from the founding of our nation up through the beginning of the twentieth century. He had graduated Harvard in 1913, been wounded in combat during the First World War, and eventually gained the rank of colonel in the post-war reserves. Inheriting a substantial textile industry fortune, he never pursued a career, but instead devoted most of his life to such gentleman pursuits as big game hunting and travel.

Although obviously distasteful to Tucker, Draper's strong racialist views seemed quite reflective of the leading American figures of his youth such as Theodore Roosevelt and Woodrow Wilson, and in his early adulthood, the books of Grant and Stoddard were on everyone's lips. Indeed, Roosevelt had praised Grant's theories, and Draper was

one of Grant's social acquaintances, regarding him as a personal role-model according to Tucker.

By modern standards, America's ruling elites of that era embraced extremely racist notions, and Draper's views fit very comfortably within that milieu. One of his earliest projects had been to promote the repatriation of America's blacks back to Africa, but such ideas were hardly uncommon at the time, and indeed during the 1920s one of America's most prominent black public figures was the nationalistic leader Marcus Garvey, who proposed to do exactly that.

Draper was hardly any sort of intellectual, but his importance lay in his willingness to heavily finance those racialists who were, and his choice of like-minded successors who continued to support such causes for decades after his death in 1972, which allowed his influence to span nearly a century, from the era of Warren Harding to that of Barack Obama. The non-profit Pioneer Fund, which he established in 1937, was the primary vehicle for his donations, but Tucker's research indicates that substantial additional sums were also disbursed directly from Draper's personal assets. In particular, it appears that much or even most of the funding for Putnam's press campaigns, book distributions, and legal efforts may have been quietly provided by Draper, who viewed Putnam as a trusted ally and advisor.

Among American foundations, the Pioneer Fund scarcely ranked as a minnow, being dwarfed a hundred times over by Ford, Carnegie, Rockefeller, and other philanthropic endowments which were enthusiastically supportive of the rising anti-racist tide in American society and thought. But although massively outspent by its ideological opponents, Pioneer's dollars played a crucial role in subsidizing and keeping alive the racialist doctrines that had once entirely dominated American society but which had begun receding from the late 1920s onward, before becoming completely marginalized among our national elites by the 1950s and 1960s.

For example, the science of eugenics had been launched in the late 19th century by polymath Francis Galton, a first cousin of Charles Darwin, and for decades was almost universally accepted by educated individuals of all ideological backgrounds, with the strongest support usually coming from progressives and only the fervently religious being the main holdouts. But under continuous pressure mostly by Jews and Marxists, the doctrine began a long and permanent retreat during the late 1920s and 1930s. Around the same time, Franz Boas and his energetic group of academic disciples, most of them Jewish,

had gained control of American anthropology, largely displacing the Anglo-Saxon academics who had originally created the discipline, and overturning the racialist theories once promoted by Grant and Stoddard.

As regular academic periodicals grew unwelcoming to articles that continued to adhere to what eventually became known as "scientific racism," the Pioneer Fund in 1960 financed the creation of *Mankind Quarterly*, a new peer-reviewed journal intended to fill that gap. When I digitized the archives of that publication around 2003, its name meant nothing to me, nor did those of its editorial board members and leading contributors. But I eventually discovered that many of these latter individuals were actually leading international scholars with distinguished academic records, whose refusal to join ideological trends had locked them out of mainstream periodicals and eventually purged their names from our media and intellectual history despite their prestigious academic credentials.

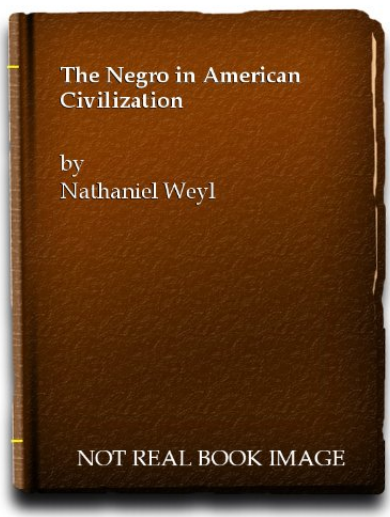
For example, Henry Garrett had been the longtime chairman of Columbia University's Psychology Department, president of the American Psychological Association, a member of the AAAS and the National Research Council, and editor of leading academic texts. R. Ruggles Gates was a prominent British geneticist and a Fellow of the Royal Society. Robert Gayre, A. James Gregor, Robert Kuttner, R. Travis Osborne, and numerous other regular contributors also had strong scientific or scholarly credentials. Although Tucker is quite hostile to these individuals and their ideology, his book is helpful in providing this important background. The 1960-2004 archives of the publication are now conveniently available for reading on this website:

- Mankind Quarterly
  128 Issues, July 1960 to July 2004

## Nathaniel Weyl as a Proto-Neoconservative

Nearly all of the prominent American racialists so far discussed came from an Old Stock Anglo-Saxon backgrounds, reflecting the elites that had totally dominated our society up until the 1930s, and their lifelong political tendencies were generally either mainstream or right-wing. But the most frequent outside contributor to *Mankind Quarterly* during the 1960s and 1970s was Nathaniel Weyl, who had different roots.

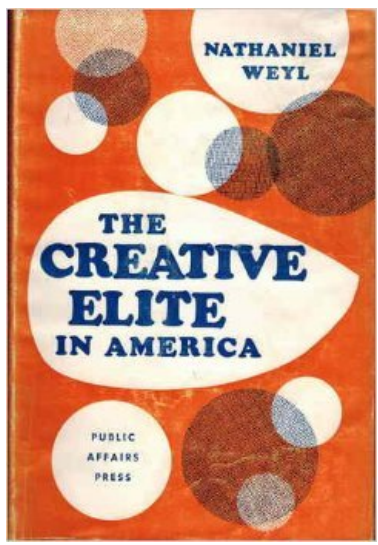
His father Walter was from a German-Jewish immigrant family and had been a leading progressive intellectual, co-founding *The New Republic* in 1914. After getting his degree from Columbia University in 1931 and doing graduate work at the London School of Economics, the younger Weyl soon veered far to the left, spending the 1930s as a committed Communist Party member while working in government and operating on the fringes of a Soviet spy network. He and his wife both broke with the Party in 1939, disgusted by the Hitler-Stalin Pact, and by the late 1940s he had become a strong conservative and a zealous anti-Communist, regularly denouncing Red espionage in various publications, eventually including *National Review*. So in some respects his ideological path anticipated that of the later neoconservatives who followed the same trajectory a generation or more later.



Racial and ethnic topics soon became one of Weyl's main areas of interest, and in 1960 he published *The Negro in American Civilization*, an exhaustive and unflinching account of the role of blacks in our nation's history. Running well over 150,000 words, the coverage stretched from their African roots down to his present day, focused primarily upon history and politics but also including extensive discussion of biological, anthropological, and sociological issues. Willmoore Kendall, a prominent Yale political scientist, was William F. Buckley Jr.'s mentor, and he gave the volume a glowing treatment in *National Review*, saying it filled the longstanding need for "a compendious and objective survey of the *facts* about the American Negro" but warned that "the evidence Weyl has assembled is vastly more discouraging…than most of us have permitted ourselves to fear

in our most pessimistic moments." While praising Weyl's bravery and candor, Kendall predicted that "He will pay dearly for it."

Indeed, Kendall's warning seems to have been borne out and almost all of Weyl's subsequent writings were confined to conservative or racialist publications, as were the reviews of his many later books. And Kendell's ringing endorsement may even have had serious personal consequences, since the following year he was forced out of his tenured Yale professorship after 14 years of teaching at that academic institution. In 1971, Weyl and a co-author published *American Statesmen on Slavery and the Negro*, which seems largely a supplement and sequel to the previous book. Both of Weyl's hefty volumes were parallel to Putnam's short books, though providing far greater breadth and depth.



Although Weyl lacked a doctorate, he was a highly innovative thinker, so his apparent blacklisting by mainstream academics and publications had unfortunate intellectual consequences. For example, in 1966 he published *The Creative Elite in America*, introducing a powerful sampling technique for determining the relative performance of different ethnic groups based upon their subset of especially distinctive last names, a tool which I had christened "Weyl Analysis" and heavily used in my long article "The Myth of American Meritocracy" analyzing elite college admissions.

Among his various quantitative findings, Weyl demonstrated the long intellectual dominance of Americans of Puritan stock, and their noticeable decline by about 1900. A half-century after Weyl's sociological breakthrough, economist Gregory Clark relied upon

exactly the same methodology in widely-praised best-seller *The Son Also Rises*, but confined any mention of Weyl to a single brief footnote, which denounced him as a "racist" and expressed surprise that such a powerful sociological technique had been so little used.

Weyl's passing at age 94 was noted in a brief 2005 *Times* obituary, which focused entirely on his anti-Communism and peripheral involvement in the Hiss case and was reasonably favorable. Since all of Weyl's decades of research in "scientific racialism" had been blacklisted by the media, later generations of journalists may have remained totally unaware of it.

## Academic Anthropologists and the Reality of Race

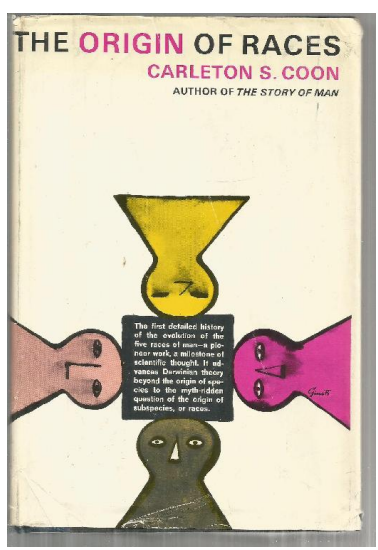
Although neither Putnam nor Weyl had held academic positions, these racialist writers and others drew quite heavily upon the works of those who did, most of whom were fully mainstream scholars. Very few of these individuals fell into the ideological camp of white racialism, and indeed the majority seem to have been either typical liberals or else entirely apolitical, merely being researchers who followed the scientific data wherever it happened to lead.

Objective scientific reality does exist, but unless we have the time and expertise to investigate the research studies ourselves, our perception of that reality relies upon the filter of the media, and that portrayal may be severely distorted. There is the notorious historical example of Stalin's elevation of Trofim K. Lysenko and his anti-hereditarian theories to official dogma while condemning to the gulag those scientists who continued to believe in genetics, a policy that crippled Soviet biology for decades.

Back in 2017 I was interviewed for an hour or two over the phone by a *New York Times* journalist focused on the racially-related political topics that had suddenly begun dominating the national headlines. She seemed very skeptical that race was a scientifically valid concept, and quite surprised when I told her that saying "race does not exist" was roughly equivalent to asserting that "gravity does not exist." I pointed out that her longtime colleague Nicholas Wade, an award-winning science journalist, had published an entire book a couple of years earlier on the science of race, and that just a few weeks before our conversation her own newspaper had devoted the entire front section of its prestigious *Week in Review* section to a lengthy

exposition of the undeniable scientific reality of race by Professor of Genetics David Reich of Harvard University and the Broad Institute. But despite these points, she still seemed quite unconvinced, presumably reflecting the uniformly contrary opinions of her own journalistic peer-group. A few months ago, James Bennet, the highly-regarded Opinion Editor of the *Times*, was suddenly purged for insufficient "wokeness," so I suspect that henceforth her beliefs will no longer be disturbed by any such discordant scientific information from her own newspaper.

Although our country has not yet reached the Soviet condition of imprisoning researchers whose scientific findings are misaligned with the reigning ideology, for decades harsh informal sanctions have been visited upon those academics who come to unwelcome conclusions, especially if they are perceived as lending aid and comfort to racialist forces and their political projects. In some cases, controversial findings have unleashed a torrent of media vilification, with the scholars being attacked as "fascists" or "neo-Nazis," despite all evidence to the contrary, and even subjected to personal threats and demands that they be censored. Occasionally, such harsh and unfair denunciations have actually moved the victims into the racialist camp, thereby becoming self-fulfilling prophecies, but more typically the scholars have quietly continued their research activities until the media spotlight eventually shifted elsewhere. Meanwhile, rival academics presenting contrary positions have often been heavily promoted by the media as fully authoritative sources, despite sometimes possessing far weaker scholarly credentials.



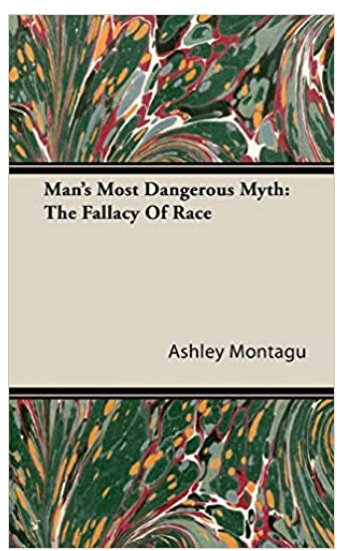
THE ORIGIN OF RACES
CARLETON S. COON
AUTHOR OF THE STORY OF MAN
The first detailed history of the evolution of the five races of man—a pioneer work, a milestone of scientific thought. It advances Darwinian theory beyond the origin of species to the myth-ridden question of the origin of subspecies, or races.

An early post-war example of this process came in the case of Prof.

Carleton Coon, one of the world's foremost physical anthropologists, who spent two decades at Harvard and later served as president of the American Association of Physical Anthropologists. Coon's specialty was race, and he authored several of the standard academic texts in that subject. His research also attracted some controversy when he proposed the hypothesis that the different races of mankind actually predated the emergence of *homo sapiens*, having previously appeared in the geographically-separated populations of our *homo erectus* predecessors, which then independently crossed the line into full sapiency at different points in time.

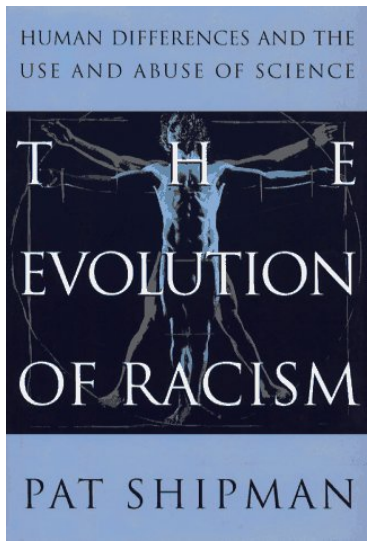
Both Coon's fully mainstream work and his more speculative theories were heavily cited by Putnam and others in their political writings on segregation, and according to Tucker's research, Coon was quietly sympathetic to their efforts. During his presidential term, a rump session of his professional association voted to condemn Putnam's book, and when Coon discovered that virtually none of those hostile members had actually read it, he threatened to resign in protest.

Throughout this era, Coon's leading scientific opponent was a British social anthropologist and follower of Franz Boas, who had originally been born Israel Ehrenberg but then chose to conceal his Jewish origins by taking the remarkably pompous and aristocratic name of "Montague Francis Ashley-Montagu." After relocating to America, he eventually shortened his new name to "Ashley Montagu" while also affecting an extremely upper-class British accent despite his very working-class roots.



Although Montagu seems to have had few scholarly achievements, had made fraudulent claims about his educational credentials, and was dismissed after a few years from his only serious academic position, he spent decades as an extremely successful scientific popularizer, gaining enormous public influence through the media and political support he received.

He was best known for his strong opposition to the concept of race, which he characterized as "Man's most dangerous myth" in a massively best-selling book of that title after having authored UNESCO's famous 1951 declaration on that subject, which he quite possibly plagiarized. Although the actual fine print of his biological claims was generally more nuanced, his headline writings successfully promoted the widespread notion that race was a dangerous pseudo-scientific illusion.



A very interesting history of the anthropological conflicts of that era may be found in Pat Shipman's 1994 book *The Evolution of Racism*. Prior to her turn to anthropology, Shipman had begun her academic career in Religion, and she seems a very zealous anti-racist, but as a diligent and candid researcher, her accounts of Coon, Montagu, and several of the other important figures may have revealed a different image than what she had originally anticipated.

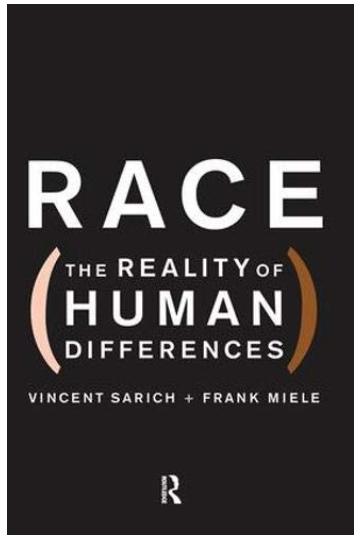
For example, Montagu's early attempts to expunge the scientific notion of race came under withering criticism by leading scholars in the field, and he defended himself by denouncing his anthropological adversaries as "racists" who opposed him because of his Jewish heritage. In an on-the-record interview decades later, he explained

those past conflicts by declaring that “all non-Jews are anti-Semitic,” a statement so remarkable that Shipman used it as the title of one of her chapters.

One of Montagu’s later books, *The Natural Superiority of Women*, also became hugely influential within the burgeoning feminist movement. Montagu remained a very prominent and mediagenic celebrity-scientist for decades, finally dying in 1999 at the age of 94.

While Montagu’s misleading claims received vast media promotion and he became a major television celebrity-intellectual, far more substantial scholarly works on the same subject received scarcely any public attention, or were even actively boycotted. For example, in 1974 John R. Baker, an eminent Oxford don, published *Race*, a magisterial 300,000 word volume presenting the entire intellectual history and scientific information on that subject, ranging from physical anthropology to psychometrics. In the opinion of Sir Peter Medawar, one of the Britain’s leading men of science, no other book “tries to encompass everything relevant to the idea of race with such thoroughness, seriousness, and honesty.” But according to later accounts, intense political pressure forced Oxford University Press to suppress the book by minimizing its distribution and visibility outside the narrow confines of academia. As a consequence, the public impact of this major work of scholarship was restricted to the white racialist community, where it was strongly endorsed by *Mankind Quarterly*.

I have only casually leafed through the very lengthy works of Coon and Baker, but these massively-documented tomes seem to contain exactly the sort of careful and dispassionate material that represents the epitome of serious science, so different from the ideologically-motivated verbiage of popular, media-promoted charlatans such as Montagu.



More recently, the current state of our scientific knowledge was helpfully summarized in *Race: The Reality of Human Differences* published in 2004 by eminent Berkeley anthropologist Vincent Sarich and journalist Frank Miele, which won glowing praise from Colombia anthropologist Ralph Holloway and several other mainstream academics. The book describes the intellectual history of the scientific issues, providing coverage of the various political controversies and Coon's important work, and since it only runs a couple of hundred pages and is written in an easy style, would serve as an excellent introduction to this controversial topic.

## IQ Researchers and Racial Differences

Putnam's second book had appeared in 1967, recounting the failure of his attempts to overturn the *Brown* decision, and thereby reestablish the legal basis for school segregation. By then, popular resistance in the South had largely crumbled, resulting in massive white flight from the local public schools. Meanwhile, Northern cities such as Boston were being roiled by similar controversies over integration, and the passage of the 1964 Civil Rights Act had considerably broadened the political battlefield for racial issues. Although elite liberal opinion had predicted that such reform legislation would greatly reduce American racial conflict, the country had instead witnessed the worst wave of urban unrest since at least the Civil War, with deadly black riots in Detroit, Watts, and numerous other cities.

An important basis for the *Brown* decision had been the argument that desegregation would substantially reduce the wide educational achievement gap between black and white students, which was also a central goal of many of Lyndon Johnson's new Great Society programs, such as Head Start. But in February 1969, the prestigious *Harvard Educational Review* gave over its entire issue to a massive 123 page article by Prof. Arthur Jensen of Berkeley, a leading psychometrician, bearing the provocative title "How Much Can We Boost IQ and Scholastic Achievement?" Jensen argued that there was overwhelming scientific evidence that IQ scores and other measures of scholastic ability were determined by nature rather than nurture and that the wide black-white performance gap was mostly biological in origin. Jensen's scientific claims provoked a national firestorm of controversy, subjecting Jensen to massive vilification, including physical assaults and very serious threats against the lives of himself and his family.

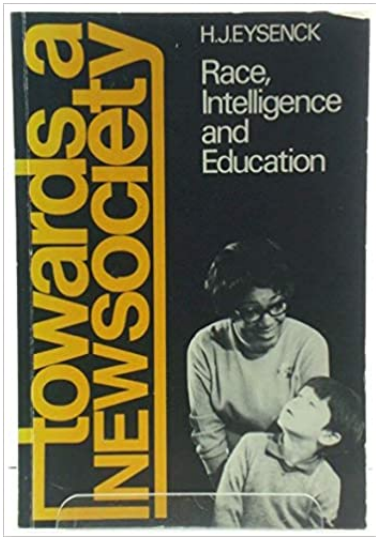
Despite these ferocious attacks, Jensen never wavered in his scientific positions during the decades that followed, and in 1998 he published his magnum opus *The g Factor: The Science of Mental Ability*, reiterating his findings. By 2005, he was widely regarded as the Grand Old Man of psychometrics, and he published an article summarizing the previous thirty years of research on racial differences in intelligence, with his co-author being Prof. J. Philippe Rushton, an evolutionary theorist who held explicitly White Nationalist beliefs.

Jensen seems to have been largely apolitical, and although his original article had ignited the controversy, he hardly desired the resulting media spotlight, which soon shifted away, allowing him to spend the

next four decades in his scholarly research prior to his death in 2012 at age 89. Instead, a much more eager lightning-rod appeared in the person of physicist William Shockley, who years earlier had won a Nobel Prize for inventing the transistor. Shockley seemed to relish public attention, which he soon attracted by wholeheartedly endorsing Jensen's views and then spending years promoting them in the media and various public forums, along with other racially-charged policy proposals such as government-paid sterilization for low-IQ individuals and similar eugenic measures. The physicist soon became a household name, attracting massive public vilification up until his death in 1989 and even long afterward.

Shockley was a Palo Alto native, and in 1956 after inventing the transistor he had founded Shockley Semiconductor in neighboring Mountain View to commercialize his invention, choosing to relocate back from the East Coast in order to be closer to his aged and ailing mother. His difficult personality and poor management skills eventually produced an exodus of his early employees, who went on to spawn many of the most important technology companies in the region, arguably making Shockley the father of the modern Silicon Valley, which otherwise might never have come into existence. But although he is probably the most important Palo Altan in history, his controversial racialist views have prevented any appropriate recognition. For years I have driven past his simple clapboard home on Waverley Ave., which is unmarked by any plaque or historic designation, and his name has never graced any building, monument, or award.

Lacking any such public honors and with his name now largely forgotten, Shockley presented no target for the recent Black Lives Matter protest movement to attack, and he was simply ignored. By contrast, a similar campaign a few years ago forced our local school district to rename Terman Middle School, which had honored famed Stanford Electrical Engineering Prof. Frederick Terman. In the 1930s, Terman had encouraged his students William Hewlett and David Packard to found their eponymous company, which also played a huge role in creating America's powerful technology industry. Terman's name was scraped from the school because he shared it with that of his father, Stanford Psychology Prof. Lewis Terman, who had pioneered American IQ testing a century ago, now considered a toxic figure despite almost no focus on race.

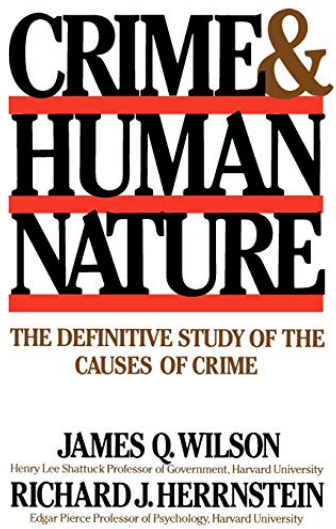


Jensen had done his own doctoral work at University College London under Hans Eysenck, a renowned professor of psychology and expert in psychometrics. A couple of years after the appearance of Jensen's controversial article on the heredity basis of IQ, Eysenck published *Race, Intelligence, and Education*, a short book taking much the same position. Once again, a massive wave of controversy and media vilification erupted, with Eysenck being physically attacked and having his life threatened. Although he never retracted his views, henceforth he focused almost entirely on other topics, and by the time of his death in 1997 was a figure of enormous eminence in the field of psychology, ranking first in the world in the number of his peer-reviewed academic citations. Despite such scholarly achievements, he had never been made a member of the British Psychological Society, apparently because of the controversial nature of his writings on race and IQ three decades earlier.

The same year that Eysenck had released his controversial book, the parallel views of a much younger Harvard psychology professor named Richard Herrnstein attracted similar attention in our own country. Founded in 1857, *The Atlantic* had for more than a century been one of America's most prestigious national magazines, and Herrnstein's 20,000 word article on IQ was one of the longest ever published in that magazine, providing a comprehensive account of the origins and accuracy of IQ tests as a measure of human intelligence, along with the enormous implications for the future of our society. Herrnstein strongly endorsed the arguments of Jensen and others that IQ was overwhelmingly determined by innate factors, but tread rather carefully on the related evidence of a large difference in intelligence

between racial groups.

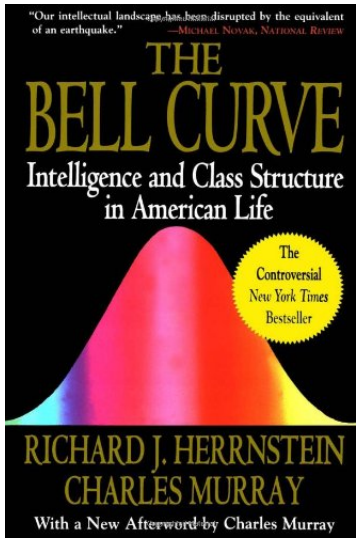
Given its venue, Herrnstein's massive article reached a large national audience, including many of America's intellectual elites, and soon provoked the usual wave of attacks and hostile criticism, though his caution on racial issues probably insulated him from the level of vitriol that Jensen and Eysenck had encountered. Rather than being expelled from respectable media circles, Herrnstein went on to publish additional major articles on related IQ issues over the next couple of decades in *The Public Interest*, *National Review*, *Commentary*, and even socialistic *Dissent*.



CRIME & HUMAN NATURE
THE DEFINITIVE STUDY OF THE CAUSES OF CRIME
JAMES Q. WILSON
Henry Lee Shattuck Professor of Government, Harvard University
RICHARD J. HERRNSTEIN
Edgar Pierce Professor of Psychology, Harvard University

In 1982, *The Atlantic* carried another one of his long articles describing the overwhelming consensus of academic researchers on IQ issues and the severe distortions of the scientific facts regularly promoted by leading mainstream media organs such as *The New York Times* and *CBS News*. So although the positions of Herrnstein and his allies were largely excluded from outlets with the largest national audiences, they continually reached smaller but more intellectually elite circles. In 1985 he co-authored *Crime and Human Nature* with eminent political scientist James Q. Wilson, an influential and well-received text arguing for a strong innate component to criminal behavior, including discussion of the very wide differences in crime rates between racial and ethnic groups.

## *The Bell Curve* Wars and Other IQ Controversies



"Our intellectual landscape has been disrupted by the equivalent of an earthquake."
—Michael Novak, National Review
THE
BELL CURVE
Intelligence and Class Structure in American Life
The Controversial New York Times Bestseller
RICHARD J. HERRNSTEIN
CHARLES MURRAY
With a New Afterword by Charles Murray

Herrnstein died of lung cancer at the age of 64 in September 1994, having devoted the final years of his life to a project that directly addressed the large racial differences in intelligence which most of his previous writings had usually sidestepped. Teaming up with prominent social scientist Charles Murray, he produced *The Bell Curve*, a massive volume that weighed in at 845 pages and over 400,000 words.

The book was released just weeks after his death and immediately became a national sensation, probably attracting more controversy and media coverage than anything published in decades. Almost three generations had passed since a major American press had published a book heavily arguing for the mostly innate nature of human intelligence and the wide racial differences in such traits, and although the latter issue constituted only small portion of the text, those incendiary claims attracted nearly all the attention.

At that time, *The New Republic* was America's most influential liberal opinion magazine, and both owner Martin Peretz and editor Andrew Sullivan together gave their strong support to the launch of *The Bell Curve*, allocating much of an issue to a 10,000 word cover-story entitled "Race, Genes, and IQ: An Apologia," which largely consisted of extended extracts from the book. But that decision sparked a huge revolt by most of the magazine's outraged staff and regular contributors, who demanded space for rebuttal, so that the same issue also carried some 19 separate attacks on the book and its theories, many of them extremely harsh, with epithets such as "neo-Nazi" tossed around. According to Sullivan, the incident marked a turning

point in his relationships with his *TNR* colleagues, which never recovered, and he eventually left the magazine.

From the distance of a quarter century, I had mostly forgotten the overwhelming media coverage at the time, but spending a couple of days reading fifty or sixty of the contemporaneous reviews, many of them quite lengthy, refreshed my memory, and also underscored the tremendously disparate reactions by usual ideological soulmates.

For example, just within the pages of the *New York Times*, the *Sunday Book Review* allocated *The Bell Curve* and two other books on similar racial issues an almost unprecedented three pages of discussion, with Malcolm Browne, the paper's Pulitzer Prize-winning science journalist taking 4,200 words to portray the works in a substantially favorable light, emphasizing the need to confront long-suppressed taboos. But a week later the same newspaper ran a very long editorial denouncing "The Bell Curve Agenda" in the harshest possible terms, and an 8,300 word cover-story in the *Sunday Magazine* had vilified Murray as "The Most Dangerous Conservative in America."

*National Review*, the leading conservative magazine, had already run a long and favorable review, but soon devoted most of an entire issue to a remarkable symposium by 14 separate contributors, many of them prominent journalists or academics, who provided a very wide range of both positive and negative perspectives. Although *TNR* was then my favorite magazine and I didn't hold *NR* in high regard, the flood of attacks in the former seemed absolutely hysterical, while I thought that the latter had provided the best and most balanced discussion.

The coincidental timing of larger political events probably helped explain this enormous media coverage. Just a couple of weeks after the book's release, Newt Gingrich and the Republicans had unexpectedly swept to power in Congressional elections, ending nearly a half-century of unbroken Democratic control by seizing majorities in both the House and the Senate, an event just as traumatic to the liberals of that day as Donald Trump's upset victory was to prove in 2016. Racial controversies had been a significant contributing factor to the Republican landslide, and appalled liberals now saw their familiar political and ideological world crumbling about them, with the frightening possibility that the "white racism" of the buried past would suddenly regain control of American society.

The result was an exceptionally bitter wave of liberal media attacks on the book, which was demonized to an unprecedented extent. As mentioned, much of the early media discussion of *The Bell Curve* and

its ideas had been favorable or at least respectful, but an enormous public campaign of vilification was now unleashed, with many timorous Republicans and conservatives soon wilting under the attacks and abandoning any support. A couple of years earlier, I had been invited to a private meeting in DC at which Murray had confidentially circulated portions of his work-in-progress and the neoconservative organizers strategized with him about the best approach for successfully launching the book; but now I heard word that Bill Kristol was seeking conservatives to sign a public statement condemning the "racist" tract.

The book continued to sell very well, but the tide of elite public opinion soon turned sharply against it, and Herrnstein's death just a month before publication was surely a contributing factor. Until just a few years earlier, Murray had been totally unaware of these scientific issues involving race and IQ, and indeed had regularly dismissed the possible role of racial differences as a factor in black social problems in his previous writings denouncing the welfare state. By contrast, Herrnstein had spent more than two decades researching the topic as a leading Harvard professor, and was also partially immunized against attacks because of his strong liberal credentials. Thus, the disappearance of the senior liberal co-author removed a crucial defender of the contents, leaving the conservative Murray much more vulnerable and exposed, and forcing him to publicly defend psychometric issues that were outside his primary area of expertise. I remember thinking at the time that when faced with sharp technical questioning by hostile journalists some of his media responses were not as effective as they might have been.

America's leading psychometricians, whose professional expertise on race and IQ had long been ignored or mischaracterized in the public arena, quickly mobilized in support, using the media firestorm as an opportunity to get their longstanding opinions into print. In December, the *Wall Street Journal* gave over most of a full editorial page to a public declaration that *The Bell Curve* represented the scholarly consensus of the "mainstream science on intelligence," a statement organized by Prof. Linda Gottfredson and signed by 52 academic experts, including such eminent scholars as Eysenck and Jensen.

Despite these counter-attacks, the intellectual tide continued to turn against the work, and within less than a year, the ideological status quo had reasserted itself, with the remaining defenders finding

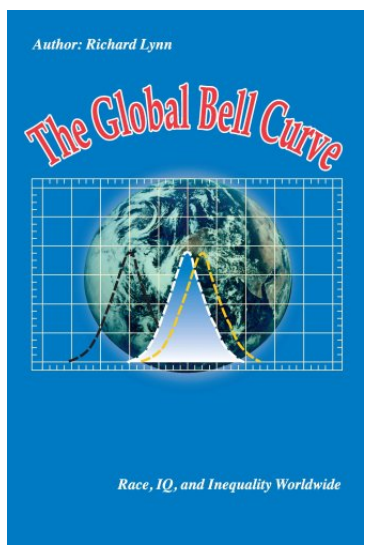
themselves severely beleaguered in the mainstream media. When the firestorm had originally erupted, famed paleolibertarian Murray Rothbard had been gleeful that the long-suppressed truths about racial matters had finally broken through, suggesting that powerful political elements had apparently decided to reverse their decades of scientific suppression. But at the ten year anniversary, longtime writers on race and IQ such as Steve Sailer and Chris Brand delivered lengthy and despairing verdicts, concluding that the ideas in the book had been successfully suppressed, and any favorable mention of it in respectable circles would render someone an immediate outcast. Sailer even suggested that the "Bell Curve Wars" represented a crucial turning point for both the neoconservative and neoliberal intellectual movements, which soon abandoned any lingering candor on racially-charged issues. Indeed, other frequent writers on racial matters such as John Derbyshire and Peter Brimelow have sometimes described the period 1995-2005 as a brief "interrglacial" during which controversial racial topics could sometimes be discussed in the mainstream media, but that the subsequent clamp-down had been even more severe than anything before.

Many journalists and academics became extremely fearful of broaching the subject of race and IQ, with even the most eminent figures sometimes suffering severe consequences when they did so. For half a century, James Watson had reigned as one of the world's greatest scientific figures, having shared a Nobel Prize for discovering DNA in 1953 and then spending decades leading Cold Spring Harbor laboratory, which he built up into a major center of scientific research. But in 2007 while on a book-tour at the age of 79, he raised questions about the average intelligence of black Africans and was immediately subjected to a firestorm of public criticism and media vituperation, soon being stripped of many of his honors, and later endured a second wave of vilification when similar remarks came to light in a 2018 documentary. This was a shocking fate for a scientist in his 90s who had spent his entire career at the peak of world renown and achievement.

At the time of the initial Watson firestorm, *Slate* was our leading online publication, generally neoliberal and well-respected, and William Saletan, one of its senior editors, began publishing a lengthy five-part series entitled "Liberal Creationism," in which he explained the solid scientific basis of Watson's casual remarks. But Saletan immediately encountered such a ferocious wave of denunciations that he soon apologized for having used "disreputable sources" amid widespread doubts that he would be able to keep his job.

## Richard Lynn and *IQ and the Wealth of Nations*

Although Saletan managed to survive, other media figures naturally became very discrete on the subject of race and IQ, either mouthing platitudes or avoiding the topic entirely lest they be mobbed and their careers destroyed. Scientists themselves also recognized that if a figure of Watson's towering stature could be so easily destroyed, they needed to watch their words very carefully if they wished to retain their positions. Meanwhile, IQ researchers and racialist elements followed the topic more eagerly than ever, but remained on the ideological margins, with few of their books or articles gaining any wider exposure. And this severe bifurcation between the two camps—one enormously large but silent and fearful and the other small and fiercely committed to IQ doctrine—had serious negative consequences.



In 2002, Richard Lynn and a co-author had published *IQ and the Wealth of Nations*, which was entirely ignored by mainstream media but became a sensation in IQ and racialist circles. Some of its striking findings began to circulate widely on the Internet, together with those presented in several follow-up volumes, such as *The Global Bell Curve*.

For decades, Lynn had been a leading figure in international IQ research, with many of his important results cited in the Herrnstein/Murray book, and his new work proposed a sweeping global hypothesis. Based upon his collection of hundreds of international IQ

samples, he demonstrated a strong correlation between national IQs and per capita incomes, claiming this proved that a nation's IQ was a central factor in determining its economic success, with obvious implications for government policies on foreign aid and immigration. In addition, the extremely low IQs in so many African countries, often running 30 points or more below the white American average, obviously explained Africa's dismal economic failures.

Despite his lack of any mainstream coverage, Lynn soon became a near cult-figure within the racialist community and the statistics in his book an object of veneration. Moreover, such explosive information may have been widely discussed in private conversations, gradually leaking into establishment circles, and perhaps even ultimately playing a role in prompting Watson's controversial public statements. I suspect that numerous mainstream academics or journalists even regarded the international IQ data as a sort of intellectual pornography, becoming the "forbidden knowledge" that often attracts keen interest.

At the time, I was totally immersed in my own software work, but about a decade later I finally looked into Lynn's material, and came to radically different conclusions. Focusing primarily upon the dozens of white European IQ samples he had presented, I noticed an extremely striking variance in those results over fairly short periods of time and between genetically-indistinguishable groups, raising strong doubts about Lynn's strict hereditarian explanation.

Just as Lynn claimed, national wealth was closely linked to IQ, but his own evidence actually suggested that the causal arrow pointed in the direction opposite to his hypothesis, with IQs seeming to rise very rapidly as national wealth increased. For example, Lynn showed that East Germans had IQs as much as 17 points lower than their West German neighbors, while in the early 1970s Ireland Irish were some 13 points below their Irish-American cousins, but both these huge gaps quickly closed as the poorer societies became less poor. A large number of such extreme anomalies seemed to refute the "Strong IQ Hypothesis" long embraced by Lynn, most of his fellow IQ researchers, and their numerous racialist admirers.

I presented this analysis in my major 2012 article "Race, IQ, and Wealth" which provoked widespread discussion, and in a series of follow-up columns I expanded on these ideas and replied to Lynn's attempted rebuttal. I think my conclusions were eventually accepted by most of the less-dogmatic elements within both the IQ and racialist communities:

- Race, IQ, and Wealth
  *What the facts tell us about a taboo subject*
  Ron Unz • The American Conservative • July 18, 2012 • 7,500 Words

Since my own findings were rather humdrum and so obviously implied by Lynn's own data, I suggested the larger surprise was that they had not been previously noticed during the years of bitter battles over IQ:

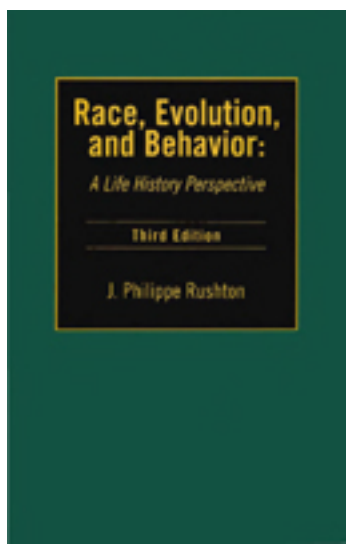
> We are now faced with a mystery arguably greater than that of IQ itself. Given the powerful ammunition that Lynn and Vanhanen have provided to those opposing their own ﷺStrong IQ Hypothesis,ﷺ we must wonder why this has never attracted the attention of either of the warring camps in the endless, bitter IQ dispute, despite their alleged familiarity with the work of these two prominent scholars. In effect, I would suggest that the heralded 300-page work by Lynn and Vanhanen constituted a game-ending own-goal against their IQ-determinist side, but that neither of the competing ideological teams ever noticed.

This seemed a perfect example of why efforts to suppress public

discussion of a contentious topic may ultimately be self-defeating, preventing the warring camps from objectively analyzing the underlying evidence and coming to realistic conclusions.

## Philippe Rushton, r/K Theory, and Accelerated Evolution

I had always been interested in racial issues, and the enormous 1994 media frenzy surrounding *The Bell Curve* naturally led me to purchase a copy, but I found it rather uninteresting and ran out of steam less than a hundred pages into the massive 845 page volume. After all, Herrnstein had been writing pretty much the same thing for more than two decades, starting with his very famous 1971 *Atlantic* article, and although he'd now compiled a great deal of additional supporting evidence, his arguments had already convinced me over many years earlier.



By contrast, another book that coincidentally came out almost at the same time fell into a very different category. Although it received merely a sliver of the media coverage given to the Herrnstein/Murray book, I found *Race, Evolution, and Behavior* by Canadian academic J. Philippe Rushton absolutely fascinating and considered it a seminal advance in human evolutionary theory.

After summarizing the known scientific facts about the main races of mankind and their different characteristics, Rushton then analyzed

this data within the context of r/K theory, a framework of biological adaptation originally developed by sociobiology pioneer E.O. Wilson, which analyzed organisms as being optimized for particular environmental conditions. Under circumstances of resource-abundance, r-selected species emphasize rapid reproduction, while if resources are scarce and competition the crucial factor, K-selected species focus on high parental-investment.

All humans are situated at the far K-end of the spectrum, but some races more so than others. Restricting his attention to the three classical continental-scale mega-races of Africans, Europeans, and East Asians, Rushton analyzed their characteristics under this theoretical framework. Across some sixty different physical and behavioral traits, Africans were invariably at one end of the continuum and Asians at the other, with Europeans in the middle but much closer to Asians. And in each case, these biological characteristics followed the same r/K pattern. A vast wealth of empirical data supported the conclusion that each race had evolved a distinct package of environmentally-influenced features.

I remember casually discussing the two contrasting books with a politically-moderate academic friend of mine at the time, and we both agreed that while the ideas in the much-hyped *Bell Curve* were neither particularly new nor provocative, Rushton's research was absolutely fascinating and probably worth a Nobel Prize. I also joked that it might take at least thirty years for such controversial material to become sufficiently accepted for him to claim that honor. Since those prizes are not awarded posthumously, when Rushton died of cancer in 2012 at the relatively young age of 68, I mentioned to one of Harvard's most prominent scholars that my prediction could no longer be tested.

Despite the shocking aspects of Rushton's racial analysis, whose controversial conclusions vastly exceeded the rather bland and well-established claims advanced by Herrnstein and Murray, his book initially received fair and even rather favorable treatment, with the two works frequently paired together in reviews. The extremely long discussion in the *New York Times Sunday Book Review* covered both of them, and while it noted Rushton's "incendiary thesis," his ideas were still treated in a fully-respectful fashion.

Nonetheless, for most modern readers, Rushton's rather straightforward discussion of racial differences in brain size, genital organs, and rates of physical maturation might trigger an almost allergic reaction, seeming to represent the most horrifying aspects of

the endlessly-vilified "scientific racism" from in the early decades of the 20th century. I was hardly surprised to notice that Rushton's Wikipedia entry tenuously attempted to link him to the Nazi Party in its second paragraph, and many journalists had pursued a very similar line of attack in 1994. Indeed, since his own book had made significant use of Rushton's research, Murray felt compelled to add an Afterword that defended Rushton as a "serious scholar," but many of the harshest attacks on *The Bell Curve* still greatly exploited that Rushton association.

Rushton's landmark book is no longer in print and only available on Amazon at excessive prices, but fortunately PDF copies may be found on the Internet, as well as those of abridged edition, which condenses his 350 page volume into what amounts to a long article.

For years, Rushton's research and writings had attracted furious hostility, with organized leftists unsuccessfully attempting to have his Canadian university fire him from his tenured professorship, and prominent politicians even suggesting that he should be investigated and prosecuted for violations of Canada's expansive hate-crimes laws. Endlessly persecuted or ignored by the political mainstream while hailed for his brilliance by the racialist community, Rushton's own ideological views may have gradually shifted as a consequence. Near the very beginning of his 1995 book, he had argued that use of his scientific research by ethnic nationalists was "problematic," but by 2002 he had assumed the presidency of the Pioneer Fund and a few years later had become a featured speaker at right-wing racialist conferences, at which point I had come to consider him as an outright White Nationalist.

This last characterization actually had important consequences for my own activities. I had done quite a lot of writing on racial and ethnic issues during the 1990s, then became absorbed in my software work and published almost nothing during the first decade of the 2000s. However, I actively participated in a lively email discussion group organized by Steve Sailer which focused on racial issues. A very common topic of discussion was immigrants and immigration, with my own generally favorable views usually rendering me a tiny minority of one. A frequent sub-topic was crime, and my claims that Hispanics had approximately the same crime rates as whites of the same age attracted endless attacks and ridicule from the overwhelming majority of the other list-members. The dispute went on for so many years that I eventually no longer bothered to argue the case, but every now and then just made some satirical jibe on the matter.

As it happens, Rushton was a very occasional participant in the group, and in late 2009 one of my jokes caught his eye. Being a bit on the humorless side, he failed to comprehend that my remarks were actually tongue-in-cheek, and after three or four explanatory exchanges, I was finally forced to state my position as explicitly as possible: "Hispanics have approximately the same crime rates as whites of the same age." He found my claim totally astonishing, saying that it contradicted absolutely everything he had ever learned about the subject and even threatened to overturn his entire ideological world-view, which he had so painstakingly built up over his previous thirty years of scientific investigation into human racial differences. Therefore, he said, I couldn't possibly be correct.

The Myth of Immigrant Crime

I then regarded Rushton as probably being the world's leading White Nationalist academic scholar, and he was basically saying that he would eat his own hat if my contradictory racial analysis proved correct. Such an intellectual challenge was just too tempting to resist, so I took a brief hiatus from my ongoing software project to work out the crime numbers, which naturally turned out to be exactly as I had expected, then published my work as "The Myth of Hispanic Crime" in January 2010, an article which provoked quite a lot of discussion on various websites. I believe my findings had a substantial impact in reshaping the public debate, and my article spent most of the next decade generally ranked #2 by Google among some 160 million search results for "Hispanic Crime" and "Latino Crime" until all the pages of our website were entirely deranked by the Internet giant a few months ago, though it still holds that impressive position both on DuckDuckGo and Bing.

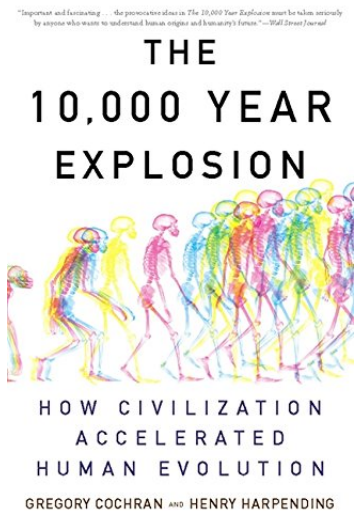
- https://www.google.com/search?q=latino+crime
- https://www.bing.com/search?q=latino+crime
- https://duckduckgo.com/?q=latino+crime

- The Myth of Hispanic Crime
  *Talk TV sensationalists and axe-grinding ideologues have fallen for a myth of immigrant lawlessness*
  Ron Unz • The American Conservative • January 26, 2010 • 5,500 Words

My satisfaction with that article prompted me to return to research and writing, and over the next couple of years, I published more than I ever done had in the past.

Whether or not Rushton's ill-treatment had pushed him into the white racialist camp, he gave little indication of deeply regretting that alignment, which only came after some twenty years of increasingly harsh vilification and harassment, both at his university and by the media. A much more unfortunate public demonization, though on a far lesser scale, occurred in the case of Henry Harpending, an eminent anthropologist with whom I'd become a little friendly during the early 2000s.

As his Wikipedia article indicates, he had spent nearly his entire career as an absolutely mainstream academic figure. After earning his Ph.D. at Harvard in 1972, he did important original work both in population genetics and anthropological fieldwork in Africa, and published over 120 articles in respected scientific journals. He eventually won election to the prestigious National Academy of Sciences, and spent his last twenty years as a full professor at the University of Utah.

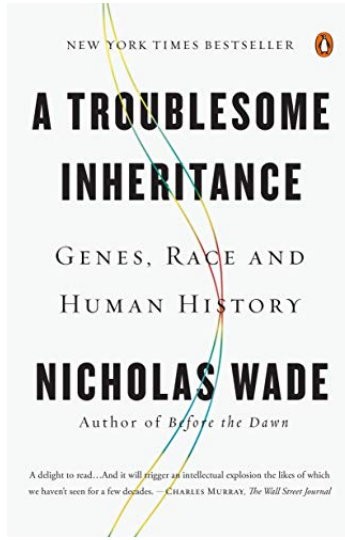


"Important and fascinating . . . the provocative ideas in The 10,000 Year Explosion must be taken seriously by anyone who wants to understand human origins and humanity's future."—Wall Street Journal
THE
10,000 YEAR
EXPLOSION
HOW CIVILIZATION
ACCELERATED
HUMAN EVOLUTION
GREGORY COCHRAN AND HENRY HARPENDING

Around 2007 he began a series of collaborations with physicist Gregory Cochran and together they published a number of important, high-profile papers. These included a theory that the introgression of Neanderthal genes may have spurred the development of early *Homo Sapiens*, the presentation of genetic evidence for the evolution of increased Ashkenazi Jewish intelligence, and most importantly the hypothesis that human evolution had been rapidly accelerating during the last 10,000 years, being driven by the increased appearance of favorable mutations due to far larger populations. All these papers appeared in well-regarded academic journals, with a couple of them being sufficiently important that they received favorable coverage in the science pages of the *New York Times*. In 2007 he and Cochran co-authored *The 10,000 Year Explosion*, published by Basic Books, which presented these various evolutionary ideas, as well as the suggestion that the evolution of lactose-tolerance might have been an important factor behind the early Indo-European expansion. The numerous reviews in academic journals were generally quite favorable.

However, the suggestion that human evolution had rapidly accelerated during the last few thousand years carried possible racial implications that did not pass unnoticed among white racialists, and the work became quite popular in such circles. Moreover, the two authors launched *West Hunter*, a joint blogsite focused on racial and evolutionary issues, and although Harpending seemed only minimally involved, many of the numerous commenters expressed sharply racialist sentiments on a wide variety of matters. Despite seemingly being apolitical, during 2009 and 2011 he accepted speaking

engagement at small right-wing gatherings on the East Coast, perhaps thereby coming to the attention of SPLC investigators.



NEW YORK TIMES BESTSELLER
A TROUBLESOME INHERITANCE
GENES, RACE AND HUMAN HISTORY
NICHOLAS WADE
Author of Before the Dawn
A delight to read…And it will trigger an intellectual explosion the likes of which we haven't seen for a few decades. —CHARLES MURRAY, The Wall Street Journal

In 2014 Nicholas Wade, a longtime science reporter and editor at the *New York Times*, published an important book on race and evolution that quickly drew an organized campaign of vilification, including a public letter signed by 134 prominent geneticists, whose absurd charges conclusively proved that not a single one had read the book they were attacking. One of Wade's chapters covered the theory of the evolution of increased Ashkenazi intelligence that Harpending had co-authored, probably placing a large target on the latter's back.

So the following year, the SPLC's *HateWatch* newsletter outrageously denounced the mild-mannered academic as a "White Nationalist." This accusation was based upon a ridiculous grab-basket of charges, several of which merely amounted to describing his scientific research findings or mere guilt by association. Other than that, they noted he had occasionally made public statements roughly along the lines of the theories promoted by Herrnstein and Murray and had once called for the mass-deportation of illegal immigrants. For his writings on controversial Jewish issues, Kevin MacDonald has long become an arch-fiend to SPLC researchers, and they demonstrated their total incompetence by claiming Harpending's theories were based upon those of MacDonald although they have no connection whatsoever and the latter's name never even appeared in the index nor the bibliography of his book.

Quiet academics who become the object of vicious accusations by influential national organizations have little recourse, and suddenly

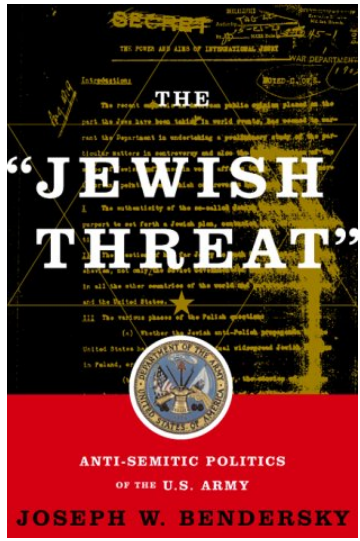
being labeled a “White Nationalist” and “racist” must have been a very painful experience, possibly contributing to his death from a couple of strokes early the following year at age 72. Despite his twenty years as an esteemed Utah professor, no obituary appeared in his local newspaper, while his university website currently contains a page disassociating itself from one of its former academic stars.

The motive behind such SPLC calumny may have been partly to provide a severe warning to other scientific researchers, much like the destruction of James Watson’s towering reputation. But think a larger factor was the desire to sufficiently anathemize the scholar that in the future no one would dare to cite his research in the public media, and that result seems to have been achieved. In 2019 a rather chauvinistic Jewish columnist at the *New York Times* casually referred to some of the findings that had been favorably discussed in his own newspaper a dozen years earlier, then desperately back-pedaled and removed the reference after someone discovered he had been relying upon a “racist” researcher.

## Jewish Issues and Revilo P. Oliver

This extreme sensitivity towards any scientific research touching upon Jews or Jewish characteristics may actually represent a major hidden subtext behind the heavy suppression of racial research over the last century, perhaps even being a more important factor than the obvious focus on black/white issues.

As discussed above, Prof. Tucker’s exhaustive investigation of the Pioneer Fund revealed that throughout most of the twentieth century the organization had been at the center of a network of racialist researchers, providing at least some funding support for many of the scholars discussed above, including Jensen, Eysenck, Rushton, and Lynn, whose focus on topics of race and IQ was heavily disfavored by the vastly larger flow of funding from governmental or mainstream philanthropic sources. But Tucker discovered strong indications that many of the key Pioneer figures had also held strong views on Jewish issues, though they were careful not to publicly disclose them.



In his first chapter, he explained that Pioneer had its ideological roots in the 1920s, when now-controversial notions of white racialism and eugenics were ubiquitous in elite American circles, especially prevalent in our officer corps and Military Intelligence, who were members of Col. Draper's own social milieu. Heavily drawing upon the ground-breaking research of Holocaust historian Joseph W. Bendersky, Tucker noted that these same groups were also deeply—if quietly—hostile to growing Jewish influence in American society, which they viewed as a direct threat to continued Anglo-Saxon dominance. For four decades one of the top figures at Pioneer was Secretary John B. Trevor, Jr., the son of the former high-ranking Military Intelligence officer who had played a central role in the passage of the 1924 Immigration Act, whose underlying motive had actually been to eliminate any future influx of Eastern European Jews.

I summarized some of Bendersky's important findings in a previous article:

> In these military circles, there was an overwhelming belief that powerful Jewish elements had financed and led Russia's Bolshevik Revolution, and were organizing similar Communist movements elsewhere aimed at destroying all existing Gentile elites and imposing Jewish supremacy throughout America and the rest of the Western world…Although intelligence officers gradually came to doubt that the *Protocols of the Elders of Zion* was an authentic document, most believed that the notorious work provided a reasonably accurate description of the strategic plans of the Jewish leadership for subverting America and the rest of the world and establishing Jewish rule.

> Although Bendersky's claims are certainly extraordinary ones, he provides an enormous wealth of compelling evidence to support them, quoting or summarizing thousands of declassified Intelligence files, and further supporting his case by drawing from the personal correspondence of many of the officers involved. He conclusively demonstrates that during the very same years that Henry Ford was publishing his controversial series *The International Jew*, similar ideas, but with a much sharper edge, were ubiquitous within our own Intelligence community. Indeed, whereas Ford mostly focused upon Jewish dishonesty, malfeasance, and corruption, our Military Intelligence professionals viewed organized Jewry as a deadly threat to American society and Western civilization in general. Hence the title of Bendersky's book.

By the late 1930s and especially after World War II, such sentiments were only rarely voiced in public, but archival research confirms that they still remained a powerful factor in private thoughts and correspondence, including within Pioneer's inner circle.

Although unconnected with Pioneer, one influential post-war racialist who placed Jewish issues at the center of his concerns was University of Illinois Classics Prof. Revilo P. Oliver. Having held an important wartime role in military code-breaking, during the 1950s Oliver became a leading figure at both *National Review* and the John Birch Society, two of the leading right-wing organizations of that era, and according to his 1981 memoirs, both had originally been established with the primary goal of combating Jewish influence. As I wrote last year:

> One of his friends, a right-wing Yale professor named Willmoore Kendall, argued that a crucial factor in the Jewish domination of American public life was their control over influential opinion journals such as *The Nation* and *The New Republic*, and that launching a competing publication might be the most effective remedy. For this purpose, he had recruited a prize student of his named William F. Buckley, Jr., who could draw upon the financial resources of his wealthy father, long known in certain circles for his discreet sponsorship of various anti-Jewish publications and &#65533;his drastic private opinion about the aliens' perversion of our national life.&#65533;
>
> By 1958 Oliver had established himself as one of *National*

*Review*'s leading contributors, and he was contacted by a wealthy Massachusetts businessman named Robert Welch, who had been an early investor in the magazine but was greatly disappointed by its political ineffectiveness, so the two men corresponded and gradually became quite friendly. Welch said he was concerned that the publication focused largely on frivolity and pseudo-literary endeavors, while it increasingly minimized or ignored the conspiratorial role of the Jewish aliens who had gained such a degree of control over the country…

Late that same year, Welch described his plans for regaining control of the country by the creation of a semi-secret national organization of patriotic individuals, primarily drawn from the upper middle classes and prosperous businessmen, which eventually became known as the John Birch Society. With its structure and strategy inspired by the Communist Party, it was to be tightly organized into individual local cells, whose members would then establish a network of front organizations for particular political projects, all seemingly unconnected but actually under their dominant influence. Secret directives would be passed along to each local chapter by the word of mouth via coordinators dispatched from Welch's central headquarters, a system also modeled after the strict hierarchical discipline of Communist movements.

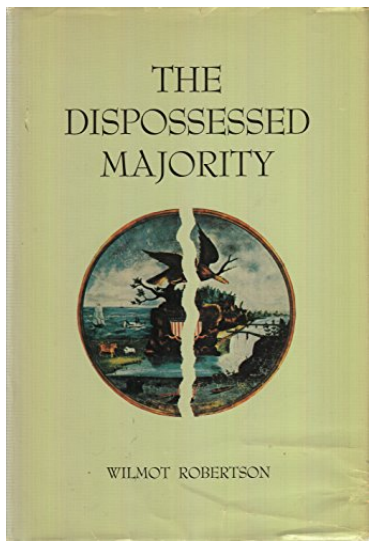
…Minimal emphasis was to be placed upon Jewish matters, partly to avoid drawing media fire and partly in hopes that a growing schism between Zionist and non-Zionist Jews might weaken their powerful adversary, or if the former gained the upper hand, perhaps help ensure the removal of all Jews to the Middle East.

Although Oliver had entered both anti-Jewish projects with high hopes, these soon dissipated, and within a few years he came to believe that each had been rendered ineffective, apparently subverted by the need for Jewish funding. He ultimately concluded that his huge investments of time and effort had been entirely wasted, and eventually broke with both organizations, mostly abandoning political activity although he continued to occasionally write for Far Right publications, and retained a great deal of prestige in those circles up until his 1994 death at the age of 86.

## Wilmot Robertson, *The Dispossessed Majority*, and

Oliver's stridently anti-Jewish views rendered him unacceptable in regular conservative circles, let alone within the political mainstream, but Tucker's archival research suggests that these same sentiments were far less uncommon among prominent racialists of the 1950s and 1960s than their public utterances might indicate.

As a longtime senior figure in the corporate world with an Ivy League education, Putnam was a member of America's elite Establishment, and his national crusade to maintain racial segregation in the public schools and prevent intermarriage was wholeheartedly endorsed by many leading Southerners of the era, including governors and influential U.S. senators. But private correspondence reveals that Putnam's true political views actually extended far beyond that particular issue, which was widely endorsed by so many leading conservatives of his day.



Around 1970, he brought to Draper's attention a lengthy manuscript by a pseudonymous author calling himself "Wilmot Robertson," strongly endorsing the work and urging financial support. Other leading figures in the Pioneer Fund circle were equally enthusiastic, and with their backing *The Dispossessed Majority* was published in 1972, not long after Draper's death, while Putnam's correspondence revealed that he then distributed copies to "very influential figures… near…to the controls of our society."

Running some 200,000 words, Robertson's opus soon became the ur-

text of modern American White Nationalism, reestablishing the ideological basis for a movement once anchored in the writings of men such as Lothrop Stoddard but which had largely disappeared in the aftermath of World War II.

From its earliest days, America had been run by its Anglo-Saxon core along with the assimilated descendents of closely-related Northern European immigrant groups, who together constituted both the bulk of the population and a large majority of its ruling elites. But Robertson argued that during the previous generation or two, a quiet revolution had steadily shifted political and social control into the hands of America's tiny Jewish minority, thereby transforming the country's huge white Gentile population into "the dispossessed majority" of his title, even as the heavily Jewish media ensured that very few members of that group had recognized this ongoing transformation.

Putnam's own books and other writings had been quite cagey on such touchy subjects, occasionally alluding to the elite "minority groups" that were his primary political opponents but almost never even mentioning the word "Jew." However, his enthusiastic support for Robertson's work suggests that he was actually in full agreement on those underlying issues, which came as a very pleasant surprise to his longtime allies in the Pioneer circle.

After encountering scattered references to the Robertson book here and there on the Internet, I finally purchased and read it about a decade ago, finding the work considerably better than I had expected. But having now learned of Putnam's personal involvement in its origins, I decided to take another look, and also noticed the cover-blurbs from prominent scholars. Prof. Coon described it as "A work of vast scope and scholarship" while Prof. Oliver praised it as "Politically the most important book published in this country since 1939—perhaps since 1917." Prompted by strong endorsements, I decided to reread it, and see how it held up the second time round.

Throughout the 1950s and 1960s, the central fault line in American society had almost invariably been that separating black from white, with few scholars exploring any residual conflicts between different white ethnic groups. Large scale European immigration had been halted in 1924, and it was widely believed that decades of action by America's powerful melting-pot had mostly eliminated the sharp differences between the various flavors of whites, a perception strongly encouraged by the media of that era. In fact, I suspect that one reason *Beyond the Melting Pot* by Nathan Glazer and Daniel Patrick

Moynihan had attracted so much attention and became such a sociological classic in 1963 was that it focused on a subject otherwise so little-discussed and one that went against the prevailing ideas of the period.

By contrast, *The Dispossessed Majority* marked an ideological return to the early decades of the twentieth century, when intra-white conflict along ethnic lines had been the central issue. Indeed, Robertson reverted to the old-fashioned separation of Europeans into the Nordic, Alpine, and Mediterranean sub-races, a usage long since fallen into disrepute and popular disuse. Although blacks, Asians, and other non-white groups were given some attention, his primary focus was on differences between American whites.

In particular, the author sharply distinguished between "assimiliable" and "non-assimiliable" white minorities. By his reckoning, America's so-called "Majority" population—the Old Stock Anglo-Saxons and other fully assimilated Northern European ethnic groups—constituted just under 60% of our total population. An additional 12% fell into the category of "assimilable white minorities," including the Irish, Poles, and French Canadians. But another 8% of the population consisted of white ethnicities he considered sufficiently alien as to be classified as "non-assimilable," including Jews, Southern Italians, and Greeks, which was quite an intellectually scandalous position to take in the early 1970s.

And although Jews only represented a small fraction of those latter groups, Robertson put them at the absolute center of his analysis. Throughout his long work, he used the term "minority" on a multitude of occasions, almost once per page, and I would guess that 90% of those references were to Jews, so much so that the word almost served as a euphemism. Considering another metric, he devoted a long section of his book to describing and discussing the country's major ethnic groups, ranging from the Irish and the Slavs to the blacks and other non-whites. But the chapter on Jews occupied nearly half the entire space: two pages on Mexicans and other Hispanics, two pages on Asians, but fifty pages on Jews. Although it might seem strange to current readers, his heavily racialist text generally paid very little attention to America's Hispanics or Asians since both those groups were then such a small fraction of the national population.

Just as Putnam and others claimed, the book contained an enormous quantity of careful research material which Robertson had spent ten years compiling, all presented in a polished, lucid style, with professional editing. But as might be expected, a work focused on

such extremely controversial material encountered severe difficulties with sales and distribution. The author later explained that nearly all conservative publications had rejected his ads and bookstores refused to stock any copies, while almost all writers who were sent review copies ignored its existence. Yet even so, within two years some 16,000 copies had been sold or otherwise distributed, a very solid achievement under such difficult circumstances, and total sales eventually exceeded 150,000 copies, quite remarkable under the circumstances.

A book first published in 1972 is now nearly a half-century old, and must be evaluated in that light, so its numerous references to the threat of Communism and the Soviet Union are obviously quite dated. But taken as a whole, I think the text holds up very well, probably remaining more relevant to the domestic problems of our own present-day American society than all but a sliver of the works published around the same time. Indeed, although I had found it quite interesting a decade ago, the events of the last few years—and especially the last few months—seem to have enormously increased its contemporary relevance. Robertson—whose real name was Humphrey Ireland—died in 2005 at the age of 90, but I think he would have found our current domestic problems an almost straight-line extrapolation of those that he had first laid out several decades ago.

Most remarkably, I think an updated version of his central ethnographic framework might be a useful means of analyzing the fault-lines in today's American society. Although Robertson might not necessarily have agreed, I believe that the last two generations have succeeded in fully merging virtually all of America's white Gentile ethnic groups—whether "assimilable" or "non-assimilable"—into what he had defined as the Majority population, with few if any sharp distinctions remaining. So by that standard, today's Majority is almost exactly the same fraction of our national population as the somewhat different Majority that he had defined fifty years ago.

And I would argue that an even more profound change has been that the bulk of America's non-whites—most Hispanic and Asian groups—have now clearly shifted into Robertson's category of "assimilable minorities," or perhaps in many cases have already even become fully-assimilated members of our Majority population. Such major revisions obviously do violence to the ideological beliefs of an author who was born more than a century ago, but I think they much better reflect the realities of today's American society than do his sharp distinctions between Europeans of Nordic and Alpine racial ancestry.

Perhaps to some extent my sociological analysis is a selfish one. Throughout world history differences of language have been among the sharpest barriers separating ethnic groups, so I believe that my own success two decades ago in dismantling the widespread system of Spanish-almost-only "bilingual education" in California and elsewhere throughout the country has probably played a large role in achieving this reclassification of America's large and rapidly growing Hispanic population, now already 17% of the national total.

And oddly enough, under this revised ethnic framework a case can be made that the vast demographic changes of the last fifty years have ultimately resulted in an America whose Majority and assimilable minorities together now constitute a much larger fraction of our national population than they did when Robertson's book first appeared. Whether or not others accept my modification of his ideas or regard them as grotesque mutilations, his masterwork is easily available online as a PDF, and also part of this website's HTML Books section:

- The Dispossessed Majority
  Wilmot Robertson • 1972 • 203,000 Words

A few years after publishing his book, Robertson launched *Instauration*, a monthly racialist magazine that appeared without fail for the next quarter century from 1975-2000. Although widely read in racialist circles, perhaps the only time it ever gained a bit of public attention was when *National Review* Senior Editor Joseph Sobran favorably mentioned it in one of his 1986 columns, thereby provoking a firestorm of criticism, and laying the groundwork for his later purge from that publication and the destruction of his career.

I managed to obtain a complete set of *Instauration* around the same time I bought Robertson's book, and then casually read through most of the issues. While the material was probably unique at the time it appeared, the growth of the Internet has spawned a multitude of websites now offering similar ideological fare, so I found the articles of only slight historical interest. With all the back issues now online as PDFs, people can judge for themselves.

One major element that did draw my attention was a long continuing series entitled "The Game and the Candle" that ran across more than two dozen issues, and which I found quite fascinating. It was described as "a dramatized rendering of the secret history of the

United States (1912-1960)" and many of the historical allusions only became intelligible to me when I finally reread it again near the end of last year. Although most of the surprising conspiratorial claims presented are far from solidly established, I suspect that much of the "alternate reality" that they describe is at least as close to the truth as the very conventional historical narrative of the twentieth century found in all our standard history textbooks. For ease of reading, I have extracted all the 29 installments, which amount to perhaps 100,000 words, and merged them together into a single long PDF.

  Wilmot Robertson • 1972-1974 • 100,000 Words

## Jared Taylor, Peter Brimelow, and Kevin MacDonald

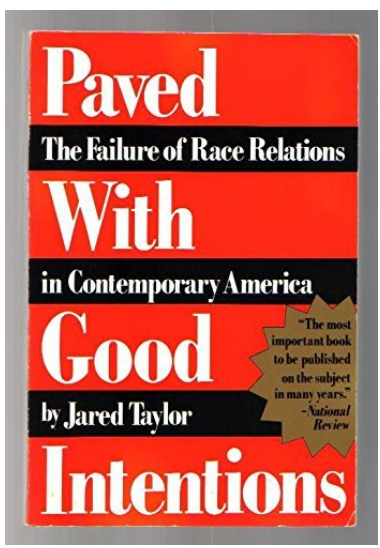
Around 1990, racial controversies began returning to the center-stage of American public life. Our nation's leading economic, political, and media elements overwhelmingly reside in New York City, Washington DC, and Los Angeles, and in all these urban centers very serious levels of black crime became a daily source of concern, with fears only growing worse after the LA Riots of 1992, the worst outbreak of racial violence in a generation. Meanwhile, a continuing flood of foreign immigration, the highest in three generations, was also rapidly altering the demographics and darkening the complexion of California and other large states, with whites gradually being reduced to a minority of the population and often a small minority of public school students.

Robertson's tiny racialist publication seems to have mostly been a one-man operation, and as someone born in 1915, he was already in his mid-70s by the beginning of this period of heightened racial tension, probably in no position to take full advantage of the opportunity. The potential audience and reach of his writings had always been severely restricted by the media boycotts he endured, but the appearance of the Internet would soon begin reducing such distributional barriers, providing a tremendous opening for those willing and able to take full advantage of the new technology. Over the next quarter-century, there was a huge growth of racialist publications, websites, and forums, which followed a wide variety of different styles and areas of

main interest.

The unexpected 2016 election victory of Donald Trump was later to place these ideas under an unprecedented national spotlight. Although the term “Alt-Right” had originally been coined a few years earlier by political activist Richard Spencer and his paleoconservative mentor Prof. Paul Gottfried, the fundamental ideas of that movement had been developed over the previous decades by these various racialist outlets, whose existence had been almost entirely ignored by the mainstream media.

Three of the most prominent figures in this Internet-based ideological movement were each roughly a generation younger than Robertson, and by taking full advantage of the Internet, they eventually created ongoing publications that have become among the most important outlets for racialist content. Although Jared Taylor, Peter Brimelow, and Kevin MacDonald share overlapping interests and have regularly collaborated together or spoken at the same events, each seems to primarily focus on a particular portion of the political landscape that Robertson’s publication had originally encompassed.



Jared Taylor launched his *American Renaissance* newsletter in late 1990, initially under a slightly different form of his name and in 1992 he published *Paved with Good Intentions*, a powerful compendium of the apparent failures of America’s efforts at racial integration, with a heavy focus upon black crime and other social dysfunction. At that time, his more controversial ideological views were not yet generally known, so the book was released by a fully mainstream press, then widely and favorably reviewed in regular conservative media outlets,

even receiving respectful treatment by a leading liberal academic in the pages of the prestigious *New York Review of Books*. An anniversary edition of Taylor's book is available in convenient HTML form on this website, allowing those so interested to read it and decide for themselves:

- Paved with Good Intentions
  *The Failure of Race Relations in Contemporary America*
  Jared Taylor • 1992 • 150,000 Words

According to his Wikipedia entry, Taylor had been born in Japan to missionary parents in 1951 and spent his first 16 years living in that country, afterward graduating from Yale and earning a postgraduate degree in Paris, with some years spent traveling in West Africa. He later worked in the financial services and publishing industries, and wrote a well-received book on Japan in 1983, obviously possessing the sort of mainstream and elite credentials which many might find surprising in a controversial political movement long pushed into the fringes. His memories of spending his early years in a racially-homogenous, peaceful, and orderly East Asian society surely stood in sharp contrast with the increasingly fragmented and crime-ridden America he saw about him during the late 1980s and early 1990s, and this must have been an important factor in his political evolution.

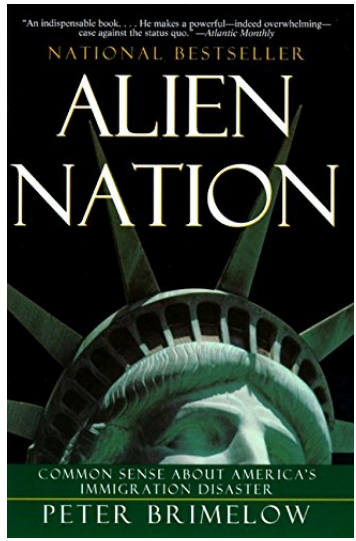
Taylor's three decades of public activity have probably established him as America's most prominent White Nationalist, while the print version of his *American Renaissance* publication shifted to an entirely online presence about a decade ago. Although many of its items have dealt with transient day-to-day events, his archives provide a cornucopia of serious racialist content, including lengthy book reviews that would be found almost nowhere else, as has already been demonstrated in this article. The quality of the content is often quite high, and under a different ideological regime one could easily imagine many of these pieces appearing in America's leading general interest magazines rather than being confined to the margins of the Internet. Although his publication covers racialist matters in general, over the years the primary focus has probably remained the subject of his original book, namely the problematic aspects of blacks in American society.

When Taylor's 1990 book was very favorably discussed in the pages of *National Review*, the writer was journalist Peter Brimelow, a senior editor at *Forbes*. Brimelow was then regarded as a very mainstream if

conservative-leaning financial journalist, who had spent part of the late 1970s serving as a Republican Senate staffer, and had long and close ties with prominent conservative intellectuals and authors, especially those grouped around the Manhattan Institute, with its intermingled neoconservative and libertarian elements. Born and educated in Britain, he had come to Stanford in the early 1970s for his MBA, then spent a number of years working as a journalist in Canada, before permanently settling in the New York City area.

Six months before writing that review, Brimelow had himself created quite a stir by publishing a *National Review* cover-story entitled "Time to Rethink Immigration?," one of the longest and most influential articles ever to appear in that magazine. The right-wing nativism of the 1920s had dissipated soon after the heavy flow of foreigners from Europe had been legally reduced to a trickle, and in recent decades conservatives had generally been quite friendly towards immigrants and immigration, with the ringing phrases of Ronald Reagan providing a perfect example of that tendency.

The 1965 Immigration Act had reopened the possibility of large-scale immigration from Europe and Asia, while the very rapid population growth in Latin America had produced a similar effect from that region, and these gradually began having a large national impact. By the late 1980s major demographic changes were taking place across American society, but most conservative leaders still continued to ignore the issue. Indeed, when Pat Buchanan published *Right from the Beginning* in 1990, his resoundingly conservative call-to-arms actually included favorable mention of America's large population of hard-working illegal immigrants. But much of the Republican Party's white conservative base had meanwhile begun to seethe on the issue, producing the dry tinder for a potential political explosion, and Brimelow's powerful 13,000 word article helped provide the spark.



"An indispensable book. . . . He makes a powerful—indeed overwhelming—case against the status quo." —Atlantic Monthly
NATIONAL BESTSELLER
ALIEN NATION
COMMON SENSE ABOUT AMERICA'S IMMIGRATION DISASTER
PETER BRIMELOW

Two years later, incumbent Gov. Pete Wilson of California turned an uphill reelection drive into a landslide victory by riding the coattails of Prop. 187, his state's anti-illegal immigration ballot measure, which passed by an even wider margin. On that same Election Day, the Republicans led by Newt Gingrich won an unexpected national victory, gaining control of both the House and the Senate for the first time in sixty years. An unforeseen consequence of these Congressional victories was that longstanding critics of immigration suddenly held the chairmanships of both relevant committees, and they pledged to pass legislation sharply reducing the flow of incoming foreigners.

Brimelow had expanded his very long *NR* article into *Alien Nation*, a book published by Random House, and with exceptionally fortuitous timing, it was released in early 1995, selling very well as a consequence. While he kept his day job at *Forbes*, he had also been named a senior editor at *NR*, and over the next few years became an influential figure at America's conservative media flagship organ. Although long out of print, his 1995 book is conveniently available in HTML format on this website:

- Alien Nation
  *Common Sense About America's Immigration Disaster*
  Peter Brimelow • 1995 • 95,000 Words

Throughout the rest of the 1990s, racial issues remained at the forefront of the American political debate. California in particular became the epicenter of such controversies, with battles over the state's Propositions 187, 209, and 227—dealing with illegal immigration, affirmative action, and bilingual education respectively

—inspiring national debates over those same topics. I myself was very heavily involved in all these conflicts, and later recounted the history and broader analysis in a long 1999 *Commentary* cover-article and an even longer *American Conservative* sequel a dozen years later. I think both these articles have held up very well, and I would strongly recommend them to those interested in the topics:

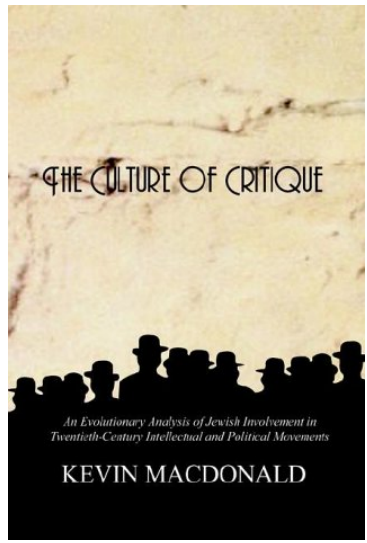
- California and the End of White America
  *The unprecedented racial transformation of California and its political consequences*
  Ron Unz • Commentary • October 1999 • 8,600 Words
- Immigration, Republicans, and the End of White America
  *The sources of America's immigration problems—and a possible solution*
  Ron Unz • The American Conservative • September 19, 2011 • 12,300 Words

Although Brimelow and his anti-immigration allies had gained the upper hand in the early battles within the conservative movement and the Republican Party, by the late 1990s their pro-immigration opponents backed by the powerful business lobby had won a complete victory and purged most of their erstwhile foes. Denied any significant media outlet for views still so widely held among ordinary grassroots conservatives, he and a small group of allies launched the VDare website near the end of 1999, and the publication soon emerged as the leading venue for hard-core anti-immigration views, often presented with a sharp racialist tinge. Although immigration has always remained its overwhelming focus, coverage soon extended to other controversial topics of a similar hue which were also generally excluded from the conservative mainstream, including black criminality, racial differences, Jewish influence, and IQ studies. Much of this material would have hardly seemed out of place in the *National Review* of the 1990s, but had now been exiled to the web.

Jared Taylor and Peter Brimelow had become racialist partisans and publishers via the unsurprising route of journalism, but a third leading figure, Kevin MacDonald, instead had a purely academic background.

Born in 1944, MacDonald had earned his Ph.D. in biobehavioral sciences in 1981 and after a post-doctoral fellowship in psychology became a faculty member in the California State University system a few years later, soon beginning to focus on evolutionary psychology. The debate over group evolutionary strategies has traditionally been a

highly contentious topic in the field, and according to his own account, MacDonald became interested in exploring the issue within the human context. Jews have been recognized as a distinct human group for thousands of years and there exist copious historical records of their activities and behavior, so they seemed an ideal subject for a case study.



THE CULTURE OF CRITIQUE
An Evolutionary Analysis of Jewish Involvement in Twentieth-Century Intellectual and Political Movements
KEVIN MACDONALD

After years of diligent research, MacDonald published *A People That Shall Dwell Alone* in 1994, having the subtitle "Judaism as a Group Evolutionary Strategy." Released by a standard academic press, the work received generally favorable reviews in academic journals and otherwise attracted no notice whatsoever. In 1998, he followed this with *Separation and Its Discontents* subtitled "Toward an Evolutionary Theory of Anti-Semitism," attracting fewer reviews and once again no other attention. His final volume *The Culture of Critique* appeared later that same year, and was far more political and contemporaneous in its focus, as indicated by the subtitle "An Evolutionary Analysis of Jewish Involvement in Twentieth-Century Intellectual and Political Movements."

According to MacDonald, he had been shocked when his research revealed the overwhelming role of organized Jewish groups in transforming America's political and intellectual life during the course of the twentieth century, most notably with regard to our immigration policy, an important history that had remained concealed from him and nearly all other Americans. Although released by the same academic press, this last work was almost entirely ignored by the scholarly journals that had reviewed the previous two volumes of his trilogy.

Despite the highly controversial nature of MacDonald's historical findings, I suspect that most of his subsequent notoriety and his entrance into political activism was due to his participation in David Irving's high-profile libel lawsuit. Irving, one of Britain's most successful historians, had been under heavy attack for many years by Jewish groups outraged over the contents of his best-selling World War II histories, and by the time of his London trial in 2000, he was a beleaguered figure, soon to be financially ruined by the heavy judgment against him. Irving's looming fate naturally intimidated most of his potential scholarly supporters, and MacDonald was the only witness willing to testify on his behalf, providing an account of the past activities of organized Jewish groups. Such involvement naturally brought the California academic to the attention of the right-wing groups who had rallied on Irving's behalf, but more importantly led MacDonald to be targeted by Irving's numerous Jewish foes, who immediately began orchestrating harsh media attacks against him.

Campaigns of public vilification are sometimes counter-productive, and I suspect that the vast majority of individuals who first discovered MacDonald's work did so from reading pieces like "Evolutionary Psychology's Anti-Semite" by Judith Shulevitz in *Slate*, then America's premier opinion webzine, with its close competitor *Salon* publishing a similar hit-piece. That was certainly true in my own case, and my curiosity at those denunciations led me to order the books of his trilogy, which I soon began to read, finding them very judicious in their approach and scholarly in their tone. But the religious and historical contents proved so tremendously dull that after reading the first volume and starting the second, I put the books aside and moved on to other things.

A few years ago, I finally returned to those works, finding the first two volumes much more interesting now than I had before, and the third volume even more so. All these works had originally been published by a highly-reputable academic press, but in 2018 the ADL finally succeeded in pressuring Amazon into taking the unprecedented step of purging them from its book store, which holds a near-total monopoly on online book sales in the Western world. However, all three books are conveniently available in HTML form on this website, so those so interested can read them and decide for themselves:

- A People That Shall Dwell Alone
  *Judaism as a Group Evolutionary Strategy*
  Kevin MacDonald • 1994 • 168,000 Words
- Separation and Its Discontents
  *Toward an Evolutionary Theory of Anti-Semitism*

Kevin MacDonald • 1998 • 168,000 Words

- The Culture of Critique
  *An Evolutionary Analysis of Jewish Involvement in Twentieth-Century Intellectual and Political Movements*
  Kevin MacDonald • 1998 • 247,000 Words

For the last couple of decades, immigration has been an especially hot-button issue among right-wing activists, with the 1965 Immigration Act regularly portrayed as a horrific political betrayal that doomed American society. MacDonald's research demonstrated that organized Jewish groups had been a central force behind passage of that legislation, a goal they had tirelessly pursued for over 40 years. As a consequence, MacDonald was soon lionized as a political hero in those circles, and the very scholarly tone of his books greatly enhanced his credibility. Meanwhile, the harsh vilification campaign by his Jewish critics severely damaged his personal standing at his Long Beach campus, producing many painful moments and further driving him toward his new collection of right-wing admirers.

Within a few years, MacDonald had become a leading figure in the racialist camp, awarded the Jack London prize by *The Occidental Quarterly* in 2004, and soon afterward becoming editor of the associated *Occidental Observer* webzine. Over the last dozen or more years, that latter outlet has published a great deal of high-quality content, releasing articles that are often heavily footnoted and may run several thousand words in length, far more scholarly and academic in tone than what is found in nearly any other racialist publication. The webzine has also served to launch a number of promising new writers, several of whom hold Ph.D.s and have impressive research skills. Although the heaviest focus tends to be on Jewish-related issues, articles on other topics such as immigration, crime, and evolutionary biology also regularly appear.

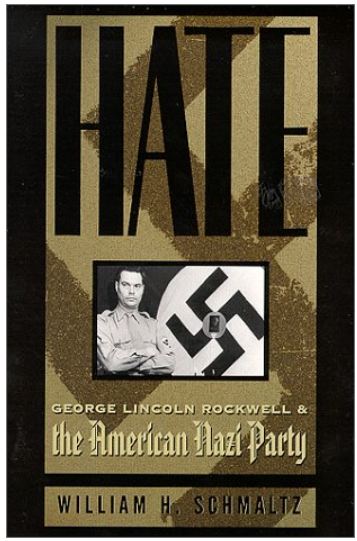
Compared with other prominent right-wing racialists, MacDonald's policy proposals have generally been rather vague and mild, I think mostly confined to criticism of affirmative action and calls for large reductions in immigration. His legion of fierce critics have surely mined every word he has ever written or spoken, and if anything more serious had been discovered, the material would certainly have been used to blacken his name. Yet despite the absence of any substantive proposals that fall to the right of *FoxNews*, his exceptionally hostile Wikipedia entry—as long as those of Taylor and Brimelow combined—contains 16 separate uses of "Nazi" or "neo-Nazi," including the explicit statement that "He is active in the American neo-Nazi movement," an entirely unsubstantiated accusation that I view with

great skepticism. By contrast, Taylor's Wikipedia article reports that he has been trying to "de-Nazify" the racialist right, while Brimelow's entry contains no reference to Nazism. This further demonstrates that focusing upon Jewish misbehavior seems to escalate personal vilification to extraordinary levels, and brings to mind the famous quote frequently misattributed to Voltaire: "To learn who rules over you, simply find out who you are not allowed to criticize."

## George Lincoln Rockwell, William Pierce, and David Duke

With the partial exception of Putnam, all the white racialists thus far discussed were academics, writers, and other intellectuals, or at least confined most of their activities to such pathways. But they sought major changes in American society, and effecting such changes must necessarily involve the organizing and activism aimed at achieving a measure of political power. Such activities require quite different talents and personalities, and therefore attract different individuals. Three of the leading white racialist political organizers had successive careers that stretched from the early post-war years down to the present day.

Although now largely forgotten, George Lincoln Rockwell became a somewhat prominent public figure in the 1960s, notorious as the founder of the American Nazi Party, and successfully operating as something of a political performance-artist, regularly employing a wide range of stunts and media events in order to attract considerable press coverage. Indeed, the name of his right-wing racialist organization along with its Hitler-era flags and uniforms had obviously been chosen for exactly that reason, serving as an irresistible lure for the media attention that serves as the life's-blood of any small and under-funded political organization, which would usually prefer to be vilified rather than merely ignored.



Rockwell himself had been a reasonably successful commercial artist and entrepreneur, serving as a naval commander during World War II, and afterward being drawn toward right-wing politics. At first, his political views were fairly mainstream, and he supported the possible presidential candidacy of Gen. Douglas MacArthur and later worked for William F. Buckley, Jr. at *National Review*. But he gradually moved farther and farther to the right, eventually coming to regard organized Jewry as the especially nefarious source of America's deepest problems. He founded his Nazi Party in 1959 and ran it with mixed success for the next eight years despite numerous bitter internal feuds and splits, eventually being assassinated by a disgruntled former member in 1967. He told his personal story and political evolution in two self-published books, his autobiographical *This Time the World* in 1961 and the posthumously-released *White Power* in 1966, which were unfortunately both purged by Amazon a couple of years ago, but can still be easily found online. In 1999, a comprehensive Rockwell biography by William H. Schmaltz was published by an academic specialty press, which helpfully fills in many of the gaps and omissions.

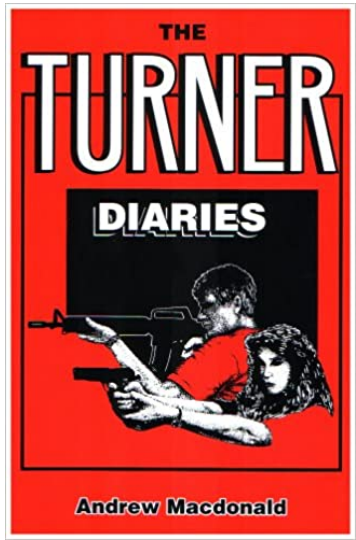
Although usually relegated to just a sentence or two in our history books and treated like a villainous clown, at times Rockwell had moved in important circles, and may have even helped influence some national events. In his autobiographical account, he describes his political education under a certain DeWest Hooker, a successful entertainment executive whom he regarded as a personal hero and mentor. Hooker was fiercely anti-Jewish and years later became a close friend of journalist Michael Collins Piper, who recounted a

fascinating tale from the 1960 Presidential race in his book *Final Judgment*.

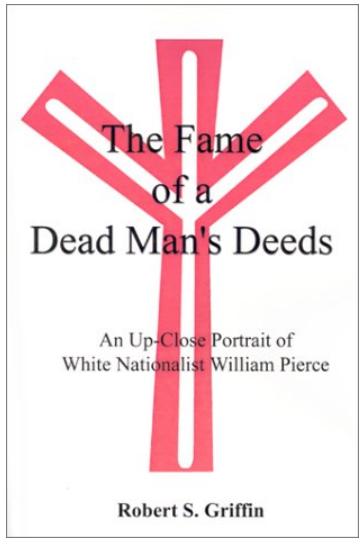
Jewish groups still had deep animosity for Joseph Kennedy over his strong opposition to American involvement in World War II, and the family patriarch feared that this lingering hostility would damage his son's chances of reaching the White House. So he asked Hooker to have his friend Rockwell organize public Nazi Party demonstrations endorsing Nixon and attacking JFK, thereby solidifying Jewish support for the latter. These protests actually attracted quite a bit of media coverage, and probably helped the younger Kennedy win 80% of the Jewish vote, along with heavy campaign donations and friendly media support, perhaps tipping the balance in such a very close national election.

In an even stranger possible twist, Hooker years later reportedly explained that the original impetus for the creation of Rockwell's American Nazi Party had actually come from the Jewish ADL, which believed that widespread media coverage of such an organization would greatly enhance their fund-raising efforts. So they allegedly approached Hooker and explained their proposal, offering to pay all the costs of publishing the Nazi literature and other materials, and he persuaded his protege to implement the idea. I think a story so bizarre is less likely to have been invented.

After Rockwell's demise, his small organization disintegrated, but within a few years the pieces were reconstituted in a somewhat different fashion by Dr. William Pierce, a former physics professor at the University of Oregon who had abandoned academia in 1965 to devote himself to racial activism, soon joining Rockwell's organization.



Over the next three decades, Pierce probably ranked as one of America's leading figures on the Far Right fringe, with his National Alliance eventually including some 1,500 dues-paying members and 15 full-time staffers, and his weekly short-wave radio broadcasts potentially reached a much larger national audience. Along the way, he published *The Turner Diaries*, a fictionalized account of a right-wing revolution against an oppressive American government, which became a gigantic underground bestseller, having some 400,000 copies in print despite being boycotted by all regular bookstores and lacking any mainstream advertising. In 1994 there were widespread media reports that the Oklahoma City Bombing had been inspired by Pierce's novel, which provided him a short burst of national media attention and as well as the benefits of a semi-mainstream publisher. Pierce died of cancer in 2002, after which his organization also soon disintegrated.



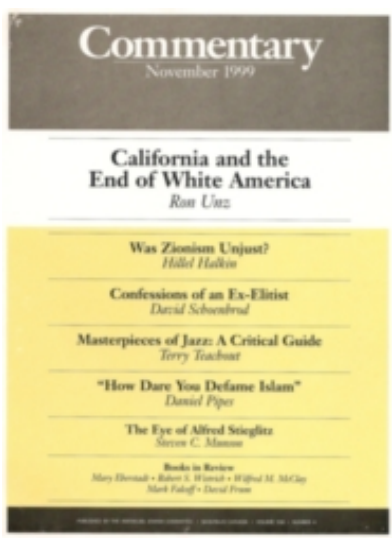
By far the most comprehensive discussion of Pierce and his efforts is *The Fame of a Dead Man's Deeds*, published the year before his death by Prof. Robert S. Griffin of the University of Vermont. Pierce's background and ideas are presented in an objective but somewhat sympathetic manner, and the book also contains a great deal of additional material on other individuals and issues from that segment of the ideological spectrum, including a long chapter on Rockwell and another on Revilo Oliver. The entire text of Griffin's volume is conveniently readable here in HTML format:

- The Fame of a Dead Man's Deeds
  *An Up-Close Portrait of White Nationalist William Pierce*
  Robert S. Griffin • 2001 • 185,000 Words

While Rockwell's numerous media stunts had gained him a certain measure of public attention during the first half of the 1960s, Pierce and his far larger and better disciplined organization remained almost entirely unknown throughout their three decades of activity. But during that same period, a much younger activist began following Rockwell's play-book and gained media attention by his bold tactics, eventually becoming a nationally-recognized racialist-celebrity and political figure, first as the leader of a faction of the Ku Klux Klan and afterward as a surprisingly successful candidate for high public office. These days, the names of George Lincoln Rockwell or William Pierce would surely draw blank stares, but David Duke probably still rings a

bell. As an objective measure of prominence, his Wikipedia article is much longer than those of Rockwell and Pierce combined, and carries an ADL endorsement ranking him as "perhaps America's most well-known racist and anti-Semite."

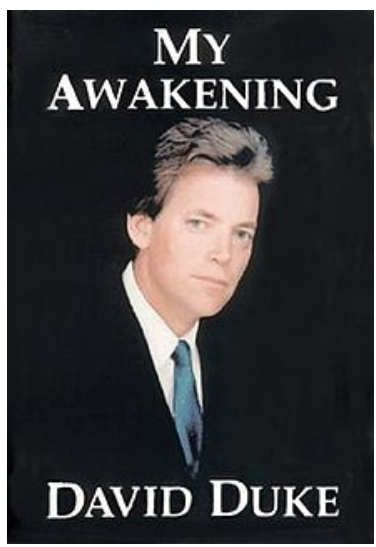
Duke's high-water mark came almost three decades ago when for a couple of years he flashed like a meteor across the American political landscape. Drawing upon deep populist anger over welfare, crime, affirmative action, and other racially-charged issues, in 1990 he challenged the incumbent Democratic senator in his home state of Louisiana. Despite being massively outspent and facing an exceptionally hostile media, with both parties absolutely united against him, he stunned the country by getting over 43% of the total vote, including a landslide majority of his state's whites. The following year, he launched a challenge to the incumbent Republican governor along similar lines, defeating him in the open primary and then once again winning a large majority of whites even while losing the run-off to a former Democratic governor, who was the recipient of a tidal wave of funding, media, and endorsements, including the active support of nearly every prominent national Republican.



Following my own successful "English" campaign in California, I had published a long 1999 cover story in *Commentary* discussing my state's racially-charged political conflicts of the preceding decade, and it had attracted a good deal of favorable interest, leading me to consider writing a book that expanded my analysis to the national level. As part of my background preparation, I began reading thirty or forty books on racial issues, of which one of the longest was Duke's *My Awakening*, which had been released the previous year.

I had expected it to be an ideological screed that I would casually skim and then abandon, but Duke's book was actually something entirely different. Two decades have almost completely blurred the details, but I remember reading the entire text and being very impressed with the quality of both the style and content. Indeed, the book was so far superior to what I had expected from someone only known to me as a fringe political-activist with no serious academic credentials that I began to wonder, perhaps a bit unfairly, about the identity of the true author.

Not long afterward I shelved my potential writing plans in favor of my content-archiving project, which steadily grew in scope and ultimately absorbed most of my time and effect for the next decade. But just a few days ago, I decided to take another look at Duke's book for the first time in twenty years. Although I merely intended to glance at a few pages, I found the material so interesting that I reread the entire text, which ran 700 pages with more than 1000 footnotes, being far longer than I had remembered.



My first surprise was the exceptionally favorable Foreword provided by Glayde Whitney, a seemingly respectable Florida professor of behavioral genetics, who described himself as a lifelong Hubert Humphrey Democrat. Whitney said that although he had never met Duke, he had independently come to most of the same conclusions over the years. Therefore, he fully endorsed the former Klansman's controversial views on racial and genetic issues and hoped that Duke's high public profile would finally succeed in bringing these important ideas to the attention of a much wider national audience. The former president of the Behavior Genetics Association even described Duke as

"a Moses-like prophet," and suggested that his book might play the same role that Adam Smith's *Wealth of Nations* had achieved with regard to the theory of capitalism.

As I read through the long text, Prof. Whitney's characterization began to seem less and less outlandish. Although obviously pitched to a popular audience, the first major section described the important scientific facts about race, IQ, and evolutionary psychology drawn from the works of many of the academic scholars discussed above, and the material presented seemed almost entirely correct.

But what impressed me even more this time round were the other elements of the book concerning history and politics that I had probably disregarded back in 2000. The next section ran over 250 pages and dealt with a variety of controversial Jewish issues. Back in 2000, these had probably raised some questions in my mind, but soon faded. However, over the last two decades, I had done a great deal of reading and investigation in the history of the twentieth century, and I now realized that many of my controversial findings had first been encountered—and then soon dismissed and forgotten—in the pages of Duke's book. For example, he included a 40 page chapter strongly disputing the reality of the Jewish Holocaust, which he argued was merely a propaganda-hoax, very likely the first time I had ever encountered that shocking claim in any serious writing, and I must have reacted with extreme skepticism. But a few years ago I finally investigated the topic at length and came to very similar conclusions.

- American Pravda: Holocaust Denial
  Ron Unz • August 27, 2018 • 17,600 Words

At the time, I had also never heard of the Nazi-Zionist partnership of the 1930s or the many strange aspects of Talmudic Judaism or the persecution of historian David Irving, and all of these accounts were so discordant with my mainstream understanding that they had never lodged in my memory when I read about them back in 2000. But over the last couple of years I discussed them at length in my American Pravda series, along with my reinterpretation of the Second World War. If prejudice means pre-judging ideas, then twenty years ago I was certainly quite prejudiced when I read and disregarded the historical claims of a former Klansman with only an undergraduate history degree from Louisiana State University, but in hindsight, he seems to have been entirely correct on so many of these important historical matters long before I had even become aware of them.

If we carefully separate Duke's ideological beliefs from his factual

claims, my considered opinion is that 80-90% of the latter are correct, and ironically enough his largest errors come in positions that he closely shares with most other American conservatives and right-wingers.

One of the more remarkable items in Duke's account, impossible to verify but quite possibly true, was his long and friendly acquaintance with Prof. William Shockley, to whom he dedicated his book. Shockley's own political notoriety had preceded Duke's entrance onto the public stage, and given their strong agreement on issues of race and IQ and mutual demonization by the media, they supposedly had a number of phone conversations from the early 1970s until shortly before Shockley's death in 1989. By then, Duke was already preparing his remarkable 1990 U.S. Senate run and according to his account, Shockley said that if he were thirty years younger and healthier, he would be campaigning on Duke's behalf. Consider such a historical tableau: the physicist who had won a Nobel Prize for inventing the transistor and then created Silicon Valley campaigning in Louisiana on behalf of the former Grand Dragon of the KKK.

Along with many other important works, Duke's book was purged from Amazon a couple of years ago, but can still be easily found online.

## *Erectus Walks Amongst Us*

Most present-day Americans, whether young or old, have lived their entire lives undergoing a form of psychological conditioning that causes them to suffer a sort of allergic reaction at ideas that fall into certain particular categories. Some of the most notable triggers include topics involving race, ethnicity, and sex, and encountering such forbidden material may be a painful experience, with the discomfort only gradually subsiding after repeated exposures. One of the most terrifying subjects for a man is the nature of mankind.

Many of the dozens of books already discussed in this long article fall into those disturbing categories, and in some cases their contents caused me considerable unease when I first encountered them ten or fifteen or twenty years ago, whether or not I ultimately concluded that much of their analysis was mistaken. But whenever I turn my thoughts to the most controversial book I have ever read, a single obvious candidate comes to mind, a self-published work of

anthropology.

I can't recall the exact circumstances of how it first came to my attention, perhaps when I was browsing the comments of some fringe website or blogger in 2008. I went ahead and clicked a button on Amazon, receiving it a few days later while my credit card was debited $18.00. The work has long since gone out of print, and the cheapest hard copies now sell for $900.

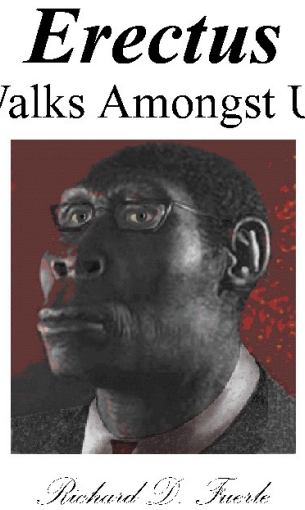
The author was an individual entirely unknown to me, apparently a longtime libertarian activist and something of a polymath, holding undergraduate and graduate degrees in mathematics, physics, chemistry, economics, and law. He claimed to have spent four full years writing the book after several previous years of lengthy Internet discussions in which he and one or more collaborators had gradually worked out most of the basic ideas and done much of the research. Such claims seem plausible since the finalized text runs some 200,000 words and is supplemented with a vast multitude of illustrations, charts, and tables, along with more than 1200 detailed footnotes, most of them substantive and many quite long. The bibliography contains over 1,000 entries.

The writing itself was quite serviceable if hardly elegant, and the work seems to fit rather comfortably within the evolutionary framework provided by Coon's racial theories from the 1960s and Rushton's r/K analysis from the 1990s, though I hadn't yet encountered the former at the time.

I have no serious expertise in anthropology, but the early chapters that covered genetics and evolution seemed quite correct in their detailed description of those scientific foundations, and the arguments advanced in the later ones were plausibly presented, if often revolutionary in their implications. But far more than Coon or Rushton, Richard D. Fuerle intended to turn the evolutionary history of *Homo sapiens* entirely on its head.

When faced with a sweeping theoretical framework of claims in a subject far beyond my personal expertise, I naturally turn to reviews and commentary, which will give me a useful starting point whether they are supportive or critical. But with the sole exception of a quite favorable and comprehensive review (PDF Version) by Jared Taylor that ran nearly 6,000 words, none existed. Not a single one of the many racialist bloggers saw fit to touch this material, thus depriving me of the extended comment-thread debates that would normally have assisted my understanding.

Faced with this dilemma, I decided to contact an eminent scholar I knew who had great expertise in exactly this subject, and gingerly asked whether he had heard of the work. As it happens, he had recently received a copy but had not bothered to look at it, and upon hearing from me decided to do so. A couple of days later, he dropped me a note saying he had already read more than half of the book, and was so extremely impressed at the vast quantity of very important information it contained that he planned to keep it close on his own shelf to use as a standard reference source. Then a day or two later, he told me that after finishing the book, he had been absolutely horrified by the theories advanced by the author. So I avoided raising that topic in the future.



I recently reread my old copy of *Erectus Walks Amongst Us* and the sheer volume of its material and sweep of its ideas impressed me just as much now as it had a dozen years ago. My expertise in anthropology has hardly much improved over the years, so my brief discussion of the contents should not be taken very seriously, and may merely demonstrate my own deep ignorance of the subject. Flying blind is always a risky endeavor.

The human evolutionary framework proposed by Fuerle seems to generally follow that of Coon, providing various arguments that contrary to modern orthodoxy, the different races of man actually predate the appearance of *Homo sapiens* itself, having evolved in the geographically-separated populations of our *Homo erectus* predecessors. As an example of the evidence presented, he notes that

the early erectoids dwelling in Asia had shovel-shaped incisors, as do modern Asians, which seems unlikely to have been purely coincidental.

But Fuerle's central thesis is that our reigning Out of Africa framework —the notion that *Homo sapiens* first evolved in Africa then spread throughout the world—should be replaced by an Out of Eurasia model, and some of his points do seem like reasonable ones.

He argues that the package of African physical traits seems to be heat-adapted, while those of Asians are cold-adapted with the Caucasian race remaining more generalized, then suggests on theoretical grounds that a heat-adapted human population would be less likely to easily evolve into cold-adapted and generalized varieties, let alone do so in as little as the 60,000 years now believed. Also, Africa's relatively stable environment would be much less likely to provide the severe environmental challenges necessary for giving rise to a new species, especially one with far greater intelligence than its erectoid predecessors.

Under the current theory of African origins, *Homo sapiens* migrated out of Africa into Eurasia during the very time that the latter continent was gripped by a severe ice age that produced very difficult living conditions compared with their less impacted African homeland, which seems implausible. Moreover, Neanderthal man had already occupied Europe and parts of Asia for hundreds of thousands of years, surely being well adapted to local conditions and also having a larger brain than *Homo sapiens*, so it seems unlikely that small numbers of African-adapted human interlopers could have easily displaced them.

Meanwhile, Fuerle's contrary model of human evolution argues that sapiency was first achieved somewhere in the Eurasian continent, far larger than Africa and also providing much more stressful selective pressure. And during the ice age that wrapped the globe 60,000 years ago, small bands of early *Homo sapiens* were driven *into* Africa's more hospitable climate rather than away from it.

Not long after Fuerle's book appeared, anthropology was rocked by the discovery that non-African DNA contained small Neanderthal elements, demonstrating that the two different species had interbred at least to some slight extent during the tens of thousands of years they overlapped in Europe and parts of Asia. Indeed, Cochran and Harpending had even suggested that such Neanderthal introgression might have involved genes crucial for the success of *Homo sapiens*,

perhaps providing traits well-adapted to local environmental conditions, and therefore been subject to strongly positive selective pressure. Not long afterward, small traces of other pre-human hominoid DNA were found in some of the present-day populations of South-East Asia, the residue of a species called the Denisovans.

All of these discoveries of residual DNA have demonstrated that species are not nearly as rigidly separated from one another as our elementary biology textbooks had usually maintained. Indeed, numerous animal species can readily mate and produce fertile offspring although they do not usually do so under natural conditions. Fuerle repeatedly stressed exactly this point in his book, long before these waves of DNA research had firmly established the case with regard to human beings. For example, *Homo neanderthalensis* had always been classified as separate from our own species, but some might now argue that it was simply a different race of *Homo sapiens* and should instead be called *Homo sapiens neanderthalensis*.

When we consider the larger populations of the Sub-Saharan African continent, those living in the Horn of Africa seem to be partial outliers, both by genes and by physical attributes, being a partial mix of the peoples on either side, African Negroes and Middle-Eastern Caucasians, in some respects actually being closer to the latter except with regard to skin color. Similar hybridization is quite common in the world, notably in Central Asia, where Caucasians and Asians have intermingled for thousands of years. So our hybridization with Neanderthals is merely an extreme example of this.

Science inevitably advances, and over the last couple of decades the analysis of human DNA has substantially revised our family tree of world populations, providing quantitative results that are far more solid and exact than the crude analyses produced by past generations of physical anthropologists. If we exclude the small local populations of Australian Aborigines, African Pygmies, and a few other minor groups, humanity has traditionally been divided into three mega-races, the Caucasoids, Mongoloids, and Negroids, and that remains true today. But genetic analysis has now revealed that the first two groups cluster together much more closely, with the last is a considerable outlier. So to a good first approximation, mankind is genetically divided into Eurasians and Africans, and Fuerle makes the provocative argument that if Africans were not a living race and were instead only known from their bones and DNA, they probably would have been classified as a separate species from Eurasians.

And in a telling passage quoted in Taylor's lengthy review, Fuerle

emphasizes that the phenotypical differences between Eurasians and Africans seem follow a consistent pattern:

> [V]irtually all of the racial differences between Africans and Eurasians are in traits that are primitive; there are few, if any, African traits that are more modern than Eurasian traits. The evidence comes from a large variety of very different traits: hard tissue, soft tissue, physiology, behavior, intelligence, accomplishments, and genes. And most importantly, *all of the evidence is consistent.* It is not the case that genes are saying blacks are modern and bones are saying they are primitive. All of the evidence is saying the same thing…

This noticeable pattern of African traits is readily explained by Fuerle's model of human origins. If *Homo sapiens* first evolved in Eurasia and small bands of this new species then entered Africa perhaps 60,000 years ago, they might naturally have hybridized with the local hominids of that continent, just like other early members of their species had done with Neanderthals or Denisovans. But since the pre-existing local populations were so much larger, a much greater portion of today's genetic ancestry might have come from those other sources.

Earlier this year, an analysis of the African genome revealed that up to 19% of the DNA appears to have its origins in "ghost populations" of the archaic pre-human hominids who had once flourished on that continent. Although these scientific results have not received the media attention they might warrant, they seem to represent a striking experimental confirmation of the remarkable predictions that Fuerle had advanced in a book published a dozen years earlier. Our standard history textbooks explain that a century ago the 1919 solar eclipse expedition by Eddington provided experimental confirmation for the predictions of General Relativity, elevating Einstein to international fame and indirectly leading to his 1921 Nobel Prize. I've sometimes wondered whether these recent DNA findings should be considered in a similar light.

Fuerle died in 2014 at the age of 73, thereby failing to see this apparent confirmation of his hypothesis, and I suspect he ended his life quite disappointed at the near-total lack of recognition his self-published 2008 book had achieved, especially given the many years of effort he had invested in producing it. Aside from that one long review in the *American Renaissance* newsletter, his work received no

substantial discussion anywhere else, and seemingly fell into oblivion.

In his preface, he had described the book as the main contribution to future generations of his waning years, and he authorized anyone to freely publish or copy without royalties, also promising to shortly make it available in HTML form on a website, which he did a few months later. He later released a PDF version, with the all-important footnotes being linked back to that website. Over the years I was a very occasional visitor, but when I checked a few years ago, I discovered that the URL had lapsed some time after his death, and the website was no longer available. As a consequence, the PDF versions still in circulation lack access to the footnotes, severely crippling the value of the text.

Fortunately, the pages of the website were backed up on Archive.org, and I was able to copy them to a location on our own website, including all the associated images. I also produced a modified version of the PDF in which the footnotes are once again active, now point to this available copy.

Those so interested may now read the work and decide for themselves how severely my own ignorance of anthropology has impaired my evaluation of his book.

# Our Disputed Election

***The Unz Review*** • January 14, 2021 • 2,000 Words

Although hardly suggested by our mainstream media, the officially-reported results demonstrated that our 2020 presidential election was extraordinarily close.

All the regular pre-election polls had shown the Democratic candidate with a comfortable lead, but just as had been the case four years earlier, the actual votes tabulated revealed an entirely contrary outcome. According to the official vote-count, the Biden/Harris ticket ended up millions of votes ahead, having racked up huge leads in overwhelmingly Democratic states such as my own California, and also won by a very comfortable 306 to 232 margin in Electoral Votes. But control of the White House depends upon the state-by-state tallies, and these told a very different story.

Incumbent Donald Trump lost Arizona, Georgia, and Wisconsin by such extremely narrow margins that a swing of less than 22,000 votes in those crucial states would have gotten him reelected. With a record 158 million votes cast, this amounted to a victory margin of around 0.01%. So if just one American voter in 7,000 had changed his mind, Trump might have received another four years in office. ***One American voter in 7,000.***

Such an exceptionally narrow victory is extremely unusual in modern American history. For decades, the very tight Kennedy-Nixon race of 1960 had been a byword for close races, but Biden's margin of victory was much smaller. More recently, George W. Bush won a narrow reelection over Sen. John F. Kerry in 2004, but Kerry would have required a voter swing nearly five times greater than Trump's in order to claim victory. Indeed, with the sole exception of the notorious "dangling chads" Florida decision of the 2000 Bush-Gore election, no American presidential candidate in over 100 years had lost by so narrow a voter margin as Donald J. Trump.

If our incompetent or dishonest media had correctly reported these simple facts, perhaps Democratic partisans would have been somewhat more understanding of the outrage expressed by so many of their Republican counterparts, who believed they had been cheated of their election victory. Admittedly, Trump backers seem equally unaware of the historically slender margin of their candidate's defeat.

The emotions on both sides of the Trump reelection campaign were among the strongest in modern American history, and the outcome was determined by the tiniest sliver of voters in a few states. So under these circumstances, last week's controversial events in DC were perhaps not so entirely unexpected. Indeed, during the weeks before the election, I'd half-predicted such a scenario, speculating about possible claims of a stolen election and the resulting civil unrest. For example, the following was my response to a question from a longtime commenter:

> Many Trump supporters are alleging that there could be massive voting fraud in the 2020 election. Some believe that if Trump is ahead on election night, Democratic machines will manufacture ballots to give a victory to Biden. Do you think this is possible or do you see this as improbable?

Well, I suppose it's possible…

Frankly, both sides are so totally agitated and extreme, the Trumpists would be saying and believing it, even if it were entirely false and impossible. It's hard to figure out what's happening when everyone involved is so dishonest and corrupt. Trump has always seemed like an ignorant buffoon to me, but I think the Democrats and liberals have almost gone insane in their opposition to him.

As I've been telling people for weeks, the whole political situation certainly seems very bizarre and I've seen some pretty plausible arguments that we might end up with a disputed election if the numbers are fairly close in key states. Apparently, the Republicans are overwhelmingly going to be voting in person, while the Democrats will be voting by mail, meaning their ballots will be much slower to come in and be counted.

So Trump could be ahead by wide margins on Election Night and declare victory to the cheers of his partisans. And then as the mail ballots come in, the numbers turn against him, but he and his die-hard supporters cry Fraud! and refuse to recognize the result. Hard to say what would happen, but I'm glad I live in California which is generally quiet and peaceful these days.

Obviously, Bush/Gore was disputed in 2000, but only party loyalists much cared at the time, while today the country is filled with Trumpists and Trump-haters, both very suspicious and angry.

Although I think my speculative scenario turned out to be reasonably correct, the actual post-election developments were far greater in magnitude than I had expected, and may have dire consequences for maintaining American civil liberties.

I haven't investigated the matter, but there does seem to be considerable circumstantial evidence of widespread ballot fraud by Democratic Party forces, hardly surprising given the apocalyptic manner in which so many of their leaders had characterized the threat of a Trump reelection. After all, if they sincerely believed that a Trump victory would be catastrophic for America why would they not use every possible means, fair and foul alike, to save our country from that dire fate?

In particular, several of the major swing-states contain large cities—Detroit, Milwaukee, Philadelphia, and Atlanta—that are both totally controlled by the Democratic Party and also notoriously corrupt, and various eye-witnesses have suggested that the huge anti-Trump margins they provided may have been heavily "padded" to ensure the candidate's defeat.

Even leaving aside some of these plausible claims, the case for a stolen election seems almost airtight. I don't know or care anything about Dominion voting machines, whether they are controlled by Venezuelan Marxists, Chinese Communists, or Martians. But the most blatant election-theft was accomplished in absolutely plain sight.

Not long before the election, the hard drive of an abandoned laptop owned by Joe Biden's son Hunter revealed a gigantic international corruption scheme, quite possibility involving the candidate himself. But the facts of this enormous political scandal were entirely ignored and boycotted by virtually every mainstream media outlet. And once they story was finally published in the pages of the *New York Post*, America's oldest newspaper, all links to the *Post* article and its website were suddenly banned by Twitter, Facebook, and other social media outlets to ensure that the voters remained ignorant until after they had cast their ballots.

Renowned international journalist Glenn Greenwald was hardly a Trump partisan, but he became outraged that the editors of the *Intercept*, the $100 million publication he himself had co-founded, refused to allow him to cover that massive media scandal, and he angrily resigned in protest. In effect, America's media and tech giants

formed a united front to steal the election and somehow drag the crippled Biden/Harris ticket across the finish line.

The Hunter Biden corruption scandal seemed about as serious as any in modern presidential election history and Biden's official victory margin was just 0.01%. So if the American voters had been allowed to learn the truth, Trump almost certainly would have won the election, quite possibly in an Electoral College landslide. Given these facts, anyone who continues to deny that the election was stolen from Trump is simply being ridiculous.

Heated election campaigns have consequences, and this is especially true when all of America's most powerful corporations and ruling elites unite to essentially steal a reelection from a populist incumbent, hero-worshiped by many tens of millions of Americans. And when despite all that blatant unfairness and theft, the final margin of defeat is just one vote in 7,000, an explosion of popular outrage should only be expected.

Solid estimates appear unavailable, but it seems that hundreds of thousands of grass-roots Trump supporters traveled to our nation's capital to protest against what they regarded as a stolen election, and then peacefully assembled to listen to their hero's speech.

Afterwards, a tiny sliver of this vast multitude of angry individuals—perhaps less than one in a thousand—barged their way into the strangely-undefended Capitol building of Congress, took souvenir selfies, livesteamed their antics, and generally played the role of tourist-protesters while the lawmakers they so despised as corrupt mostly fled or hid. These Trumpists and some of their colorful costumes brought to mind the radical Yippies of the late 1960s.

The previous year had seen an unprecedented wave of violent riots, arson, and looting across some 200 American cities, which our entirely corrupt and dishonest media had generally characterized as "mostly peaceful protests." In previous years, angry mobs of organized Democratic activists had repeatedly invaded and occupied the Wisconsin Legislature, sometimes winning praise from the media. But when unarmed Trump supporters now did something similar for a few hours in Washington, they were quickly branded "domestic terrorists" seeking to overthrow our democracy.

A video shows Ashli Babbitt, an unarmed female protester, being shot

dead by a security guard as she tried to climb through a window, an incident not dissimilar to the famous Kent State shootings of a 1960s campus protest, but hardly treated by the media in a similar manner.

https://twitter.com/dancohen3000/status/1347076676342185984

A couple of other Trump protesters, probably elderly, overweight, or in poor health, died of strokes or heart-attacks during all the excitement, and one Capitol police officer later died as well, allegedly struck in the head with a fire-extinguisher although there has been no solid account of the incident. Yet this confused tableau of chaos and popular anger, which recalls scenes from the 1968 Chicago Democratic Convention protests, has been portrayed as a "coup attempt" incited by President Trump, and therefore justifying his second impeachment.

Even more importantly, the incoming Biden/Harris Administration may be considering the most sweeping domestic crackdown upon traditional American civil liberties since the Patriot Act was passed in the hurried aftermath of the 9/11 terrorist attacks twenty years ago. This has been justified by the need to suppress "domestic extremism."

Even without any new governmental legislation, a remarkable Internet crackdown has already begun. In an absolutely unprecedented development, the sitting president of the United States—who had just lost his reelection by 0.01% of the vote—has been summarily banned by Twitter, Facebook, and all other major social media outlets, preventing him from communicating with his followers, and with many of his leading supporters suffering the same fate. Famed libertarian Ron Paul criticized Twitter for banning Trump, and he was immediately locked out of his own Facebook page. Parler, a young but rapidly growing Twitter competitor, refused to ban Trump, and was immediately driven off the Internet by a combined attack from Apple, Google, and Amazon, possibly never to return. Our Information Age has entered a truly Orwellian period.

These Tech giants have often justified their extreme censorship by expressing the need to combat the spread of the dangerous "conspiracy theories" so widespread among Trump partisans. Particularly demonized by the media is the wildly popular "QAnon" theory, which numbered the unfortunate Ms. Babbitt among its committed followers. Although I'm only very slightly familiar with QAnon, it appears to be a bizarre mishmash of many strange ideas, notably including the belief that our ruling elites heavily consist of exceptionally corrupt and criminal individuals, sometimes even being

Satanic pedophiles.

Although much of that doctrine seems like total nonsense to me, we should note the massive suppression this movement has experienced and bear in mind that “the wicked flee when no man pursueth.” And indeed, my own articles over the years have solidly established that many of the seemingly ridiculous elements of QAnon probably contain a very large nugget of truth:

- American Pravda: John McCain, Jeffrey Epstein, and Pizzagate
- John McCain: When “Tokyo Rose” Ran for President
- Our American Pravda
- American Pravda: How the CIA Invented Conspiracy Theories

# Covid-19, Its Impact and Origins After One Year

*As We Rapidly Approach a Million American Deaths*

***The Unz Review*** • March 15, 2021 • 8,700 Words

## More Than a Million Dead Americans?

Winston Churchill famously observed that in wartime the truth must be surrounded by a bodyguard of lies. Many of my own long and most controversial articles have followed a somewhat analogous presentation, with the opening sections that sometimes run hundreds of words or longer often being rather innocuous or even somewhat off-topic. These are intended to serve as a bland or sugar-coated introduction to the far more dangerous material that then follows, which might otherwise tend to alarm and deter the casual reader if introduced too quickly.

Although I think this approach has its benefits, there are disadvantages as well. An unknown number of casual or busy readers may abandon the piece at that early stage, finding it too uninteresting to continue through to the more explosive elements. So there is probably value in extracting and highlighting some of the latter for a different sort of audience, and this may be especially true with regard to the current Covid-19 outbreak in America, which recently marked its first anniversary.

Almost exactly one year ago on March 16th, 2020, the local public health officers of the San Francisco Bay region, including Dr. Sarah Cody of my own Santa Clara County, suddenly imposed a sweeping lockdown order upon their nearly seven million residents, a government action unprecedented in American history. At that point, our country had suffered perhaps a dozen recorded deaths, and relatively little public attention had been focused on the growing danger. But experts believed that the virus was rapidly and invisibly spreading, and this dramatic Bay Area decision was quickly copied elsewhere, first in Los Angeles, then throughout the entire state of California, and soon afterward in other large states such as New York and Illinois. A temporary lockdown of three weeks was gradually extended to several months, with masking and social-distancing suddenly becoming a major part of everyday life throughout much of

our country.

Not long afterward, federal health officials released a shocking warning that the new disease might eventually claim as many as 100,000 to 240,000 American lives. For over a century, nothing like that had ever happened in our country and with existing deaths still merely numbering in the dozens, these gigantic "worst case" estimates were ridiculed by various ideological camps and disbelieving individuals as absurdly inflated and alarmist. Yet today the official Covid-19 death toll stands at around 550,000, a figure more than twice as high as the upper bound of that supposedly exaggerated projection.

From the very beginning, "Covid Skeptics" have fiercely disputed such official totals. They have noted the considerable confusion between "dying from Covid-19" and "dying with Covid-19," plausibly arguing that such postmortem diagnoses are often ambiguous, with many deaths of infected individuals having primarily been due to other factors. But it also seems quite likely that many Covid-19 deaths may not have been officially recorded as such. Given such problems of both over-counting and under-counting, the most reliable metric would be the total number of "excess deaths," those above and beyond the normal figure for a given period. But considering these much more solid estimates for the actual death toll suffered during our current epidemic actually reveals a picture far worse than those official numbers.

Two months ago a large team of nearly a dozen *Wall Street Journal* reporters published a 2,000 word article entitled "The Covid-19 Death Toll Is Even Worse Than It Looks" which carefully analyzed the worldwide losses, finding that the CDC figures for total deaths during the first 11 months of 2020 suggested some grim conclusions:

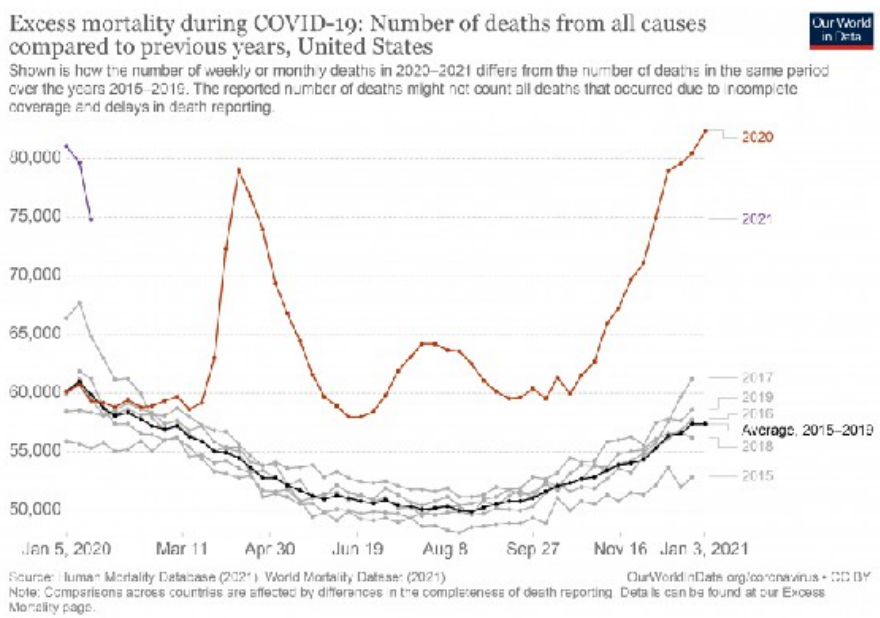
> In the U.S. alone, Centers for Disease Control and Prevention data show more than 475,000 excess deaths through early December, a time frame that also included about 281,000 deaths linked to Covid-19, according to Johns Hopkins University.
>
> The pandemic led U.S. deaths to climb at least 10% last year. Typically U.S. deaths grow about 1.6% a year as the population grows and ages.

Since that date, our official count of Covid-19 fatalities has nearly doubled, so if the same ratio of "excess" deaths has remained

unchanged, well over 900,000 Americans have now died as a consequence of the epidemic. I have seen other estimates that are significantly lower, but even these still indicate that we have suffered nearly 800,000 additional deaths during the first twelve months of the disease outbreak, amounting to the greatest loss of life in American national history, far surpassing the combined total of all our foreign wars, and even exceeding the four bloody years of our Civil War, though admittedly relative to a much larger population base.

Moreover, the sluggish implementation of our national vaccination program ensures that these totals will continue to climb throughout much of the remaining year and are almost certain to break the million mark. Last spring, predictions that more than a million Americans would die despite our unprecedented disease control efforts might have been dismissed as total lunacy, but such numbers are now on the verge of becoming our actual reality. We should hardly be surprised that the CDC has estimated that by mid-2020 American life-expectancies had already dropped by a full year, their greatest decline since World War II.

A leading data website provides a convenient graph of the monthly mortality figures:



Excess mortality during COVID-19: Number of deaths from all causes compared to previous years, United States
Our World in Data
Shown is how the number of weekly or monthly deaths in 2020–2021 differs from the number of deaths in the same period over the years 2015–2019. The reported number of deaths might not count all deaths that occurred due to incomplete coverage and delays in death reporting.

The public health measures implemented to control this severe epidemic have remained controversial in various political quarters,

and I have become somewhat agnostic regarding the relative impact of the different policies such as lockdowns, masking, and social-distancing. Indeed, a very long and comprehensive recent analysis argues that lockdowns—at least the rather intermittent and half-hearted ones used throughout the West—have had little impact upon ultimate deaths. But it seems almost undeniable that without some combination of these various approaches, our national death toll would have been far worse.

I am equally ignorant of the competing merits of the different types of vaccines that have been rushed into production to control the illness, but without such vaccines, the bulk of our entire population would surely become infected over the next year or more. Although the impact of the disease is very sharply age-skewed—with the death rate of those over 60 being more than a hundred times higher than those under 40—the overwhelming majority of studies have indicated an average community fatality rate of around 0.5% to 1.0%. So simple arithmetic indicates the vast human consequences of achieving unvaccinated "herd immunity" in our population of 330 million.

Even leaving aside our huge American death toll, the social and economic consequences of the Covid-19 outbreak have been enormous, certainly constituting the most momentous event in our national history since the Great Depression or World War II, perhaps even since the Civil War. We are likely living through one of those massive "discontinuities" that will eventually divide one section of a thick American history textbook from the next. And the impact upon many other countries around the world has been equally substantial.

## What Did the Chinese Know and When Did They Know It?

According to the widely accepted conventional narrative, the original Covid-19 outbreak began during late 2019 in the Chinese city of Wuhan. Given the catastrophic consequences both for America and the entire world, our leading media organs and their teams of investigative journalists have naturally made every effort over the last year to establish the exact chronology of those crucial early days, also prompted by the sometimes reckless accusations of the Trump Administration and its political allies. As I previously wrote in April 2020:

> For obvious reasons, the Trump Administration has become very eager to emphasize the early missteps and delays in the Chinese

reaction to the viral outbreak in Wuhan, and has presumably encouraged our media outlets to direct their focus in that direction.

As an example of this, the Associated Press Investigative Unit recently published a rather detailed analysis of those early events purportedly based upon confidential Chinese documents. Provocatively entitled "China Didn't Warn Public of Likely Pandemic for 6 Key Days", the piece was widely distributed, running in abridged form in the *NYT* and elsewhere. According to this reconstruction, the Chinese government first became aware of the seriousness of this public health crisis on Jan. 14th, but delayed taking any major action until Jan. 20th, a period of time during which the number of infections greatly multiplied.

Last month, a team of five *WSJ* reporters produced a very detailed and thorough 4,400 word analysis of the same period, and the *NYT* has published a helpful timeline of those early events as well. Although there may be some differences of emphasis or minor disagreements, all these American media sources agree that Chinese officials first became aware of the serious viral outbreak in Wuhan in early to mid-January, with the first known death occurring on Jan. 11th, and finally implemented major new public health measures later that same month. No one has apparently disputed these basic facts.

The *WSJ* continued to devote considerable investigative resources to this same issue, and in August 2020, a team of several journalists published a further report focusing upon these same developments in China, which I summarized soon afterward:

Numerous publications have documented America's severe mistakes in combating the disease, but this 4,500 word *WSJ* report focused upon the serious mishandling of the original outbreak by Chinese authorities.

The article revealed that top public health officials at China's Center for Disease Control only became aware of the situation on December 30th, when they learned that at least 25 suspected cases of a mysterious illness had already occurred in Wuhan during that month. But as the writers noted, the outbreak had certainly begun somewhat earlier:

> Even a fully empowered China CDC would likely have missed the very first cases of the coronavirus, which probably began

> spreading around Wuhan in October or November, most likely in people who never showed symptoms, or did but never saw a doctor, researchers say.

But the most detailed and exhaustive analysis of the circumstances of the Wuhan outbreak appeared outside the traditional media, published last August and September in *Quillette*, a well-regarded independent webzine. The author was Philippe Lemoine, a Cornell graduate student originally from France, and his remarkable four-part 31,000 word analysis remains the definitive work on the subject:

- The China Syndrome Part I: Outbreak
- The China Syndrome Part II: Transmission and Response
- The China Syndrome Part III: Wet Markets and BioLabs
- The China Syndrome Part IV: Did China Fudge its Data?
  Philippe Lemoine • *Quillette* • August 24-September 6, 2020 • 31,000 Words

The first two parts of Lemoine's series exhaustively analyzed the widespread claims by the Trump Administration and its political allies that China had somehow attempted to "cover up" the initial viral outbreak in Wuhan, or unreasonably delayed reporting the crucial facts to the outside world. He seems to scrupulously follow proper scholarly methods, carefully evaluating the often conflicting sources and applying a good deal of logic and common sense. In some cases he draws clear conclusions, though more often he correctly settles for reasonable likelihoods rather than anything stronger. But the ultimate result of the investigation was his total demolition of the case made against China on these particular grounds.

Obviously, there were some inevitable delays in discovering and responding to the sudden outbreak of an entirely unknown and unsuspected viral disease, including serious bureaucratic missteps or political failures; but the same had been equally true of the American government's reaction to our own Swine Flu epidemic back in 2009. He also notes that the American CDC has a financial budget 150 times larger than its Chinese counterpart, and a per capita staff 25 times greater; yet the subsequent American delays and errors in detecting and containing our own Covid-19 outbreak were far worse, despite our many weeks of advance warning.

Based upon these results there seems not the slightest legitimate grounds for our sharp criticism of China regarding its promptness in alerting the world to the new and dangerous disease that had erupted in one of its largest cities. The exhaustive subsequent research by

Lemoine, the *WSJ*, and others has fully confirmed my original April 2020 verdict:

> Then on Jan. 23rd and after only 17 deaths, the Chinese government took the astonishing step of locking down and quarantining the entire 11 million inhabitants of the city of Wuhan, a story that drew worldwide attention. They soon extended this policy to the 60 million Chinese of Hubei province, and not longer afterward shut down their entire national economy and confined 700 million Chinese to their homes, a public health measure probably a thousand times larger than anything previously undertaken in human history. So either China's leadership had suddenly gone insane, or they regarded this new virus as an absolutely deadly national threat, one that needed to be controlled at any possible cost.
>
> Given these dramatic Chinese actions and the international headlines that they generated, the current accusations by Trump Administration officials that China had attempted to minimize or conceal the serious nature of the disease outbreak are so ludicrous as to defy rationality. In any event, the record shows that on December 31st, the Chinese had already alerted the World Health Organization to the strange new illness, and Chinese scientists published the entire genome of the virus on Jan. 12th, allowing diagnostic tests to be produced worldwide.

## Accusations of a Chinese Lab Leak

The claims that the Chinese had failed to warn the world in timely fashion of the deadly new threat became ubiquitous in American-influenced media, but the weakness of such blatant falsehoods soon led Trump partisans to begin promoting far more shocking claims. As I wrote last year:

> I do not think these particular facts are much disputed except among the most blinkered partisans, and the Trump Administration probably recognizes the hopelessness of arguing otherwise. This may explain its recent shift towards a far more explosive and controversial narrative, namely claiming that Covid-19 may have been the product of Chinese research into deadly viruses at a Wuhan laboratory, which suggests that the blood of hundreds of thousands or millions of victims around the world will be on Chinese hands. Dramatic accusations backed by overwhelming international media power may deeply resonate

across the globe.

> News reports appearing in the *Wall Street Journal* and the *New York Times* have been reasonably consistent. Senior Trump Administration officials have pointed to the Wuhan Institute of Virology, a leading Chinese biolab, as the possible source of the infection, with the deadly virus having been accidentally released, subsequently spreading first throughout China and later worldwide. Trump himself has publicly voiced similar suspicions, as did Secretary of State and former CIA Director Mike Pompeo in a *FoxNews* interview. Private lawsuits against China in the multi-trillion-dollar range have already been filed by rightwing activists and Republican senators Tom Cotton and Lindsey Graham have raised similar governmental demands.

Within a few weeks, these claims had already become strongly embedded within American public opinion:

> According to a poll taken at the end of April, a remarkable 45% of Americans believed that the deadly virus had "probably" or "definitely" originated in such a laboratory, with 74% of Republicans having that belief.

Although soon pushed aside by more recent domestic political controversies, the Wuhan Lab Leak Hypothesis has hardly disappeared from prominent public discussion. Just a few days ago, the top of the *Wall Street Journal* opinion page carried a piece by its leading business columnist, Holman W. Jenkins, Jr., entitled "Wuhan Lab Theory a Dark Cloud on China," once again restating these widespread suspicions. A day earlier, a *Washington Post* columnist named Josh Rogin had decided to revive his previous allegations along similar lines.

Leading American media outlets had promoted these theories last year by citing government intelligence sources. In an interview, Trump himself had fingered the Wuhan lab as the source of the virus, a conclusion which Pompeo immediately claimed was supported by "enormous evidence." Yet absolutely no such evidence was ever provided.

Indeed, oddly enough, these exact sorts of accusations had begun widely circulating in social media and corners of the Internet as early as January, beginning almost as soon as the new epidemic in Wuhan became a major source of world attention. These claims were afterward picked up and regurgitated by American outlets and pundits

hostile to China, but over a full year later no substantial evidence has ever been presented. Thus, the most recent *WSJ* column relied merely upon innuendo and statements of suspicion without citing a single fact, an astonishing basis for such monumental accusations of Chinese culpability in more than 2.5 million worldwide deaths.

The obvious reason for such circumspection is that the actual case is extremely weak, almost non-existent. The third part of Lemoine's *Quillette* series, appearing last September and running 8,000 words, almost completely demolished the purported evidence. As I wrote a week later:

> In reading this analysis I was repeatedly struck by the extremely flimsy nature of the evidence being used to indict China. One of the most widely cited theories implicating the Wuhan lab was apparently based upon nothing more than unsubstantiated social media rumors, while a major article in *National Review* doctored its central quotes by leaving out sentences that completely changed their meaning. In recent years our media has fiercely ridiculed those lunatic conspiracy-mongers who claim that most of our mass-shootings have been media hoaxes perpetrated by "crisis actors" or that "nobody died at Sandy Hook." But much of the main evidence pointing to Chinese culpability for the worldwide Covid-19 disaster appears just as vacuous.

## Pro-Chinese Counter-Propaganda

However, absence of evidence does not constitute evidence of absence, and although there seems virtually no solid evidence for a Wuhan lab leak being the source of the epidemic, the scientific facility did specialize in bat viruses closely related to Covid-19, which has naturally raised reasonable suspicions even in the fair-minded. Lemoine may have effectively debunked a considerable assortment of extremely weak or even fraudulent claims, but this hardly disproves the controversial hypothesis.

Under these circumstances, we should not be surprised that China's own committed partisans soon began promoting their own theories and counter-narratives, intended to firmly close the door to those Wuhan lab accusations. But in most cases, the arguments they advanced were even weaker or more ludicrous than those of their anti-China opponents, perhaps underscoring the generally poor quality of pro-Chinese propaganda.

One of the most widespread of these theories, which had begun circulating on the Internet by early March, was the suggestion that the Covid-19 virus had its origins outside of China, and had actually been present in the U.S. during much of 2019; the disease was then accidentally brought to Wuhan by American visitors, thereby producing the Chinese outbreak. Since anti-China accusations had pointed to the Wuhan lab as the likely source of the virus, China's partisans often returned the favor, suggesting that the deadly infection had somehow escaped from Ft. Detrick, America's premier biowarfare research facility. During summer 2019 America had seen a flurry of news stories about "vaping deaths" and these were cited as misdiagnosed Covid-19 fatalities, while Ft. Detrick's temporary shutdown for a few months during the summer became proof of a laboratory leak.

However, this theory makes absolutely no logical sense. The single most crucial fact about Covid-19 is that the virus is extremely contagious under normal conditions, and once it has become established in a community, the number of infected individuals will tend to double every three to five days absent strong public health measures. Thus, the infection of a tiny handful of Americans in January or February had led to huge regional outbreaks by March and April, including many thousands of deaths, with overburdened hospitals containing scenes out of Dante's *Inferno*. If any significant number of Americans had already become infected during late summer 2019, the gigantic resulting epidemic and huge death toll by the end of that year would have so dominated our news headlines that no one would have paid any attention to the international developments out of Wuhan.

Exactly the same argument applies to claims that a single wastewater sample revealed traces of the virus in Barcelona during March 2019. Lab tests do occasionally produce false-positives, and since no further sample was detected in that city during the eight months that followed, a one-time testing error seems the most logical explanation.

There does exist much more credible wastewater evidence that the virus was already present in Italy by December 2019 and that a Frenchman had also become infected by that date, somewhat earlier than previously had been believed. But the current assumption is that Patient Zero became infected in Wuhan during late October or early November, thereby providing a couple of months for the earliest virus carriers to have reached those other cities, which hardly seems impossible. And with the sole exception of that entirely anomalous March 2019 wastewater sample from Barcelona, there is no solid

evidence of the virus anywhere in the world prior to its original appearance in Wuhan.

As an extreme example of the sort of foolish speculation sometimes promoted on the Internet, a published study suggested that fully 2% of California's entire population had already been infected by December 13, 2019. However, one of the authors later admitted the testing method used may not have been reliable, and I certainly think that if 800,000 Californians had already been suffering from Covid-19 at such an early date, we surely would have noticed something.

Some advocates of these pro-China fringe theories have argued that the virus might originally have been harmless or only slightly contagious while it was circulating in America during 2019, and then later mutated into its currently dangerous form only after it had arrived in Wuhan; but this is obviously *ad hoc* reasoning. Anyway, with the sole exception of that one discordant Barcelona result, wastewater tests have failed to find any reliable traces of the virus anywhere in the world before the Wuhan outbreak.

## Scientific Claims and Counter-Claims

Although circulation of such weak and contradictory attacks on the Wuhan Lab Leak Hypothesis have been confined to fringe outlets, highly reputable mainstream scientists have made more sweeping claims on the same issue, arguing that the structure of Covid-19 was clearly natural in origin, and not what would have been produced in a lab. For example, a 3,000 word article published in *Nature*, one of the world's premier scientific journals, has been regularly cited as debunking any artificial origin, with the five reputable co-authors lending weight to those claims. This analysis was initially released in mid-February and around that same time *The Lancet,* another highly authoritative publication, also carried a public declaration by 27 scientists taking a similar position while condemning the "conspiracy theories" suggesting a laboratory origin. However, the impact of that latter statement was considerably diminished once it became known that the main organizer, zoologist Peter Daszak, had himself long been closely associated with the Wuhan lab under suspicion, and indeed had previously channeled American funding toward its viral research.

Perhaps these sweeping denials of any possible man-made origin are correct, and I lack the professional expertise in virology or microbiology to properly evaluate them. But scientists do live in the real world, and one might easily imagine that the wild charges of the

Trump Administration—itself hardly popular in academic circles—would have inspired various researchers to try to defuse the potentially dangerous looming international conflict by claiming that the virus was obviously natural, even if the actual evidence seemed much less clear-cut.

Meanwhile, the background of the leading scientific advocates taking the opposite side of this contentious issue raise even more serious suspicions. There exists a large body of work on the Internet claiming that the the virus displayed tell-tale evidence of artificial bioengineering, with particular signs pointing to the Wuhan lab as the creator. But apparently the bulk of this material is either based upon the work of an anonymous group of researchers calling themselves "Project Evidence" or that of a previously obscure biotech entrepreneur and part-time blogger. Lemoine carefully examined this evidence, found the case fairly weak, and laid out some reasonable objections to those theories.

Although I cannot properly weigh such conflicting claims, my strongest doubts fall in a completely different direction. As I wrote at the time:

> Lemoine seems a very cautious writer and he carefully avoids contaminating his important analysis by suggesting any bad faith or fraud in the work he is examining, but given the history of the last couple of decades we can hardly ignore that possibility. Our disastrous Iraq War was promoted by the knowingly-false claims of Saddam's WMDs, and the equally farcical Russiagate Hoax has roiled American politics for more than three years. Governmental intelligence agencies have great resources and expertise in fabricating evidence and then effectively promoting their concoctions through their network of friendly journalists. We should hardly be surprised if such means had been employed to redirect the political blame for a multi-trillion-dollar global catastrophe.

When an entirely anonymous group of allegedly independent researchers devotes a great deal of time and effort to publishing a set of scientific findings on the Internet that so exactly match the aggressive propaganda accusations of an American president and his national security apparatus, huge suspicions seem warranted. Is this not exactly the sort of propaganda project that we would normally expect to be undertaken by our intelligence agencies, notably the CIA, which most recently had been led by Pompeo, the leading proponent of the Wuhan Lab Leak Hypothesis?

Or take the other main scientific source, an individual named Yuri Deigin, previously almost unknown to the world except through his occasional blogging in the unrelated field of gerontology. On April 22nd, just one week after Trump, Pompeo, and other top officials began making their dramatic charges, Deigin released a massive 16,000 word article on *Medium,* containing an ocean of colorful and very professionally-produced diagrams, charts, and graphs, making exactly the same case, but doing so in tremendous scientific detail. No other authors were listed, so we are required to assume that a single, independently-minded individual decided to put aside all his regular work and undertake such heroic efforts to investigate, write, and produce this enormous research report simply out of his disinterested concern regarding the true origins of the Covid-19 outbreak, which had only just become an important issue for Americans the previous month.

That indeed may be exactly what happened, but I have my doubts. I carefully read the entire Deigin document not long after it was released, and found it exceptionally impressive, many, many times longer and more comprehensive than the contrary article published by those five academic scholars in *Nature* the previous month. Deigin's analysis was so enormously detailed and exhaustive, one might at first glance assume that it had been the product of months of dedicated effort by a large team of top professionals rather than just a hobbyist-type undertaking by a solitary part-time blogger; and I strongly suspect that the former possibility is the actual reality.

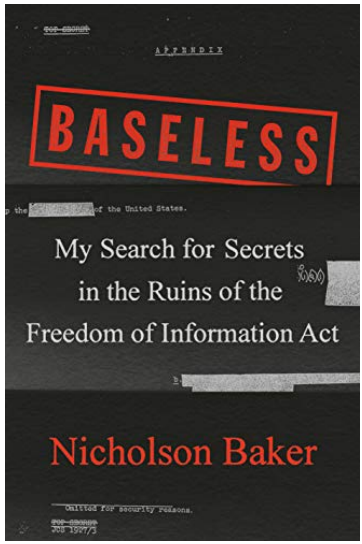
Science functions under the honor system, and a research paper should be judged on its own merits rather than dismissed if the authors happen to be anonymous or previously obscure individuals. But international intelligence agencies obviously operate under entirely different rules, and we must become very suspicious when astonishingly detailed research findings suddenly appear on the Internet that dovetail so exactly with the current goals of the CIA or its various counterparts. But if authors and their publishers already have strong established reputations to protect, we can assume that they would be far less likely to serve as the willing front-men for government-sponsored black propaganda and scientific disinformation.

Major political events are always competing for the transitory mind-share of the fickle American public. The massive urban political protests following the May 25th death of George Floyd in Minneapolis

police custody soon pushed aside the controversy over the Wuhan lab, and these were then followed by the national focus on Trump's heated presidential reelection campaign and the bitter conflict in the media over alleged voter fraud that produced an angrily disputed outcome. But on January 4th, the debate over the true origins of Covid-19 seemed about to be reignited by a major cover-story in *New York* magazine, only to be immediately swamped and forgotten in the wake of the Capitol Hill protests two days later and the resulting arrests and national crackdown so heavily covered by the media.

The author of that massive but largely ignored 12,000 word article entitled "The Lab-Leak Hypothesis" was Nicholson Baker, a prominent novelist and liberal public intellectual, hardly a Neocon or Trump supporter and quite unlikely to be acting as a front for American intelligence agencies. Although he did not possess professional expertise in the subject, he seemed a sincere and intelligent layman, which actually constituted a strength rather than a weakness. Instead of attempting to blind his readers with the science of a dizzyingly long collection of technical references, colorful charts, and complex graphs —which 99% of his audience would have been unable to easily interpret or verify—he instead straightforwardly reported the results of his discussions with a number of reputable academics, together with his own conclusions.

- The Lab-Leak Hypothesis
  *For decades, scientists have been hot-wiring viruses in hopes of preventing a pandemic, not causing one. But what if …?*
  Nicholson Baker • *New York Magazine* • January 4, 2021 • 12,000 Words



Baker may not have been a professional virologist or expert in biowarfare, but as the Covid-19 outbreak began he had just completed *Baseless*, a lengthy non-fictional account of American national security secrets, which appeared to glowing reviews in July 2020. One of his major elements was an account of America's massive 1950s bioweapons research program, which had been accorded resources and importance matching that of our nuclear weapons efforts. Based upon his years of research, the author was not a complete neophyte on biological warfare issues and was also fully aware of our own long history of laboratory accidents, which had claimed a number of lives. So he was naturally alert to the possibility that a similar accident had occurred in Wuhan, which contained China's most secure facility of that same type.

As he discussed in his very long article, many knowledgeable scientists had had similar thoughts during the initial Wuhan outbreak, and regarded the leak scenario as a very plausible one. Indeed, one of the earliest papers raising that possibility was released by a mainstream Chinese scientist only to be quickly removed under government pressure, and an early paper by a Taiwanese researcher took the same position and soon suffered the same fate. Several perfectly respectable American scientists held similar opinions, but as one of them explained, the reckless public accusations by Trump and Pompeo had rendered such ideas "toxic" in their academic circles.

Baker seems scrupulously fair in his presentation, emphasizing that numerous other scientists have taken the entirely contrary position that the virus is most likely natural, while honest members of both

rival camps acknowledged that neither case had been solidly established. But he himself strongly leaned towards an artificial origin, emphasizing the seemingly remarkable efficiency with which Covid-19 spreads itself and attacks the human body. He therefore believed that a lab leak was the most likely source, and his thoughtfully considered opinion cannot easily be dismissed.

## Considering an American Biowarfare Attack

The greatest weakness of Baker's comprehensive analysis is not the controversial theory that he carefully examines, but the even more controversial possibility that he seems to totally ignore. At one point, he notes the remarkable characteristics of the pathogen, whose collection of features allowed it to so effectively target humans and which had first appeared in a city having one of the very few world laboratories engaged in exactly that type of viral research, closing his paragraph with the sentence "What are the odds?" But other, even more implausible coincidences were entirely excluded from his discussion, and the same had also been true for Lemoine.

Both these authors seem to assume that there exist only two possible scenarios: a natural virus that suddenly appeared in Wuhan during late 2019 or an accidental lab-leak of an enhanced disease agent in that same city. But there is an obvious third case as well, clearly suggested by Baker's focus on America's own very active biowarfare program, which he extensively discussed both in his long article and in his highly-regarded book. We must surely consider the possibility that the Covid-19 outbreak was not at all accidental, but instead constituted a deliberate attack against China, occurring as it did near the absolute height of the international tension with America, and therefore suggesting that elements of our own national security apparatus were the most obvious suspects. Given the realities of the publishing industry, any serious exploration of such a scenario would probably have precluded the appearance of the important Baker or Lemoine articles in any respectable publication, perhaps helping to explain such silence. But as I have argued in my long American Pravda series, many historical accounts that were blacklisted for exactly those sorts of reasons appear quite likely to be true.

As I had noted in my April article:

> Although the coronavirus is only moderately lethal, apparently having a fatality rate of 1% or less, it is extremely contagious, including during an extended pre-symptomatic period and also

among asymptomatic carriers. Thus, portions of the US and Europe are now suffering heavy casualties, while the policies adopted to control the spread have devastated their national economies. Although the virus is unlikely to kill more than a small sliver of our population, we have seen to our dismay how a major outbreak can so easily wreck our entire economic life.

During January, the journalists reporting on China's mushrooming health crisis regularly emphasized that the mysterious new viral outbreak had occurred at the worst possible place and time, appearing in the major transport hub of Wuhan just prior to the Lunar New Year holiday, when hundreds of millions of Chinese would normally travel to their distant family homes for the celebration, thereby potentially spreading the disease to all parts of the country and producing a permanent, uncontrollable epidemic. The Chinese government avoided that grim fate by the unprecedented decision to shut down its entire national economy and confine 700 million Chinese to their own homes for many weeks. But the outcome seems to have been a very near thing, and if Wuhan had remained open for just a few days longer, China might easily have suffered long-term economic and social devastation.

The timing of an accidental laboratory release would obviously be entirely random. Yet the outbreak seems to have begun during the precise period of time most likely to damage China, the worst possible ten-day or perhaps thirty-day window. As I noted in January, I saw no solid evidence that the coronavirus was a bioweapon, but if it were, the timing of the release seemed very unlikely to have been accidental.

Consider also the preceding waves of other unfortunate viral epidemics that had recently ravaged China:

[D]uring the previous two years, the Chinese economy had already suffered serious blows from other mysterious new diseases, although these had targeted farm animals rather than people. During 2018 a new Avian Flu virus had swept the country, eliminating large portions of China's poultry industry, and during 2019 the Swine Flu viral epidemic had devastated China's pig farms, destroying 40% of the nation's primary domestic source of meat, with widespread claims that the latter disease was being spread by mysterious small drones. My morning newspapers had hardly ignored these important business stories, noting that the sudden collapse of much of China's

domestic food production might prove a huge boon to American farm exports at the height of our trade conflict, but I had never considered the obvious implications. So for three years in a row, China had been severely impacted by strange new viral diseases, though only the most recent had been deadly to humans. This evidence was merely circumstantial, but the pattern seemed highly suspicious.

Another even more remarkable coincidence has received far greater distribution, becoming a staple of anti-American "conspiracy theories" and even resulting in a diplomatic incident involving the Chinese Foreign Ministry.

According to the widely accepted current chronology, the Covid-19 epidemic began in Wuhan during late October or early November of 2019. But the World Military Games were also held in Wuhan during that same period, ending in late October, with 300 American military servicemen attending. As I've repeatedly emphasized in my articles and comments for more than a year, how would Americans react if 300 Chinese military officers had paid an extended visit to Chicago, and soon afterward a mysterious and deadly epidemic had suddenly erupted in that city?

It surely would have been very easy for our intelligence services to have slipped a couple of their operatives into that large American military contingent, and the presence of many thousands of foreign military personnel, traveling around the large city and doing sightseeing, would have been ideally suited to providing cover for the quiet release of a highly-infectious viral bioweapon. None of this constitutes proof, but the coincidental timing is quite remarkable.

This intriguing speculation was included in a very long piece by an obscure and eccentric American ex-pat living in China that we had republished on our website on February 14, 2020. By the end of January, we had already run a dozen articles and posts on the coronavirus outbreak, then added many more by the middle of February. These pieces totaled tens of thousands of words and provoked a half million additional words of comments, probably establishing our website as the primary English-language source for this particular perspective on the deadly epidemic, with this material eventually attracting many hundreds of thousands of pageviews. The particular article suggesting that the American visitors to Wuhan had unleashed the disease quickly became one of our most popular, with over 90,000 pageviews and 110,000 words of comments, and with much of the interest coming from within China itself. Then, one week

later, leading Chinese government newspapers, such as *People's Daily* and *Global Times* began reporting the same story, citing growing speculation on Chinese social media sites. By mid-march, the Chinese Foreign Ministry spokesman had Tweeted out links to foreign articles making these same points, which received enormous attention, leading the Trump Administration to summon the Chinese ambassador and demand a formal apology.

This latter sequence of events is carefully recounted in a massive 17,000 word, 54 page report released a few weeks ago by DFRLab, a social media-oriented research unit within the establishmentarian Atlantic Council, with the work being based upon nine months of research and preparation by a dozen staffers, together with the Associated Press investigations team. The study seemed aimed at tracking the appearance and Internet dissemination of a wide range of supposedly false or unsubstantiated "conspiracy theories" regarding the Covid-19 outbreak, and AP journalists soon publicized the results, denouncing "the superspreaders" of such allegedly spurious and potentially dangerous beliefs.

- Weaponized: How Rumors About Covid-19's Origins Led to a Narrative Arms Race
  DFRLab/The Atlantic Council • February 2021 • 17,000 Words

But while this project did produce a very useful compendium of the chronology and source references of the various unorthodox narratives surrounding the disease, many of which were certainly erroneous or implausible, few effective rebuttal arguments were provided, notably regarding the extremely suspicious timing of the American military presence in Wuhan. Blogger Steve Sailer and others have often ridiculed this "point-and-sputter" school of refutation, in which non-mainstream theories need only be described in order to be considered conclusively disproved.

Although the Atlantic Council/Associated Press team certainly included numerous skilled social media researchers, journalists, and editors, there is no indication that any of these individuals possessed serious national security credentials, let alone specialized expertise in the arcane topic of biowarfare. This may help to explain why the weighty report which drew upon such enormous resources was almost entirely descriptive and made so little effort to analyze or evaluate the plausibility of the various conflicting "conspiracy narratives" that it treated at great length. By contrast, the very different perspective of someone apparently well-versed in the subject was initially confined to his informal comments left on an obscure corner of the Internet.

> Biological warfare is a highly technical subject, and those possessing such expertise are unlikely to candidly report their classified research activities in the pages of our major newspapers, perhaps even less so after Prof. Lieber was dragged off to prison in chains. My own knowledge is nil. But in mid-March I came across several extremely long and detailed comments on the coronavirus outbreak that had been posted on a small website by an individual calling himself "OldMicrobiologist" and who claimed to be a retired forty-year veteran of American biodefense. The style and details of his material struck me as quite credible, and after a little further investigation I concluded that there was a high likelihood his background was exactly as he had described. I made arrangements to republish his comments in the form of a 3,400 word article, which soon attracted a great deal of traffic and 80,000 words of further comments.
>
> Although the writer emphasized the lack of any hard evidence, he said that his experience led him to strongly suspect that the coronavirus outbreak was indeed an American biowarfare attack against China, probably carried out by agents brought into that country under cover of the Military Games held at Wuhan in late October, the sort of sabotage operation our intelligence agencies had sometimes undertaken elsewhere. One important point he made was that high lethality was often counter-productive in a bioweapon since debilitating or hospitalizing large numbers of individuals may impose far greater economic costs on a country than a biological agent which simply inflicts an equal number of deaths. In his words "a high communicability, low lethality disease is perfect for ruining an economy," suggesting that the apparent characteristics of the coronavirus were close to optimal in this regard. Those so interested should read his analysis and assess for themselves his credibility and persuasiveness.

During January, American media outlets, including those under the authority of Secretary of State and former CIA Director Mike Pompeo, began focusing attention on the Wuhan lab as the potential source of the viral outbreak, while journalists disputing this narrative and attempting to raise other possibilities had serious difficulties even getting their articles published on alternative websites:

> Scientific investigation of the coronavirus had already pointed to its origins in a bat virus, leading to widespread media speculation that bats sold as food in the Wuhan open markets had been the original disease vector. Meanwhile, the orchestrated waves of

anti-China accusations had emphasized Chinese laboratory research on that same viral source. But we soon published a lengthy article by investigative journalist Whitney Webb providing copious evidence of America's own enormous biowarfare research efforts, which had similarly focused for years on bat viruses. Webb was then associated with *MintPress News*, but that publication had strangely declined to publish her important piece, perhaps skittish about the grave suspicions it directed towards the US government on so momentous an issue. So without the benefit of our platform, her major contribution to the public debate might have attracted relatively little readership.

The extensive material collected by the Atlantic Council researchers lent further support to an important point I had made last April about the curious nature of the early Covid-19 coverage:

> One intriguing aspect of the situation was that almost from the first moment that reports of the strange new epidemic in China reached the international media, a large and orchestrated campaign had been launched on numerous websites and Social Media platforms to identify the cause as a Chinese bioweapon carelessly released in its own country. Meanwhile, the far more plausible hypothesis that China was the victim rather than the perpetrator had received virtually no organized support anywhere, and only began to take shape as I gradually located and republished relevant material, usually drawn from very obscure quarters and often anonymously authored. So it seemed that only the side hostile to China was waging an active information war. The outbreak of the disease and the nearly simultaneous launch of such a major propaganda campaign may not necessarily prove that an actual biowarfare attack had occurred, but I do think it tends to support such a theory.

## The Smoking Gun?

All the evidence thus far presented has merely been circumstantial, strongly establishing that elements of the American national security establishment had the means, motive, and opportunity to stage a biowarfare attack in Wuhan. However, in April additional facts appeared that some have characterized as "smoking gun" evidence of that disturbing scenario:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies

> have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.
>
> ***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by "the second week of November" our Defense Intelligence Agency was already preparing a secret report warning of a "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious. Furthermore:

> As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hatred Iranian enemies were now

dropping like flies.

Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

I can easily understand why all these simple facts and their obvious implications regarding the likely origins of the worldwide epidemic might be considered extremely uncomfortable, perhaps too uncomfortable to be discussed in our media outlets, and therefore have been so widely ignored. Most of these crucial points were already presented in my original April 2020 article on the subject, which quickly began to attract enormous traffic and interest in social media. Yet just days after it ran, our entire website was suddenly banned from Facebook and all our web pages were deranked by Google, perhaps underscoring the very dangerous nature of this material, and the reasons why so few others have been willing to raise the same points.

But America now stands on the brink of recording a million "excess deaths" from this epidemic, so perhaps it has finally now become time to honestly explore the true reasons for our gigantic national calamity.

## The Hypothetical Scenario of the Covid-19 Outbreak

Given the conclusions suggested above, I think it may be useful for me to provide my own summary of a plausible scenario for the Covid-19 outbreak. Although I had already presented this outline six months ago in one of my previous articles, I see no need for any revisions. Obviously, this reconstruction is quite speculative, but I think it best fits all the available evidence, while individual elements may be modified, dropped, or replaced without necessarily damaging

the overall hypothesis.

(1) Rogue elements within our large national security apparatus probably affiliated with the Deep State Neocons decided to inflict severe damage upon the huge Chinese economy using biowarfare. The plan was to infect the key transport hub of Wuhan with Covid-19 so that the disease would invisibly spread throughout the entire country during the annual Lunar New Year travels, and they used the cover of the Wuhan International Military Games to slip a couple of operatives into the city to release the virus. My guess is that only a relatively small number of individuals were involved in this plot.

(2) The biological agent they released was designed primarily as an anti-economy rather than an anti-personnel weapon. Although Covid-19 has rather low fatality rates, it is extremely contagious, has a long pre-symptomatic infectious period, and can even spread by asymptomatic carriers, making it ideally suited for that purpose. Thus, once it established itself throughout most of China, it would be extremely difficult to eradicate and the resulting efforts to control it would inflict enormous damage upon China's economy and society.

(3) As a secondary operation, they decided to target Iran's political elites, possibly deploying a somewhat more deadly variant of the virus. Since political elites generally tend to be elderly, they would anyway suffer far greater fatalities.

(4) The deadly SARS and MERS outbreaks in East Asia and the Near East had never significantly spread back to America (or Europe), so the plotters wrongly assumed that the same would be the case with Covid-19. Anyway, since international organizations always ranked the US and Europe as having the best and most effective public health systems for combating any disease epidemic, they believed that any possible blowback damage would be very minor.

(5) Only a small number of individuals were directly involved in this plot, and soon after the disease was successfully released in Wuhan, they decided to further safeguard America's own interests by alerting the appropriate units with the Defense Intelligence Agency, probably by fabricating some sort of supposed "intelligence leak." Basically, they arranged for the DIA to hear that Wuhan was apparently suffering a "cataclysmic" disease outbreak, thereby leading the DIA to prepare and distribute a secret report warning our own forces and allies to take appropriate precautions.

(6) Unfortunately for these plans, the Chinese government reacted

with astonishing determination and effectiveness, and soon stamped out the disease. Meanwhile, the lackadaisical and incompetent American government largely ignored the problem, only reacting after the massive outbreak in Northern Italy had gotten media attention. Since the CDC had botched production of a testing kit, we had no means of recognizing that the disease was already spreading in our country, and the result was massive damage to America's economy and society. In effect, America suffered exactly the fate that had originally been intended for its Chinese rival.

# "The Truth" and "the Whole Truth" About the Origins of Covid-19

***The Unz Review*** • May 10, 2021 • 6,400 Words

## The Covid-19 Epidemic and How It Began

As every fan of the old *Perry Mason* show remembers, courtroom witnesses swear "to tell the truth, the whole truth, and nothing but the truth."

There's a reason for that particular choice of words. A pattern of selective omissions in an otherwise entirely truthful presentation can easily mislead us as much as any outright lie. And under certain circumstances, such omissions may be made necessary by powerful outside forces, so that even the most well-intentioned writer is faced with the difficult choice of either excluding certain elements from his analysis or having his important work denied a proper audience. I have sometimes faced this dilemma myself, but over the last few years, my lengthy American Pravda series has charted those gaping lacunae in our received accounts of modern world history, as I have sought to provide a historical counter-narrative of the last one hundred years.

Careful reexaminations of events from fifty or sixty years ago may be interesting, but those of the present day have far greater importance, and this is particularly true with regard to the Covid-19 epidemic that has engulfed the world since early 2020. Millions have already died, including many hundreds of thousands of Americans, with a newly released research study by the University of Washington's authoritative Institute for Health Metrics and Evaluation (IHME) now suggesting that our domestic death-toll has already exceeded 900,000. This global outbreak first began in Wuhan, and the nature of its origin has become a major flashpoint in the new Cold War between China and America, with the trajectory of that conflict having only slightly changed as Trump Neocons have been replaced by Biden Neocons at the helm of our foreign policy.

Two months ago I published a lengthy article summarizing much of the information from the first year of the outbreak and focusing upon the heated debate regarding the origins of the virus. Aside from the reports of the teams of investigative journalists at the *New York Times*,

the *Wall Street Journal*, and the *Associated Press*, several very long articles by independent journalists and researchers have constituted my main sources of information, including:

- How It All Started: China's Early Coronavirus Missteps
  *The Wall Street Journal* • March 6, 2020 • 4,400 words
- China Didn't Warn Public of Likely Pandemic for 6 Key Days
  *The Associated Press* • April 14, 2020 • 2,400 Words
- China's CDC, Built to Stop Pandemics Like Covid, Stumbled When It Mattered Most
  *The Wall Street Journal* • August 17, 2020 • 4,500 Words
- The China Syndrome Part I: Outbreak
- The China Syndrome Part II: Transmission and Response
- The China Syndrome Part III: Wet Markets and BioLabs
- The China Syndrome Part IV: Did China Fudge its Data?
  Philippe Lemoine • *Quillette* • August 24-September 6, 2020 • 31,000 Words
- The Lab-Leak Hypothesis
  *For decades, scientists have been hot-wiring viruses in hopes of preventing a pandemic, not causing one. But what if …?*
  Nicholson Baker • *New York Magazine* • January 4, 2021 • 12,000 Words

This compendium of crucial research has now received a major addition, a 11,000 word analysis of the likely origins of Covid-19 by Nicholas Wade, a distinguished former science reporter and editor, who had spent more than four decades at the *New York Times, Science,* and *Nature*, and the author of several excellent books dealing with anthropology and evolutionary biology.

- Origin of Covid — Following the Clues
  *Did people or nature open Pandora's box at Wuhan?*
  Nicholas Wade • *Medium* • May 4, 2021 • 11,000 Words

## Suppressing Possible Artificial Origins as "a Conspiracy Theory"

The central focus of both Baker and Wade is indicated by their closely-related titles, namely the origins of the virus and whether it was the product of a laboratory, presumably the Wuhan Institute of Virology, then later released in a tragic accident. Both these authors strongly lean toward that latter possibility, but take somewhat different approaches. While Baker, a prominent novelist and liberal public intellectual, must rely upon general arguments or merely reports the

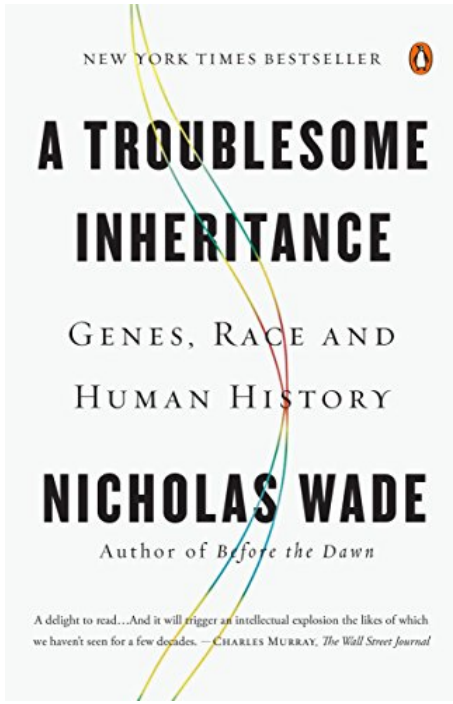
opinions of the experts that he interviewed, Wade deploys his strong scientific background to build a persuasive case for that same conclusion.

From nearly the beginning of the epidemic, the position taken by the mainstream media had been that Covid-19 was very likely natural in origin, and although President Trump and some of his political allies soon loudly claimed otherwise, the perceived scientific consensus remained unchanged.

But as Wade demonstrates, that supposed consensus was largely illusory, having been shaped by two early items that appeared in prestigious scientific publications. On February 19, 2020, the *Lancet* had published a statement signed by 27 virologists and other noted scientists that declared: "We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin," and that "[scientists] overwhelmingly conclude that this coronavirus originated in wildlife." Then the following month *Nature Medicine* published an analysis by five virologists providing some theoretical arguments against any artificial origin, stating that: "Our analyses clearly show that SARS-CoV-2 is not a laboratory construct or a purposefully manipulated virus."

These published pieces became far more influential than was warranted. Wade notes that the former statement had actually been organized behind the scenes by Peter Daszak, an American closely associated with the Wuhan lab and therefore hardly a disinterested party, while the latter relied heavily upon very dubious scientific reasoning. But once these emphatic conclusions had appeared in influential periodicals, few microbiologists were willing to challenge this newly established orthodoxy, especially because doing so would have placed them in the same political camp as Trump, a much vilified figure in their community. Baker had earlier made similar criticism and I had fully endorsed his verdict in my own March article, but Wade's analysis provides far greater depth.

Moreover, Wade also emphasizes the climate of fear that today governs much of our academic world, with future grant applications and even careers at risk if researchers depart from perceived orthodoxy on certain issues, perhaps including disputing the origins of Covid-19. He argues that although the *Lancet* and *Nature Medicine* letters were actually political statements rather than scientific findings, they were "amazingly effective" in suppressing dissent and led the overwhelming majority of journalists to accept them as reflecting a research consensus that actually did not exist.



NEW YORK TIMES BESTSELLER
A TROUBLESOME INHERITANCE
GENES, RACE AND HUMAN HISTORY
NICHOLAS WADE
Author of Before the Dawn
A delight to read…And it will trigger an intellectual explosion the likes of which we haven't seen for a few decades. —CHARLES MURRAY, The Wall Street Journal

Wade's own personal experiences have surely informed this shrewd analysis of the underlying political dynamics. His most recent book *A Troublesome Inheritance* had appeared in 2014, and its subtitle "Genes, Race, and Human History" reflected the potentially explosive nature of his subject matter. Although I considered it an outstanding treatment of the controversial topic, Wade's work soon attracted a lynch-mob of critics, who organized a denunciatory public statement that they persuaded 139 prominent genetic scientists to sign. All these individuals were soon humiliated once it was proven that not a single one of them had actually bothered examining the true contents of the book that they were so fiercely attacking.

In the case of Covid-19, Wade demonstrates that once the political barriers have been removed and we are allowed to consider the evidence objectively, our conclusions are transformed. The scientific case for the natural origins of the virus becomes pitifully weak, thereby automatically elevating the competing lab-leak hypothesis, which had previously been denounced and stigmatized as a so-called "conspiracy theory."

For example, despite fifteen months of presumably intensive effort, the Chinese have failed to locate evidence of any wildlife population

hosting a closely-related precursor virus, which had easily been found in the previous cases of emergent viral epidemics such as SARS and MERS. Indeed, the closest natural relative to Covid-19 only exists among bats in the caves of Yunnan, nearly 1,000 miles distant from the Wuhan outbreak.

We would also expect an animal virus that became dangerous to humans would require a lengthy series of intermediate mutational steps as it gradually evolved the ability to effectively infect our own species, just as had been the case with SARS and other previous diseases. But Covid-19 seems to have suddenly appeared in a maximally infectious form, perfectly pre-adapted to humans and apparently derived from a single original source.

Finally, an important structural element of the virus, the "furin cleavage site," is entirely absent from all other members of its viral family, and crucially contributes to its dangerously infectious nature. A natural origin for that structure seems implausible, while the scientific literature is replete with such additions having been made in laboratory experiments, including those conducted by the Wuhan researchers. Moreover, the particular genetic sequence found in that Covid-19 element is extremely rare in other coronaviruses, strongly suggesting that it was added from a different source.

## The Excluded Third Possibility

Having now twice read Wade's long article, I can say that I find nearly all of his scientific arguments quite compelling, and I have almost no points of significant disagreement. Yet my overall conclusions are entirely different from his.

The explanation of this seeming paradox comes near the very beginning of his article, when he accurately states:

> As many people know, there are two main theories about its origin. One is that it jumped naturally from wildlife to people. The other is that the virus was under study in a lab, from which it escaped.

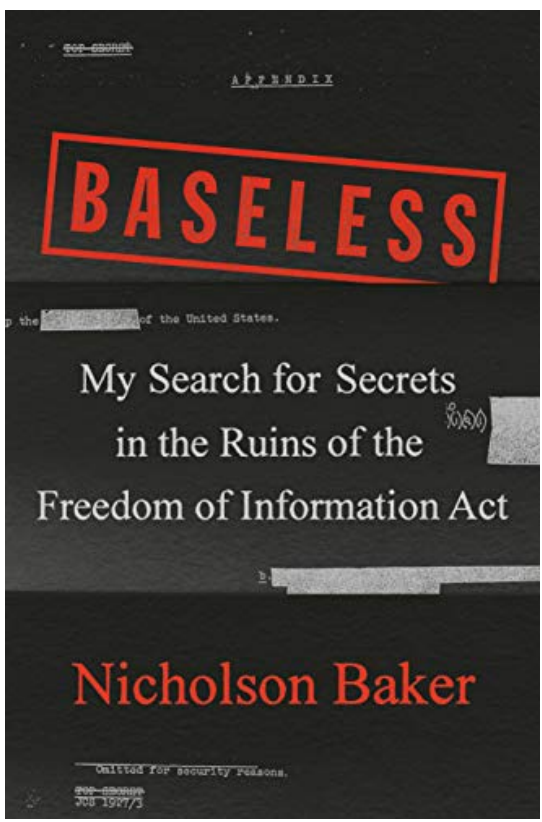
A paragraph later, the text contains his first major section heading, entitled "A Tale of Two Theories."

Although Wade is absolutely correct in stating that "there are two main theories" about the origins of Covid-19, this duality has been enforced by political pressures quite similar to those that had earlier

excluded discussion of the "lab-leak hypothesis," but with the sanctions being far harsher and more extreme.

Wade's analysis masterfully demonstrates that once we are actually willing to explore the much-vilified "conspiracy theory" of an accidental lab-leak, we discover that it is far more plausible than the case of a natural origin, partly because the latter appears so unlikely. And if these were the only two possible theories, all arguments against the one would necessarily support the other. But this framework is upended once we recognize that there is a third logical possibility, far more vilified and excluded than that of the "lab-leak hypothesis" but also far more plausible and supported by much stronger evidence.

In my March discussion of Baker's long article, I summarized how he first became involved in the topic, and described the crucial omission I had noticed in his 12,000 word opus:



Baker may not have been a professional virologist or expert in biowarfare, but as the Covid-19 outbreak began he had just completed *Baseless*, a lengthy non-fictional account of American

national security secrets, which appeared to glowing reviews in July 2020. One of his major elements was an account of America's massive 1950s bioweapons research program, which had been accorded resources and importance matching that of our nuclear weapons efforts. Based upon his years of research, the author was not a complete neophyte on biological warfare issues and was also fully aware of our own long history of laboratory accidents, which had claimed a number of lives. So he was naturally alert to the possibility that a similar accident had occurred in Wuhan, which contained China's most secure facility of that same type.

The greatest weakness of Baker's comprehensive analysis is not the controversial theory that he carefully examines, but the even more controversial possibility that he seems to totally ignore. At one point, he notes the remarkable characteristics of the pathogen, whose collection of features allowed it to so effectively target humans and which had first appeared in a city having one of the very few world laboratories engaged in exactly that type of viral research, closing his paragraph with the sentence "What are the odds?" But other, even more implausible coincidences were entirely excluded from his discussion, and the same had also been true for Lemoine.

Both these authors seem to assume that there exist only two possible scenarios: a natural virus that suddenly appeared in Wuhan during late 2019 or an accidental lab-leak of an enhanced disease agent in that same city. But there is an obvious third case as well, clearly suggested by Baker's focus on America's own very active biowarfare program, which he extensively discussed both in his long article and in his highly-regarded book. We must surely consider the possibility that the Covid-19 outbreak was not at all accidental, but instead constituted a deliberate attack against China, occurring as it did near the absolute height of the international tension with America, and therefore suggesting that elements of our own national security apparatus were the most obvious suspects. Given the realities of the publishing industry, any serious exploration of such a scenario would probably have precluded the appearance of the important Baker or Lemoine articles in any respectable publication, perhaps helping to explain such silence. But as I have argued in my long American Pravda series, many historical accounts that were blacklisted for exactly those sorts of reasons appear quite likely to be true.

Exactly the same glaring omission is found in Wade's 11,000 word

article. Taken together, Lemoine, Baker, and Wade have produced a large collection of high-quality articles on the origins of the global Covid-19 epidemic, but nowhere among their 54,000 words is there even a hint that the virus might possibly have had its origins in America's well-documented and lavishly funded biowarfare program. For several years, our newspapers have proclaimed that we are now locked into a new Cold War against China, with some risk that it might turn hot. But the obvious possible implications of the sudden, potentially-devastating outbreak of a dangerous viral epidemic in our leading international adversary remains unmentionable, too explosive even to dismissed or ridiculed, let alone carefully considered.

As I noted towards the end of my long March article:

> I can easily understand why all these simple facts and their obvious implications regarding the likely origins of the worldwide epidemic might be considered extremely uncomfortable, perhaps too uncomfortable to be discussed in our media outlets, and therefore have been so widely ignored. Most of these crucial points were already presented in my original April 2020 article on the subject, which quickly began to attract enormous traffic and interest in social media. Yet just days after it ran, our entire website was suddenly banned from Facebook and all our web pages were deranked by Google, perhaps underscoring the very dangerous nature of this material, and the reasons why so few others have been willing to raise the same points.

## The Strong Evidence for an American Biowarfare Attack

I find almost nothing to dispute in the comprehensive analyses provided by Lemoine, Baker, and Wade, but I do think my own work represents a crucial supplement to their research, given that I have primarily focused on that third possibility, a possibility that they were necessarily forced to avoid considering. Readers may judge for themselves, but I believe that my articles have demonstrated that the evidence supporting that excluded hypothesis is considerably stronger than that favoring either of those other two possibilities, whether the mainstream narrative of a natural virus or the much-vilified "conspiracy theory" of a lab-leak in Wuhan.

- American Pravda: Our Coronavirus Catastrophe as Biowarfare Blowback?
  Ron Unz • *The Unz Review* • April 21, 2020 • 7,400 Words

- American Pravda: Covid-19, Its Impact and Origins After One Year
  Ron Unz • *The Unz Review* • March 15, 2021 • 8,700 Words

For convenience, I am excerpting substantial portions of my original April 2020 and my most recent March 2021 articles:

> Although the coronavirus is only moderately lethal, apparently having a fatality rate of 1% or less, it is extremely contagious, including during an extended pre-symptomatic period and also among asymptomatic carriers. Thus, portions of the US and Europe are now suffering heavy casualties, while the policies adopted to control the spread have devastated their national economies. The virus is unlikely to kill more than a small sliver of our population, but we have seen to our dismay how a major outbreak can so easily wreck our entire economic life.
>
> During January, the journalists reporting on China's mushrooming health crisis regularly emphasized that the mysterious new viral outbreak had occurred at the worst possible place and time, appearing in the major transport hub of Wuhan just prior to the Lunar New Year holiday, when hundreds of millions of Chinese would normally travel to their distant family homes for the celebration, thereby potentially spreading the disease to all parts of the country and producing a permanent, uncontrollable epidemic. The Chinese government avoided that grim fate by the unprecedented decision to shut down its entire national economy and confine 700 million Chinese to their own homes for many weeks. But the outcome seems to have been a very near thing, and if Wuhan had remained open for just a few days longer, China might easily have suffered long-term economic and social devastation.
>
> The timing of an accidental laboratory release would obviously be entirely random. Yet the outbreak seems to have begun during the precise period of time most likely to damage China, the worst possible ten-day or perhaps thirty-day window. As I noted in January, I saw no solid evidence that the coronavirus was a bioweapon, but if it were, the timing of the release seemed very unlikely to have been accidental.
>
> Consider also the preceding waves of other unfortunate viral epidemics that had recently ravaged China:
>
> [D]uring the previous two years, the Chinese economy had

already suffered serious blows from other mysterious new diseases, although these had targeted farm animals rather than people. During 2018 a new Avian Flu virus had swept the country, eliminating large portions of China's poultry industry, and during 2019 the Swine Flu viral epidemic had devastated China's pig farms, destroying 40% of the nation's primary domestic source of meat, with widespread claims that the latter disease was being spread by mysterious small drones. My morning newspapers had hardly ignored these important business stories, noting that the sudden collapse of much of China's domestic food production might prove a huge boon to American farm exports at the height of our trade conflict, but I had never considered the obvious implications. So for three years in a row, China had been severely impacted by strange new viral diseases, though only the most recent had been deadly to humans. This evidence was merely circumstantial, but the pattern seemed highly suspicious.

Another even more remarkable coincidence has received far greater distribution, becoming a staple of anti-American "conspiracy theories" and even resulting in a diplomatic incident involving the Chinese Foreign Ministry.

According to the widely accepted current chronology, the Covid-19 epidemic began in Wuhan during late October or early November of 2019. But the World Military Games were also held in Wuhan during that same period, ending in late October, with 300 American military servicemen attending. As I've repeatedly emphasized in my articles and comments for more than a year, how would Americans react if 300 Chinese military officers had paid an extended visit to Chicago, and soon afterward a mysterious and deadly epidemic had suddenly erupted in that city?

It surely would have been very easy for our intelligence services to have slipped a couple of their operatives into that large American military contingent, and the presence of many thousands of foreign military personnel, traveling around the large city and doing sightseeing, would have been ideally suited to providing cover for the quiet release of a highly-infectious viral bioweapon. None of this constitutes proof, but the coincidental timing is quite remarkable.

Biological warfare is a highly technical subject, and those possessing such expertise are unlikely to candidly report their

classified research activities in the pages of our major newspapers, perhaps even less so after Prof. Lieber was dragged off to prison in chains. My own knowledge is nil. But in mid-March I came across several extremely long and detailed comments on the coronavirus outbreak that had been posted on a small website by an individual calling himself "OldMicrobiologist" and who claimed to be a retired forty-year veteran of American biodefense. The style and details of his material struck me as quite credible, and after a little further investigation I concluded that there was a high likelihood his background was exactly as he had described. I made arrangements to republish his comments in the form of a 3,400 word article, which soon attracted a great deal of traffic and 80,000 words of further comments.

Although the writer emphasized the lack of any hard evidence, he said that his experience led him to strongly suspect that the coronavirus outbreak was indeed an American biowarfare attack against China, probably carried out by agents brought into that country under cover of the Military Games held at Wuhan in late October, the sort of sabotage operation our intelligence agencies had sometimes undertaken elsewhere. One important point he made was that high lethality was often counter-productive in a bioweapon since debilitating or hospitalizing large numbers of individuals may impose far greater economic costs on a country than a biological agent which simply inflicts an equal number of deaths. In his words "a high communicability, low lethality disease is perfect for ruining an economy," suggesting that the apparent characteristics of the coronavirus were close to optimal in this regard. Those so interested should read his analysis and assess for themselves his credibility and persuasiveness.

Some of this same speculation eventually reached Chinese social media, and led to articles in Chinese government publications, which immediately provoked a very hostile response by Trump Administration officials.

This latter sequence of events is carefully recounted in a massive 17,000 word, 54 page report released a few weeks ago by DFRLab, a social media-oriented research unit within the establishmentarian Atlantic Council, with the work being based upon nine months of research and preparation by a dozen staffers, together with the *Associated Press* investigations team. The study seemed aimed at tracking the appearance and Internet dissemination of a wide range of supposedly false or

unsubstantiated "conspiracy theories" regarding the Covid-19 outbreak, and AP journalists soon publicized the results, denouncing "the superspreaders" of such allegedly spurious and potentially dangerous beliefs.

- Weaponized: How Rumors About Covid-19's Origins Led to a Narrative Arms Race
  DFRLab/The Atlantic Council • February 2021 • 17,000 Words

But while this project did produce a very useful compendium of the chronology and source references of the various unorthodox narratives surrounding the disease, many of which were certainly erroneous or implausible, few effective rebuttal arguments were provided, notably regarding the extremely suspicious timing of the American military presence in Wuhan. Blogger Steve Sailer and others have often ridiculed this "point-and-sputter" school of refutation, in which non-mainstream theories need only be described in order to be considered conclusively disproved.

Although the Atlantic Council/Associated Press team certainly included numerous skilled social media researchers, journalists, and editors, there is no indication that any of these individuals possessed serious national security credentials, let alone specialized expertise in the arcane topic of biowarfare. This may help to explain why the weighty report which drew upon such enormous resources was almost entirely descriptive and made so little effort to analyze or evaluate the plausibility of the various conflicting "conspiracy narratives" that it treated at great length.

One further oddity of the very comprehensive DFRLab/Atlantic Council report was its own rather curious omissions. Given that its entire focus was on the full range of absurd "conspiracy theories," the authors naturally explored speculation regarding an American biowarfare attack, and attributed this theory partly to Kevin Barrett, whom the report characterized as "a US Holocaust denier who has also claimed that the September 11 attacks were an 'inside job' by the George W. Bush Administration."

The resulting news story by its *Associated Press* partners prominently featured Barrett as one of the America's leading "super-spreaders" of Covid-19 conspiracy-nonsense. Yet Barrett's only real role had been to quote and endorse my own very substantial writings in that area, and although he unsuccessfully urged the *AP* journalists to contact me directly, my name was entirely absent from either the news articles or

the lengthy underlying research report. Since my own writings had constituted the longest and most comprehensive presentation of the American Biowarfare Hypothesis, such an omission appears curious. I suspect that the editors concluded that any attack on me would bring my articles to much wider attention, and therefore ruled it out as being obviously counter-productive.

I find it highly unlikely that the DFRLab staffers were unaware of my existence. Their comprehensive report appeared in February 2021, and since it was based upon nine months of investigation, the project would have begun in May 2020. But on April 21, 2020, I had published my long original article making the case for an American biowarfare attack, and its rapidly growing popularity on Facebook only came to an end after the social media giant quickly banned our entire website, a sudden action that had been based upon a very doubtful report produced by that very same DFRLab team, with which Facebook has long partnered. Indeed this remarkable coincidence of timing raises the interesting possibility that the appearance of my article and its considerable popularity had actually prompted DFRLab to undertake its nine month investigation into the general subject of Covid-19 "conspiracy theories." Furthermore:

> The extensive material collected by the Atlantic Council researchers lent further support to an important point I had made last April about the curious nature of the early Covid-19 coverage:
>
> One intriguing aspect of the situation was that almost from the first moment that reports of the strange new epidemic in China reached the international media, a large and orchestrated campaign had been launched on numerous websites and Social Media platforms to identify the cause as a Chinese bioweapon carelessly released in its own country. Meanwhile, the far more plausible hypothesis that China was the victim rather than the perpetrator had received virtually no organized support anywhere, and only began to take shape as I gradually located and republished relevant material, usually drawn from very obscure quarters and often anonymously authored. So it seemed that only the side hostile to China was waging an active information war. The outbreak of the disease and the nearly simultaneous launch of such a major propaganda campaign may not necessarily prove that an actual biowarfare attack had occurred, but I do think it tends to support such a theory.
>
> During January, American media outlets, including those under the authority of Secretary of State and former CIA Director Mike

> Pompeo, began focusing attention on the Wuhan lab as the potential source of the viral outbreak, while journalists disputing this narrative and attempting to raise other possibilities had serious difficulties even getting their articles published on alternative websites:
>
> Scientific investigation of the coronavirus had already pointed to its origins in a bat virus, leading to widespread media speculation that bats sold as food in the Wuhan open markets had been the original disease vector. Meanwhile, the orchestrated waves of anti-China accusations had emphasized Chinese laboratory research on that same viral source. But we soon published a lengthy article by investigative journalist Whitney Webb providing copious evidence of America's own enormous biowarfare research efforts, which had similarly focused for years on bat viruses. Webb was then associated with *MintPress News*, but that publication had strangely declined to publish her important piece, perhaps skittish about the grave suspicions it directed towards the US government on so momentous an issue. So without the benefit of our platform, her major contribution to the public debate might have attracted relatively little readership.

All the evidence thus far presented has merely been circumstantial, strongly establishing that elements of the American national security establishment had the means, motive, and opportunity to stage a biowarfare attack in Wuhan. However, in April 2020 certain additional facts appeared that some have characterized as "smoking gun" proof of that disturbing scenario:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli

television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by "the second week of November" our Defense Intelligence Agency was already preparing a secret report warning of a "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious. Furthermore:

As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hatred Iranian enemies were now dropping like flies.

Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any

rational individual possibly regard this as a mere coincidence?

## Summarizing the Evidence for a Biowarfare Attack and Outlining the Hypothetical Scenario

Most of the material quoted above had originally appeared in my April 2020 article and was afterwards extended and further discussed in my later pieces, the most recent appearing in March 2021. Taken together, they have been read at least a couple of hundred thousand times, and have provoked more than 500,000 words of comments. Yet the undeniable facts I presented have remained almost entirely excluded from the ongoing public debate, presumably for the practical political reasons I have suggested, so it is difficult to know exactly who has become aware of them.

Donald Trump's departure from the White House seems to have finally encouraged our timorous mainstream media organs to admit that their longstanding presumption of the entirely natural origin of Covid-19 might not be correct, and they have begun giving some consideration to the long-derided competing theory of a man-made virus released in an accidental lab-leak. But under these changed circumstances, I consider it entirely unreasonable if they continue ignoring that very real third possibility of an American biowarfare attack. The key pieces of evidence I have provided that favor this hypothesis over the competing lab-leak scenario may easily be summarized:

(1) For three years, China had been locked in growing conflict with America over trade and geopolitics, and for three years in a row, China had been hit very hard by mysterious viruses. An Avian Flu virus severely damaged its poultry industry in 2018 and the following year a Swine Flu virus destroyed over 40% of its pig herds, China's primary meat source. The third year, Covid-19 appeared. Certainly a suspicious pattern if the last were just a random lab-leak.

(2) The Covid-19 outbreak appeared at absolutely the worst time and place for China, the major transit hub of Wuhan, timed almost perfectly to reach high local levels of infection just as the travelers for the Lunar New Year holiday spread the disease to all other parts of the country, thereby producing an unstoppable epidemic. The timing of an accidental lab-leak would obviously be random.

(3) 300 American military servicemen had just visited Wuhan as part of the World Military Games, providing a perfect opportunity for releasing a viral bioweapon. Consider what Americans would think if

300 Chinese military officers had visited Chicago, and immediately afterwards a mysterious, deadly viral disease suddenly broke out in that city. It would be a strange coincidence if that the American military visit and an entirely unrelated accidental lab-leak had occurred at exactly the same time.

(4) The characteristics of Covid-19, including high communicability and low lethality, are absolutely ideal in an anti-economy bioweapon. It seems odd that a random lab-leak would release a virus so perfectly designed to severely damage the Chinese economy.

(5) From almost the very moment that the outbreak began, anti-China bloggers in America and the US-funded Radio Free Asia network had launched a powerful international propaganda offensive against China, claiming that the outbreak in Wuhan was due to the leak of an illegal bioweapon from the Wuhan lab. This may have merely been an exceptionally prompt but opportunistic response of our propaganda organs, but they seemed remarkably quick to take full advantage of an entirely unexpected and mysterious development, which they immediately identified as being due to a lab-leak.

(6) By "the second week of November" our Defense Intelligence Agency had already begun preparing a secret report warning of a "cataclysmic" disease outbreak in Wuhan although according to the standard timeline at that point probably only a couple of dozen people had started experiencing any symptoms of illness in a city of 11 million. How did they discover what was happening in Wuhan so much sooner than the Chinese government or anyone else?

(7) Almost immediately afterwards, the ruling political elites in Iran became severely infected, with many of them dying. Why did the accidental Wuhan lab-leak jump to the Iran's political elites so quickly, before it had reached almost anywhere else in the world.

Given the conclusions suggested above, I also think it would be useful for me to provide my own summary of a plausible scenario for the Covid-19 outbreak. Although I had already presented this outline in a September 2020 article, I see no need for any revisions. Obviously, this reconstruction is quite speculative, but I think it best fits all the available evidence, while individual elements may be modified, dropped, or replaced without necessarily compromising the overall hypothesis.

(1) Rogue elements within our large national security apparatus probably affiliated with the Deep State Neocons decided to inflict severe damage upon the huge Chinese economy using biowarfare. The plan was to infect the key transport hub of Wuhan with Covid-19 so that the disease would invisibly spread throughout the entire country during the annual Lunar New Year travels, and they used the cover of the Wuhan International Military Games to slip a couple of operatives into the city to release the virus. My guess is that only a relatively small number of individuals were involved in this plot.

(2) The biological agent they released was designed primarily as an anti-economy rather than an anti-personnel weapon. Although Covid-19 has rather low fatality rates, it is extremely contagious, has a long pre-symptomatic infectious period, and can even spread by asymptomatic carriers, making it ideally suited for that purpose. Thus, once it established itself throughout most of China, it would be extremely difficult to eradicate and the resulting efforts to control it would inflict enormous damage upon China's economy and society.

(3) As a secondary operation, they decided to target Iran's political elites, possibly deploying a somewhat more deadly variant of the virus. Since political elites generally tend to be elderly, they would anyway suffer far greater fatalities.

(4) The deadly SARS and MERS outbreaks in East Asia and the Near East had never significantly spread back to America (or Europe), so the plotters wrongly assumed that the same would be the case with Covid-19. Anyway, since international organizations always ranked the US and Europe as having the best and most effective public health systems for combating any disease epidemic, they believed that any possible blowback damage would be very minor.

(5) Only a small number of individuals were directly involved in this plot, and soon after the disease was successfully released in Wuhan, they decided to further safeguard America's own interests by alerting the appropriate units with the Defense Intelligence Agency, probably by fabricating some sort of supposed "intelligence leak." Basically, they arranged for the DIA to hear that Wuhan was apparently suffering a "cataclysmic" disease outbreak, thereby leading the DIA to prepare and distribute a secret report warning our own forces and allies to take appropriate precautions.

(6) Unfortunately for these plans, the Chinese government reacted with astonishing determination and effectiveness, and soon stamped out the disease. Meanwhile, the lackadaisical and incompetent

American government largely ignored the problem, only reacting after the massive outbreak in Northern Italy had gotten media attention. Since the CDC had botched production of a testing kit, we had no means of recognizing that the disease was already spreading in our country, and the result was massive damage to America's economy and society. In effect, America suffered exactly the fate that had originally been intended for its Chinese rival.

# George Orwell's Virus Lab-Leak

***The Unz Review*** • May 31, 2021 • 5,200 Words

## An Orwellian Reversal on the Origins of Covid

It's been decades since I last read George Orwell's *1984*, but portions of that classic dystopian novel have become part of our common political culture.

There's that famous scene in which an orator is giving a lengthy wartime speech at a political rally, praising the heroic ally of Eurasia and denouncing the arch-foe of Eastasia, but then is quietly handed a note partway through and completely reverses himself, vilifying the former and hailing the latter. "We have always been at war with Eurasia."

Over the last couple of weeks, we have witnessed in real time this sort of stark and sudden reversal in long-held positions with regard to the origins of the global Covid epidemic, which has devastated much of the world. From early 2020 onward, the mainstream narrative had been that the virus was completely natural, and anyone who suggested that it might be the man-made product of a laboratory was denounced as a "conspiracy theorist," closely akin to the QAnon activists endlessly ridiculed in the media. This official party-line was often harshly enforced by our leading social media monopolies, with Facebook summarily banning all posts suggesting otherwise.

But this situation has now entirely changed, and in recent days the *Wall Street Journal*, the *New York Times*, and our leading electronic media outlets have carried top stories treating that former heresy in a very respectful manner, and even suggesting that the weight of evidence might favor it. The Senate has voted in favor of immediately declassifying all our intelligence documents related to the origin of the virus, and massive political pressure upon President Joe Biden has forced him to order that a full intelligence review be produced and released within 90 days. It appears that an emerging elite consensus may soon favor theories that had previously been consigned to odd corners of the Internet.

The triggering event for this remarkable reversal in American elite sentiment was a closely reasoned and persuasive 11,000 word article

by journalist Nicholas Wade. Although the author had spent more than four decades as a top science reporter at the *New York Times* and other leading outlets, his work was quietly released May 2nd on the *Medium* blogging site, lacking any endorsements or prestigious imprimatur, then republished on May 5th by the low-traffic website of the *Bulletin of Atomic Scientists*.

- Origin of Covid — Following the Clues
  *Did people or nature open Pandora's box at Wuhan?*
  Nicholas Wade • *Medium* • May 2, 2021 • 11,000 Words

Despite such extremely inauspicious beginnings and the cautious and subdued tone of his text, the consequences were dramatic. Although nearly all the facts and evidence that Wade discussed had already been publicly available for most of the past year, his careful analysis and considerable journalistic credibility quickly transformed the intellectual landscape. He began his long article by explaining that from February 2020 onward a huge ideological bubble had been inflated by political propaganda masquerading as science, a bubble that was afterwards maintained through a combination of journalistic cowardice and incompetence. President Donald Trump had proclaimed that the virus was artificial, so our media therefore insisted that it must be natural, even if all the evidence seemed to suggest otherwise.

Facebook Ends Ban on Posts Asserting Covid-19 Was Man-Made
Social media titan's policy shift reflects a deepening debate over the origins of the virus first identified in Wuhan, China
Facebook

Wade's careful presentation immediately punctured that bubble, and upended the public discussion of an epidemic that had killed millions around the world. By May 28th, the *Wall Street Journal* carried the headline "Facebook Ends Ban on Posts Asserting Covid-19 Was Man-Made," so that in less than one month a self-published article had already changed what nearly three billion individuals around the world were allowed to read and write. This illustrates the totalitarian control of information on the Internet held by American's huge Tech monopolies, which determine the limits of permitted discussion worldwide at the flip of a switch. Can there be any better example of the ridiculous, Stalinesque climate of intellectual censorship currently enforced by those corporate giants?

Although Wade's article served as the crucial catalyst, something similar had almost happened in early January, when prestigious *New York* magazine published a 12,000 cover-story by prominent liberal public intellectual Nicholson Baker, which reached very similar conclusions and might have produced the same impact. But Baker's article ran on January 4th, and two days later our DC Capitol was suddenly stormed by a mob of outraged Trumpists, ensuring that all other matters were quickly forgotten for the next couple of months:

- The Lab-Leak Hypothesis
  *For decades, scientists have been hot-wiring viruses in hopes of preventing a pandemic, not causing one. But what if …?*
  Nicholson Baker • *New York Magazine* • January 4, 2021 • 12,000 Words

I think a strong case may be made that the Covid epidemic has been the most important global event since World War II, and so sweeping and rapid a journalistic about-face seems almost unprecedented. Leading members of the Fourth Estate have fully recognized the magnitude of this reversal and the dire implications for their profession, registering their reactions, whether with delight or resigned embarrassment.

As a leading critic of our media establishment, famed investigative journalist Glenn Greenwald Tweeted out his own harsh verdict:

> It's stunning how quickly, in mainstream sectors, this traveled from "insane unhinged conspiracy theory that must be censored from the internet as harmful disinformation" to "serious and plausible possibility for which rational evidence exists."
>
> Let's learn lessons from this. https://t.co/aPnY0JLRJX

— Glenn Greenwald (@ggreenwald) May 25, 2021

His frequent ally Matt Taibbi made similar remarks:

> When the *Wall Street Journal* came out with a story that a previously undisclosed U.S. intelligence report detailed how three Wuhan researchers became sick enough to be hospitalized in November of 2019, the toothpaste was fully out of the tube: there was no longer any way to say the "lab origin" hypothesis was too silly to be reported upon.
>
> That's not to say the "lab origin" theory is correct, at all. However, that's irrelevant to issue at hand.

But even more noteworthy was the lengthy *mea culpa* issued by Douglas J. McNeil, Jr., the forty-five year veteran of the *New York Times* who had spearheaded his newspaper's Covid coverage from the very beginning. Soon after reading his former colleague's analysis and carefully considering the voluminous evidence cited, McNeil entirely reversed his opinion on the origins of the virus, endorsing a theory that he and other mainstream journalists had spent more than a year dismissing as "far right" lunacy, which he admitted they had grouped together with "Pizzagate, the Plandemic, Kung Flu, Q-Anon, Stop the Steal, and the January 6 Capitol invasion."

- How I Learned to Stop Worrying And Love the Lab-Leak Theory
  Douglas G. McNeil, Jr. • *Medium* • May 17, 2021 • 4,700 Words

## Was Covid Developed as a Bioweapon?

With belief in a natural origin for the virus swiftly ebbing, our elite consensus seems to be moving toward the position of Wade, Baker, and many others that the original outbreak probably resulted from an accidental lab-leak at the Wuhan Institute of Virology, known to have been experimenting in that general area of viral research. Recent disclosures by members of our intelligence community that support this theory have been promoted in front-page stories in the *Wall Street Journal* and other leading media outlets, while naturally inspiring an enormous amount of discussion on the Internet.

One important element of the debate is the growing public awareness that the Wuhan lab's viral research had received much of its recent funding from our own National Institutes of Health, providing a major scope for angry American political recriminations. These facts have

been well known for more than a year, but they obviously had little importance when the virus was assumed to be natural.

Even the most horrific biological accidents can happen, but given the demonstrable cowardice and incompetence of our leading media organs, we should hardly be surprised that certain rather obvious implications of this lab-leak hypothesis have received less attention than they deserve.

First, there is the important fact that the top researchers at the Wuhan lab have adamantly denied that the virus was developed there, a position strongly supported by China's national government. So if we accept a lab-leak, then both the local Chinese researchers and the country's top political leaders have been concealing the true facts of this massive global catastrophe from day one. Such a total lack of candor might not be entirely surprising, but it casts a dark shadow over all of China's other claims.

Even more suspicious is the publication history of the Wuhan lab. Sympathetic American scientists who had doubted that the virus was artificial have emphasized that absolutely none of the numerous articles produced by those Chinese viral researchers had included any mention of experimental work with the virus eventually known as Covid-19, which surely would have required a considerable amount of time and effort to transform into its current, highly-dangerous form. This implies that any such viral development work was kept entirely secret, a fact that carries dark implications. The production of biological weapons has been banned by international treaties, so any such illegal virus project would necessarily have remained secret.

Early last year, we published the perspective of a retired forty-year veteran of American biodefense, who focused on the particular epidemiological characteristics of the virus, which was extremely contagious but had a low fatality rate of 1% or less. As I summarized his analysis:

> One important point he made was that high lethality was often counter-productive in a bioweapon since debilitating or hospitalizing large numbers of individuals may impose far greater economic costs on a country than a biological agent which simply inflicts an equal number of deaths. In his words "a high communicability, low lethality disease is perfect for ruining an economy," suggesting that the apparent characteristics of the coronavirus were close to optimal in this regard.

For obvious reasons the majority of our mainstream journalists have been very reluctant to connect these dots of the Wuhan lab-leak scenario which they are now increasingly endorsing, just as nearly all of them had earlier failed to recognize that the virus was probably artificial. Even Wade and Baker have completely avoided any suggestion that the virus accidentally released in Wuhan had been an illegal bioweapon.

But if we abandon this understandable reticence and merely list the central elements of the Wuhan lab-leak hypothesis, the logical implications are quite obvious:

1. The virus accidentally leaked from China's most advanced bioresearch facility, whose top virologists have repeatedly been lying about both the leak itself and their creation of the virus, falsehoods strongly echoed by top Chinese governmental leaders.
2. Since no mention of the virus development work had ever appeared in any published articles, the project had been kept entirely secret. Such total secrecy would be consistent with the creation of an illegal bioweapon.
3. The virus seems to have the ideal characteristics of an anti-economy bioweapon, intended to devastate the society and economic life of a targetted country.

Based upon these facts, the "Wuhan Lab-Leak Hypothesis" seems merely a euphemistic way of describing what is actually the "Chinese Bioweapon Lab-Leak Hypothesis."

From the earliest days of the outbreak, anti-China publications and activists have regularly claimed that Covid was created in a laboratory, also describing it as an illegal Chinese bioweapon accidentally released into the world. Now that the former once-stigmatized assertion is becoming widely accepted, the latter possibility will inevitably become part of the public debate, regardless of any media attempts efforts to prevent this.

Once the virus began devastating large portions of Europe and America during the early months of 2020, the attacks upon China by President Trump and other top figures in his administration like Mike Pompeo became extremely harsh, and although the term "bioweapon" was only rarely uttered in public, it seemed implicit in many of their angry accusations and was probably widely discussed behind closed doors. For example, earlier this year David Asher, a former top Pompeo aide, publicly claimed that Covid was a Chinese bioweapon

during a panel discussion organized by the neoconservative Hudson Institute.

The worldwide destruction inflicted by the virus has been enormous, both in human life and in social and economic damage. Taking into account both deaths and the concurrent lockdowns, America has clearly suffered its worst national calamity since the Great Depression. Many hundreds of thousands of our citizens have died, and according to the detailed analysis of the University of Washington public health researchers, our true total of virus deaths is already close to a million.

Other parts of the world have been even harder hit. India is currently the global epicenter of the outbreak, and most outside observers regard its official death tolls as severe undercounts. Last week, a major *NYT* survey of public health experts estimated that India's actual fatalities have probably already exceeded 1.5 million and perhaps even passed 4 million.

If the carelessness of well-intentioned Chinese scientists has cost the world so many millions of lives and trillions of dollars, that situation would be bad enough. But if all this death and destruction was due to the accidental release of an illegal bioweapon which had been purposefully designed to destroy countries, the international consequences will surely be far more severe.

There are certain logical progressions that almost inevitably follow each other, so that once we have accepted A, we are forced to proceed to B, and then to C and D. Now that our elite media and political establishment seem ready to recognize the artificial nature of the virus, they will find it impossible to suppress the resulting debate on whether Covid was an illegal bioweapon. Indeed, I strongly suspect that many of those early figures who desperately—and often dishonestly—sought to establish the virus as natural and stifle any contrary possibility did so hoping to forestall exactly this situation. But as the Taibbi quote above emphasizes, by late May "the toothpaste was fully out of the tube."

## A Bioweapon Lab-Leak Scenario Without a Lab-Leak?

As discussed above, during the last two or three weeks we have witnessed the explosion of a massive propaganda bubble that had dominated our media narrative for more than a year, built around the

assumption that Covid was a natural virus. That bubble had been maintained by the unwillingness of journalists to take notice of the obvious flaws in that theory and its total lack of any supporting evidence, while also completely ignoring important facts that pointed in an entirely different direction. As a consequence, that belief is being rapidly replaced by the contrary lab-leak hypothesis promoted by the Wade and Baker articles. But under these circumstances, we must be careful that we are not merely replacing one propaganda bubble with another.

Taken together, the Wade and Baker articles total some 23,000 words, and although they constitute the main case for the Wuhan lab-leak hypothesis, they strangely seem almost devoid of any significant evidence for an actual lab-leak. Even worse, from April 2020 onward Trump and Pompeo had loudly declared that they possessed "enormous evidence" supporting their claims of a Wuhan lab-leak, yet no such evidence has ever appeared. Have we forgotten the story of the Iraqi WMD's so quickly?

There is one partial exception to these bare shelves. Wade's long article contains a brief mention that just before Pompeo left office, he had his State Department release a Fact Sheet which mentioned that the US "had reason to believe" that during Autumn 2019, several researchers at the Wuhan lab fell ill with flu-like symptoms, and a couple of months later a former top Pompeo aide publicly made that same claim in somewhat greater detail.

Then last week, this tiny morsel resurfaced as the subject of an entire front-page *WSJ* story. According to intelligence from an unnamed third-party source of disputed reliability, three Wuhan lab researchers had fallen seriously ill during November 2019, around the time that the outbreak first began. Taibbi seemed to regard this tidbit as strong support for a lab-leak, and the story has been widely promoted on social media.

But this actual evidence seems almost invisibly thin. The journalists failed to mention that the Wuhan lab had over 1,000 staffers, and is it really so remarkable that three of these might have come down with serious flu-like symptoms at the height of flu season? Was this really the sum-total of the "enormous evidence" once claimed by Pompeo? Moreover, a sharp-eyed blogger noticed that the lead author of that *WSJ* article was none other than Michael R. Gordon, who had partnered with Judith Miller on her notoriously-fraudulent Iraqi WMD articles, an important detail that surely raises further doubts. And if we can credit the Chinese authorities, they say they later tested all

Wuhan lab employees, none of whom had any signs of past infection.

It is true that there were also some American reports suggesting that the safety conditions at the Wuhan lab were insufficient, but relying upon such weak indications becomes a two-edged sword. Over the last year, pro-China propaganda-activists have widely promoted the completely unsubstantiated theory that the Covid virus had accidentally escaped from Ft. Detrick, America's own premier biowarfare lab, heavily relying upon the fact that for eight months of 2019 major portions of the facility had been ordered shut down by the CDC for serious safety violations. There obviously exists far stronger circumstantial evidence of an American lab-leak than anything similar having happened in Wuhan.

So the major weakness in the Wuhan lab-leak hypothesis is that there are no actual signs of any lab-leak in Wuhan.

## The Case for an American Biowarfare Attack

Thus, we are left with the strong likelihood that Covid came from a laboratory along with a good possibility that it was designed as a bioweapon, yet we lack serious indications that any lab-leak occurred. So if the original Wuhan outbreak was due to the deployment of a powerful bioweapon but not one that had accidentally leaked from any lab, then surely China was the intended target, the victim rather than the perpetrator. Indeed, the PRC only avoided suffering devastation because it responded in such extremely prompt fashion and quickly imposed exceptionally strong public health controls. Some 700 million Chinese were confined to their homes for weeks, a lockdown probably more than a thousand times greater than anything previously seen in history.

Given our ongoing military and geopolitical confrontation with China, America seems the likely source of the attack. However, once the virus eventually reached our own country, President Trump's completely lackadaisical response demonstrated that he himself had absolutely no idea that he was confronting the threat of a dangerous bioweapon, thereby proving his own personal innocence. The most likely suspects would be rogue elements of our national security establishment, probably some of the Deep State Neocons whom Trump had placed near the top of his administration.

This small handful of high-level plotters would have then drawn upon the resources of the American national security apparatus to actually

carry out the operation. The virus and its dispersal devices might have been obtained from Ft. Detrick and CIA operatives or members of special forces would have been sent to Wuhan to release it. However, all these latter individuals would have believed that they were participating in a fully authorized covert military strike against America's primary geopolitical adversary. In effect, what happened was a *Dr. Strangelove*-type scenario, but brought to real life.

Starting in April 2020, I began publishing a long series of articles and columns that presented the evidence for this biowarfare attack hypothesis. Three of the most substantial pieces are linked below, and I would suggest that those so interested read them, especially the most recent one.

- American Pravda: Our Coronavirus Catastrophe as Biowarfare Blowback?
  Ron Unz • *The Unz Review* • April 21, 2020 • 7,400 Words • 1,638 Comments
- American Pravda: Covid-19, Its Impact and Origins After One Year
  Ron Unz • *The Unz Review* • March 15, 2021 • 8,700 Words • 975 Comments
- American Pravda: "The Truth" and "The Whole Truth" About the Origins of Covid-19
  Ron Unz • *The Unz Review* • May 10, 2021 • 6,400 Words • 847 Comments

In addition, we had earlier republished two very relevant articles, one by a retired forty year veteran of American biodefense and the other by investigative journalist Whitney Webb:

- Was Coronavirus a Biowarfare Attack Against China?
  OldMicrobiologist • *The Unz Review* • March 13, 2020 • 3,400 Words • 705 Comments
- Bats, Gene Editing and Bioweapons: Recent Darpa Experiments Raise Concerns Amid Coronavirus Outbreak
  Whitney Webb • *The Unz Review* • January 30, 2020 • 5,700 Words • 297 Comments

The following few paragraphs extracted my articles probably provide some of the most compelling evidence for my thesis:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at

the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by "the second week of November" our Defense Intelligence Agency was already preparing a secret report warning of a "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious. Furthermore:

As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hatred Iranian enemies were now

> dropping like flies.
>
> Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

On March 15, 2020 I had published a brief comment providing my simple analogy of what I thought had transpired. At that point, our country had only suffered a couple of dozen fatalities and had not yet had its first lockdown, but I would still stand by those same words today:

> Suppose two neighbors are feuding, and one of them has a psychopathic teenage son, who sneaks out late at night and starts an arson fire next door to "teach them a lesson."
>
> But the victimized family smells smoke, wakes up, and using heroic effort puts the fire out with only fairly minor damage.
>
> Meanwhile, the fire spreads back to the teenager's own house, and since the family is too lazy and incompetent to bother doing anything, the house catches on fire and burns to the ground, killing several relatives and leaving everyone homeless.
>
> Under such a scenario, wouldn't it be more sensible for the attacked family to just quietly gloat a little and maybe offer condolences rather than to plot further vengeance?

## Evidence Favors a Biowarfare Attack Rather Than a Random Lab-Leak

My past articles linked above make my case for an American biowarfare attack against China (and Iran) but run many thousands of words. So I am providing below a brief summary of those main points, especially focused upon why the biowarfare scenario seems far more likely that the competing lab-leak hypothesis:

(1) For three years, China had been locked in growing conflict with

America over trade and geopolitics, and for three years in a row, China had been hit very hard by mysterious viruses. An Avian Flu virus severely damaged its poultry industry in 2018 and the following year a Swine Flu virus destroyed over 40% of its pig herds, China's primary meat source. The third year, Covid-19 appeared. Certainly a suspicious pattern if the last were just a random lab-leak.

(2) The Covid-19 outbreak appeared at absolutely the worst time and place for China, the major transit hub of Wuhan, timed almost perfectly to reach high local levels of infection just as the travelers for the Lunar New Year holiday spread the disease to all other parts of the country, thereby producing an unstoppable epidemic. The timing of an accidental lab-leak would obviously be random.

(3) 300 American military servicemen had just visited Wuhan as part of the World Military Games, providing a perfect opportunity for releasing a viral bioweapon. Consider what Americans would think if 300 Chinese military officers had visited Chicago, and immediately afterwards a mysterious, deadly viral disease suddenly broke out in that city. It would be a strange coincidence if that the American military visit and an entirely unrelated accidental lab-leak had occurred at exactly the same time.

(4) The characteristics of Covid-19, including high communicability and low lethality, are absolutely ideal in an anti-economy bioweapon. It seems odd that a random lab-leak would release a virus so perfectly designed to severely damage the Chinese economy.

(5) From almost the very moment that the outbreak began, anti-China bloggers in America and the US-funded Radio Free Asia network had launched a powerful international propaganda offensive against China, claiming that the outbreak in Wuhan was due to the leak of an illegal bioweapon from the Wuhan lab. This may have merely been an exceptionally prompt but opportunistic response of our propaganda organs, but they seemed remarkably quick to take full advantage of an entirely unexpected and mysterious development, which they immediately identified as being due to a lab-leak.

(6) By "the second week of November" our Defense Intelligence Agency had already begun preparing a secret report warning of a "cataclysmic" disease outbreak in Wuhan although according to the standard timeline at that point probably only a couple of dozen people had started experiencing any symptoms of illness in a city of 11 million. How did they discover what was happening in Wuhan so much sooner than the Chinese government or anyone else?

(7) Almost immediately afterwards, the ruling political elites in Iran became severely infected, with many of them dying. Why did the accidental Wuhan lab-leak jump to the Iran's political elites so quickly, before it had reached almost anywhere else in the world.

## Outline of the Hypothetical Biowarfare Attack Scenario

Given the conclusions suggested above, I also think it would be useful for me to provide my own summary of a plausible scenario for the Covid outbreak. Although I had already presented this outline in a September 2020 article, I see no need for any revisions. Obviously, this reconstruction is quite speculative, but I think it best fits all the available evidence, while individual elements may be modified, dropped, or replaced without necessarily compromising the overall hypothesis.

(1) Rogue elements within our large national security apparatus probably affiliated with the Deep State Neocons decided to inflict severe damage upon the huge Chinese economy using biowarfare. The plan was to infect the key transport hub of Wuhan with Covid-19 so that the disease would invisibly spread throughout the entire country during the annual Lunar New Year travels, and they used the cover of the Wuhan International Military Games to slip a couple of operatives into the city to release the virus. My guess is that only a relatively small number of individuals were involved in this plot.

(2) The biological agent they released was designed primarily as an anti-economy rather than an anti-personnel weapon. Although Covid-19 has rather low fatality rates, it is extremely contagious, has a long pre-symptomatic infectious period, and can even spread by asymptomatic carriers, making it ideally suited for that purpose. Thus, once it established itself throughout most of China, it would be extremely difficult to eradicate and the resulting efforts to control it would inflict enormous damage upon China's economy and society.

(3) As a secondary operation, they decided to target Iran's political elites, possibly deploying a somewhat more deadly variant of the virus. Since political elites generally tend to be elderly, they would anyway suffer far greater fatalities.

(4) The deadly SARS and MERS outbreaks in East Asia and the Near East had never significantly spread back to America (or Europe), so the plotters wrongly assumed that the same would be the case with

Covid-19. Anyway, since international organizations always ranked the US and Europe as having the best and most effective public health systems for combating any disease epidemic, they believed that any possible blowback damage would be very minor.

(5) Only a small number of individuals were directly involved in this plot, and soon after the disease was successfully released in Wuhan, they decided to further safeguard America's own interests by alerting the appropriate units with the Defense Intelligence Agency, probably by fabricating some sort of supposed "intelligence leak." Basically, they arranged for the DIA to hear that Wuhan was apparently suffering a "cataclysmic" disease outbreak, thereby leading the DIA to prepare and distribute a secret report warning our own forces and allies to take appropriate precautions.

(6) Unfortunately for these plans, the Chinese government reacted with astonishing determination and effectiveness, and soon stamped out the disease. Meanwhile, the lackadaisical and incompetent American government largely ignored the problem, only reacting after the massive outbreak in Northern Italy had gotten media attention. Since the CDC had botched production of a testing kit, we had no means of recognizing that the disease was already spreading in our country, and the result was massive damage to America's economy and society. In effect, America suffered exactly the fate that had originally been intended for its Chinese rival.

# The Covid Epidemic as Lab-Leak or Biowarfare?

***The Unz Review*** • July 12, 2021 • 13,100 Words

## The Alleged Wuhan Lab-Leak and Its Scientific Skeptics

During most of the last year theories regarding the origins of Covid, whether conspiratorial or otherwise, had disappeared from the public debate, pushed aside by the nationwide Black Lives Matter protests and the final stages of the heated presidential campaign.

In early January, prominent liberal author and public intellectual Nicholson Baker had tried to revive the issue with a 12,000 word cover story in *New York* magazine, only to see his Covid lab-leak theory swamped and forgotten when the DC Capitol was stormed by a mob of outraged Trumpists two days later.

- The Lab-Leak Hypothesis
  *For decades, scientists have been hot-wiring viruses in hopes of preventing a pandemic, not causing one. But what if …?*
  Nicholson Baker • *New York Magazine* • January 4, 2021 • 12,000 Words

But then on May 2nd, a revolution occurred after former *New York Times* science journalist and editor Nicholas Wade published a lengthy article on *Medium*. His careful 11,000 word analysis mustered the strong evidence that the virus was the artificial product of a human lab, suggesting that it had probably leaked out of the Wuhan Institute of Virology, China's most advanced viral research facility. That laboratory was known to have been working with those types of coronaviruses and was located in Wuhan, the site of the initial outbreak, raising all sorts of obvious suspicions.

- The Origin of Covid
  *Did people or nature open Pandora's box at Wuhan?*
  Nicholas Wade • *Bulletin of the Atomic Scientists* • May 5, 2021 • 11,000 Words

The floodgates soon opened and over the next few weeks far more was written on that subject than had been produced during the previous

twelve months combined. In just one example, Donald G. McNeil, Jr., the forty-five year veteran of the *Times* who had spearheaded his paper's Covid coverage, published a striking *mea culpa* and embraced the lab-leak hypothesis, admitting that he and other *Timesmen* had previously dismissed the idea as "far right" lunacy, closely associated with "Pizzagate, the Plandemic, Kung Flu, Q-Anon, Stop the Steal, and the January 6 Capitol invasion."

- How I Learned to Stop Worrying And Love the Lab-Leak Theory
  Donald G. McNeil, Jr. • *Medium* • May 17, 2021 • 4,700 Words

McNeil had already retired from the *Times* the previous December after an unrelated controversy, but others at his former newspaper had also experienced a similar change of heart. For more than a year, the editors had been fiercely critical of the lab-leak theory, heavily promoted by Donald Trump and his allies, but with Trump now safely gone, their perspective changed.

In late June, Zeynep Tufekci, one of their opinion columnists, published a 5,500 word article harshly criticizing China and arguing that the global epidemic had probably been the consequence of a Chinese lab-leak. Prof. Tufekci's field of study was sociology rather than the biological sciences and her expertise lay in social media, but the appearance of her long piece surely reflected a seismic shift in the views of her top editors.

- Where Did the Coronavirus Come From? What We Already Know Is Troubling.
  Zeynep Tufekci • June 25, 2021 • *The New York Times* • 5,500 Words

A far longer exposition of this emerging American media consensus had appeared at the beginning of that same month in *Vanity Fair*. The 12,000 word article strongly favored the lab-leak theory and focused upon the bureaucratic infighting regarding that issue within the national security apparatus of the Trump Administration. Based upon months of investigative reporting and numerous interviews, the piece seemed to heavily rely upon anonymous Trump intelligence sources, while generally taking our government claims at face value.

- The Lab-Leak Theory: Inside the Fight to Uncover COVID-19's Origins
  *Throughout 2020, the notion that the novel coronavirus leaked from a lab was off-limits. Those who dared to push for transparency say toxic politics and hidden agendas kept us in the dark.*

Moreover, although the suggestion was presented in a defensive, insinuating manner, the long article also raised serious suspicions that Covid had been developed as a Chinese bioweapon, with that particular word appearing nine times in the text. Millions had already died around the world, including many hundreds of thousands of Americans, so some might find it troubling that such inflammatory accusations had appeared in one of America's most prestigious general interest magazines, especially considering the near-total lack of any supporting evidence. This article demonstrated the drastic shift in elite media sentiment, with theories previously confined to the extreme anti-China ideological fringe now occupying the center of American journalism.

This situation carried disturbing echoes of how those same mainstream media organs had played a similar role twenty years ago in fostering the hoax of Saddam's WMD and promoting our disastrous Iraq War. Indeed, I found it rather ironic that one of the main Trump Administration Covid experts quoted in that article and others was David Feith, whose father Douglas Feith had been one of the leading Neocons involved in that notorious Bush Administration intelligence fraud. Moreover, the lead author of the front-page *Wall Street Journal* story that helped to revive the lab-leak theory in late May was Michael R. Gordon, who had previously shared a byline with Judith Miller on most of the fraudulent Iraqi WMD stories that had propelled us into war. And in early 2020, former Mossad agent Dany Shoham had been one of the earliest figures suggesting that Covid was a Chinese bioweapon leaked from the Wuhan lab, with few remembering that in 2001 he had falsely fingered Saddam's regime as the source of the Anthrax mailings. It almost seemed that members of the old Iraqi WMD cast were reassembling for a revival.

A useful roundup of this sudden wave of supportive lab-leak coverage came in a 4,500 word article published by Fairness and Accuracy in Reporting (FAIR), a left-leaning watchdog organization. The article documented this rapid media shift by citing examples from the *Washington Post*, the *New Yorker*, *New York* Magazine, and *ABC News*, and strongly pushed back against it, continuing to argue for a natural origin of the virus.

- US Media Give New Respect to Lab Leak Theory—Though Evidence Is as Lacking as Ever
  Joshua Cho • *Fairness and Accuracy in Reporting (FAIR)* • June 28, 2021 • 4,500 Words

Unfortunately, although this piece was quite useful as a compendium of media links, the analysis provided was far from persuasive. Author Joshua Cho was described as a recent college graduate and former *FAIR* intern, presumably placing him in his early 20s, so I was hardly surprised to notice quite a number of factual and logical errors in his presentation. Most egregiously, he devoted half his article to attacking Wade, whom he ignorantly and insultingly denounced as a notorious promoter of "pseudo-science" and he seemed rather dismayed that prominent left-liberal journalists such as Thomas Frank and Jonathan Cook had taken Wade's views so seriously. Perhaps this rather self-important former intern should recognize that they probably know some things that he does not, and might consider that Wade had become the science editor at the *New York Times* almost a decade before Cho was even born.

However, others possessing far greater credibility and scientific expertise have also recently challenged the lab-leak hypothesis on much stronger grounds. The day before Cho's article appeared, *Bloomberg* had run a long interview with Danielle Anderson, an experienced Australian virologist who had been the only Westerner working at the Wuhan lab during the period in question. By her account, the description of the lab and its operations provided by the Western media had been totally at odds with what she had seen working there, and the likelihood of a virus leak seemed nil.

- The Last—And Only—Foreign Scientist in the Wuhan Lab Speaks Out
  *Virologist Danielle Anderson paints a very different picture of the Wuhan Institute*
  Michelle Fay Cortez • June 27, 2021 • *Bloomberg* • 2,200 Words

Based upon a few sentences in American government cables, our media has repeatedly alleged that the operating standards of the Wuhan lab were poor, but Anderson's own experience had been entirely different, with the safety protocols so impressive that she later suggested they be adopted at her own research organization. For many months, former members of the Trump Administration had been promoting some questionably-sourced "third party" intelligence claiming that three lab workers became seriously ill in November 2019 with Covid-like symptoms, but Dr. Anderson could recall no such cases, and believed that she would have heard about them. She had generally enjoyed a very friendly and open relationship with her Chinese colleagues, with scientific gossip regularly being shared back and forth. Under these circumstances, she felt certain that if a suspected lab-leak had occurred, she would have heard about it, but

there had never been a hint of any such incident.

Furthermore, the creation of a dangerous virus such as Covid would have required many layers of official authorization by lab administrators, and she doubted that a decision of such importance could have been taken without word getting around. While she admitted that it was theoretically possible for some rogue Chinese lab researcher to have secretly undertaken such a project and bioengineered the virus, then accidentally infected himself or others, she rated the likelihood as "exceedingly slim."

So based upon her personal experience at the Wuhan lab, she thought it very unlikely that the Covid virus was developed there and equally unlikely that any lab-leak had ever occurred. For these reasons, she still leaned towards a natural source for the viral outbreak.

Similar conclusions had been made in an early June interview with Christian Drosten, a German virologist ranked as one of the world's leading experts on both SARS and Covid. Although the discussion appeared in a small German-language publication and has received minimal attention, the magic of Google Translate has made this important material available to a worldwide audience:

- Mr. Drosten, where did this virus come from?
  Marie-Jose Kolly, Angela Richter, and Daniel Ryser • June 5, 2021 • *Republik* • 4,500 Words

Although Dr. Drosten fully accepted a natural origin for the virus, speculating that the undiscovered intermediate host might be found somewhere in China's huge fur-farming industry, he also gave his opinion on the possibility of a bioengineered virus or a lab-leak. In particular, he broached the possibility that the virus was created and released as a bioweapon, but deliberately shied away from discussing it:

> There are actually two laboratory theses. One would be malice that someone has intentionally constructed such a virus. The other would be the research accident, that in spite of good intentions and curiosity an experiment went wrong. The malicious thing, to be honest: you have to talk to the secret service about it. As a scientist, I cannot judge that.

He went on to say that the structure of the virus made it very unlikely that it would have been produced as a product of an innocent scientific research project, or that it came from the Wuhan lab and

was accidentally released:

> This idea of ??a research accident is extremely unlikely for me because it would be far too cumbersome. The idea of ??malicious use by some secret service laboratory somewhere: If anything, something like that would probably not come from the Wuhan Virology Institute. This is a reputable academic institute.

Although their reasons differ, the combined testimony of virologists Anderson and Drosten raises considerable doubts about the accidental Wuhan lab-leak scenario that now increasingly represents the conventional wisdom of the American mainstream media. Both experts are very skeptical that Covid could have been the product of innocent scientific research, and they also think it quite unlikely that the Wuhan lab either created or accidentally released it. Thus, although they both still prefer the natural virus theory, they seem to regard the likely alternative as an illegal or malicious project, seemingly implying the creation and deliberate release of a deadly bioweapon. But under such a scenario, the initial outbreak in Wuhan, one of China's largest cities and a key transport hub, would obviously tend to exculpate that country, while logically pointing the finger of blame in an entirely different direction.

It is noteworthy that we have one of the world's leading scientific authorities on Covid gingerly raising the possibility that it was a non-Chinese bioweapon, and doing so in a small-circulation German-language publication. Yet this very brief and glancing speculation seems to be the only time I have encountered this obvious idea anywhere in the 100,000 or more words of mainstream articles I have read on the possible origins of Covid during the last year or more. Surely many other journalists and scientists must have considered such a possibility, yet virtually none of them had allowed such an idea to appear in print. How can we best understand this complete intellectual embargo?

I think part of the explanation may be found in an interesting exchange late last year on entirely different matters between prominent liberal journalists Matt Taibbi and Chris Hedges, formerly of *Rolling Stone* and the *New York Times* respectively. As they described it, working journalists greatly rely upon social media, especially if they are not directly affiliated with a major publication. And such individuals recognized that a few wrongly-chosen words can provoke a swarming Twitter lynch-mob, possibly leading to the deadly fate of deplatforming. So writers and their employers must necessarily exercise a great deal of self-censorship, fearful of the

disastrous consequences of a careless sentence.

Given this reality, the sudden, striking collapse of the natural virus propaganda-bubble that had so completely dominated the mainstream media for more than a year becomes much less surprising. Probably a considerable number of individuals had had their doubts all along, but fearful of being purged, they had kept silent. However, once Wade's article appeared and began attracting some favorable discussion on social media, they gradually lost their fears and jumped on board, soon demonstrating that those views had been far more widespread than anyone realized.

## The Plausible Deniability of Bioweapons and Their Effectiveness in Economic Warfare

There may or may not exist similar hidden reservoirs of support for the possibility that Covid was a non-Chinese bioweapon, but if so these have remained remarkably well concealed.

Over the last year I have produced a long series of articles explicitly making the case that the Covid virus was released in a deliberate biowarfare attack against China (and Iran). Taken together, these pieces have been viewed some 250,000 times. Yet with a few rare exceptions, the material has been considered far too radioactive to have been acknowledged anywhere in the alternative media, let alone by its mainstream counterpart. The following are the most substantial elements of the series:

- American Pravda: Our Coronavirus Catastrophe as Biowarfare Blowback?
  Ron Unz • *The Unz Review* • April 21, 2020 • 7,400 Words • 1,638 Comments
- American Pravda: Covid-19, Its Impact and Origins After One Year
  Ron Unz • *The Unz Review* • March 15, 2021 • 8,700 Words • 975 Comments
- American Pravda: "The Truth" and "The Whole Truth" About the Origins of Covid-19
  Ron Unz • *The Unz Review* • May 10, 2021 • 6,400 Words • 847 Comments
- American Pravda: George Orwell's Virus Lab-Leak
  Ron Unz • *The Unz Review* • May 31, 2021 • 5,200 Words • 999 Comments

These articles have established our publication as one of the very few venues open to such controversial ideas. As a consequence, we recently received and published a submission by an emeritus professor in Europe with a background in politics and security issues, who wrote under the pen-name "Andreas Canetti." Although somewhat unwieldy and unpolished, his text ran 26,000 words with over 280 footnotes and provided an enormous wealth of information and references, much of it analyzing and explicating the biowarfare hypothesis. While I would not necessarily endorse some of the arguments made, the article served as a very useful source of information on many aspects of the topic.

- The Flying Pangolin
  Andreas Canetti • June 18, 2021 • *The Unz Review* • 26,000 Words

The lengthy *Vanity Fair* article had revealed that some Trump Administration national security officials were strongly opposed to challenging the natural virus theory, fearing that talk of an artificial origin would "open a can of worms," with that phrase so significant that it was even used as one of the main section headings. But the possible nature of those concerns is much better understood after we absorb some of the important material revealed in the Canetti article.

For example, Canetti quotes long passages by a noted military expert on the particular effectiveness of biological warfare in crippling the economy of an international adversary but doing so in a manner that retains the plausible deniability that any attack had even occurred:

> [T]he twenty-first century will be a century of economic warfare… [The] emergence of economic competition…raises the possibility of a new form of warfare. This includes the development and use of biological warfare (BW) against economic targets. Using BW to attack livestock, crops, or ecosystems offers an adversary the means to wage a potentially subtle yet devastating form of warfare, one which would impact the political, social, and economic sectors of a society and potentially of national survival itself…[Bacteria and viruses] that incapacitate or kill humans, animals, or plants have an unsettling value in waging economic warfare….[U]sing BW may inflict a grave blow to that nation's economy or society and possibly result in some political impact. History has recorded the chaos and instability created by such natural catastrophes as famines and epidemics. Using BW in this fashion would have applications to waging low-intensity warfare with strategic outcomes.

> [A bioweapon] is the only weapon of mass destruction which has utility across the spectrum of conflict. Using biological weapons under the cover of an endemic or natural disease occurrence provides an attacker the potential for plausible denial. In this context, [bioweapons] offer greater possibilities for use than do nuclear weapons… [Bioweapons] can be employed in noncombat settings under the guise of natural events, during operations other than war, or can be used in open combat scenarios against all biological systems – man, animal, or plant. Deliberate dissemination of BW agents may be afforded possible denial by naturally occurring diseases and events… Biological warfare's potential to create significant economic loss and subsequent political instability with plausible denial exceeds any other known weapon.

These words were written in 1998 by Robert P. Kadlec, who went on to become a top biowarfare advisor in the George W. Bush Administration, and then most recently returned to government in 2017 as an Assistant Secretary under Trump. His cogent analysis brought to mind some disturbing facts I had noted in my original April 2020 article:

> [D]uring the previous two years, the Chinese economy had already suffered serious blows from other mysterious new diseases, although these had targeted farm animals rather than people. During 2018 a new Avian Flu virus had swept the country, eliminating large portions of China's poultry industry, and during 2019 the Swine Flu viral epidemic had devastated China's pig farms, destroying 40% of the nation's primary domestic source of meat, with widespread claims that the latter disease was being spread by mysterious small drones…So for three years in a row, China had been severely impacted by strange new viral diseases, though only the most recent had been deadly to humans. This evidence was merely circumstantial, but the pattern seemed highly suspicious.

Furthermore, the particular features of Covid itself seem to fall into this same category. Early last year, we published the perspective of a retired forty-year veteran of American biodefense, who focused on the unusual epidemiological characteristics of the virus, which was extremely contagious but had a low fatality rate of 1% or less. As I summarized his analysis:

> One important point he made was that high lethality was often counter-productive in a bioweapon since debilitating or

hospitalizing large numbers of individuals may impose far greater economic costs on a country than a biological agent which simply inflicts an equal number of deaths. In his words “a high communicability, low lethality disease is perfect for ruining an economy,” suggesting that the apparent characteristics of the coronavirus were close to optimal in this regard.

- Was Coronavirus a Biowarfare Attack Against China?
  OldMicrobiologist • *The Unz Review* • March 13, 2020 • 3,400 Words

For decades, America has maintained the world’s most extensive biowarfare program, having absorbed much of the previous Soviet capacity after the collapse of the USSR. We now operate a global network of biolabs in 25 countries, many of them bordering either China or Russia.

US biolabs in 25 countries around Russia and China and in Africa (from Dilyana Gaytandzhieva)

A great deal of this information was summarized in a January 2020 article by investigative journalist Whitney Webb, which we published after her regular outlet at the time had balked at releasing it:

- Bats, Gene Editing and Bioweapons: Recent Darpa Experiments Raise Concerns Amid Coronavirus Outbreak
  Whitney Webb • *The Unz Review* • January 30, 2020 • 5,700 Words

Finally, the website of Dilyana Gaytandzhieva, a former Bulgarian journalist, contains a long article providing a wealth of links and information on America’s biowarfare efforts, representing a very useful resource for those interested in further investigating this important topic:

- The Pentagon Bio-weapons
  Dilyana Gaytandzhieva • *Arms Watch* • June 14, 2019 • 6,800 Words

From the earliest days of the administration, leading Trump officials had regarded China as America's most formidable geopolitical adversary, and orchestrated a policy of confrontation. Then from January to August 2019, Kadlec's department ran the "Crimson Contagion" simulation exercise, involving the hypothetical outbreak of a dangerous respiratory viral disease in China, which eventually spreads into the United States, with the participants focusing on the necessary measures to control it in this country. As one of America's foremost biowarfare experts, Kadlec had emphasized the unique effectiveness of bioweapons as far back as the late 1990s and we must commend him for his considerable prescience in having organized a major viral epidemic exercise in 2019 that was so remarkably similar to what actually began in the real world just a few months later.

With leading Trump officials greatly enamored of biowarfare, fiercely hostile to China, and running large-scale 2019 simulations on the consequences of a mysterious viral outbreak in that country, it seems entirely unreasonable to completely disregard the possibility that such extremely reckless plans may have been privately discussed and eventually implemented, though probably without presidential authorization.

## The Long-Forgotten Early Iranian Outbreak

China ranks as our most formidable geopolitical rival, and when it was suddenly struck by a mysterious viral plague at the height of our international tensions, the implications were entirely ignored by our timorous media. But they have also completely ignored an even stranger coincidence, as I had noted in my original April 2020 article:

> As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began

> gleefully noting that their hatred Iranian enemies were now dropping like flies.
>
> Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

That initial Iranian outbreak was also strangely centered on the Holy City of Qom, the home of that country's elite political and religious leadership rather than in the far larger metropolis of Tehran. Whether Covid appeared in Wuhan as a natural virus or was released due to an accidental lab-leak, Wuhan is some 5,500 kilometers from Qom, so the latter city would hardly seem the most likely location for the next major appearance of the virus.

By March additional major Covid outbreaks had also occurred in Northern Italy and soon afterwards Spain, but the circumstances were quite different. According to Wikipedia, some 300,000 Chinese live and work in that Italian region while another 150,000 Chinese reside in Spain, and many of these individuals had surely returned from annual Lunar New Year trips to their Chinese homeland, perhaps bringing the virus back with them. By contrast, Iran's total Chinese population is one of the smallest in the world, numbering just 5,000-9,000, and overwhelmingly concentrated in Tehran rather than Qom.

China has very extensive trading and business links throughout the world, with perhaps a million Chinese residing in Africa and several million Chinese immigrants in the US and Canada, many of whom retain close personal ties to their homeland. So if an international panel of expert epidemiologists had been given the hypothetical case of a new epidemic in Wuhan, China and asked to predict the next city to which the disease would spread, I suspect that Qom in Iran would have been close to the bottom of their list. But after our early January assassination of Gen. Qasem Soleimini and Iran's retaliatory cruise missile strikes against our Middle Eastern bases, any panel of military strategists would surely have ranked Iran's leadership near the absolute top of American targets.

Together with its close Israeli ally, the U.S. has long maintained an effective network of agents and operatives in Iran, who have successfully carried out numerous major sabotage operations and high-level assassinations. Compared to such difficult attacks on heavily-guarded targets, the quiet release of an invisible and untraceable but highly contagious virus in some gathering of political elites would have been an extremely easy operation, especially since the results would have only become apparent weeks later as the victims fell ill and the disease began to spread.

The circumstantial evidence suggesting that America (or its Israeli partner) had deployed Covid against Iran's leadership class in Qom seemed so strong, I found it puzzling that the Iranians themselves had apparently not drawn those same conclusions and publicly denounced what had occurred. They might not have had any proof, but such a biowarfare attack would been an unprecedented violation of important international conventions, and surely such plausible allegations would have generated international headlines and elicited a considerable amount of sympathy. But then a few months ago, I was very much surprised to discover that the Iranians had actually done exactly that.

In February 2021, a social media research group affiliated with the establishmentarian Atlantic Council released a massive 17,000 word, 54 page report documenting and denouncing the wide range of supposedly false or unsubstantiated "conspiracy theories" regarding the Covid epidemic, and devoted several pages to presenting what they considered widespread Iranian "falsehoods," but which I viewed in an entirely different light. By early March 2020, the Iranian general overseeing his country's biowarfare defense had already begun suggesting that Covid was a Western biological attack against his country and China, and a couple of days later the semiofficial Iranian news agency FARS quoted Iran's top Revolutionary Guards military commander as declaring:

> Today, the country is engaged in a biological battle. We will prevail in the fight against this virus, which might be the product of an American biological [attack], which first spread in China and then to the rest of the world…America should know that if it has done so, it will return to itself.

Soon afterward, Iran's Supreme Leader Ali Khamenei took the same public position, while populist former president president Mahmoud Ahmadinejad became especially vocal on Twitter for several months, even directing his formal accusations to UN Secretary-General Antonio

Guterres. Just a single one of his numerous Tweets drew many thousands of Retweets and Likes.

Iranian radio and television and its international news service repeatedly carried these stories, backed by supportive interviews with a top political aide to Malaysia's former prime minister. But America's overwhelming domination over the English-language global media ensured that this major international controversy never came to my attention at the time it occurred.

The blockade preventing these Iranian charges from reaching the English-speaking world was further facilitated by American control over the basic infrastructure of the Internet. Just one month earlier, Iran's *PressTV* channel for Britain had been deleted by YouTube, following the earlier elimination of its main global channel. Most recently, the American government took the unprecedented action of seizing *PressTV*'s Internet domain, completely eliminating all access to that website.

Wikipedia is also under hostile control, so we should hardly be surprised that ubiquitous source of worldwide information rather implausibly suggests that a single Iranian businessman returning from China was the cause of the Qom outbreak.

## Manipulating Scientists into Deflecting the Iranian Accusations

Although in recent decades America seems to have fallen behind various other countries in industrial production, governing competence, and some important aspects of military technology, the effectiveness of our propaganda organs remains undiminished. As I considered the means by which our Neocon-dominated national-security-media complex had so effortlessly deflected those seemingly formidable Iranian accusations, an apparent strategy became clear. As I explained in my April 2020 article:

> Using alternative media to immediately promote theories that the coronavirus outbreak was the result of a leak from a Chinese biowarfare lab was a natural means of preempting any later Chinese accusations along similar lines, thereby allowing America to win the international propaganda war before China had even begun to fight….I discovered that the fringes of the Internet were awash with claims that the disease was caused by a Chinese

> bioweapon accidentally released from that same Wuhan laboratory, with former Trump advisor Steve Bannon and *ZeroHedge*, a popular right-wing conspiracy-website, playing leading roles in advancing the theory. Indeed, the stories became so widespread in those ideological circles that Sen. Tom Cotton, a leading Republican Neocon, began promoting them on Twitter and *FoxNews*, thereby provoking an article in the *NYT* on those "fringe conspiracy theories."

As the *Times* article indicated, these early claims that Covid might be a leaked Chinese bioweapon were soon heavily amplified by Neocon-oriented international news outlets such as the *Washington Times* and Alex Jones's popular *InfoWars* network. Fearful of the possible international consequences of such explosive charges, well-intentioned scientists mobilized behind the defense that the virus was entirely natural, whether or not they actually believed the evidence was as strong as they claimed. Public statements to this effect appeared in a January 29th *Washington Post* article and a couple of weeks later the *New York Times* article debunking Sen. Cotton's charges.

This may also be the most likely explanation for the high-profile declaration published in the *Lancet* on February 19, 2020 by a group of 27 virologists and other noted scientists, condemning speculation about an artificial virus as an untenable "conspiracy theory," and the equally high-profile piece the following month in *Nature Medicine* arguing for a natural Covid origin. These early statements in prestigious journals completely framed the media discourse for more than a year, and as a consequence this supposed scientific consensus ensured that any Iranian accusations of a biowarfare attack were automatically dismissed as absurd and ridiculous.

I think that this reconstruction of events is supported by the remarkably contradictory public positions taken by Prof. Richard H. Ebright, a highly-reputable Rutgers molecular biologist and biosafety expert, who has recently established himself as one of the most widely cited scientific backers of the Wuhan lab-leak theory.

In January, Nicholson Baker had quoted Ebright as saying that for years he had been concerned about the Wuhan lab and the work being done there to create "chimeric" SARS-related bat coronaviruses "with enhanced human infectivity." In an email, the scientist further declared that "In this context, the news of a novel coronavirus in Wuhan ***screamed*** lab release."

Soon afterwards, Ebright became one of the prominent signatories of

the March Open Letter sharply criticizing the WHO report and calling for a renewed international investigation of the Wuhan lab, outlining his views in a lengthy *Independent Science News* interview. According to the *Vanity Fair* article, when the earliest reports of the Covid outbreak appeared, his suspicions that an artificial virus had leaked from the Wuhan lab were immediate, emerging within "a nanosecond or a picosecond." Ebright's statements also constituted a centerpiece of Wade's seminal article:

> It is clear that the Wuhan Institute of Virology was systematically constructing novel chimeric coronaviruses and was assessing their ability to infect human cells and human-ACE2-expressing mice. It is also clear that, depending on the constant genomic contexts chosen for analysis, this work could have produced SARS-CoV-2 or a proximal progenitor of SARS-CoV-2…It is clear that some or all of this work was being performed using a biosafety standard … that would pose an unacceptably high risk of infection of laboratory staff. It also is clear that this work never should have been funded and never should have been performed.

Yet strangely enough, during the early months of the epidemic, Ebright had seemingly taken an entirely contrary public position. In his January 29, 2020 interview with the *Washington Post*, he had declared: "Based on the virus genome and properties there is no indication whatsoever that it was an engineered virus." And according to a *Post* story a couple of weeks later, he also added "The possibility that this was a deliberately released bioweapon can be firmly excluded."

Ebright's sweeping statements had been intended to rebut the widespread allegations that Covid was a *Chinese* bioweapon that had accidentally been leaked, but they soon proved extremely helpful to our own government-sponsored *RFE/RL*, which denounced the Iranian biowarfare accusation as "an unfounded claim" backed by "no evidence," and quoted Ebright's blanket assertion as an effective rebuttal. The apparent scientific consensus that the virus was natural ensured that any further Iranian accusations were summarily rejected as completely irrational by the international media, forcing Tehran to soon abandon the effort as counter-productive.

Whether or not my analysis of Ebright's motive is correct, there is the undeniable reality that the loudest early scientific voice favoring Covid as natural has become the loudest voice arguing that it came from a lab, a belief he now claims to have held from the very beginning. No one in the media seems to have commented upon or

perhaps even noticed this radical reversal.

I cannot say if this political/media strategy was actually planned, but it proved very effective, and the fierce, early attacks on China for having released Covid achieved a double result. The accusations successfully demonized that country with much of the American and world public, so that according to a poll taken at the end of April, a remarkable 45% of Americans believed that the deadly virus had "probably" or "definitely" originated in a Chinese laboratory, with 74% of Republicans holding that belief. But the charges also provoked a defensive response by reputable scientific authorities, who gravitated towards the doubtful natural virus theory as their best defense, and this proved extremely useful in defeating the Iranian accusations when they soon came. Moreover, the resulting natural virus consensus remained confined to the mainstream media, a source of information widely distrusted by populist conservatives, most of whom may have remained stubbornly convinced that Covid had indeed come from the Wuhan lab and had probably been a Chinese bioweapon.

By the beginning of 2021, the extremely suspicious aspects of the early Iranian outbreak had long since been forgotten and Iran's biowarfare accusations abandoned, so there was little cost in allowing the resurrection of the theory that Covid was the artificial product of a lab. This cleared the way for a new media consensus along those lines.

## Trying to Disguise a Smoking Gun

The extremely suspicious nature of the very early Covid outbreak in Qom points the finger of blame in an obvious direction, as Iran's top leadership had publicly declared at the time. But evidence related to Wuhan itself is even more compelling, and the probable timeline of the first appearance of Covid constitutes a crucial element of that story.

Throughout 2020, teams of investigative journalists from the *New York Times*, the *Wall Street Journal*, and the *Associated Press*, sometimes assisted by leaked Chinese documents, had firmly established that China's central government was unaware of the growing viral epidemic until the end of December, and then immediately provided the information to the World Health Organization and other international authorities. That same year a very thorough analysis by Philippe Lemoine in *Quillette* had also strongly argued that the local

Wuhan officials only discovered the viral outbreak a couple of days earlier.

The exact date of Wuhan's Patient Zero is much more difficult to determine, but can probably be roughly estimated. Years of censorship and ideological curation have severely impaired the utility of Google as an objective search engine on controversial topics, but it remains invaluable as a guide to the established standard narrative. And if we Google a phrase like "first Wuhan Covid case," a top result is the official summary of an academic paper published in *Science* on March 18, 2021 by a team of researchers from the University of California San Diego School of Medicine, with the first author being Dr. Jonathan Pekar.

- Novel Coronavirus Circulated Undetected Months before First COVID-19 Cases in Wuhan, China
  *Study dates emergence to as early as October 2019; simulations suggest in most cases zoonotic viruses die out naturally before causing a pandemic*
  Scott LaFee • UCSanDiegoHealth • March 18, 2021 • 1,100 Words

Based upon the characteristics of the virus and employing a series of simulations using standard molecular clock techniques, the researchers concluded that the outbreak in Hubei province probably began no earlier than mid-October 2019, while regional newspaper reports suggest that Covid was already actively circulating by November 17, 2019. This allows us to effectively bracket the appearance of Patient Zero between mid-October and mid-November, with very early November being the most likely date. According to the paper's estimate, there were probably no more than four infected individuals by mid-November and just nine by December 1, 2019, though obviously all these dates and totals are mere approximations. A rough timeline along these same lines had already been widely accepted by spring of last year, but a rigorous academic study has now placed it upon a much more solid footing.

However, when we combine certain other facts with these seemingly solid scientific conclusions, the implications are explosive, as I have repeatedly emphasized for more than a year:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four

separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by "the second week of November" our Defense Intelligence Agency was already preparing a secret report warning of a "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious.

Founding *Slate* Editor Michael Kinsley once famously quipped that a gaffe was when a politician inadvertently spoke some forbidden truth, and by failing to recognize the obvious implications of the date of the secret DIA report, the four government sources who revealed its existence and the Israeli source who independently confirmed that disclosure had constructed an enormous political bomb, which only the "see no evil" behavior of our timorous media has allowed to remain undetonated.

Because the nominal focus of the original *ABC News* report had been the incompetence of the Trump Administration in failing to heed the November warning of the looming epidemic, the story received

enormous early discussion, being very widely Tweeted out and attracting over 1,700 comments. The lead author was Josh Margolin, the news network's chief investigative reporter, whose excellent governmental and intelligence sources greatly strengthened its credibility and impact. Even the much less prominent Israeli story confirming the secret report's international distribution attracted more than 50 comments.

But there are grave implications to a secret American government report that described a potentially "cataclysmic" disease outbreak in Wuhan that has not yet actually occurred, and once these were recognized, the entire episode was quickly flushed down the media memory hole and almost never mentioned again, even by alternative journalists.

One particularly suspicious aspect of the DIA report was that it had allegedly been "the result of analysis of wire and computer intercepts, coupled with satellite images." Yet at the time it was prepared—"the second week" of November—we now believe that no more than a handful of Chinese had yet become infected by Covid in that city, hardly the sort of situation that would have been apparent on satellite reconnaissance photos.

The Pentagon's first line of defense was simply to deny that the report had ever existed, though this became more difficult after the Israelis confirmed that both they and NATO had received copies at the time. But given the enormous stakes involved, additional efforts to obfuscate the apparent smoking gun seem to have been quickly undertaken.

Two months after he had published his inadvertent bombshell, Margolin co-authored another article almost twice as long, which heavily promoted an unpublished Harvard Medical School study allegedly replicating those DIA findings. The authors claimed to have used satellite images and electronic Internet data to demonstrate that the virus outbreak had already produced a major health crisis in Wuhan by September or October, with local hospitals supposedly already heavily burdened by Covid patients, months earlier than previously believed. Such findings were obviously intended to explain how the DIA had come to similar conclusions in November, and the second sentence of the news story stated that the research study was performed "[u]sing techniques similar to those employed by intelligence agencies," while explicit references to the DIA report also appeared later in the text.

- Satellite data suggests coronavirus may have hit China earlier: Researchers
  *Researchers say surge in cars at hospitals may indicate outbreak in fall*
  Kaitlyn Folmer and Josh Margolin • *ABC News* • June 8, 2020 • 2,500 Words

Dr. John Brownstein, the lead author of the study, served as an *ABC News* contributor, and he was described as having spent more than a month on the project, suggesting that it had begun just days after Israeli television confirmed the existence of the officially-denied secret DIA report. Heavy use was made of satellite-imaging and RS Metrics, a leading geospatial analysis firm, was recruited to evaluate the data. The authors claimed to have received no outside funding, but surely such services hardly came cheap, and the project seems to have been initiated and completed in record time.

Unpublished studies rarely receive much media coverage, but the report was propelled into the public eye by a glowing 2,500 word *ABC News* story, longer than the body of the paper itself, and immediately Tweeted out by such high-profile individuals as Donald Trump, Jr. and the Executive Director of Human Rights Watch, thereby attracting a great deal of attention. According to Margolin's article, it had been submitted to *Nature Digital Health* and was undergoing peer review, yet more than thirteen months later it has never appeared in that publication or anywhere else, implying that it was uniformly rejected for publication. Moreover, after such an auspicious launch, it has never been mentioned or cited in any subsequent mainstream analysis of the early Wuhan outbreak, suggesting that it was considered an embarrassment, an analysis that no respectable journalist nor editor took seriously.

The reasons are obvious. Covid is an extremely contagious disease, and once it has become established in an urban community, infections will normally tend to double every 3-6 days, so if thousands of Covid victims had been clogging Wuhan's hospitals in September or October, the entire city would probably have reached herd immunity by the time the lockdowns and other strong public health measures were implemented in mid-January. Yet this huge supposed local health crisis had remained entirely invisible to the many Westerners who were still living in the city during that period.

The fact that a team of Harvard researchers was mobilized on such extremely short notice to produce an obviously fallacious and illogical study intended to explain away the secret DIA report simply

underscores the tremendous importance of that inadvertent disclosure. And although apparently rejected by all academic journals and shunned by the regular media, the study has still served as a useful talking-point for the gullible, being regularly cited by online commenters as supposedly explaining and justifying those impossible DIA conclusions, which is how it first came to my attention.

## False Narratives Based Upon False Positives

The promotion of the fallacious evidence that the Covid outbreak in Wuhan had begun much earlier than generally believed was a product of the anti-China camp. But similar sorts of claims have become quite common among pro-China propagandists, who have regularly argued that the virus was circulating in parts of Europe, America, and other countries during 2019, long before the Chinese authorities discovered its existence in Wuhan at the very end of that year. This theory has obviously been intended to deflect the accusation that a Chinese virus, whether natural or not, had been responsible for the deaths of millions around the world.

The most solid evidence for these supposedly early Covid infections have been tests of stored wastewater or blood samples in various countries, with the results published in reputable scientific journals. For reference purposes, here is a list of the examples known to me:

- Barcelona, Spain. *Reuters*, The Conversation. Wastewater, March 12, 2019. Paper.
- Milan, Italy, *Reuters*. Blood samples in lung cancer screening, as early as September 2019. Paper.
- Santa Catalina, Brazil. *SCMP*. Wastewater, November 27, 2019. Paper.
- France. *CGTN*, *Inserm*. Blood samples in twelve regions, between November 2019 and January 2020. Paper.
- Milan and Turin, Italy. *Reuters*. Wastewater, December 18, 2019. Paper.
- California and eight other states. *NYT*. Red Cross CDC blood samples, as early as December 13, 2019. Paper.
- Illinois and four other states, *NYT*, *WSJ*. Blood samples, as early as December 24, 2019. Paper.

At first glance, this collection of more than a half-dozen scientific studies seems a very impressive body of evidence. But although these individual cases are often grouped together and presented as evidence for the early presence of Covid in the West, important distinctions

must be drawn. According to our standard timeline, the Covid virus probably first appeared in Wuhan between mid-October and mid-November of 2019, so given widespread international jet travel, the possibility that it might have initially reached parts of Europe or America by December hardly overturns our existing framework, and the same might even be true for those examples in which the virus seems to have appeared somewhere else by late November.

Wuhan is a densely populated urban metropolis, ideally suited for the rapid spread of an unsuspected contagious disease, and we still believe that a couple of months elapsed between the appearance of Patient Zero and the steadily growing epidemic reaching the attention of the local health authorities, so a roughly similar gap between the initial presence of the virus in other parts of the world and serious local outbreaks would only be expected. Also, the epidemiological simulations run in the Pekar study mentioned above have suggested that a large majority of initial pinprick infections die out by themselves, with only a fraction become the larger, exponentially-growing local epidemics that gain public visibility.

So among the above cases, only the first two—from March and September 2019—seem to seriously challenge our existing assumption of an original Wuhan source. And as we examine those cases in detail, their credibility disintegrates.

In June 2020, stored Barcelona wastewater revealed a single positive Covid result for March 12, 2019, while no other instances were found for the subsequent ten months until January 2020, a few weeks before the earliest victims were discovered and the large Spanish outbreak began. Such a single, anomalous datapoint can easily be ascribed to lab-error or accidental contamination of the sample, and indeed other Spanish and Chinese experts expressed strong skepticism of the test results on exactly those grounds.

Similarly, the Italian evidence for Covid infections as early as September 2019 was based upon stored blood samples from a large cancer-screening trial, and is also very doubtful. According to the antibody test used, a remarkable 11.6% of all healthy volunteers had tested positive for the virus by March 2020, seeming to imply that enormous numbers of Italians had already been infected by that date, a far larger total than the corresponding number of hospitalizations or deaths. So if an overwhelming majority of those 111 total Covid infections appear to be false-positives, the same might easily be true of the four cases that dated back to September.

The likely prevalence of false-positives also undermines the credibility of the other studies, which allegedly detected the virus in France, Brazil, Italy, and parts of the U.S. by November or December of 2019. For example, the French study based upon blood antibody tests seemed to reveal that 1.9% of the population—more than a million individuals—had already been infected by November 2019, which would have produced a huge public health care crisis long before the one that actually began in April of the following year.

Similarly, an antibody analysis of Red Cross blood samples by the researchers at our own CDC seemed to indicate that 2% of Americans —more than six million people—had already been infected by January 2020, long before our own first large outbreak began. If such enormous numbers of Americans had been infected that early, we surely would have seen direct evidence, and the exponential growth of infections would have swamped our health care system by the following month. Indeed, the lead author of the article seemed to acknowledge that the antibody evidence found was actually quite doubtful, suggesting that up to 98% of the supposed infections detected might be erroneous.

Our strong suspicion that nearly all these anomalous results were simply due to false-positives seems entirely confirmed once we carefully consider the details of the last study in the list.

On June 15, 2021 both the *New York Times* and the *Wall Street Journal* reported the results of a newly published study that applied antibody tests to a very large set of stored blood samples, and found evidence of American infections as early as December 24, 2019, several weeks before the first known case. It is hardly surprising that the virus might have reached this country before the end of 2019, and those results do not seriously challenge our existing narrative. However, certain aspects of the methodology employed provide important information.

Due to serious concerns over false-positives, the researchers had decided to apply two consequence Covid antibody tests to the 24,000 blood samples that they analyzed, and the first test flagged 147 positive results, a total which was then reduced to just 9 by the second test. This implies that roughly 95% of the initial Covid antibody matches were actually false-positives, and it is quite possible that a third antibody test might have further reduced the total of true infections detected. Once we realize that at least 95% of the matches in a single-antibody test are likely to be false-positives, the very few anomalous early Covid results in those other papers no longer seem at

all mysterious.

All these studies were aimed at locating the earliest signs of the Covid virus in various parts of the world, and there surely must have been many other studies that found no results worthy of publication, let alone media coverage. Yet with the exception of two minor and obviously spurious instances, this global effort found absolutely no signs of the virus anywhere in the world prior to the date we currently believe that it first appeared in Wuhan. This provides strong support for the null hypothesis, fully affirming our existing Covid timeline.

## Promoting a Ft. Detrick Lab-Leak as a Failure of Nerve

The total absence of any Covid antibodies prior to December 2019 in tens of thousands of American blood samples should be kept firmly in mind as we consider the possibility of a summer 2019 Ft. Detrick leak, a theory widely popular among pro-China propagandists and anti-American "conspiracy" websites.

From January 2020 onward, anti-China elements had been promoting the theory of a Wuhan lab-leak, so a few weeks later their pro-China and anti-American counterparts began responding in kind, arguing that Covid had indeed leaked from a lab, but that the source had been Ft. Detrick, America's premier biowarfare center. In fairness, that latter hypothesis at least had some solid factual basis, given that the facility had been ordered shut down by the CDC for eight months due to safety violations, as reported in the *New York Times* and other newspapers:

***Deadly Germ Research Is Shut Down at Army Lab Over Safety Concerns***

Problems with disposal of dangerous materials led the government to suspend research at the military's leading biodefense center.

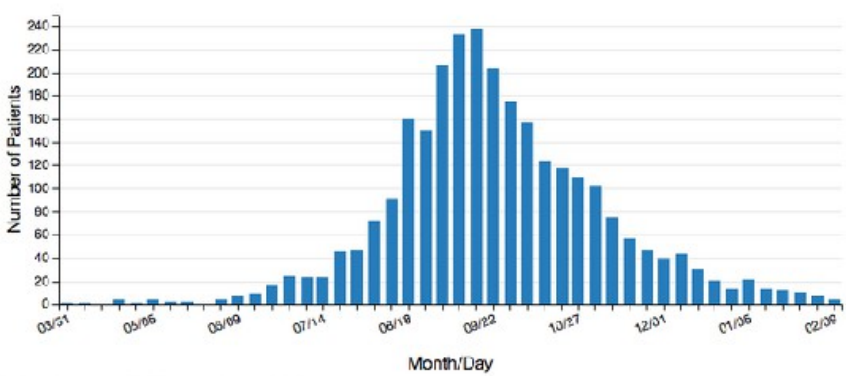
Screenshot from The New York Times August 08, 2019

However, the other half of the theory was much more doubtful. During 2019 there had been a flurry of unusual respiratory illnesses

across America, including more than 2,600 individuals requiring hospitalization and 68 deaths, with the condition labeled EVALI by the CDC. A public shutdown of Ft. Detrick for safety violations soon followed by a wave of illness with symptoms somewhat similar to Covid constitutes a tidy package providing simple talking-points, and this allowed the blame for the virus to be thrown back at the Americans. Many China partisans jumped at this attractive bait, with the accusations sometimes amplified by Chinese officials or media organs.

This hypothesis disintegrates upon any close examination of the evidence. An unusual aspect of Covid is the extreme age-skew, with victims over 60 having fatality rates perhaps a hundred times greater than those under 40, and the young being almost invulnerable. Indeed, according to some estimates the majority of deaths have been among individuals in their late 70s or older. By contrast, EVALI was an illness of youth, with 52% of the serious cases occurring among those younger than 25, compared to perhaps 0.2% for Covid. Thus, the profile of victims seems entirely dissimilar, differing by more than two orders of magnitude.

Moreover, the single most important characteristic of Covid is the extremely contagious nature of the disease, with outbreaks growing exponentially if not controlled by strong public health measures. But the graph of EVALI cases provided on the CDC website tells a very different story, rising sharply during the summer of 2019, but then tailing off to low levels by late December.



EVALI Hospitalizations (CDC Website)

If thousands of Americans had become infected with Covid by mid-2019, the total would have reached many tens of millions by the end of the year, and the resulting hundreds of thousands of excess deaths would have ensured that no one paid any attention to

emerging reports of some viral outbreak in Wuhan on the other side of the world. By contrast, there seems no evidence that EVALI was contagious, and according to the CDC it was strongly associated with the use of Vitamin E acetate in vaping products.

Thus, the two illnesses had entirely different age-profiles, entirely different epidemiological characteristics, and apparently different causes. No trace of Covid antibodies was found in America during the peak of the EVALI cases, which had already dwindled down to low levels several months before our Covid outbreak began. There were only a few dozen EVALI cases in the Ft. Detrick region and far more in California, Texas, Illinois, and New York. And much speculation notwithstanding, there is no evidence that anything, contagious, Covid, or otherwise, had leaked out of Ft. Detrick around the time of its temporary shutdown.

Closely associated with the highly implausible theory of a Ft. Detrick lab-leak has been the suggestion that the virus was accidentally brought to Wuhan by the American participants in the World Military Games held in that city, which ended on October 27, 2019. That date does seem to almost perfectly match the beginning of the Covid outbreak, and for more than a year I have suggested that the presence of 300 American military servicemen and many thousands of those from other countries would have provided perfect cover for a couple of operatives to have been slipped into the city in order to quietly release the virus. It is noteworthy that the Sheraton Wuhan Hankou Hotel hosting some of the American military contingent was located only a mile and a half from the Huanan seafood market, an early epicenter of the outbreak, while the Wuhan lab is twenty miles distant.

But there is no evidence that any of the American participants were themselves infected and if Covid had already spread widely enough in the U.S. to have infected random members of the team, our own outbreak would have occurred months before the one in China rather than months afterward.

I strongly suspect that the widespread focus by pro-China partisans on a Ft. Detrick lab-leak or some other accidental American release has been due to political expediency more than anything else. As discussed above, there exists strong even overwhelming evidence that the worldwide Covid epidemic was caused by an American biowarfare attack against China (and Iran), probably by rogue elements of our national security establishment associated with the Deep State Neocons near the top of the Trump Administration. But with millions

dead, many of them American, such monumental accusations might easily exceed the intestinal fortitude of nearly all journalists and editors, even those found among alternative media outlets. Therefore, they judged it far safer to instead condemn America for an alleged lab-leak at Ft. Detrick, thereby mirroring the Wuhan lab charges. But there are serious difficulties with advancing theories that have no factual basis, including doing severe damage to one's future credibility.

## Diverting "Conspiracy Theorists" into Dead-Ends

In the years following the 9/11 attacks, a vibrant movement of "conspiracy theorists" developed on the Internet, arguing that the true facts had been quite different than the official story, with most of them suggesting heavy American government involvement in those momentous events.

Back then, the Internet was far less channeled and regulated than it eventually became, and few effective means existed for the political establishment to shut down such troubling discussions. So Harvard Law professor Cass Sunstein, soon to become a top Obama aide, shrewdly suggested that the activities of those energetic individuals could best be undermined and disrupted by means of "cognitive infiltration." Agents of the government or its close allies should join those online communities and promote a wide range of additional theories, often rather absurd ones, thereby stirring up internal conflicts, diverting the members into theoretical dead-ends, and heavily discrediting them with the broader American public.

There is no evidence that Sunstein himself ever attempted to implement the project, nor did he pioneer the idea. Such an approach was hardly new, and J. Edgar Hoover's notorious Cointelpro program of the late 1950s and 1960s had used quite similar methods, though the FBI had targeted real-life activist organizations rather than any non-existent online communities of those pre-Internet days. Indeed, the use of *agents provocateurs* has always been a standard technique of internal security services. But we should keep these obvious tactics in mind as we consider the vast profusion of diverse conspiratorial theories that have sprung up like mushrooms in the wake of the global Covid epidemic and the severe stresses that it imposed on the ordinary lives of so many Americans.

Many, perhaps most individuals are quite reluctant to embrace any theory not blessed by their personal figures of authority, whether

these be the editors of the *New York Times* or the pundits of *FoxNews*. Only a small minority of the population is willing to cross such ideological boundaries and risk the stinging epithet of being labeled "a conspiracy theorist."

Those transgressive individuals who adhere to some heterodox beliefs are usually willing to accept many others as well, and are often quite eager to do so, sometimes exhibiting the serious lack of logical thinking and careful analytical judgment that may taint their entire community. This leaves them open to eagerly nibbling the poisoned bait of fraudulent but attractive theories, whether these are advanced by well-meaning advocates, self-serving charlatans, or covert agents of the establishment engaged in "cognitive infiltration." The vast profusion of unorthodox Covid theories, heavily promoted in videos, Tweets, and websites, may derive from all three of these different sources.

Some individuals have claimed that Covid does not exist, or that it is almost harmless, being little more dangerous than the ordinary flu, with our alleged death-toll merely a product of fraud and media propaganda. Others have taken this notion even further, arguing that viruses in general do not exist. Such sentiments have been all too annoyingly frequent on the very lightly moderated comment-threads of this website, provoking me to leave the following response on several occasions:

> But here's a listing of TOTAL American deaths from all causes over the last few years, taken directly from the CDC website:
>
> 2014: 2,626,418
> 2015: 2,712,630
> 2016: 2,744,248
> 2017: 2,813,503
> 2018: 2,839,205
> 2019: 2,854,838
> 2020: 3,384,426
>
> You'll notice that the numbers are fairly steady until 2020 when they suddenly jumped by well over 500,000.
>
> If I didn't know any better, I'd almost think that America had been struck by a dangerous disease epidemic that year.
>
> It's obviously just a matter of personal opinion whether an extra half-million deaths in 2020 is a big number or a small number …

The strong public health measures implemented in this country and elsewhere to control the spread of the virus—lockdowns, masking, and social distancing—have been very disruptive and unpleasant for many people, producing a wide range of harsh criticism, ranging from the reasonable to the ridiculous. The all-out effort to develop and distribute effective vaccines, including new and lightly-tested ones, has merged the Covid controversy with the longstanding anti-vaxx movement, whose best-known advocate has been Robert F. Kennedy, Jr.

Not having devoted much time to these matters, I can only say that a great deal of the agitated commentary on this subject seems outlandish and implausible. Many activists seem to assume a unified worldwide conspiracy involving China, America, Russia, Israel, Iran, and virtually every other nation, all secretly working together to pretend that Covid is dangerous and that the vaccines against it are not, even though the truth is exactly the opposite. But the notion of all these mutually-hostile countries collaborating in such a bizarre scheme seems extremely unlikely, and Russian President Vladimir Putin recently made exactly this important point in his long annual presentation to his concerned citizens:

> I heard: that there is nothing at all, in reality there is no epidemic. When you tell them that this is happening all over the world, they reply: "Right, country leaders have come into collusion." Do they have any idea of what is happening in the world, of the contradictions that are plaguing today's world, where all leaders allegedly upped and conspired with each other? It is absolute rubbish.

Particularly absurd has been the cast of primary villains among many of these agitated activists, who often focus upon Klaus Schwab of the World Economic Forum and Microsoft founder Bill Gates as the diabolical masterminds of our global calamity, with their plot identified as "the Great Reset." A couple of months ago I addressed some of these claims in one of my comments:

> I'll admit that the whole Great Reset/Agenda 2021/World Economic Forum stuff has always seemed like total crackpottery to me, so ridiculous that I never looked into it other than sometimes reading some of the articles or discussion on my own website. I also put all the "Bill Gates' diabolical plot to exterminate mankind" stuff in pretty much the same category.
>
> My very strong suspicion is that these sorts of (in my opinion)

implausible and ridiculous “conspiracy theories” are probably promoted to divert attention from the very real and strong evidence of Covid-19 having been an American biowarfare attack. After all, wouldn’t the CIA or whomever prefer that agitated activists on the Internet spend all their time ranting about some 83-year-old Swiss international banker named Klaus Schwab who holds annual public conferences in Davos rather than paying attention to all the numerous pieces of evidence I’ve accumulated implicating America’s national security apparatus in the gigantic global disaster?

In fact, didn’t that Cass Sunstein fellow years ago say that the using “cognitive infiltration” to promote ridiculous nonsense was the best means of defeating “conspiracy theorists” on the Internet? It worked pretty well for 9/11, so why not apply it to Covid-19 as well?

I’d be the first to admit that various groups and individuals are certainly taking advantage of the viral epidemic, notably getting the Federal Reserve to spend many trillions of dollars bailing out their businesses and loans, and massively boosting their stock prices. But after the 2008 Financial Meltdown, they used their political power to loot the American Treasury in exactly the same way and got a huge government bailout without the need for any disease outbreak. So I doubt they created Covid-19 for that purpose.

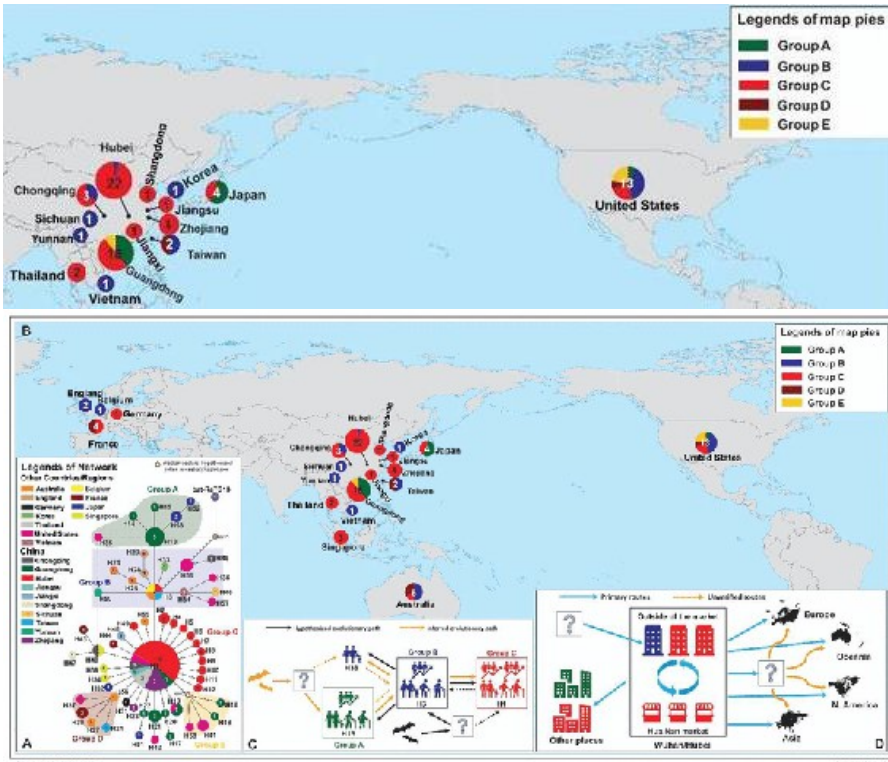
## The Unresolved Phylogenetic Analysis Puzzle

For reasons of completeness, I should also discuss one strange aspect of the global Covid epidemic that has been completely ignored by our Western media even while it has been heavily promoted by pro-China activists and outlets.

Like any RNA coronavirus, Covid has undergone a series of random mutations as it has spread around the world, and scientists have created an international database containing a large number of fully-sequenced Covid viruses from different geographical regions, allowing experts to trace the likely origins of particular outbreaks.

Beginning in March 2020, several different research teams of virologists and other scientists published academic papers attempting to use this genetic data to construct a complete ancestry-tree of the virus, using mathematical techniques to divide the virus into several

major clades or ancestral families. But the rather surprising findings seemed to reveal only a single uniform clade in Wuhan itself, while several different ancestral families were found in Guangdong, other countries in Asia and Europe, and especially in the United States. This was illustrated by the diagrams below, taken from one of these papers.



Such a result seemed quite counter-intuitive, since we would normally expect the greatest genetic diversity of the virus to be found at the site of its first appearance, and various pro-China writers quickly seized upon these findings to argue that Covid did not originate in Wuhan but instead had been brought there from the U.S., which possessed the greatest number of different Covid strains.

These journal articles were published at the early stages of the massive international propaganda-war between China and America over culpability for the global disaster, whose cost would total many trillions of dollars. Most of the papers were written by Chinese researchers at Chinese academic institutions, raising natural suspicions that the findings might be inaccurate or at least distorted. But one of the most prominent articles was authored by a British-German team and appeared in *PNAS*, the prestigious flagship journal of the our own National Academy of Science, and anyway all the results were

supposedly based upon objective analyses of a public genetic dataset. The following are links to two of the earliest papers as well as a much more recent one:

- Phylogenetic network analysis of SARS-CoV-2 genomes
  Peter Forster, Lucy Forster, Colin Renfrew, and Michael Forster • *PNAS* • April 28, 2020 • 2,100 Words
- Decoding the evolution and transmissions of the novel pneumonia coronavirus (SARS-CoV-2 / HCoV-19) using whole genomic data
  Wen-Bin Yu, Guang-Da Tang, Li Zhang, and Richard T. Corlett • *Zoological Research* • May 2020 • 7,300 Words
- Analysis of the Genomic Distance Between Bat Coronavirus RaTG13 and SARS-CoV-2 Reveals Multiple Origins of COVID-19
  Shaojun Pei and Stephen S.-T. Yau • *Acta Mathematica Scientia* • April 19, 2021 • 2,800 Word

As we have seen, analysis of stored wastewater and blood samples in the U.S., Europe, and other parts of the world have found no credible traces of Covid anywhere prior to the Wuhan outbreak, so the interpretation of these research findings by pro-China elements seems erroneous. But the international map of Covid clades remains puzzling.

Given the total absence of any discussion of these anomalies in the mainstream sources I consulted, I tried to read the articles for myself, but my complete lack of technical expertise left me adrift. The important *PNAS* paper had provoked three critical letters by other researchers that disputed the results, and the authors then rebutted these, while admitting that the implications of their findings had been misinterpreted by some writers. But I found it impossible to properly evaluate these conflicting claims.

With no informed discussion of the results anywhere to be found and being at a loss to properly interpret them, I contacted a knowledgeable individual and solicited his opinion. Although previously unaware of these scientific findings, he suggested that the small number of Covid mutations during the few months between the initial Wuhan outbreak and those which soon followed elsewhere in the world might render the ancestry-tree techniques invalid or misleading, perhaps explaining the discrepancy. But I would feel much more comfortable if this issue were thoroughly debated in public by disinterested scientists rather than having been entirely ignored by our media.

# Understanding the Most Important World Event in Three Generations

World War II ended more than 75 years ago, and across the last three generations there seems no single event that has impacted the world as much as the ongoing global Covid epidemic. The collapse of the USSR would be the only serious rival, but while that dramatic development greatly changed the lives of hundreds of millions of Soviet citizens and Eastern Europeans, most people elsewhere regarded it as no more than a story in the news. By contrast, the daily lives of many billions have already been drastically affected by Covid, while the fiscal and economic policies of major nations including our own have been transformed.

From the very beginning, many leading scientific experts believed that Covid was a product of human design, notably including virologist David Baltimore, a Nobel Laureate and former president of Caltech. But for various reasons our Western media establishment instead quickly constructed a Potemkin-like consensus that the virus was entirely natural and the global catastrophe a random, unforeseen event for which no one could be blamed. However, over the last couple of months, this propaganda-bubble has collapsed, and there is now increasing agreement that Covid was probably an artificial creation, engineered in some laboratory.

The same American-dominated propaganda organs that had spent more than twelve months mustering shreds of fact and logic to loudly proclaim that the virus was natural and ignoring all dissenting voices have now mustered other shreds of fact and logic to argue that it was created in China and leaked from a Wuhan lab, once again ignoring those who suggest otherwise.

But the flood of mainstream writers promoting this new consensus have built their narrative on a factual foundation that is gossamer-thin, and those spiderwebs of speculation were recently swept aside by the direct personal testimony of Danielle Anderson, a respected Western virologist who was working at the Wuhan lab during that period, and who described the likelihood that Covid was either created there or that any lab-leak had ever occurred as “exceedingly slim.”

From the first, there had been three plausible origins for the disease. Covid was either a natural virus, a Chinese virus, or an American virus. But although our media has wildly swung between the first and

second possibilities, the third has been entirely excluded from consideration, with those who suggest it completely ignored.

This information blackout even extended to major world governments. The remarkable speed with which the virus had jumped more than 3,000 miles from Wuhan to Qom and infected much of Iran's parliament and political leadership class led that country and its media to denounce the outbreak as a likely American biowarfare attack against its two leading international adversaries, China and Iran, with the former Iranian president lodging an official complaint with the United Nations. But virtually no Americans were ever informed of these grave public accusations by a nation of 80 million people.

A few weeks ago I summarized my own conclusions regarding the epidemic:

> Thus, we are left with the strong likelihood that Covid came from a laboratory along with a good possibility that it was designed as a bioweapon, yet we lack serious indications that any lab-leak occurred. So if the original Wuhan outbreak was due to the deployment of a powerful bioweapon but not one that had accidentally leaked from any lab, then surely China was the intended target, the victim rather than the perpetrator. Indeed, the PRC only avoided suffering devastation because it responded in such extremely prompt fashion and quickly imposed exceptionally strong public health controls. Some 700 million Chinese were confined to their homes for weeks, a lockdown probably more than a thousand times greater than anything previously seen in history.
>
> Given our ongoing military and geopolitical confrontation with China, America seems the likely source of the attack. However, once the virus eventually reached our own country, President Trump's completely lackadaisical response demonstrated that he himself had absolutely no idea that he was confronting the threat of a dangerous bioweapon, thereby proving his own personal innocence. The most likely suspects would be rogue elements of our national security establishment, probably some of the Deep State Neocons whom Trump had placed near the top of his administration.
>
> This small handful of high-level plotters would have then drawn upon the resources of the American national security apparatus to actually carry out the operation. The virus and its dispersal

devices might have been obtained from Ft. Detrick and CIA operatives or members of special forces would have been sent to Wuhan to release it. However, all these latter individuals would have believed that they were participating in a fully authorized covert military strike against America's primary geopolitical adversary. In effect, what happened was a *Dr. Strangelove*-type scenario, but brought to real life.

I have elsewhere provided summaries of the evidence favoring a biowarfare attack over a random lab-leak and also an outline of the hypothetical scenario:

- Evidence Favoring a Biowarfare Attack Over a Random Lab-Leak
- Outline of the Hypothetical Biowarfare Attack Scenario

During the fifteen months that I have advocated this same basic thesis, the most surprising reaction has been from the fierce critics of the Trump Administration, so numerous in elite circles.

During the last few years, Trump was regularly vilified in almost comic-book fashion, as a uniquely dangerous president who threatened our entire way of life, with such hysterical charges usually being based upon his crude public utterances or even his misspelled Tweets. Meanwhile, these same critics have entirely ignored the very real evidence that individuals he had placed in authority had carried out exceptionally reckless biowarfare attacks against China and Iran, with the unintended blowback consequences devastating our own society and killing many hundreds of thousands of our citizens. The ruling elites who fiercely attacked Trump dwelt upon his vulgar trivialities, which were magnified beyond all recognition, while steadfastly disregarding his enormities, thereby demonstrating astonishing levels of decadence and solipsism.

Future historians will surely mark this as a very telling episode in the likely twilight of the decaying American Empire.

# Waging Biological Warfare

***The Unz Review*** • August 9, 2021 • 7,500 Words

I came of age during the late Cold War Era, and while the possibility of nuclear war was regarded as horrifying, it was hardly unthinkable, being the subject of countless films and stories and with the rival U.S. and Soviet arsenals regularly compared in newspapers and magazines.

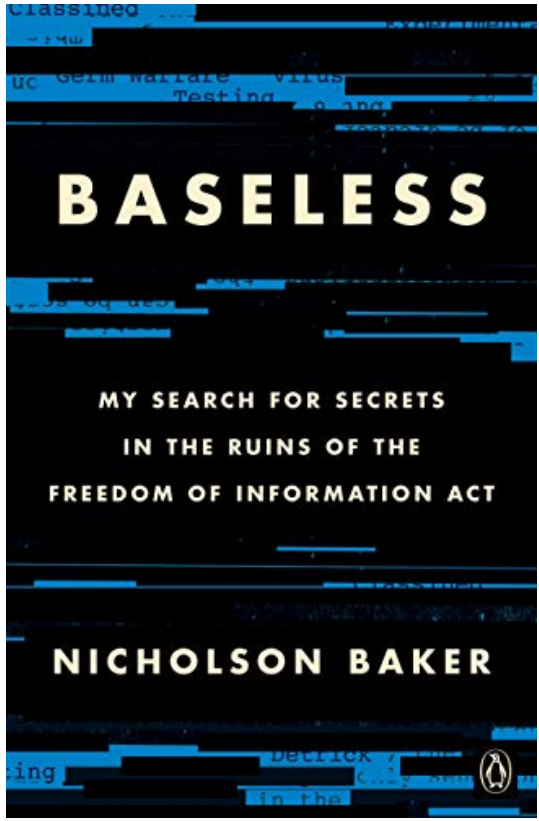
However, biological warfare did indeed seem unthinkable. Back in 1969, President Richard Nixon had ordered the destruction of our entire biowarfare arsenal and soon signed an international treaty with his Soviet counterparts to outlaw those horrifying weapons. The release of deadly, self-replicating biological organisms that respected no national borders obviously raised uniquely dangerous risks, and I easily understood why such weapons could never possibly be used in combat, especially by our own government.

Preconceived notions sometimes crack and crumble a bit before they finally collapse. For years I'd begun to see claims about the past use of biological weapons floating around the Internet, but the collapse only began in early January when I read a remarkable 12,000 word cover story in *New York* magazine. The author was Nicholson Baker, a prominent writer and liberal public intellectual, and he made a detailed and rather persuasive case that instead of being natural, the Covid virus devastating our country and the rest of the world was artificial, the product of some lab. As an intelligent layman rather than a scientist Baker's expertise on the topic came from the many years of research that he had undertaken for *Baseless*, his 2020 book documenting America's own extensive biological warfare program.

Nearly all of Baker's very long article concerned the Covid issue, but a few facts from that book were mentioned here and there, and these greatly surprised me. Apparently during the 1950s our biowarfare program had been assigned a priority and importance comparable to that of nuclear weapons development, and the project had also resulted in numerous accidents, many of them fatal, which was hardly something I'd ever seen mentioned in my introductory textbooks. So the actual history of the topic was apparently far more complex than I'd realized.

At the time, my focus was entirely on Covid matters and my analysis that our disastrous global epidemic was probably the result of an

American biowarfare attack against China (and Iran). But after producing a long series of articles on that topic, I decided to take a closer look at the history of American biowarfare programs, with Baker's own book being a natural starting point.



Baker opened his volume by explaining that in 2009 he had begun to wonder about certain disputed events from the Korean War, a conflict that ended in 1953, years before he was even born. At the time, the Communist world had loudly accused the Americans of engaging in illegal "germ warfare" and the Americans had hotly denied those charges. Although never fully resolved during the decades that followed, most mainstream historians seemed to have come down on the American side, but Baker wondered who had really been telling the truth.

His initial exploration of books and articles led him to available government documents, including those found at a couple of presidential libraries and the National Archives, and he also interviewed some of the knowledgeable individuals and researchers. But none of the material he found seemed conclusive, so in 2012 he began using the provisions of the Freedom of Information Act (FOIA)

in hopes of obtaining some restricted documents that might finally resolve the matter.

He continued filing such FOIA requests for seven more years, and the nature of that landmark 1966 law, now seemingly honored as much in the breech as the observance, is a central theme of his book, almost as important as the particular historical question that originally prompted his effort, leading him to subtitle his volume "My Search for Secrets in the Ruins of the Freedom of Information Act." Such criticism seems warranted given that the original statute required that agencies should respond with their documents within twenty working days, and if another agency needed to be consulted, they should do so "with all practicable speed." But in reality, years of delay are not uncommon, with one outstanding FOIA request now more than a quarter-century old. Furthermore, such documents when finally released are sometimes rendered almost unintelligible by the whited-out redactions of words, sentences, paragraphs, or multiple pages.

The alleged legal justification for holding back or heavily mutilating such documents is that their release would endanger our current national security, but we must ask ourselves how plausible this really seems. The events of interest to Baker took place during a war that ended almost seventy years ago, fought against a global Communist coalition that no longer exists, and it hardly seems likely that any of the operational plans or technologies from that era would have much relevance today, while surely even the grandchildren of the individuals mentioned are now quite elderly if they are even still alive.

After the fall of the USSR, the old Soviet archives were generally thrown open to the world, allowing Western historians to discover many important facts and resolve various longstanding controversies such as the Katyn Forest Massacre, but over the last couple of decades they have mostly been closed back up again. Can anyone seriously argue that keeping secret the minutes of Stalin's old Politburo meetings is vital for protecting current Russian national security rather than merely preventing Russian national embarrassment? And the same must surely be true with regard to almost all our own secret documents from the early 1950s.

At one point in his quest, Baker described sitting in a reading room of the National Archives building knowing that just on the other side of a thin wall were the 21 unavailable documents that would conclusively resolve his long investigation one way or the other. Instead, he was forced to make due with what he had been able to obtain, massive

redactions and all.

By 2019 Baker had spent more than a decade on his project, punctuated by writing several unrelated but successful books and novels, and having reached his mid-sixties, he felt sure that the patient government bureaucrats would successfully outlast him. He had accumulated thousands of pages of notes and many boxes of reports and other materials, as well as a great deal of important personal knowledge that would not survive him, so he finally decided to write a book telling others what he had learned and allowing them to use the information for themselves.

Lacking access to the documents he had spent so many years fruitlessly seeking, he abandoned any effort to produce a polished chronological narrative. The author is best known as a novelist, so rather than writing in a dryly academic style, he instead chose to produce several months' worth of long diary-style entries, mostly discussing and analyzing the contents and implications of the various documents he had uncovered, but leavening his account by including brief descriptions of his personal life and activities. Although his style was unassuming and informal, the main text itself, running less than 150,000 words, was backed by more than fifty pages of detailed source notes. The credibility of his material is indicated by the glowing cover-blurbs from noted writers who had covered related subjects.

Given that the crucial secret documents still remain secret, Baker's analysis is necessarily based upon circumstantial evidence, including the unredacted portions of those documents that had been released, and he fully admits this difficulty, providing all his facts and conclusions in plain sight and drawing likelihoods and plausible inferences rather than expounding certitudes. Overall, I found him a very judicious analyst, and believe he made a strong even overwhelming case that America did indeed engage in biological warfare during the early stages of the Korean conflict, much as our Communist adversaries had charged at the time. The separate elements of this historical puzzle fit together to produce a reasonably persuasive whole.

First, over the decades it has been thoroughly documented that America did have a very substantial biowarfare program based at Ft. Detrick, originally established during World War II and then continuing into the postwar era, heavily augmented by the absorption

of Japan's own very extensive biowarfare resources after the close of hostilities. The Japanese had developed the feather as an ideal means of widely disseminating all sorts of deadly biological agents from the air, and our own military researchers soon built and tested a variety of "feather bombs" for that purpose, generally using the same physical containers that had been developed to distribute propaganda leaflets from planes.

In late 1950 American forces suffered a series of disastrous defeats in Korea at the hands of Chinese troops, and the report from a Pentagon committee in early December emphasized the importance of accelerating the development of bioweapons such as Q Fever, plague, and anthrax together with the necessary delivery mechanisms for covert use, while especially praising the CIA for its effectiveness in that regard. This secret report was eventually declassified by a FOIA request in 1996.

Around the same time that report was being written, a British sergeant retreating through a deserted North Korean village before advancing Chinese troops observed American military personnel, masked and gloved, carefully removing large quantities of feathers from special containers and flinging them into the empty houses before he was warned away by American MPs. He later stated that he had obviously witnessed "a clandestine operation" of some sort and mentioned that a few days afterward he was required to take an unspecified vaccine. This curious vignette appears in *Unit 731*, a 1989 historical account of Japan's biowarfare program written by two BBC journalists, but oddly enough the incident was removed from the American edition of that same book.

Months later, the North Korean foreign minister issued a formal complaint to the United Nations that America had used illegal biological warfare, attacking his own troops and those of China with smallpox. These mysterious outbreaks had occurred a few months earlier, but only in areas recently occupied by retreating American forces. The accusations briefly appeared in the Western media, but were ridiculed and hotly denied by American government spokesmen.

Around the same time that Communist troops were sickening and dying, around two hundred American soldiers in the same theater had also been suddenly stricken by a mysterious outbreak of Songo fever, never before seen in Korea but with symptoms quite similar to smallpox and a specialty of America's Japanese biowarfare mentors. Strict censorship prevented these stories from reaching the American media until many months later, at which point our government

claimed that the illnesses had been spread by Chinese troops. But the disease seemed entirely absent from the hundreds of miles of Korean territory the enemy forces had traversed, and only appeared in a narrow belt along the front lines, with our stricken servicemen believing that they seemed to be spread by infected field mice or voles. Voles had long been regarded by American researchers as an excellent vector for their bioweapons, and when interviewed years later for a history of the Korean War, one of the leaders of our local CIA efforts explained that his covert operations had created a defensive belt along the front lines.

The diarist format used by Baker scatters these closely-connected facts across nearly 200 pages. So although I think any reader of Baker's entire book will find his thesis quite convincing, any few pages read in isolation provide only a small portion of the crucial story, lacking the necessary juxtaposition to make the strongest case.

Although this round of events in 1951 and the accompanying Communist accusations received some world media coverage, a far greater volume of controversy came the following year, when Communist media organs issued widespread charges that America had begun a much larger round of biowarfare, claiming that American planes were dropping all sorts of diseased insects and voles in Korea and even parts of nearby China, once again trying to unleash an epidemic. Sensing the opportunity for a major propaganda coup, the Chinese organized an independent international fact-finding commission to investigate their accusations and interview local witnesses, managing to enlist as its head Dr. Joseph Needham, one of Britain's most celebrated scientists and China experts, and the 665 page report eventually published claimed to have confirmed the Chinese case. An especially important element were the public confessions of numerous captured American pilots who admitted that they had taken part in such illegal germ warfare attacks.

SCIENTIST WHO UNLOCKED THE
MYSTERIES OF THE MIDDLE KINGDOM

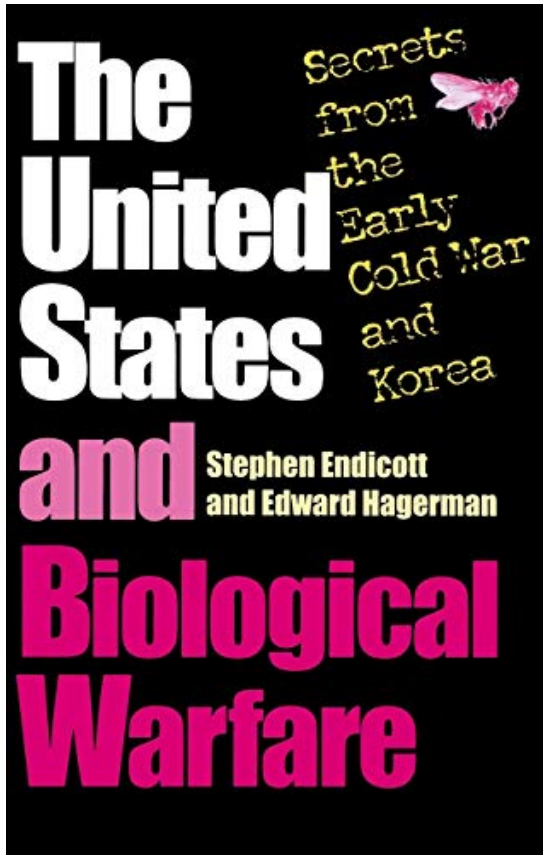
However, these new accusations were once again blasted as a hoax by the much more powerful Western media, and after repatriation, the captured Americans claimed their statements had been coerced. Many later historians have come to the same conclusion, especially after 1998 when previously secret documents of the Soviet KGB archives revealed that they had created fake areas of disease exposure for propaganda purposes. As an example of this historical consensus, Simon Winchester's widely-praised 2008 biography of Needham devoted almost 20 pages to this episode, which nearly wrecked his subject's career, and firmly concluded that that the Communist charges were fallacious.

Baker, however, suggests a more nuanced reconstruction. The notion that American planes were dropping insects and rodents from the sky seems quite an extraordinary claim, less likely to be the sort of plausible-sounding story fabricated for a war propaganda plan, especially given the very large number of seemingly-credible eyewitnesses later interviewed by Needham and other investigators, and the author wonders whether thousands of individuals could have been enlisted into such a long-standing hoax. Moreover, in 2007 the

CIA finally declassified and made available on its website a large cache of secret American documents, and these included numerous communication intercepts of Chinese and North Korean commanders reporting these events and urgently requesting vaccines or DDT to protect their troops from the expected disease outbreaks. So although the evidence for such actual epidemics seems minimal and possibly fabricated, the Communist forces certainly believed that they were under biological attack, suggesting that something very odd was happening.

Baker notes that psychological warfare was a central element of CIA operations, and memos from that period indicate that all sorts of possible strategies were being explored to demoralize enemy troops, including the unusual idea of using planes to spread "fake radioactive dust" and convince the Communist forces that they were in deadly peril. Absent a public and self-defeating American announcement, it is difficult to imagine that any such dust would have even been noticed let alone regarded as dangerous, but dropping large numbers of mysterious insects and rodents might have immediately persuaded the enemy they were suffering another round of American biological attacks, with the American pilots involved assuming the same thing, and Baker believes this best fits the limited available evidence. To a considerable extent, this resembles another bizarre but solidly documented action called Operation Red Frog, in which the CIA caught a hundred Korean frogs, painted them red, then had them dropped from planes to unnerve the opposing military forces.

Moreover, top Pentagon officials believed that full-scale war against the Soviets and the Chinese might break out at any moment, and this operation allowed them to test their biological delivery systems, which would have become a crucial element of their military strategy in such a conflict. So Baker believes that a small-scale covert biological warfare operation beginning in late 1950 afterward became confused and conflated with a large-scale psychological warfare operation in 1952, leading many later historians to discount the reality of the former.



The United States and Biological Warfare
Secrets from the Early Cold War and Korea
Stephen Endicott and Edward Hagerman

Aside from the numerous FOIA documents that he had personally obtained, one of Baker's most important sources was a short 1998 volume by Canadian historians Stephen Endicott and Edward Hagerman aptly entitled *The United States and Biological Warfare*. He became personally friendly with the authors, whom he interviewed early in his project, and was later given twenty boxes of their accumulated research materials.

Published by a small American university press, the Endicott/ Hagerman volume contains an enormous wealth of very detailed factual material, and was glowingly praised by Prof. Richard Falk of Princeton, an eminent scholar of international law, as well as mainstream historian Stephen Ambrose, who had built his career upon Eisenhower hagiography. But the text is written in a very dry and dull manner, so I found the Baker book, despite its lack of a chronological sequence, much more useful, although it was obviously built upon the research foundation provided by that earlier work.

The authors differ with Baker by firmly believing that the aerial drops of 1952 were also biological attacks, but their evidence seems

overwhelmingly circumstantial and most of it could easily be explained within Baker's framework.

One crucial point they properly emphasize is the terrible scale of the American defeat at the hands of the intervening Chinese ground forces during late 1950. They quote from *Disaster in Korea*, the definitive military account of that conflict by Lt. Col. Roy E. Appleman, who characterizes the situation in extreme terms: "…a series of disasters unequaled in our country's history…a massive retreat, without parallel in U.S. military history." As a consequence, both President Truman and the Joint Chiefs of Staff agreed that atomic bombs should be used if necessary to avert total defeat. Under such circumstances, is it really plausible that our forces would have balked at the use of biological warfare, especially in a very limited capacity and deployed in a plausibly-deniable manner?

Unless and until our remaining secret documents from seven decades ago are finally made available, Baker's reconstruction strikes me as the most balanced and consistent with the somewhat contradictory evidence, and Winchester apparently agrees, seeming to reverse the conclusions of his Needham biography of a dozen years earlier by providing a long and glowing blurb for Baker's book.

Preparation for the full use of offensive biowarfare against large enemy population centers obviously requires extensive field testing, and these efforts sometimes provoked great controversy when they eventually came to light. During September 1950, a mysterious fog with a strange odor enveloped the city of San Francisco for several days, and only decades later was this discovered to have been caused by a major biowarfare field test, as an offshore minesweeper blew a huge cloud of bacterial spores intended as a stand-in for anthrax towards the city. Although the spores were purportedly harmless, they actually produced a number of serious infections among the local residents, including at least one death. In 1975, the *New York Times* revealed that a decade earlier the CIA had filled New York City's subways with "a harmless simulant of a disease-carrying gas" provoking further outrage.

There also seems reasonable evidence that far more permanent mistakes sometimes occurred. Lyme disease, transmitted by ticks, can produce itches, rashes, and sometimes more serious ailments and annually infects some 300,000 Americans and countless pets, plaguing the inhabitants of New England and much of the coastal North East. It

was first diagnosed in 1975, a suspiciously recent date for the sudden appearance of an entirely natural disease, and based upon *Lab 257*, a heavily-researched 2005 book by Michael Carroll, Baker argues it was probably an inadvertent consequence of our biowarfare experiments. Apparently, nearby Plum Island had long been the center of CIA- and Army-funded research into tick-borne livestock diseases, and these could have accidentally infected local deer or birds, which then crossed the bay to Lyme, Connecticut, producing the endemic infestation.

Although hardly as controversial as those aimed at humans, such biological weapons targeting food supply had also constituted an important element of America's military plans from the earliest stages, though they seem to have almost entirely disappeared from the historical record.

By early 1945, Ft. Detrick researchers had developed and tested a variety of weapons aimed at destroying Japan's rice harvest, producing bombs to deliver mold, fungus, or bacteria for that purpose, while other military experts argued that spraying fuel oil would be the most effective means of destroying rice seedlings. Combined with America's complete blockade of Japan's home islands and the destruction of her fishing fleet, the strategy was intended to reduce the overcrowded Japanese population to total starvation.

Although the key documents regarding any actual implementation of these war plans remain classified or so heavily redacted as to be unreadable, we do know that the Joint Chiefs of Staff at some point officially authorized the full use of "plant BW[Biowarfare]." Baker notes that Japan's rice crop failed in 1945, producing the worst harvest since 1909, when the population had been one-third smaller, and Japan only survived because Gen. MacArthur's occupation government imported huge quantities of food. After the close of hostilities, leading biowarfare figures intervened with the media to suppress or downplay any stories of the methods that had been used to destroy Japanese agriculture.

Given such apparent success against Japan, it was hardly surprising that such anti-crop techniques soon became an important component of our Cold War strategy, though the consequences may have sometimes been counter-productive.

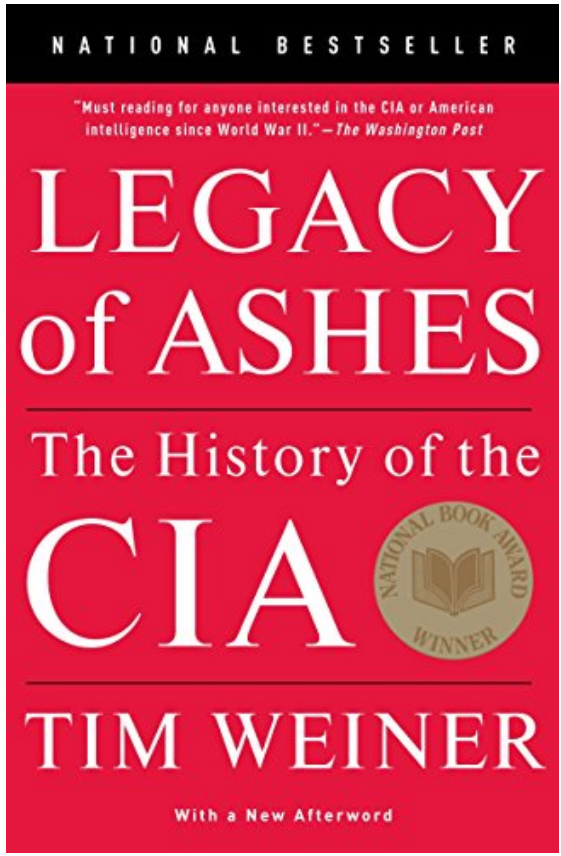
Wheat was as important to the Soviet food supply as rice had been to Japan's, and our biowarfare experts investigated parasitic "wheat stem rust," which they believed might be effective at destroying Soviet

agriculture. By 1949 they had developed powerful anti-wheat strains, and the project was put into full production. A huge stockpile of spores was required in order to be able to deal a crushing blow to the USSR food supply, far more than could be produced in the enclosed Ft. Detrick greenhouses that had been used for testing purposes, so our experts began cultivating the fungal parasite on large sections of open acreage.

The spores were extremely light, could be lofted up to 10,000 feet into the air by winds, and a single pustule might produce 350,000 new spores. Although our biowarriors surely tried to be careful, mistakes do sometimes happen, and while no attack upon Soviet agriculture ever took place, beginning in 1950 our own wheat crop was devastated by five years of mysterious wheat rust epidemics, which eventually encompassed twelve states and by 1954 had destroyed a quarter of our bread wheat and three-quarters of our pasta wheat. This timing may have been purely coincidental, but Baker notes that a declassified Air Force report reveals that the main spore cultivation efforts had occurred in generally the same states which then became the epicenters of the spreading blight.

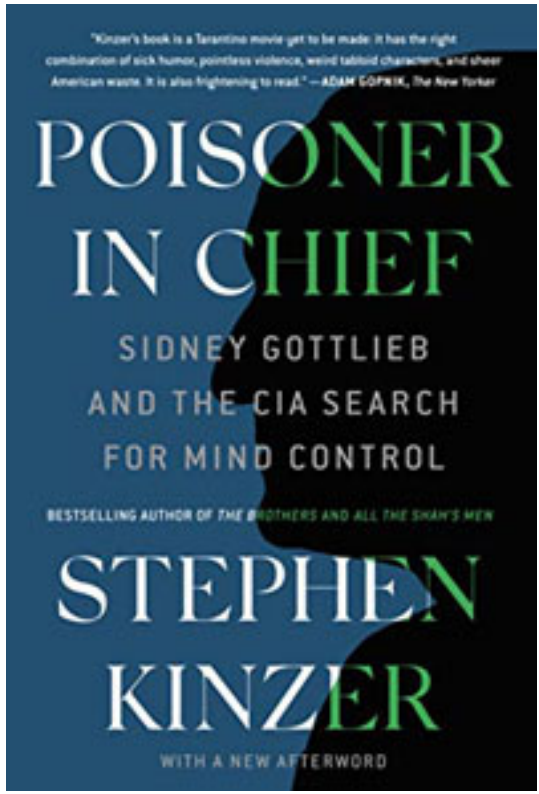
Sometimes such mistakes must be repeated before they are fully admitted. By the early 1960s, Ft. Detrick researchers were once again cultivating wheat rust in several acres of an experimental crop-station in Kansas, and their reports boasted of their success in reducing crop yields by 70%. This effort continued until 1965 when a huge wheat rust epidemic severely damaged the farmlands of much of Kansas and Nebraska, after which the project was halted.

Other anti-food projects were aimed at livestock, and Baker strongly suspects that hog cholera was used against East Germany's swine herds, with the epidemic beginning soon after the CIA-abetted Berlin riots of 1953 and forcing the destruction of many tens of thousands of pigs. Such methods became part of the CIA's standard toolkit, and according to *Newsday* their operatives in 1971 successfully infected Cuba's herds with the African swine flu virus, forcing the slaughter of 500,000 pigs and completely eliminating the availability of pork, a staple of the Cuban diet, although similar efforts to destroy Cuba's poultry industry failed. These historical events seem eerily reminiscent of the mysterious viral epidemics that began devastating China's poultry and pork industries in 2018 and 2019, soon after the Trump Administration had brought on board one of America's leading biowarfare advocates.



NATIONAL BESTSELLER
"Must reading for anyone interested in the CIA or American intelligence since World War II." — The Washington Post
LEGACY of ASHES
The History of the CIA
NATIONAL BOOK AWARD WINNER
TIM WEINER
With a New Afterword

Although most of these historical facts have been known to academic specialists for decades, or could be discovered by those who actively searched them out, they have been much less likely to appear in more general works. For example, one of the glowing blurbs provided to Baker's book is by Pulitzer Prize winner Tim Weiner, who had spent decades covering intelligence issues at the *New York Times* and elsewhere. His 2007 work *Legacy of Ashes* runs 700 pages, and is considered an authoritative history of the CIA, but when I read it a year or two ago, I saw virtually no mention anywhere of biological weapons let alone their actual use, and rechecking the index just now confirmed my recollection.



"Kinzer's book is a Tarantino movie yet to be made: it has the right combination of sick humor, pointless violence, weird tabloid characters, and sheer American waste. It is also frightening to read." —ADAM GOPNIK, The New Yorker
POISONER IN CHIEF
SIDNEY GOTTLIEB AND THE CIA SEARCH FOR MIND CONTROL
BESTSELLING AUTHOR OF THE BROTHERS AND ALL THE SHAH'S MEN
STEPHEN KINZER
WITH A NEW AFTERWORD

However, this climate of media avoidance has recently begun changing. Another strong endorsement of Baker's book came from Stephen Kinzer, who just a year earlier had published *Poisoner in Chief*, primarily focused upon the notorious MK-ULTRA mind-control projects of Dr. Sidney Gottlieb, the CIA researcher described in the title. Kinzer's book attracted glowing accolades from Pulitzer Prize winners Seymour Hersh and Kai Bird, both writers with great experience on intelligence matters, and received quite favorable reviews in the elite mainstream media.

At first glance, mind-control and biological warfare might seem entirely dissimilar topics, but they actually share considerable areas of overlap. Both required the creation and use of dangerous biological or biochemical agents, which for maximal effectiveness must then be tested upon unwilling human subjects, often in dangerous or lethal ways. Since in this regard they obviously operate outside the boundaries of normal legality, especially in peacetime, their use must be kept entirely secret, naturally matching them with the proclivities of an intelligence agency such as the CIA. Throughout his book Kinzer emphasized the considerable overlapping personnel and resources between these two domains. Indeed, as the CIA's "chief poisoner,"

Gottlieb developed a wide range of deadly biological compounds which he deployed in a number of mostly unsuccessful attempts to assassinate foreign leaders such as Prime Ministers Zhou Enlai of China and Patrice Lumumba of the Congo, as well as Cuba's Fidel Castro.

But Gottlieb's great personal quest was to create an effective system of mind-control, the use of chemical compounds or physical techniques to gain mental control over an unwilling subject, which he persuaded CIA leaders represented the Holy Grail of their espionage efforts.

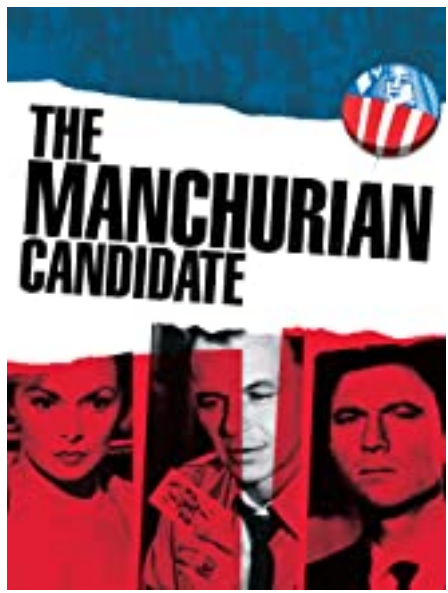
There is an additional and rather ironic connection between the Ft. Detrick biowarfare programs and the unsuccessful CIA efforts at mind-control. As discussed above, there seems to be overwhelming evidence that the severe military setbacks of the early Korean War had prompted America to surreptitiously employ biological warfare, though the military impact was hardly enormous. Then in 1952, a much larger aerial effort dropped insects, rodents, and other obvious potential disease carriers on Communist-held territory, including parts of China. Baker believes that these later attacks were mostly elements of psychological warfare, with no effort made to infect the potential carriers with diseases, but obviously both the enemy governments and the pilots involved would have assumed that actual biological attacks were once again taking place. So when some of the American pilots were shot down and captured, they confessed to these apparent germ-warfare attacks, signing statements and admitting the facts to foreign visitors, thereby serving as the centerpiece of a major Communist propaganda campaign.

Since such actions would have been considered war-crimes, their widespread recognition might have produced a huge public relations disaster for America, and they were heatedly denied in the strongest possible terms as ridiculous Communist propaganda, with these determined public efforts to suppress the facts largely succeeding within the Western bloc.

Upon their return, these captured flyers were threatened with court-martials, causing them to repudiate their statements as having been made under duress. But the records show that any such coercion was almost entirely psychological, with virtually no claims of harsh physical treatment or torture.

This naturally raised the problem of explaining away the detailed and seemingly credible public statements of those captured American officers and why they had confessed to supposedly non-existent war

crimes. The response was the creation of a widespread myth that the Chinese Communists had pioneered "brainwashing" as a powerful technique of mind-control. This suggested that our Cold War adversaries had made a major breakthrough in a potentially important military technology, and prompted CIA efforts to match their techniques and close the "brainwashing-gap."

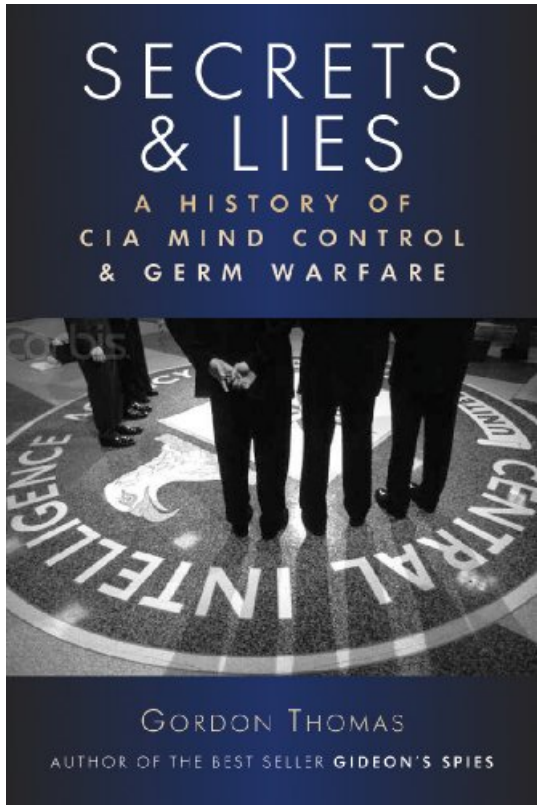


These ideas also soon entered the popular culture, with the classic example being *The Manchurian Candidat*e, a 1959 bestseller that became an even more influential 1962 film. The fictional work tells the story of a captured American soldier transformed by Chinese brainwashing into a programmed assassin used to remove any human obstacles to a Communist seizure of our political system, and for decades afterward brainwashing remained a staple of fictional suspense plots. Yet Kinzer notes that right around the time the film appeared, the CIA finally abandoned the project as a failure despite the heavy resources expended, hardly surprising since the underlying premise had been entirely fallacious.

One major element of these failed CIA efforts had been the widespread use of LSD and other hallucinogenic drugs, often tested upon unwitting civilian subjects, and the use of these drugs eventually leaked out into our wider society, with serious negative consequences. So to some extent, our official refusal to acknowledge that we had illegally waged biological warfare in the early 1950s may have indirectly helped promote the creation of the drug culture that so greatly transformed our society by the late 1960s.

Although Gottlieb's mind-control efforts had gone into high gear in the aftermath of the Korean War, they had actually begun during the early stages of that conflict, as Kinzer quotes in this grisly excerpt:

> "In 1951 a team of CIA scientists led by Dr. Gottlieb flew to Tokyo," according to one study. "Four Japanese suspected of working for the Russians were secretly brought to a location where the CIA doctors injected them with a variety of depressents and stimulants…Under relentless questioning, they confessed to working for the Russians. They were taken out into Tokyo Bay, shot and dumped overboard. The CIA team flew to Seoul in South Korea and repeated the experiment on twenty-five North Korean prisoners-of-war. They were asked to denounce Communism. They refused and were executed…In 1952 Dulles brought Dr. Gottlieb and his team to post-war Munich in southern Germany. They set up a base in a safe house…Throughout the winter of 1952-3 scores of 'expendables' were brought to the safe house. They were given massive amounts of drugs, some of which Frank Olson had prepared back at Detrick, to see if their minds could be altered. Others were given electro-convulsive shocks. Each experiment failed. The 'expendables' were killed and their bodies burned."



This remarkable passage came from one of Kinzer's major sources, *Secrets and Lies* by Thomas Gordon, which was published by a small American press in 2007 and bore the provocative subtitle "A History of CIA Mind Control and Germ Warfare." Intrigued by this material, I decided to order a copy for myself, which proved a less trivial undertaking than I had assumed.

At one point in Baker's account, he related the anecdote that when one of the earliest books revealing CIA activities appeared in 1964, representatives of the agency threatened to buy up all the copies and thereby remove it from circulation. This plan was immediately frustrated when the editor at Random House said he would simply order another print run, but such a strategy would obviously be much more effective if directed against books produced by small presses and that were no longer being printed. When I checked Amazon for the Thomas book, the cheapest hard copy available was listed at over $500, a price I had never previously encountered for a mainstream hardcover less than 15 years old and the only copy listed at AbeBooks.com turned out to be missing, but fortunately I was able to locate a more reasonably priced copy elsewhere.

The extreme rarity of that particular book is certainly quite different from the dozens of others in Thomas's huge oeuvre, which accumulated an astonishing 45 million in total sales. Although produced by an extremely successful author and BBC broadcaster on historical and intelligence matters, this volume lacks any source notes and is also replete with the sort of detailed private conversations likely to have been invented by Thomas, who probably hoped the work would be made into a film, as had been the case with seven of his previous books. These factors naturally gave me some pause compared with the carefully-documented Baker, Endicott/Hagerman, and Kinzer volumes.

However, Thomas claims that much of his information came from CDs containing 22,000 secret CIA documents that a whistleblower had sent him in 2001, and he republishes some of these in his book, while his material has been treated as fully authentic by later writers such as Kinzer. The author also drew heavily upon extensive personal interviews, with his most important source being William Buckley, a thirty-year CIA veteran at the heart of the events, who had been close to both Allen Dulles and William Casey, two leading directors of the agency. So on balance, I regarded Thomas's material as uniquely valuable and reasonably credible, though perhaps not quite as solid as the explicitly document-based works by Baker and Kinzer.

Thomas's material strongly supports Baker's account of American biowarfare attacks during the Korean War, and he even expands the story in important ways. For example, he suggests that during 1951 Gottlieb and our other biowarfare experts may have tested their lab-cultured diseases upon 20,000 North Korean POWs, of whom nearly 1,800 died, with the full CIA records of this damaging incident possibly having been destroyed during 1972-1973. According to Thomas, Buckley also investigated the records of the confessions of our captured pilots, and noted that their detailed descriptions so perfectly matched our actual biowarfare technologies as to seem very persuasive.

And if Thomas and his personal sources can be credited, his account may resolve one of the most puzzling and notorious incidents of the 1950s, widely discussed in other works.

In 1953 one of our leading biowarfare experts, Dr. Frank Olson, began behaving very oddly and after being taken to New York City for treatment by a psychiatrist was found dead on the pavement beneath the broken windows of his fifth floor hotel room, with the official verdict being suicide due to sudden mental illness. Decades later it

came out that he had secretly been given a heavy dose of LSD as part of the CIA's mind-control research project, and the incident was regarded as a notorious example of the potentially deadly effects of that hallucinogenic drug, which had been introduced into our society and tested upon unsuspecting Americans by CIA researchers. As compensation, the Olson family received a large financial settlement. But according to Thomas, the truth may have actually been far darker than even this story.

The development of deadly toxins and other biological weapons obviously requires considerable human testing to be effective, and during World War II Japan's extremely large biowarfare program apparently consumed thousands of human subjects—euphemistically labeled "logs" in their reports—mostly hapless Chinese but also including some American and other Western POWs. The claims that similar lethal human experiments had been performed upon the inmates of some Nazi concentration camps figured quite prominently at the Nuremberg Tribunals. But practical needs transcend ideologies, and America's own growing biowarfare program of the postwar years seems to have adopted entirely similar methods of testing, much of it taking place at a large secluded compound in the Black Forest region of occupied Germany, with the victims—various suspicious characters or other such "expendables"—afterwards eliminated if they somehow managed to survive the weapon tests themselves.

In 1953 Olson took his first trip to that field establishment and apparently was deeply horrified at personally witnessing the actual use of the deadly technologies he had spent the last dozen years developing in his laboratory. Returning home via Britain, his distraught state was apparent to one of his British biowarfare colleagues, who reported the facts to his superiors and the information was immediately passed along to their opposite numbers in America. It appears that Gottlieb, the head of the American program, became fearful that Olson might eventually reveal the sordid facts to the media, so he arranged to have him quickly killed, first administering a massive dose of LSD to produce the sudden behavioral changes that would support a verdict of suicide.

Apparently CIA Director Allen Dulles was very suspicious of the official suicide story, telling his close aide Buckley that Olson had seemed almost the last person in the world to commit suicide, and he tasked that officer with getting to the bottom of what had really happened. Buckley believed he had done so, even determining the identity of the assassin employed, and decades later the exhumation and autopsy of Olson's corpse seemed to strongly support that

reconstruction, so that a New York public prosecutor was preparing a homicide indictment of Gottlieb in 1999 shortly before the latter's death. But the sordid incident was completely hushed up at the time, and after the fall of Communism, the files of the KGB and the East German Stasi revealed that they used the example of Olson's demise as a case study of "the perfect murder by suicide."

Kinzer seems to support this same reconstruction, though lacking access to Thomas's documents or the benefit of his personal interviews with Buckley, he is much more circumspect in his conclusion.

Reading these books also helped to fully resolve an additional biowarfare question that had remained in the back of my mind for the last couple of years.

David Irving quite possibly ranks as Britain's most internationally successful historian of the last one hundred years, and some of his archival research produced remarkable revelations. As I wrote in 2018:

> Along with the laws prohibiting the bombing of cities, all nations had similarly agreed to ban the first use of poison gas, while stockpiling quantities for necessary retaliation. Since Germany was the world-leader in chemistry, the Nazis had produced the most lethal forms of new nerve gases, such as Tabun and Sarin, whose use might have easily resulted in major military victories on both the Eastern and Western fronts, but Hitler had scrupulously obeyed the international protocols that his nation had signed. However, late in the war during 1944 the relentless Allied bombardment of German cities led to the devastating retaliatory attacks of the V-1 flying bombs against London, and an outraged Churchill became adamant that German cities should be attacked with poison gas in counter-retaliation. If Churchill had gotten his way, many millions of British might soon have perished from German nerve gas counter-strikes. Around the same time, Churchill was also blocked in his proposal to bombard Germany with hundreds of thousands of deadly anthrax bombs, an operation that might have rendered much of Central and Western Europe uninhabitable for generations.

According to Irving, only the stubborn resistance of Churchill's appalled military and political subordinates prevented the drunken wartime leader from carrying out his plan to to annihilate the heart of

Europe with biological warfare. The great historian gives the details in one of his riveting public lectures, once easily available on YouTube, but now confined to Bitchute:

Under normal circumstances, I would consider such astonishing claims almost impossible to believe. However, during the notorious 2000 libel trial that wrecked Irving's career and bankrupted him, his Jewish tormenters drew upon their almost unlimited funding to hire an army of researchers who spent a year or more subjecting Irving's vast corpus of writings to line-by-line and footnote-by-footnote scrutiny, a degree of hostile fact-checking surely unprecedented in the annals of historiography. And since they never challenged any of these striking statements, I felt confident in accepting that the claims were correct. But I was still gratified to see these facts seemingly confirmed by the Kinzer, Endicott/Hagerman, and Thomas books, which each reported Churchill's urgent 1944 order for the mass-production of anthrax bombs by his domestic industry and also his successful demand that the Americans ship him another 500,000 from our own stockpile.

One of the odd aspects of America's informational landscape is that so many of the most controversial historical facts seem to be hidden in very plain sight. Both Nicholson Baker and Stephen Kinzer are fully mainstream and well-regarded authors, with their books heavily praised by prominent reviewers and easily available for purchase on Amazon.com, and the same is true for the much earlier history by Stephen Endicott and Edward Hagerman. The volume by Gordon Thomas is somewhat more difficult to obtain in hard copy, but the Kindle version is priced at just $9.99, and his other books had racked

up many tens of millions in sales while being made into seven films. No one could possibly describe these writers as marginalized figures, purged for their controversial historical claims. And the stories they told of America's extensive use of biological warfare and the lethal experiments conducted upon large numbers of human victims seem quite explosive. We are obviously not living in a totalitarian state that imposes a wall of secrecy upon these sordid facts. Anyone can click a button on Amazon and begin reading the material a day or two later, or buy the Kindle version and open the book within seconds.

Yet sales of such books have probably been limited to the thousands or low tens of thousands of copies, and none of this history is promoted in the mainstream media or incorporated into our standard textbooks, which would allow it to reach many millions of readers. Most importantly, it is entirely ignored by our electronic media, which is the primary source of information for the vast majority of our population. As a consequence, I had been completely ignorant of this material, and when I contacted several knowledgeable and well-read individuals, some of whom are primarily focused upon national security issues, the same was true for them as well. Merely by failing to sufficiently emphasize certain facts, the media is hiding them almost as effectively as if they had been declared official state secrets.

One might easily argue that although quite distasteful these past events had little effect upon the world and are merely details of history, unimportant to our present-day lives. Our biowarfare attacks during the Korean War killed or injured merely the tiniest sliver of the casualties that were inflicted by our massive strategic bombing campaign or the rest of the conventional fighting on the ground. And except for Midwestern farmers whose wheat crops were devastated during the early 1950s or Northeasterners who still suffer the pangs of Lyme disease, the number of Americans impacted by these policies or their unintentional blowback, has been absolutely negligible.

But biological weapons do create enormous potential dangers, as President Nixon had emphasized when he decided to ban them, and playing Russian Roulette may seem absolutely safe until one time when it suddenly isn't.

Consider the reality of today's global Covid epidemic. Although still just partway through its second year, the outbreak has already killed perhaps 14 million people worldwide, and together with the efforts at control has heavily affected the lives of nearly all the world's eight billion people, touching every continent and city. Many hundreds of thousands of Americans have been among the dead, and our own

society has been enormously disrupted. By any reasonable measure, the Covid outbreak has already had an impact upon the world many times greater than that of the 9/11 attacks and the two decades of major wars and population displacements that followed, certainly making it one of the three or four most momentous events of the last one hundred years.

From April 2020 onward I have been presenting the strong perhaps even overwhelming evidence that the disease outbreak was unleashed by an exceptionally reckless American biowarfare attack against China (and Iran). The numerous articles in my series have now been viewed more than 350,000 times, a total perhaps as much as an order-of-magnitude greater than the combined sales of the various major books discussed in this article. Yet for exactly the same reasons—the studious avoidance of the mainstream and electronic media—only the tiniest fraction of those impacted by these disastrous events have become aware of the likely cause of their plight.

Perhaps if the unfortunate historical facts of America's past decades of biowarfare development and use had become better known over the last couple of generations, our current calamity might have been avoided.

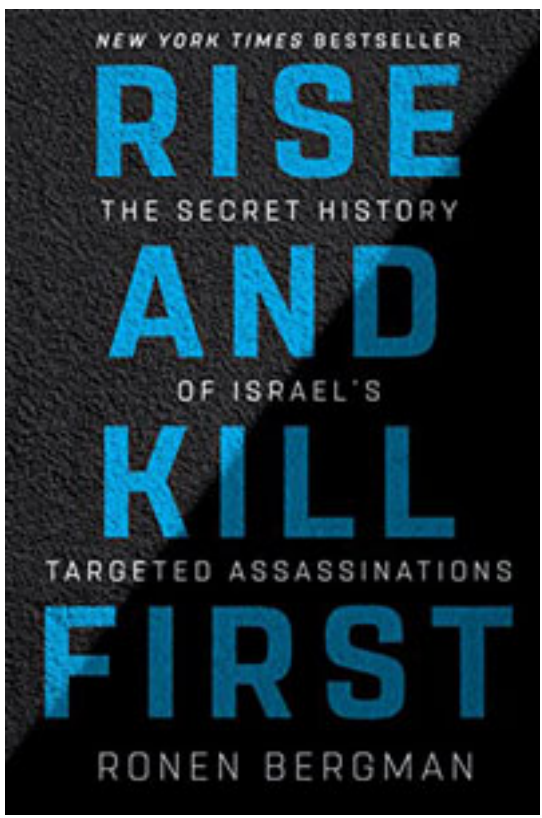
# Seeking 9/11 Truth After Twenty Years

***The Unz Review*** • September 7, 2021 • 7,800 Words

The twentieth anniversary of the 9/11 Attacks is almost upon us, and although their immediacy has been somewhat reduced by the events of the last eighteen months, we must recognize that they have drastically shaped the world history of the last two decades, greatly changing the daily lives and liberties of most ordinary Americans.

The widespread doubts about the reality of the official story provided by our government and almost universally promoted by our media has severely diminished popular faith in the credibility of those two crucial institutions, with consequences that are still very apparent in today's highest profile issues.



Over the years, diligent researchers and courageous journalists have largely demolished the original narrative of those events, and have made a strong, perhaps even overwhelming case that the Israeli

Mossad together with its American collaborators played the central role. My own reconstruction, substantially relying upon such accumulated evidence, came to such conclusions, and I am therefore republishing it below, drawn from my previous articles which had appeared in late 2018 and early 2020, with the later material making heavy use of Ronen Bergman's authoritative 2018 history of the Mossad, which ran more than 750 pages.

Immediately following my own analysis is a link to a particularly noteworthy article along the same lines by French writer Laurent Guyénot, which we had originally released simultaneously with my own, then followed by more than a dozen other significant articles of the previous decade, all published or republished on this website. In coming days, some of these may also be separately featured as part of the twenty-year commemoration.

## The 9/11 Attacks – What Happened?

> Although somewhat related, political assassinations and terrorist attacks are distinct topics, and Bergman's comprehensive volume explicitly focuses on the former, so we cannot fault him for providing only slight coverage of the latter. But the historical pattern of Israeli activity, especially with regard to false-flag attacks, is really quite remarkable, as I noted in a 2018 article:
>
> One of history's largest terrorist attacks prior to 9/11 was the 1946 bombing of the King David Hotel in Jerusalem by Zionist militants dressed as Arabs, which killed 91 people and largely destroyed the structure. In the famous Lavon Affair of 1954, Israeli agents launched a wave of terrorist attacks against Western targets in Egypt, intending to have those blamed on anti-Western Arab groups. There are strong claims that in 1950 Israeli Mossad agents began a series of false-flag terrorist bombings against Jewish targets in Baghdad, successfully using those violent methods to help persuade Iraq's thousand-year-old Jewish community to emigrate to the Jewish state. In 1967, Israel launched a deliberate air and sea attack against the *U.S.S. Liberty*, intending to leave no survivors, killing or wounding over 200 American servicemen before word of the attack reached our Sixth Fleet and the Israelis withdrew.
>
> The enormous extent of pro-Israel influence in world political and media circles meant that none of these brutal attacks ever drew serious retaliation, and in nearly all cases, they were quickly

thrown down the memory hole, so that today probably no more than one in a hundred Americans is even aware of them. Furthermore, most of these incidents came to light due to chance circumstances, so we may easily suspect that many other attacks of a similar nature have never become part of the historical record.

Of these famous incidents, Bergman only includes mention of the King David Hotel bombing. But much later in his narrative, he describes the huge wave of false-flag terrorist attacks unleashed in 1981 by Israeli Defense Minister Ariel Sharon, who recruited a former high-ranking Mossad official to manage the project.

Under Israeli direction, large car bombs began exploding in the Palestinian neighborhoods of Beirut and other Lebanese cities, killing or injuring enormous numbers of civilians. A single attack in October inflicted nearly 400 casualties, and by December, there were eighteen bombings per month, with their effectiveness greatly enhanced by the use of innovative new Israeli drone technology. Official responsibility for all the attacks was claimed by a previously unknown Lebanese organization, but the intent was to provoke the PLO into military retaliation against Israel, thereby justifying Sharon's planned invasion of the neighboring country.

Since the PLO stubbornly refused to take the bait, plans were put into motion for the huge bombing of an entire Beirut sports stadium using tons of explosives during a January 1st political ceremony, with the death and destruction expected to be "of unprecedented proportions, even in terms of Lebanon." But Sharon's political enemies learned of the plot and emphasized that many foreign diplomats including the Soviet ambassador were expected to be present and probably would be killed, so after a bitter debate, Prime Minister Begin ordered the attack aborted. A future Mossad chief mentions the major headaches they then faced in removing the large quantity of explosives that they had already planted within the structure.

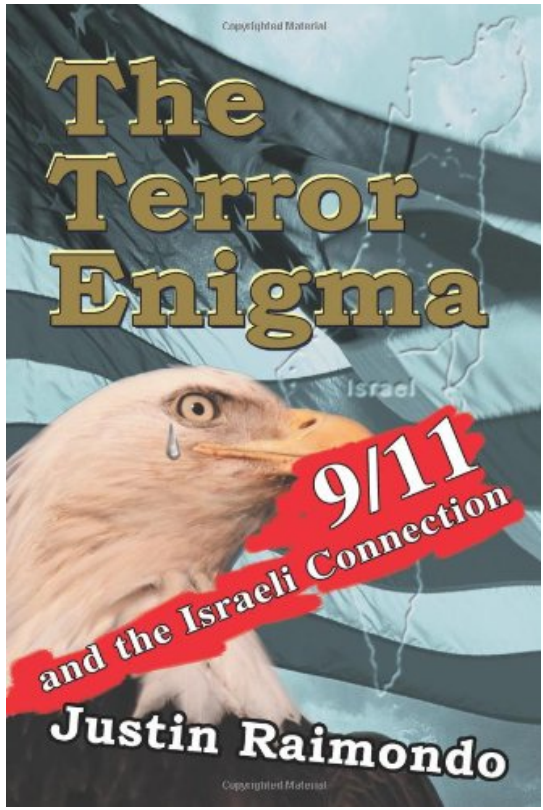
I think that this thoroughly documented history of major Israeli false-flag terrorist attacks, including those against American and other Western targets, should be carefully kept in mind when we consider the 9/11 attacks, whose aftermath has massively transformed our society and cost us so many trillions of dollars. I

analyzed the strange circumstances of the attacks and their likely nature at considerable length in my 2018 article:

Oddly enough, for many years after 9/11, I paid very little attention to the details of the attacks themselves. I was entirely preoccupied with building my content-archiving software system, and with the little time I could spare for public policy matters, I was totally focused on the ongoing Iraq War disaster, as well as my terrible fears that Bush might at any moment suddenly extend the conflict to Iran. Despite Neocon lies shamelessly echoed by our corrupt media, neither Iraq nor Iran had had anything whatsoever to do with the 9/11 attacks, so those events gradually faded in my consciousness, and I suspect the same was true for most other Americans. Al Qaeda had largely disappeared and Bin Laden was supposedly hiding in a cave somewhere. Despite endless Homeland Security "threat alerts," there had been no further Islamic terrorism on American soil, and relatively little anywhere else outside of the Iraq charnel house. So the precise details of the 9/11 plots had become almost irrelevant to me.

Others I knew seemed to feel the same way. Virtually all the exchanges I had with my old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan, had concerned the Iraq War and risk it might spread to Iran, as well as the bitter anger he felt toward Bush's perversion of his beloved NSA into an extra-constitutional tool of domestic espionage. When the *New York Times* broke the story of the massive extent of domestic NSA spying, Gen. Odom declared that President Bush should be impeached and NSA Director Michael Hayden court-martialed. But in all the years prior to his untimely passing in 2008, I don't recall the 9/11 attacks themselves even once coming up as a topic in our discussions.

Admittedly, I'd occasionally heard of some considerable oddities regarding the 9/11 attacks here and there, and these certainly raised some suspicions. Most days I would glance at the *Antiwar.com* front page, and it seemed that some Israeli Mossad agents had been caught while filming the plane attacks in NYC, while a much larger Mossad "art student" spy operation around the country had also been broken up around the same time. Apparently, *FoxNews* had even broadcast a multi-part series on the latter topic before that expose was scuttled and "disappeared" under ADL pressure.



Although I wasn't entirely sure about the credibility of those claims, it did seem plausible that Mossad had known of the attacks in advance and allowed them to proceed, recognizing the huge benefits that Israel would derive from the anti-Arab backlash. I think I was vaguely aware that *Antiwar.com* editorial director Justin Raimondo had published *The Terror Enigma*, a short book about some of those strange facts, bearing the provocative subtitle "9/11 and the Israeli Connection," but I never considered reading it. In 2007, *Counterpunch* itself published a fascinating follow-up story about the arrest of that group of Israeli Mossad agents in NYC, who were caught filming and apparently celebrating the plane attacks on that fateful day, and the Mossad activity seemed to be far larger than I had previously realized. But all these details remained a little fuzzy in my mind next to my overriding concerns about wars in Iraq and Iran.

However, by the end of 2008 my focus had begun to change. Bush was leaving office without having started an Iranian war,

and America had successfully dodged the bullet of an even more dangerous John McCain administration. I assumed that Barack Obama would be a terrible president and he proved worse than my expectations, but I still breathed a huge sigh of relief every day that he was in the White House.

Moreover, around that same time I'd stumbled across an astonishing detail of the 9/11 attacks that demonstrated the remarkable depths of my own ignorance. In a *Counterpunch* article, I'd discovered that immediately following the attacks, the supposed terrorist mastermind Osama bin Laden had publicly denied any involvement, even declaring that no good Muslim would have committed such deeds.

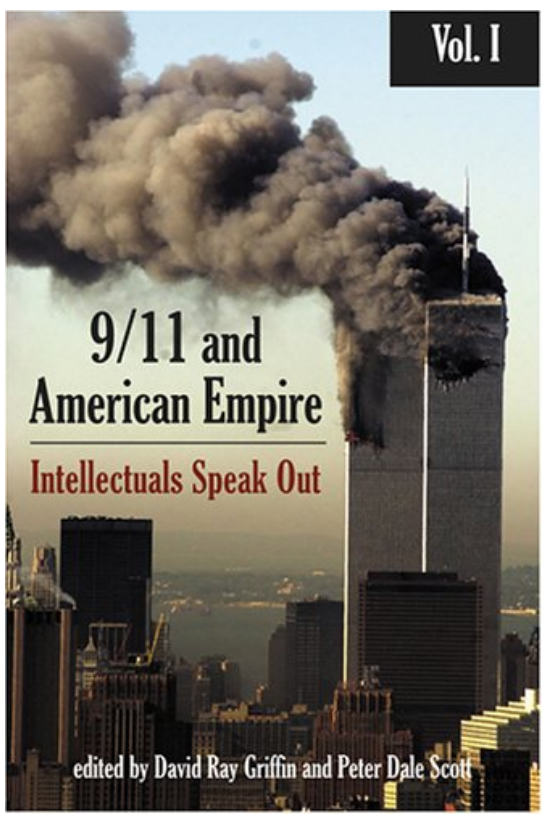
Once I checked around a little and fully confirmed that fact, I was flabbergasted. 9/11 was not only the most successful terrorist attack in the history of the world, but may have been greater in its physical magnitude than all past terrorist operations combined. The entire purpose of terrorism is to allow a small organization to show the world that it can inflict serious losses upon a powerful state, and I had never previously heard of any terrorist leader denying his role in a successful operation, let alone the greatest in history. Something seemed extremely wrong in the media-generated narrative that I had previously accepted. I began to wonder if I had been as deluded as the tens of millions of Americans in 2003 and 2004 who naively believed that Saddam had been the mastermind behind the September 11th attacks. We live in a world of illusions generated by our media, and I suddenly felt that I had noticed a tear in the paper-mache mountains displayed in the background of a Hollywood sound-stage. If Osama was probably not the author of 9/11, what other huge falsehoods had I blindly accepted?

A couple of years later, I came across a very interesting column by Eric Margolis, a prominent Canadian foreign policy journalist purged from the broadcast media for his strong opposition to the Iraq War. He had long published a weekly column in the *Toronto Sun* and when that tenure ended, he used his closing appearance to run a double-length piece expressing his very strong doubts about the official 9/11 story, even noting that the former director of Pakistani Intelligence insisted that Israel had been behind the attacks.

I eventually discovered that in 2003 former German Cabinet Minister Andreas von Bülow had published a best-selling book

strongly suggesting that the CIA rather than Bin Laden was behind the attacks, while in 2007 former Italian President Francesco Cossiga had similarly argued that the CIA and the Israeli Mossad had been responsible, claiming that fact was well known among Western intelligence agencies.

Over the years, all these discordant claims had gradually raised my suspicions about the official 9/11 story to rather strong levels, but it was only very recently that I finally found the time to begin to seriously investigate the subject and read eight or ten of the main 9/11 Truther books, mostly those by Prof. David Ray Griffin, the widely acknowledged leader in that field. And his books, together with the writings of his numerous colleagues and allies, revealed all sorts of very telling details, most of which had previously been unknown to me. I was also greatly impressed by the sheer number of seemingly reputable individuals of no apparent ideological bent who had become adherents of the 9/11 Truth movement over the years.



When utterly astonishing claims of an extremely controversial nature are made over a period of many years by numerous

seemingly reputable academics and other experts, and they are entirely ignored or suppressed but never effectively rebutted, reasonable conclusions seem to point in an obvious direction. Based on my very recent readings in this topic, the total number of huge flaws in the official 9/11 story has now grown extremely long, probably numbering in the many dozens. Most of these individual items seem reasonably likely and if we decide that even just two or three of them are correct, we must totally reject the official narrative that so many of us have believed for so long.

Now I am merely just an amateur in the complex intelligence craft of extracting nuggets of truth from a mountain of manufactured falsehood. Although the arguments of the 9/11 Truth Movement seem quite persuasive to me, I would obviously have felt much more comfortable if they were seconded by an experienced professional, such as a top CIA analyst. A few years ago, I was shocked to discover that was indeed the case.

William Christison had spent 29 years at the CIA, rising to become one of its senior figures as Director of its Office of Regional and Political Analysis, with 200 research analysts serving under him. In August 2006, he published a remarkable 2,700 word article explaining why he no longer believed the official 9/11 story and felt sure that the 9/11 Commission Report constituted a cover-up, with the truth being quite different. The following year, he provided a forceful endorsement to one of Griffin's books, writing that "[There's] a strong body of evidence showing the official U.S. Government story of what happened on September 11, 2001 to be almost certainly a monstrous series of lies." And Christison's extreme 9/11 skepticism was seconded by that of many other highly regarded former US intelligence professionals.

We might expect that if a former CIA intelligence officer of Christison's rank were to denounce the official 9/11 report as a fraud and a cover-up, such a story would constitute front-page news. But it was never reported anywhere in our mainstream media, and I only stumbled upon it a decade later.

Even our supposed "alternative" media outlets were nearly as silent. Throughout the 2000s, Christison and his wife Kathleen, also a former CIA analyst, had been regular contributors to *Counterpunch*, publishing many dozens of articles there and certainly being its most highly credentialed writers on intelligence and national security matters. But editor Alexander

Cockburn refused to publish any of their 9/11 skepticism, so it never came to my attention at the time. Indeed, when I mentioned Christison's views to current *Counterpunch* editor Jeffrey St. Clair a couple of years ago, he was stunned to discover that the friend he had regarded so very highly had actually become a "9/11 Truther." When media organs serve as ideological gatekeepers, a condition of widespread ignorance becomes unavoidable.

With so many gaping holes in the official story of the events of seventeen years ago, each of us is free to choose to focus on those we personally consider most persuasive, and I have several of my own. Danish Chemistry professor Niels Harrit was one of the scientists who analyzed the debris of the destroyed buildings and detected the residual presence of nano-thermite, a military-grade explosive compound, and I found him quite credible during his hour-long interview on *Red Ice Radio*. The notion that an undamaged hijacker passport was found on an NYC street after the massive, fiery destruction of the skyscrapers is totally absurd, as was the claim that the top hijacker conveniently lost his luggage at one of the airports and it was found to contain a large mass of incriminating information. The testimonies of the dozens of firefighters who heard explosions just before the collapse of the buildings seems totally inexplicable under the official account. The sudden total collapse of Building Seven, never hit by any jetliners is also extremely implausible.

## The 9/11 Attacks – Who Did It?

Let us now suppose that the overwhelming weight of evidence is correct, and concur with high-ranking former CIA intelligence analysts, distinguished academics, and experienced professionals that the 9/11 attacks were not what they appeared to be. We recognize the extreme implausibility that three huge skyscrapers in New York City suddenly collapsed at free-fall velocity into their own footprints after just two of them were hit by airplanes, and also that a large civilian jetliner probably did not strike the Pentagon leaving behind absolutely no wreckage and only a small hole. What actually did happen, and more importantly, who was responsible?

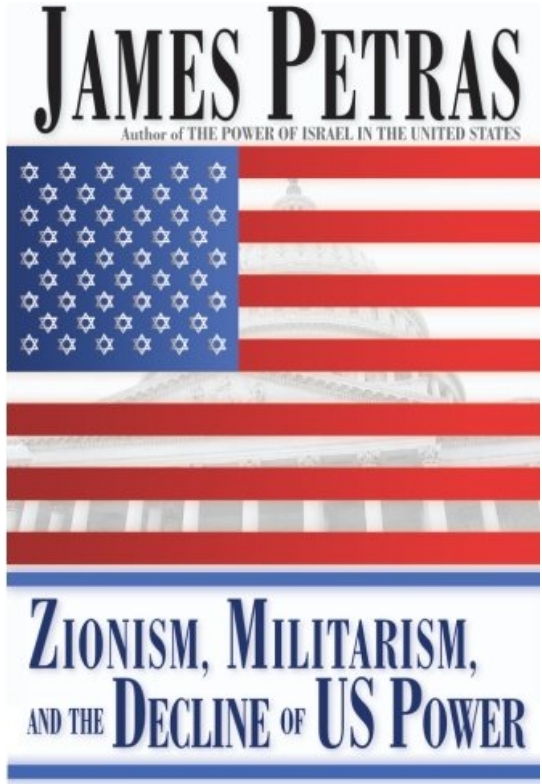
The first question is obviously impossible to answer without an honest and thorough official investigation of the evidence. Until that occurs, we should not be surprised that numerous, somewhat

conflicting hypotheses have been advanced and debated within the confines of the 9/11 Truth community. But the second question is probably the more important and relevant one, and I think it has always represented a source of extreme vulnerability to 9/11 Truthers.

The most typical approach, as generally followed in the numerous Griffin books, is to avoid the issue entirely and focus solely on the gaping flaws in the official narrative. This is a perfectly acceptable position but leaves all sorts of serious doubts. What organized group would have been sufficiently powerful and daring to carry off an attack of such vast scale against the central heart of the world's sole superpower? And how were they possibly able to orchestrate such a massively effective media and political cover-up, even enlisting the participation of the U.S. government itself?

The much smaller fraction of 9/11 Truthers who choose to address this "whodunit" question seem to be overwhelmingly concentrated among rank-and-file grassroots activists rather than the prestigious experts, and they usually answer "inside job!" Their widespread belief seems to be that the top political leadership of the Bush Administration, probably including Vice President Dick Cheney and Defense Secretary Donald Rumsfeld, had organized the terrorist attacks, either with or without the knowledge of their ignorant nominal superior, President George W. Bush. The suggested motives included justifying military attacks against various countries, supporting the financial interests of the powerful oil industry and military-industrial complex, and enabling the destruction of traditional American civil liberties. Since the vast majority of politically-active Truthers seem to come from the far left of the ideological spectrum, they regard these notions as logical and almost self-evident.

Although not explicitly endorsing those Truther conspiracies, filmmaker Michael Moore's leftist box office hit *Fahrenheit 9/11* seemed to raise such similar suspicions. His small budget documentary earned an astonishing $220 million by suggesting that the very close business ties between the Bush family, Cheney, the oil companies, and the Saudis were responsible for the Iraq War aftermath of the terrorist attacks, as well as the domestic crackdown on civil liberties, which was part-and-parcel of the right-wing Republican agenda.



Unfortunately, this apparently plausible picture seems to have almost no basis in reality. During the drive to the Iraq War, I read *Times* articles interviewing numerous top oil men in Texas who expressed total puzzlement at why America was planning to attack Saddam, saying that they could only assume that President Bush knew something that they themselves did not. Saudi Arabian leaders were adamantly opposed to an American attack on Iraq, and made every effort to prevent it. Prior to his joining the Bush Administration, Cheney had served as CEO of Halliburton, an oil services giant, and his firm had heavily lobbied for the lifting of U.S. economic sanctions against Iraq. Prof. James Petras, a scholar of strong Marxist leanings, published an excellent 2008 book entitled *Zionism, Militarism, and the Decline of US Power* in which he conclusively demonstrated that Zionist interests rather than those of the oil industry had dominated the Bush Administration in the wake of the 9/11 attacks, and promoted the Iraq War.

As for the Michael Moore film, I remember at the time sharing a laugh with a (Jewish) friend of mine, both of us finding it ridiculous that a government so overwhelmingly permeated by

fanatically pro-Israel Neocons was being portrayed as being in thrall to the Saudis. Not only did the plotline of Moore's film demonstrate the fearsome power of Jewish Hollywood, but its huge success suggested that most of the American public had apparently never heard of the Neocons.

Bush critics properly ridiculed the president for his tongue-tied statement that the 9/11 terrorists had attacked America "for its freedoms" and Truthers have reasonably branded as implausible the claims that the massive attacks were organized by a cave-dwelling Islamic preacher. But the suggestion that they were led and organized by the top figures of the Bush Administration seems even more preposterous.

Cheney and Rumsfeld had both spent decades as stalwarts of the moderate pro-business wing of the Republican Party, each serving in top government positions and also as CEOs of major corporations. The notion that they capped their careers by joining a new Republican administration in early 2001 and almost immediately set about organizing a gigantic false-flag terrorist attack upon the proudest towers of our largest city together with our own national military headquarters, intending to kill many thousands of Americans in the process, is too ridiculous to even be part of a leftist political satire.

Let's step back a bit. In the entire history of the world, I can think of no documented case in which the top political leadership of a country has launched a major false-flag attack upon its own centers of power and finance and tried to kill large numbers of its own people. The America of 2001 was a peaceful and prosperous country run by relatively bland political leaders focused upon the traditional Republican goals of enacting tax-cuts for the rich and reducing environmental regulations. Too many Truther activists have apparently drawn their understanding of the world from the caricatures of leftist comic-books in which corporate Republicans are all diabolical Dr. Evils, seeking to kill Americans out of sheer malevolence, and Alexander Cockburn was absolutely correct to ridicule them at least on that particular score.

Consider also the simple practicalities of the situation. The gigantic nature of the 9/11 attacks as postulated by the Truth movement would have clearly required enormous planning and probably involved the work of many dozens or even hundreds of

skilled agents. Ordering CIA operatives or special military units to organize secret attacks against civilian targets in Venezuela or Yemen is one thing, but directing them to mount attacks against the Pentagon and the heart of New York City would be fraught with stupendous risk.

Bush had lost the popular vote in November 2000 and had only reached the White House because of a few dangling chads in Florida and the controversial decision of a deeply divided Supreme Court. As a consequence, most of the American media regarded his new administration with enormous hostility. If the first act of such a newly-sworn presidential team had been ordering the CIA or the military to prepare attacks against New York City and the Pentagon, surely those orders would have been regarded as issued by a group of lunatics, and immediately leaked to the hostile national press.

The whole scenario of top American leaders being the masterminds behind 9/11 is beyond ridiculous, and those 9/11 Truthers who make or imply such claims—doing so without a single shred of solid evidence—have unfortunately played a major role in discrediting their entire movement. In fact, the common meaning of the "inside job" scenario is so patently absurd and self-defeating that one might even suspect that the claim was encouraged by those seeking to discredit the entire 9/11 Truth movement as a consequence.

The focus on Cheney and Rumsfeld seems particularly ill-directed. Although I've never met nor had any dealings with either of those individuals, I was quite actively involved in DC politics during the 1990s, and can say with some assurance that prior to 9/11, neither of them were regarded as Neocons. Instead, they were the archetypical examples of moderate business-type mainstream Republicans, stretching all the way back to their years at the top of the Ford Administration during the mid-1970s.

Skeptics of this claim may note that they signed the 1997 declaration issued by the Project for the New American Century (PNAC), a leading Neocon foreign policy manifesto organized by Bill Kristol, but I would regard that as something of a red herring. In DC circles, individuals are always recruiting their friends to sign various declarations, which may or may not be indicative of anything, and I remember Kristol trying to get me to sign the PNAC statement as well. Since my private views on

that issue were absolutely 100% contrary to the Neocon position, which I regarded as foreign policy lunacy, I deflected his request and very politely turned him down. But I was quite friendly with him at the time, so if I had been someone without strong opinions in that area, I probably would have agreed.

This raises a larger point. By 2000, the Neocons had gained almost total control of all the major conservative/Republican media outlets and the foreign policy wings of nearly all the similarly aligned thinktanks in DC, successfully purging most of their traditional opponents. So although Cheney and Rumsfeld were not themselves Neocons, they were swimming in a Neocon sea, with a very large fraction of all the information they received coming from such sources and with their top aides such as "Scooter" Libby, Paul Wolfowitz, and Douglas Feith being Neocons. Rumsfeld was already somewhat elderly while Cheney had suffered several heart-attacks starting at age 37, so under those circumstances it may have been relatively easy for them to be shifted toward certain policy positions.

Indeed, the entire demonization of Cheney and Rumsfeld in anti-Iraq War circles has seemed somewhat suspicious to me. I always wondered whether the heavily Jewish liberal media had focused its wrath upon those two individuals in order to deflect culpability from the Jewish Neocons who were the obvious originators of that disastrous policy; and the same may be true of the 9/11 Truthers, who probably feared accusations of anti-Semitism. Regarding that former issue, a prominent Israeli columnist was characteristically blunt on the matter in 2003, strongly suggesting that 25 Neocon intellectuals, nearly all of them Jewish, were primarily responsible for the war. Under normal circumstances, the president himself would have surely been portrayed as the evil mastermind behind the 9/11 plot, but "W" was too widely known for his ignorance for such accusations to be credible.

It does seem entirely plausible that Cheney, Rumsfeld, and other top Bush leaders may have been manipulated into taking certain actions that inadvertently fostered the 9/11 plot, while a few lower-level Bush appointees might have been more directly involved, perhaps even as outright conspirators. But I do not think this is the usual meaning of the "inside job" accusation.

So where do we now stand? It seems very likely that the 9/11 attacks were the work of an organization far more powerful and professionally-skilled than a rag-tag band of nineteen random Arabs armed with box-cutters, but also that the attacks were very unlikely to have been the work of the American government itself. So who actually attacked our country on that fateful day seventeen years ago, killing thousands of our fellow citizens?

Effective intelligence operations are concealed in a hall of mirrors, often extremely difficult for outsiders to penetrate, and false-flag terrorist attacks certainly fall into this category. But if we apply a different metaphor, the complexities of such events may be seen as a Gordian Knot, almost impossible to disentangle, but vulnerable to the sword-stroke of asking the simple question "Who benefited?"

America and most of the world certainly did not, and the disastrous legacies of that fateful day have transformed our own society and wrecked many other countries. The endless American wars soon unleashed have already cost us many trillions of dollars and set our nation on the road to bankruptcy while killing or displacing many millions of innocent Middle Easterners. Most recently, that resulting flood of desperate refugees has begun engulfing Europe, and the peace and prosperity of that ancient continent is now under severe threat.

Our traditional civil liberties and constitutional protections have been drastically eroded, with our society having taken long steps toward becoming an outright police state. American citizens now passively accept unimaginable infringements on their personal freedoms, all originally begun under the guise of preventing terrorism.

I find it difficult to think of any country in the world that clearly gained as a result of the 9/11 attacks and America's military reaction, with one single, solitary exception.

During 2000 and most of 2001, America was a peaceful prosperous country, but a certain small Middle Eastern nation had found itself in an increasingly desperate situation. Israel then seemed to be fighting for its life against the massive waves of domestic terrorism that constituted the Second Palestinian Intifada.

Ariel Sharon was widely believed to have deliberately provoked

that uprising in September 2000 by marching to the Temple Mount backed by a thousand armed police, and the resulting violence and polarization of Israeli society had successfully installed him as Prime Minister in early 2001. But once in office, his brutal measures failed to end the wave of continuing attacks, which increasingly took the form of suicide-bombings against civilian targets. Many believed that the violence might soon trigger a huge outflow of Israeli citizens, perhaps producing a death-spiral for the Jewish state. Iraq, Iran, Libya, and other major Muslim powers were supporting the Palestinians with money, rhetoric, and sometimes weaponry, and Israeli society seemed close to crumbling. I remember hearing from some of my DC friends that numerous Israeli policy experts were suddenly seeking berths at Neocon thinktanks so that they could relocate to America.

Sharon was a notoriously bloody and reckless leader, with a long history of undertaking strategic gambles of astonishing boldness, sometimes betting everything on a single roll of the dice. He had spent decades seeking the Prime Ministership, but having finally obtained it, he now had his back to the wall, with no obvious source of rescue in sight.

The 9/11 attacks changed everything. Suddenly the world's sole superpower was fully mobilized against Arab and Muslim terrorist movements, especially those connected with the Middle East. Sharon's close Neocon political allies in America used the unexpected crisis as an opportunity to seize control of America's foreign policy and national security apparatus, with an NSA staffer later reporting that Israeli generals freely roamed the halls of the Pentagon without any security controls. Meanwhile, the excuse of preventing domestic terrorism was used to implement newly centralized American police controls that were soon employed to harass or even shut down various anti-Zionist political organizations. One of the Israeli Mossad agents arrested by the police in New York City as he and his fellows were celebrating the 9/11 attacks and producing a souvenir film of the burning World Trade Center towers told the officers that "We are Israelis…Your problems are our problems." And so they immediately became.

General Wesley Clark reported that soon after the 9/11 attacks he was informed that a secret military plan had somehow come into being under which America would attack and destroy seven major Muslim countries over the next few years, including Iraq, Iran,

Syria, and Libya, which coincidentally were all of Israel's strongest regional adversaries and the leading supporters of the Palestinians. As America began to expend enormous oceans of blood and treasure attacking all of Israel's enemies after 9/11, Israel itself no longer needed to do so. Partly as a consequence, almost no other nation in the world has so enormously improved its strategic and economic situation during the last seventeen years, even while a large fraction of the American population has become completely impoverished during that same period and our national debt has grown to insurmountable levels. A parasite can often grow fat even as its host suffers and declines.

I have emphasized that for many years after the 9/11 attacks I paid little attention to the details and had only the vaguest notion that there even existed an organized 9/11 Truth movement. But if someone had ever convinced me that the terrorist attacks had been false-flag operations and someone other than Osama had been responsible, my immediate guess would have been Israel and its Mossad.

Certainly no other nation in the world can remotely match Israel's track-record of remarkably bold high-level assassinations and false-flag attacks, terrorist and otherwise, against other countries, even including America and its military. Furthermore, the enormous dominance of Jewish and pro-Israel elements in the American establishment media and increasingly that of many other major countries in the West has long ensured that even when the solid evidence of such attacks was discovered, very few ordinary Americans would ever hear those facts.

Once we accept that the 9/11 attacks were probably a false-flag operation, a central clue to the likely perpetrators has been their extraordinary success in ensuring that such a wealth of enormously suspicious evidence has been totally ignored by virtually the entire American media, whether liberal or conservative, left-wing or right-wing.

In the particular case at hand, the considerable number of zealously pro-Israel Neocons situated just beneath the public surface of the Bush Administration in 2001 could have greatly facilitated both the successful organization of the attacks and their effective cover-up and concealment, with Libby, Wolfowitz, Feith, and Richard Perle being merely the most obvious names.

Whether such individuals were knowing conspirators or merely had personal ties allowing them to be exploited in furthering the plot is entirely unclear.

Most of this information must surely have long been apparent to knowledgeable observers, and I strongly suspect that many individuals who had paid much greater attention than myself to the details of the 9/11 attacks may have quickly formed a tentative conclusion along these same lines. But for obvious social and political reasons, there is a great reluctance to publicly point the finger of blame towards Israel on a matter of such enormous magnitude. Hence, except for a few fringe activists here and there, such dark suspicions remained private.

Meanwhile, the leaders of the 9/11 Truth movement probably feared they would be destroyed by media accusations of deranged anti-Semitism if they had ever expressed even a hint of such ideas. This political strategy may have been necessary, but by failing to name any plausible culprit, they created a vacuum that was soon filled by "useful idiots" who shouted "inside job!" while pointing an accusing finger toward Cheney and Rumsfeld, and thereby did so much to discredit the entire 9/11 Truth movement.

This unfortunate conspiracy of silence finally ended in 2009 when Dr. Alan Sabrosky, former Director of Studies at the US Army War College, stepped forward and publicly declared that the Israeli Mossad had very likely been responsible for the 9/11 attacks, writing a series of columns on the subject, and eventually presenting his views in a number of media interviews, along with additional analyses.

Obviously, such explosive charges never reached the pages of my morning *Times*, but they did receive considerable if transitory coverage in portions of the alternative media, and I remember seeing the links very prominently featured at *Antiwar.com* and widely discussed elsewhere. I had never previously heard of Sabrosky, so I consulted my archiving system and immediately discovered that he had a perfectly respectable record of publication on military affairs in mainstream foreign policy periodicals and had also held a series of academic appointments at prestigious institutions. Reading one or two of his articles on 9/11, I felt he made a rather persuasive case for Mossad involvement, with some of his information already known to me

but much of it not.

Since I was very busy with my software work and had never spent any time investigating 9/11 or reading any of the books on the topic, my belief in his claims back then was obviously quite tentative. But now that I have finally looked into the subject in much greater detail and done a great deal of reading, I think it seems quite likely that his 2009 analysis was entirely correct.

I would particularly recommend his long 2011 interview on Iranian Press TV, which I first watched just a couple of days ago. He came across as highly credible and forthright in his claims:

I have had long conversations over
the last two weeks with contacts
at the Army War College and the
headquarters, Marine Corps and
I've made it absolutely clear in
both cases that it is 10
rtain
that 9/11 was a Mossa
ation
Period
The Zionists are playing this as an
all-or-nothing exercise
If they lose this one, they're done..
Alan Sabrosky
US Army War College Retired

He also provided a pugnacious conclusion in a much longer 2010 radio interview:

Sabrosky focused much of his attention upon a particular segment of a Dutch documentary film on the 9/11 attacks produced

several years earlier. In that fascinating interview, a professional demolition expert named Danny Jowenko who was largely ignorant of the 9/11 attacks immediately identified the filmed collapse of WTC Building 7 as a controlled-demolition, and the remarkable clip was broadcast worldwide on *Press TV* and widely discussed across the Internet.

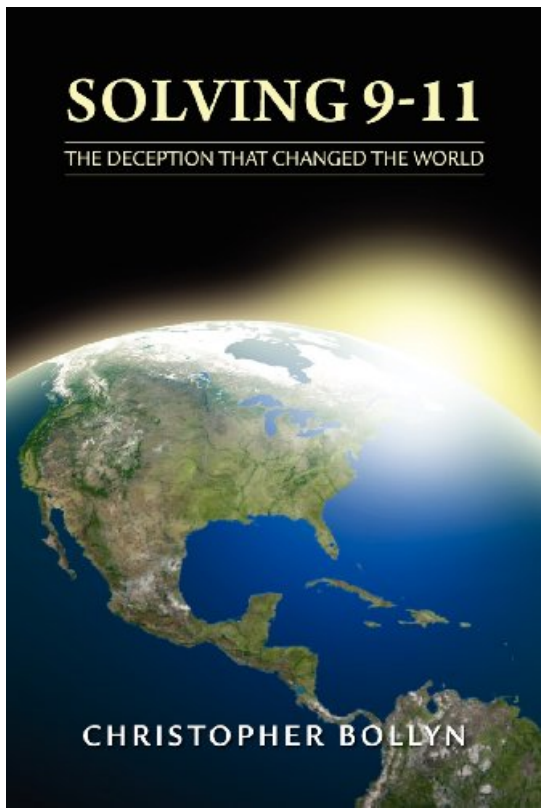
And by a very strange coincidence, just three days after Jowenko's broadcast video interview had received such heavy attention, he had the misfortune to die in a frontal collision with a tree in Holland. I'd suspect that the community of professional demolition experts is a small one, and Jowenko's surviving industry colleagues may have quickly concluded that serious misfortune might visit those who rendered controversial expert opinions on the collapse of the three World Trade Center towers.

Meanwhile, the ADL soon mounted a huge and largely successful effort to have *Press TV* banned in the West for promoting "anti-Semitic conspiracy theories," even persuading YouTube to entirely eliminate the huge video archive of those past shows, notably including Sabrosky's long interview.

Most recently, Sabrosky provided an hour-long presentation at this June's Deep Truth video panel conference, during which he expressed considerable pessimism about America's political predicament, and suggested that the Zionist control over our politics and media had grown even stronger over the last decade.

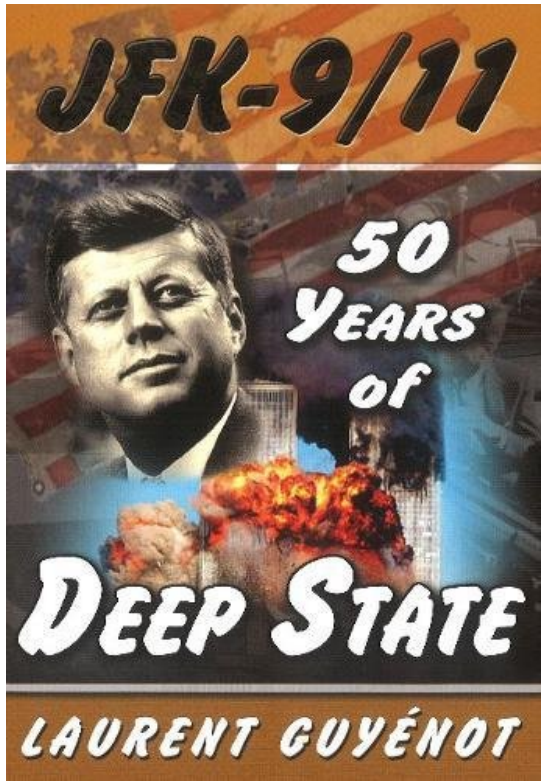
His discussion was soon rebroadcast by *Guns & Butter*, a prominent progressive radio program, which as a consequence was soon purged from its home station after seventeen years of great national popularity and strong listener support.

The late Alan Hart, a very distinguished British broadcast journalist and foreign correspondent, also broke his silence in 2010 and similarly pointed to the Israelis as the likely culprits behind the 9/11 attacks. Those interested may wish to listen to his extended interview.



Journalist Christopher Bollyn was one of the first writers to explore the possible Israeli links to the 9/11 attacks, and the details contained in his long series of newspaper articles are often quoted by other researchers. In 2012, he gathered together this material and published it in the form of a book entitled *Solving 9-11*, thereby making his information on the possible role of the Israeli Mossad available to a much wider audience, with a version being available online. Unfortunately his printed volume severely suffers from the typical lack of resources available to the writers

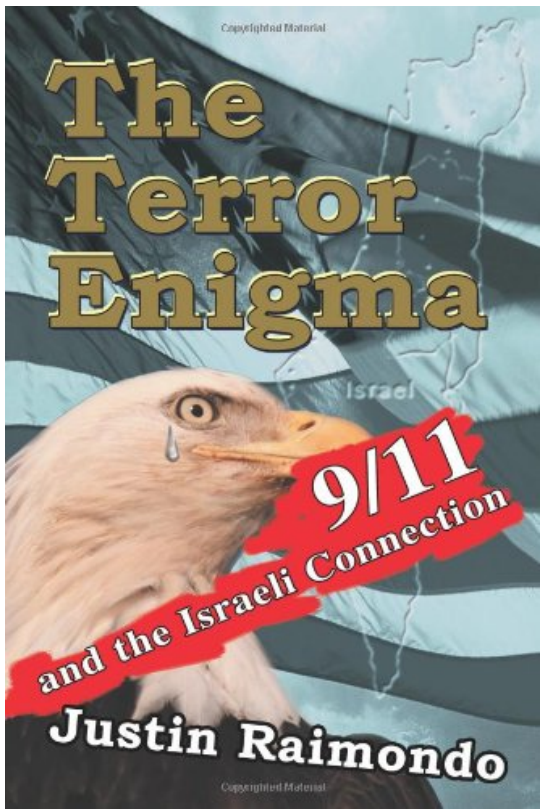
on the political fringe, with poor organization and frequent repetition of the same points due to its origins in a set of individual articles, and this may diminish its credibility among some readers. So those who purchase it should be forewarned about these serious stylistic weaknesses.



Probably a much better compendium of the very extensive evidence pointing to the Israeli hand behind the 9/11 attacks has been more recently provided by French writer Laurent Guyénot, both in his 2017 book *JFK-9/11: 50 Years of the Deep State* and also his 8,500 word article "9/11 was an Israeli Job", published concurrently with this one and providing a far greater wealth of detail than is contained here. While I would not necessarily endorse all of his claims and arguments, his overall analysis seems fully consistent with my own.

These writers have provided a great deal of material in support of the Israeli Mossad Hypothesis, but I would focus attention on just one important point. We would normally expect that terrorist attacks resulting in the complete destruction of three gigantic

office buildings in New York City and an aerial assault on the Pentagon would be an operation of enormous size and scale, involving very considerable organizational infrastructure and manpower. In the aftermath of the attacks, the US government undertook great efforts to locate and arrest the surviving Islamic conspirators, but scarcely managed to find a single one. Apparently, they had all died in the attacks themselves or otherwise simply vanished into thin air.



But without making much effort at all, the American government did quickly round up and arrest some 200 Israeli Mossad agents, many of whom had been based in exactly the same geographical locations as the purported 19 Arab hijackers. Furthermore, NYC police arrested some of these agents while they were publicly celebrating the 9/11 attacks, and others were caught driving vans in the New York area containing explosives or their residual traces. Most of these Mossad agents refused to answer any questions, and many of those who did failed polygraph tests, but under massive political pressure all were eventually released and deported back to Israel. A couple of years ago, much of this information was very effectively presented in a short video

available on YouTube.

There is another fascinating tidbit that I have very rarely seen mentioned. Just a month after the 9/11 attacks, two Israelis were caught sneaking weapons and explosives into the Mexican Parliament building, a story that naturally produced several banner-headlines in leading Mexican newspapers at the time but which was greeted by total silence in the American media. Eventually, under massive political pressure, all charges were dropped and the Israeli agents were deported back home. This remarkable incident was only reported on a small Hispanic-activist website, and discussed in a few other places. Some years ago I easily found the scanned front pages of the Mexican newspapers reporting those dramatic events on the Internet, but I can no longer easily locate them. The details are obviously somewhat fragmentary and possibly garbled, but certainly quite intriguing.

One might speculate that if supposed Islamic terrorists had followed up their 9/11 attacks by attacking and destroying the Mexican parliament building a month later, Latin American support for America's military invasions in the Middle East would have been greatly magnified. Furthermore, any scenes of such massive destruction in the Mexican capital by Arab terrorists would surely have been broadcast non-stop on *Univision*, America's dominant Spanish-language network, fully solidifying Hispanic support for President Bush's military endeavors.

Although my growing suspicions about the 9/11 attacks stretch back a decade or more, my serious investigation of the topic is

quite recent, so I am certainly a newcomer to the field. But sometimes an outsider can notice things that may escape the attention of those who have spent so many years deeply immersed in a given topic.

From my perspective, a huge fraction of the 9/11 Truth community spends far too much of its time absorbed in the particular details of the attacks, debating the precise method by which the World Trade Center towers in New York were brought down or what actually struck the Pentagon. But these sorts of issues seem of little ultimate significance.

I would argue that the only important aspect of such technical issues is whether the overall evidence is sufficiently strong to establish the falsehood of the official 9/11 narrative and also demonstrate that the attacks must have been the work of a highly sophisticated organization with access to advanced military technology rather than a rag-tag band of 19 Arabs armed with box-cutters. Beyond that, none of those details matter.

In that regard, I believe that the volume of factual material collected by determined researchers over the last seventeen years has easily met that requirement, perhaps even ten or twenty times over. For example, even agreeing upon a single particular item such as the clear presence of nano-thermite, a military-grade explosive compound, would immediately satisfy those two criteria. So I see little point in endless debates over whether nano-thermite was used, or nano-thermite plus something else, or just something else entirely. And such complex technical debates may serve to obscure the larger picture, while confusing and intimidating any casually-interested onlookers, thereby being quite counter-productive to the overall goals of the 9/11 Truth movement.

Once we have concluded that the culprits were part of a highly sophisticated organization, we can then focus on the *Who* and the *Why*, which surely would be of greater importance than the particular details of the *How*. Yet currently all the endless debate over the *How* tends to crowd out the *Who* and the *Why*, and I wonder whether this unfortunate situation might even be intentional.

Perhaps one reason is that once sincere 9/11 Truthers do focus on those more important questions, the vast weight of the evidence clearly points in a single direction, implicating Israel and its

Mossad intelligence service, with the case being overwhelmingly strong in motive, means, and opportunity. And leveling accusations of blame at Israel and its domestic collaborators for the greatest attack ever launched against America on our own soil entails enormous social and political risks.

But such difficulties must be weighed against the reality of three thousand American civilian lives and the subsequent seventeen years of our multi-trillion-dollar wars, which have produced tens of thousands of dead or wounded American servicemen and the death or displacement of many millions of innocent Middle Easterners.

The members of the 9/11 Truth movement must therefore ask themselves whether or not “Truth” is indeed the central goal of their efforts.

# Remembering the *Liberty*

*President Lyndon Johnson and World War III?*

***The Unz Review*** • October 18, 2021 • 11,300 Words

## Concealing the Deliberate Israeli Attack

I'm not exactly sure when I first heard of the *Liberty* incident of 1967. The story was certainly a dramatic one, the attack upon an almost defenseless American intelligence ship by Israel's air and naval forces late in the Six Day War fought against several Arab states. Over 200 American servicemen were killed or wounded by Israeli machine-guns, rockets, napalm, and torpedos, representing our greatest naval loss of life since World War II. Only tremendous luck and the heroic actions of the sailors prevented the *Liberty* from being sunk with all hands lost.

The Israeli government quickly claimed that the attack had been accidental, a consequence of mistaken identification and the fog of war, but none of the survivors ever believed that story, nor did many of America's top political and military leaders, notably Secretary of State Dean Rusk, CIA Director Richard Helms, and numerous top officers, including a later Chairman of the Joint Chiefs of Staff.

Although a brief investigation ordered by President Lyndon Johnson

quickly endorsed the Israeli account, over the next half-century the *Liberty* survivors regularly condemned that official verdict as a cover-up and a whitewash. Their deep outrage was only slightly assuaged by the flood of medals they had received from our guilt-ridden government, which established the *Liberty* as perhaps the most highly-decorated ship in American naval history, at least with regard to a single engagement.

The real-life events of that day almost seem like a script out of Hollywood. The first wave of unmarked attacking jets had targeted and destroyed all of the *Liberty*'s regular transmission antennas while also trying to jam all standard American broadcast frequencies to prevent any calls for help. A flotilla of torpedo boats later machine-gunned the life-rafts to ensure there would be no survivors. These relentless attacks lasted for more than an hour and completely perforated the vessel, with the sides and the decks being pitted by more than 800 holes larger than a man's fist, including 100 rocket-hits that were six to eight inches wide, and a 40 foot hole below the waterline produced by a torpedo strike. Only a miracle kept the ship afloat.

But the desperate sailors braved constant enemy fire to jury-rig a single transmission antenna, allowing them to send out an urgent plea for help. Their SOS was finally received by our nearby Sixth Fleet, whose commanders immediately dispatched two waves of jet fighters to rescue the *Liberty* and drive off the attackers, only to have both flights recalled by order of America's highest political leadership, which chose to abandon the *Liberty* and its crew to their fate. At the end, two large helicopters filled with commandos dressed in full battle gear and armed with assault weapons were preparing to board the *Liberty*, sweep its decks clear of any resistance, and sink it. But at that moment their headquarters apparently discovered that the ship had managed to report its plight to other American military forces, so the enemy broke off the attack and retreated. The first American assistance finally arrived seventeen hours after the first shots had been fired, as two destroyers reached the stricken vessel, which was still desperately trying to stay afloat.

This story combined so many elements of exceptional military heroism, political treachery, and success against all odds that if the *Liberty* had been attacked by any nation on earth except Israel, the inspirational events of June 8, 1967 might have become the basis for several big-budget, Oscar-nominated movies as well as a regular staple of television documentaries. Such a patriotic narrative would have provided very welcome relief from the concurrent military disaster

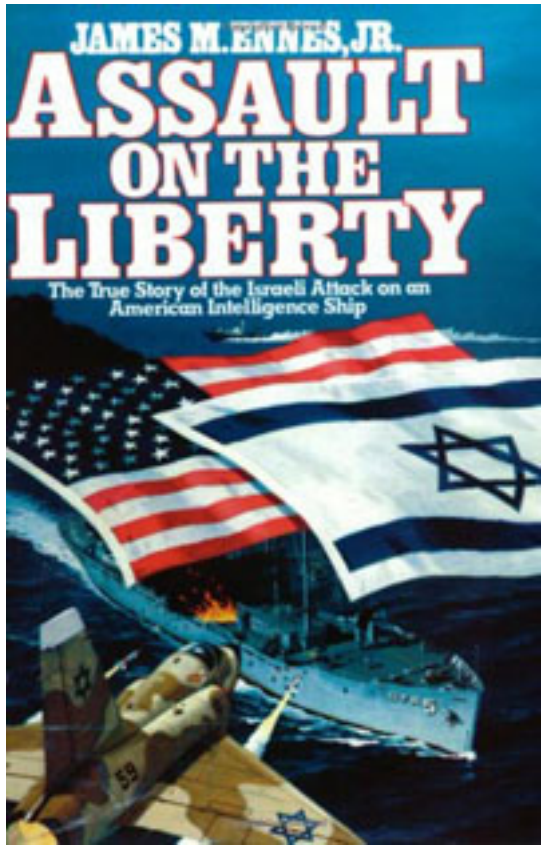
our country was then facing in its Vietnam War debacle. But events involving serious misdeeds of the Jewish State are hardly viewed with great favor by the leading lights of our entertainment industry, and the story of the *Liberty* quickly vanished from sight so that today I doubt whether even one American in a hundred has ever heard of it.

Our news media has been almost as silent on the subject. In the immediate aftermath of the attack, there was naturally some coverage in our major newspapers and magazines, with several of the reports expressing considerable skepticism of the Israeli claims of having made an innocent mistake. But the Johnson Administration quickly imposed an extreme clampdown to suppress any challenges to the official story.

An American admiral soon met with all of the survivors in small groups, including the many dozens still hospitalized from their serious injuries, and he issued fearsome threats to those terrified young sailors, most of whom were still in their teens or early twenties. If any of them ever mentioned a word of what had happened—even to their mothers, fathers, or wives, let alone the media—they would immediately be court-martialed and end their lives in prison "or worse."

With our journalists having great difficulty finding any eyewitnesses willing to talk and our government firmly declaring that the attack had been an unfortunate instance of accidental "friendly fire," the newsmen quickly lost interest and the story faded from the headlines. Our government still remained so concerned about the smoldering embers of the incident that the surviving sailors were distributed across the other ships of our navy, apparently with efforts made to avoid having any of them serve together, which would have allowed them an opportunity to discuss the events they had barely survived.

The ensuing decade of the 1970s saw the Watergate Scandal unfold, culminating in the impeachment and resignation of a president, and numerous other sordid governmental scandals and abuses of power came to light in the years that followed, greatly eroding popular faith in the honesty of our government.



These changed circumstances helped provide an opening to James M. Ennes, Jr., one of the young surviving *Liberty* officers, who defied the threats of prosecution and imprisonment in order to reveal to the world what had happened. Working closely with many of his fellow survivors, he spent years preparing a powerful manuscript and was introduced to a major publishing house by star *New York Times* reporter Neil Sheehan, who had written one of the earliest news accounts of the attack. His book *Assault on the Liberty* was released in 1979, producing the first major crack in the continuing wall of silence. Admiral Thomas Moorer, former Chairman of the Joint Chiefs of Staff, contributed a Foreword to a later edition, and the facts and gripping eyewitness testimony almost conclusively established that the Israeli attack had been entirely intentional. There were quite a number of favorable early reviews and interviews, leading to strong initial sales and further media coverage.

But organized pro-Israel groups soon counterattacked with a widespread campaign of suppression, working to prevent book sales and distribution while pressuring such influential television shows as ABC's *Good Morning America* and CBS's *Sixty Minutes* into canceling

their planned segments. Successful books may sell tens of thousands of copies, but popular television programs reach tens of millions, so only a sliver of the American public ever learned the story of the *Liberty*. However, those who were politically aware and interested in the topic now had a solid reference source to cite and distribute, and the book also sparked the creation of the Liberty Veterans Association, which began to demand a reopening of the case and an honest investigation of what had happened that day.

The Israelis always claimed that the *Liberty* had been attacked because it was misidentified as a particular Egyptian naval vessel, and the official report of the American investigation had concurred. But Ennes' book demolished that possibility.

(*) As America's most advanced electronic surveillance ship, the *Liberty* had one of the most unique profiles in any navy, with its topside covered by an enormous array of different communications antennas, even including a 32-foot satellite-dish used to bounce signals off the Moon. By contrast, the Egyptian vessel was a decrepit old horse-transport just a fraction of the size, which was then rusting away in the port of Alexandria.

(*) By nearly all accounts, the air and naval forces deployed against the *Liberty* were completely unmarked, thus disguising their origins. None of the calls for help sent out mentioned the identity of the attackers, which the victims only discovered near the very end of the sustained engagement. If the Israeli forces had merely been striking against an assumed Egyptian military vessel, why would they have bothered to conceal their nationality?

(*) Despite repeated Israeli claims to the contrary, the *Liberty* had a large and very visible American flag flying at all times, and when the first one was shot down and destroyed early in the attack, an even larger Stars and Stripes was quickly hoisted as a replacement. The name of the ship was written in large English letters on its side, instead of the Arabic used by Egyptian vessels. The clear, bright weather that day provided perfect visibility.

(*) Israeli surveillance planes had repeatedly over-flown the *Liberty* all that morning, sometimes flying so low that the faces of the pilots could be seen, so the ship would have been easily identified.

(*) From the moment the attack began, Israeli electronic jamming had

been employed to blanket all regular American communication channels, proving that the attackers knew the nationality of the ship they were targeting.

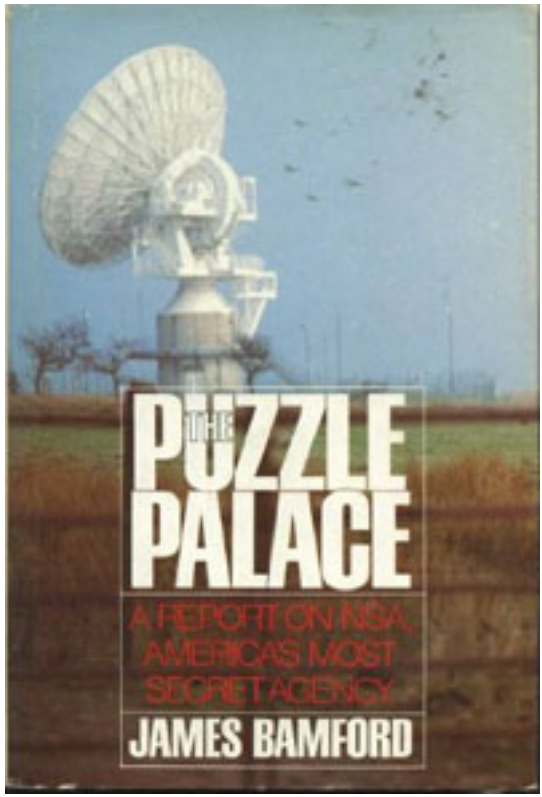
(*) The Israelis claimed that they initially assumed that the *Liberty* was a warship because it was traveling at a high speed of nearly 30 knots, but the ship's speed during that entire period had merely been 5 knots, slower by a factor of six.

(*) The attack on the *Liberty* was a massive and coordinated action, lasting one to two hours, and involved waves of jet fighters, three torpedo boats, and a couple of large helicopters loaded with commandos. The initial strike destroyed all communications antennas in order to prevent the ship from calling for help, and later all the lifeboats were machine-gunned. The obvious goal was to sink the ship, leaving no survivors to report what had happened.

(*) After the attack ended, the Israelis steadfastly refused to admit any serious error on their part, with none of their commanders being prosecuted or even reprimanded, and instead placed the entire blame for the incident upon the Americans. Trophies from the *Liberty* attack still occupy a place of honor in Israel's war museum. Financial compensation was only paid to the seriously wounded survivors after a long battle in American courts.

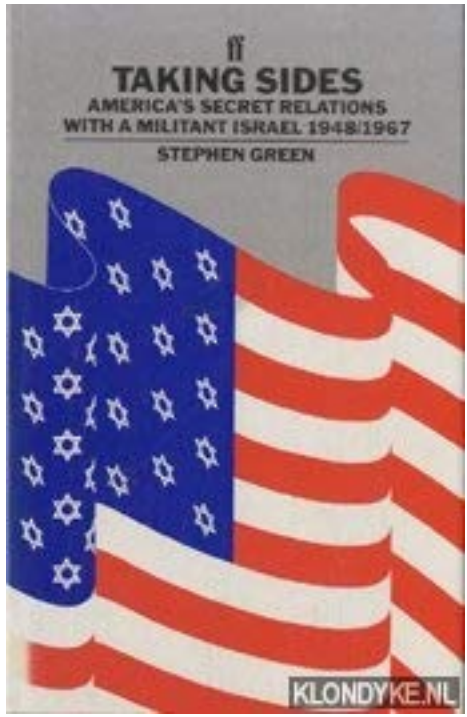
## Confirming the Facts But Seeking a Motive

At the time, Israel was America's primary international backer and ally, so the motive has always greatly puzzled observers—a deadly, unprovoked attack upon an American military vessel sailing in international waters, something which certainly constituted a major war-crime. Ennes had no clear answer to that question, and his carefully factual book closed with an Epilogue entitled "Why Did Israel Attack?" which provided a few pages of speculation. He suggested that the Israelis may have feared that the *Liberty*'s electronic surveillance equipment might have revealed their plans to invade Syria and conquer the Golan Heights against American wishes, and indeed that attack occurred soon after the *Liberty* was crippled. The Syrian invasion was ordered by Israeli Defense Minister Moshe Dayan, and a declassified CIA intelligence report later claimed that Dayan had ordered the attack on the *Liberty* against the opposition of some of his generals. This explanation seemed somewhat plausible but far from solidly established.



With the Ennes book having blazed a trail, other authors gradually followed. As an electronic surveillance platform, the *Liberty* operated under the auspices of the NSA, an organization then so secret that its employees sometimes joked that the initials stood for "No Such Agency." In 1982, those shrouds of mystery were finally pierced when journalist James Bamford published *The Puzzle Palace*, presenting the agency's history and activities, which soon became a national bestseller and launched him on a career as one of America's premier authors on national security matters.

From the very first, the NSA had been absolutely certain than the Israeli attack on the *Liberty* was deliberate, and the death or grievous injury of so many of its communication technicians and other employees together with an American cover-up deeply rankled the top leadership. So Bamford's book included more than a dozen pages on the *Liberty* incident, revealing some of the secret intelligence evidence that had demonstrated Israel's clear intent.



Two years later in 1984, foreign policy writer Stephen Green published a highly-regarded analysis of Israeli-American relations entitled *Taking Sides*, which drew glowing praise from former Sen. William Fulbright, who had chaired the Foreign Affairs Committee, international legal scholar Richard Falk of Princeton, and former Undersecretary of State George Ball. Green devoted his penultimate chapter to the *Liberty* incident, effectively summarizing the facts across those 30 pages and strongly endorsing most of Ennes' conclusions, while providing additional evidence that the attack was deliberate, some of it based upon newly declassified documents. He also pointed out that if the operation had succeeded and the *Liberty* had been sunk with no survivors, America might have easily blamed Egypt for the attack, with major geopolitical consequences. Since the ship's survival was little short of a miracle, that might have been the primary motive.

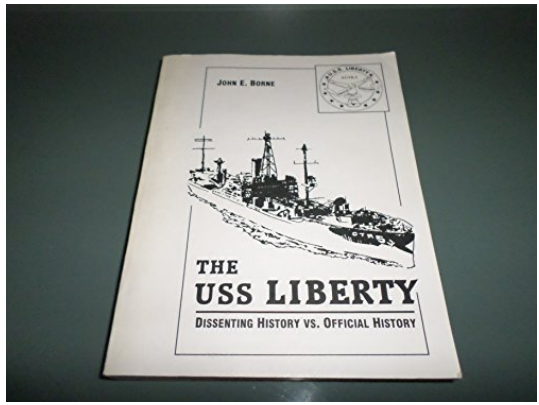
I was just a young child in 1967, and never heard a word about the attack at the time nor for long afterward. Even once the Ennes book appeared a dozen years later, I don't remember seeing anything about it, nor was I aware of the accounts contained in the specialized volumes by Bamford and Green that soon followed. At some point, I think I did vaguely hear something about an American ship that had

been accidentally attacked by Israel during the 1960s, but that was probably the limit of my knowledge.

In 1991 the subject finally did get some national attention in the aftermath of America's victorious Gulf War against Saddam Hussein, as President George H.W. Bush became embroiled in a political battle with the Israeli government over the expansion of their illegal Jewish settlements in the Occupied West Bank and Gaza.

At that time, the Evans & Novak column by conservatives Rowland Evans and Robert Novak was among the most widely syndicated and influential in America, running in many hundreds of newspapers, and with Novak also having a large presence on the weekly political television shows. Their November 6, 1991 column dropped a major bombshell, reporting that radio transmissions proved the Israeli pilots had been fully aware that they were attacking an American ship and despite their frantic protestations had been ordered to go ahead and sink the *Liberty* regardless. These communications had been intercepted and decrypted by the intelligence staff at our Beirut Embassy, and the shocking transcripts were immediately provided to our ambassador, Dwight Porter, a highly esteemed diplomat, who had finally broken his self-imposed silence after 24 years. Moreover, these same facts were also confirmed by an American-born Israeli military officer who had been present at IDF headquarters that day, and who said that all the commanders there were sure that the ship being attacked was American. This may have been the first time I learned the true details of the 1967 incident, probably from one of Novak's many television appearances.

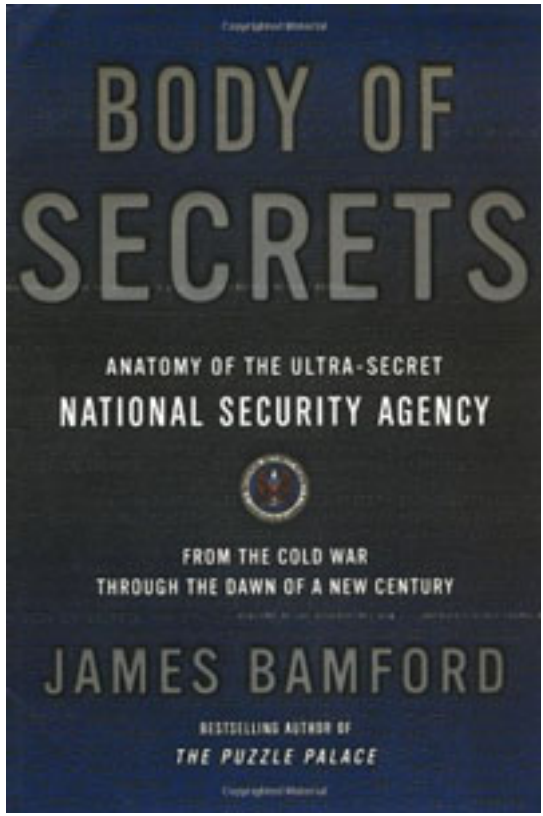
Pro-Israel elements of the media and their numerous activist supporters immediately launched a fierce counter-attack, spearheaded by former *New York Times* Executive Editor Abe Rosenthal, a fervent partisan of Israel, who denounced the Evans & Novak column as biased, misinterpreted, and fraudulent. When I read Novak's memoirs last year, he described how Israel's partisans had spent many years pressuring newspapers into dropping his column, which substantially reduced its reach as the years went by. The columnists were punished for crossing red-lines, their future influence diminished, and other journalists were given a powerful warning message against ever doing anything similar.



The story of the *Liberty* and especially the subsequent decades of political and media battles surrounding the case soon became the focus of scholarly research, with John E. Bourne making it the subject of his 1993 doctoral dissertation in history at NYU, then publishing the work through a small press two years later under the title *The USS Liberty: Dissenting History Vs. Official History*. Bourne's coverage seemed meticulous and scrupulously fair, breaking little new ground but gathering together and conveniently referencing a great deal of the underlying information, including the surprising success of the *Liberty* survivors in getting their account of the attack into the public arena despite the overwhelmingly greater political and financial resources of their determined opponents.

One important point emphasized by Bourne is that while the version of events provided by the *Liberty* crewmen has been almost completely consistent and unchanging from the first day, the Israeli government and its partisans had promoted numerous contrary narratives, most of them mutually contradictory, with pro-Israel advocates making absolutely no effort to reconcile these, and instead merely ignoring such severe discrepancies. This surely relates to the fact that although there can only be one true account of a historical event, invented falsehoods may diverge in a wide variety of different directions.

A couple of years later in 1995, the front page of the *New York Times* broke a seemingly unrelated story, which certainly captured my attention at the time. Our national newspaper of record revealed that during both the 1956 and 1967 wars, the Israeli military had brutally massacred large numbers of Egyptian POWs, with the evidence coming from the detailed research of Israeli military historians, eyewitness testimony including that of a retired Israeli general, and the discovery of mass graves in the Sinai desert.



Then in 2001, James Bamford published *Body of Secrets*, a much longer and more detailed sequel to his earlier history of the NSA, which once again became a national bestseller. This time the author devoted one of his longest chapters entitled "Blood" entirely to the story of the *Liberty*, and provided many new revelations. Among other things, he suggested that the ship had been targeted for destruction because the Israeli leadership feared that its extensive electronic surveillance equipment might record evidence of the enormous war-crimes they had then been committing along the neighboring coast, now believed to involve the execution of some 1,000 helpless Egyptian captives and local civilians, certainly one of the largest such atrocities committed by any Western army since World War II. This now provided an additional possible motive for the seemingly inexplicable Israeli attack.

Bamford's book also contained an even more momentous disclosure. After 35 years of NSA silence, he revealed that the entire *Liberty* incident had been monitored in real-time by an American electronic spy plane cruising far overhead, which intercepted and rapidly translated all the radio communications between the attacking Israeli forces and their Tel Aviv controllers,

information long regarded as "among NSA's deepest secrets." This helped explain why the senior leadership of the NSA had always been virtually unanimous that the attack was deliberate and intended to leave no survivors.

These intercepted conversations from the Israeli planes and torpedo boats had repeatedly mentioned seeing the *Liberty*'s large American flag, putting the lie to decades of emphatic denials. In Washington, DC, the top leadership of the NSA had been outraged by this information, especially once they realized that the Johnson Administration intended to protect Israel from any embarrassment, and had even considered sinking the *Liberty* after the attack to prevent journalists from photographing the severe damage. Indeed, the *Liberty* was strangely ordered to sail to distant Malta rather than the much closer port in Crete, perhaps in hopes that the limping vessel with a large hole in its hull would sink along the way, thereby permanently hiding the visual evidence.

Bamford's book also provided new information on the strange circumstances of the recall of two flights of carrier jets dispatched to rescue the *Liberty* during the attack, a development that had always been a source of puzzlement. The *Liberty*'s senior intelligence officer revealed that he was later informed by the Sixth Fleet's carrier admiral that the recall had been ordered by a direct phone call from Secretary of Defense Robert McNamara, with President Lyndon Johnson himself allegedly even getting on the line to demand that the order be obeyed and the *Liberty* left to its fate.

Bamford also noted that Israel's brutal and unprovoked attack on the American ship was hardly inconsistent with that country's other behavior. Not only had the Israelis been concurrently massacring so many hundreds of Egyptian POWs, but just a day or two earlier an Israeli tank column had attacked a convoy of unarmed UN peacekeepers flying their blue flag, brutally killing more than a dozen of them, while also blasting the local UN headquarters.

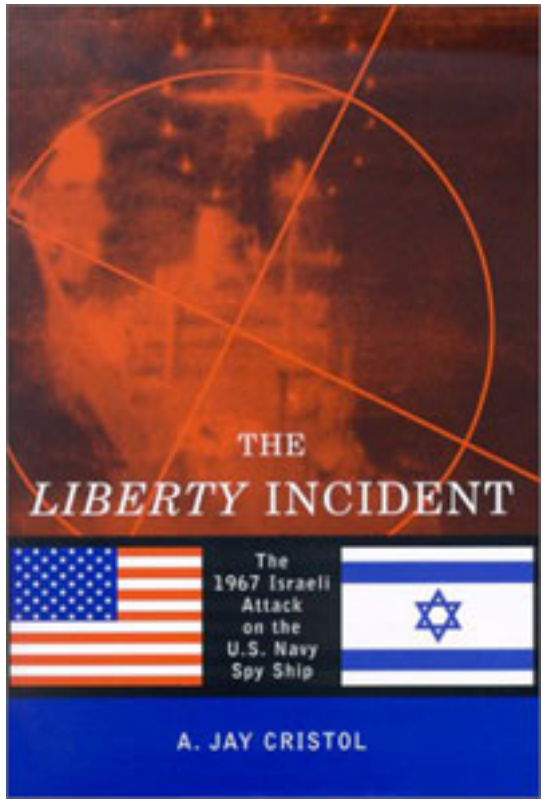
Bamford's text ran more than 700 pages, with his discussion of the *Liberty* incident amounting to less than 10% of the total, but that chapter attracted a hugely disproportionate share of the press interest, with the *New York Times* even running a major news story on the important new evidence he provided. The book's very favorable *Times* review also devoted quite a lot of space to his *Liberty* coverage, even though the reviewer strongly questioned the theory that the attack might have been motivated by Israel's desire to conceal its concurrent war crimes. Although most such reviews were quite

laudatory, the notoriously pro-Israel *New Republic* launched a fierce attack, authored by an American-born Israeli historian who had renounced his U.S. citizenship in order to enter Israeli government service, and I hardly considered it convincing at the time, even before I recently discovered Bamford's very effective rebuttal.

Although I only read Bamford's book itself a couple of years ago, I had seen the *Times* pieces and many of the other reviews when they originally appeared, and taken together all of this material further strengthened my conviction that the *Liberty* attack had been no accident.

## Revealing the American Cover-Up After 40 Years

Up until this point, Israel's partisans had mostly operated on defense, emphasizing the original verdict of accident issued by America's official 1967 inquiry panel, while working to suppress the reach of books or articles that challenged this established position. Given this situation, Borne's thorough media research suggested that they probably believed that silence was the best strategy to follow. The longest piece actively promoting the accidental attack theory had been a 6,000 word article in the September 1984 issue of *The Atlantic Monthly*, possibly written in response to the Ennes or Green books. The two authors had been Israeli journalists who relied almost entirely upon Israeli sources, mostly official ones, and the piece was hardly likely to sway the growing number of skeptics.



But in 2002, A. Jay Cristol, a Jewish bankruptcy judge in Florida who had served nearly four decades in our naval reserves, released *The Liberty Incident*, arguing that the attack had been purely accidental. Cristol's Preface emphasized his pro-Israel views and numerous Israeli friends, who encouraged and assisted this project, which he had begun some fifteen years earlier as an adult education masters thesis.

Although heavily promoted by Israel's numerous partisans, who used the occasion to loudly declare "Case Closed," I never heard of the book at the time, and was quite unimpressed when I recently read it, since it seemed to largely ignore or dismiss the mountain of evidence contrary to its thesis of Israeli innocence.

Indeed, the publication of Cristol's book provoked a particularly important reaction. One of the individuals whom the author had favorably cited as "a man of integrity," was retired Captain Ward Boston, Jr., the Navy attorney who had actually authored the official inquiry report in 1967. After having kept silent for nearly four decades, Boston was so outraged by Cristol's analysis that he came forward and signed a legal affadivit revealing the true facts of the original investigation.

According to Boston, both he and his superior, Admiral Isaac C. Kidd, the presiding judge, had been absolutely convinced at the time that Israel had deliberately attacked the *Liberty* and murdered our sailors, but they had been ordered by their political and military superiors, including Admiral John S. McCain, Jr., father of the late senator, to absolve the Jewish State of any blame. Moreover, major elements of their written report were deleted or altered before release, in further efforts to conceal the clear evidence of Israel's guilt. Considering that for over 35 years, Boston's official handiwork had been cited as the primary bulwark supporting Israeli innocence, his signed January 9, 2004 affidavit constituted a very powerful declaration to the contrary. Aside from condemning Cristol as a fraud and a liar and reporting that Admiral Kidd believed the author "must be an Israeli agent," Boston's statement closed with the following paragraph:

> Contrary to the misinformation presented by Cristol and others, it is important for the American people to know that it is clear that Israel is responsible for deliberately attacking an American ship and murdering American sailors, whose bereaved shipmates have lived with this egregious conclusion for many years.

A few years later, a major expose in the *Chicago Tribune* finally demolished the remaining shards of the decades-long cover-up. Written by a senior *Tribune* journalist who had previously won a Pulitzer Prize at the *New York Times* and drawing upon dozens of interviews and a large cache of official government documents newly declassified after four decades, the 5,400 word article was probably the longest piece on the *Liberty* incident ever to appear in the mainstream American news media. Much of the material presented was extremely damning, fully confirming crucial elements of previous accounts and demonstrating the extent of the ensuing cover-up.

Tony Hart, a former communications operator at a relay station remembers listening to the words of Secretary of Defense McNamara as he personally ordered the recall of the jets sent to rescue the *Liberty*: "President [Lyndon] Johnson is not going to go to war or embarrass an American ally over a few sailors." This independently confirmed the account reported by a *Liberty* officer a few years earlier in Bamford's book.

Aside from McNamara, nearly all the other senior members of the Johnson administration agreed with top intelligence advisor Clark Clifford that it was "inconceivable" that the attack had been a case of

mistaken identity. NSA Director Lt. Gen. Marshall Carter later secretly testified to Congress that the attack "couldn't be anything else but deliberate," and numerous other former top national security officials provided similar statements to the *Tribune,* finally going on the record after forty years.

For decades, a crucial point of contention had been whether the *Liberty* was flying an American flag visible to the attacking Israeli forces. At the time, the Israeli court of inquiry had firmly declared that "Throughout the contact, no American or any other flag appeared on the ship." As recently as 2003, the *Jerusalem Post* had interviewed the first Israeli pilot to attack, and he once again declared that he had circled the ship twice, slowing down and looking carefully, and "there was positively no flag."

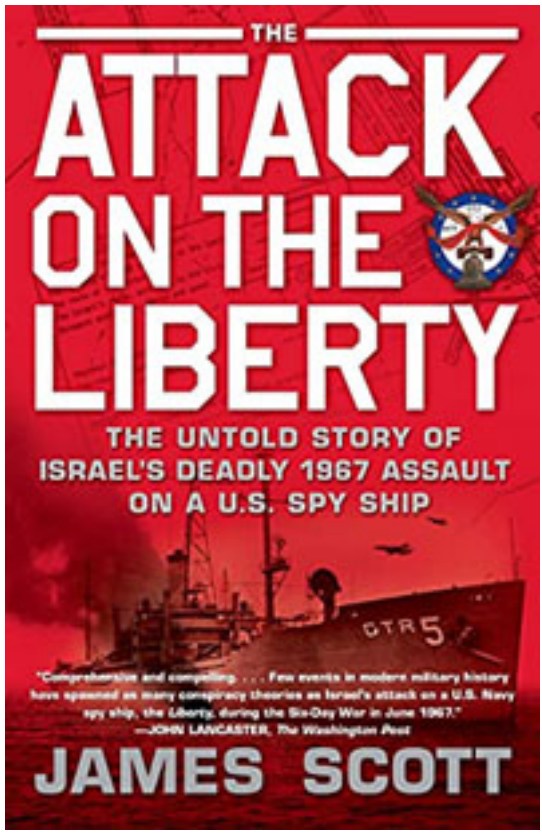
By contrast, declassified NSA documents stated that all the surviving crew members interviewed had uniformly stated that their ship had been flying a large flag before, during, and after the attack, except for a brief period when it had been shot down, quickly replaced by their largest American flag, measuring 13 feet long.

NSA transcripts affirmed the claims of the Americans and proved that the Israelis were lying. As numerous sources had claimed over the years, the intercepted transmissions of the Israeli pilots had been immediately translated into English, with transcripts of their conversations rolling off the teletype machines at our intelligence offices around the world. These proved beyond any doubt that the pilots reported the ship was American and they had been ordered to sink it regardless, with the content of the transcripts confirmed by separate interviews with American intelligence specialists based in Nebraska, California, and Crete, while several other former American officials also affirmed the existence of those transcripts.

Five days later the Israeli Ambassador secretly warned his government that the Americans had "clear proof" that the attack had been deliberate. But according to a former CIA officer, the transcripts "were deep-sixed because the administration did not wish to embarrass the Israelis." This official cover-up was partially circumvented by some shrewd intelligence officials who had those transcripts assigned for official training purposes at the U.S. Army's intelligence school. W. Patrick Lang, who later spent eight years as Chief of Middle East intelligence for the DIA, vividly remembers seeing them in his coursework, and they left absolutely no doubt that the Israeli attack had been deliberate.

Although some tapes had been released, several of the personnel originally involved in recording and translating the transmissions agree that at least two of the key tapes have now gone missing or at least have not yet been declassified, and this is supported by gaps in the numbering of those that have been released.

- New revelations in attack on American spy ship
  John Crewdson • ***The Chicago Tribun***e • October 2, 2007 • 5,400 Words



A couple of years later in 2009, James Scott, a young, award-winning journalist and son of a *Liberty* survivor, published *Attack on the Liberty*, a book that seemed likely to become the final major account of the incident. Released by a prestigious mainstream press, the text ran more than 350 pages with copious notes and numerous photographs. When I read it six or seven years ago, I didn't think it broke much new ground, but the work seemed to very effectively summarize all of the main material from more than four decades of research and debate, probably becoming that standard text on the topic.

A great deal of information is also now easily available on the Internet. Alison Weir runs *If Americans Knew*, an activist organization focused on the Israel-Palestine conflict, and a section of her website provides a convenient repository of numerous primary source documents regarding the U.S.S. Liberty incident. A U.S.S. *Liberty* Memorial website also provides considerable material on the event.

In recent years, our own Philip Giraldi, a former CIA officer, has become one of the most regular writers on the story of the *Liberty*, producing half a dozen articles focused directly on that topic:

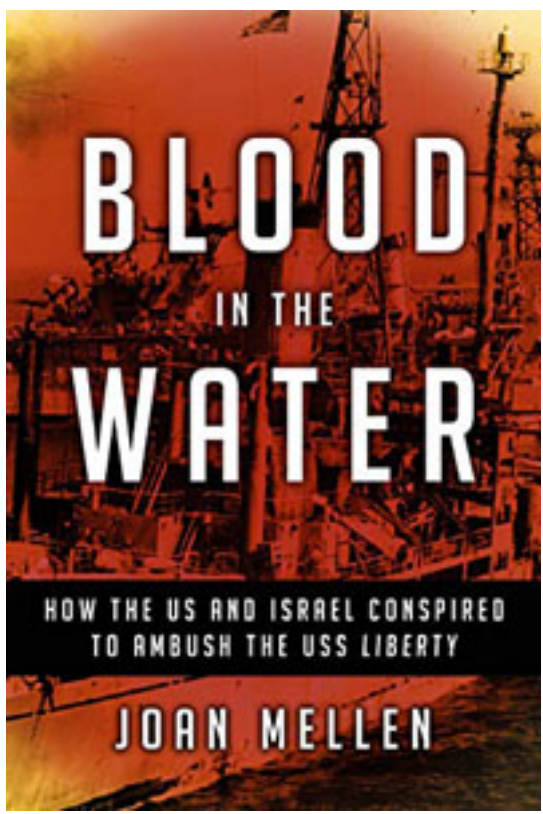
## President Lyndon Johnson and a Planned Attack on Egypt?

Over the last few years my understanding of many major historical events has undergone a radical transformation, but the *Liberty* incident was not among them. Since I first encountered the story almost thirty years ago, my views had merely solidified rather than changed in any significant respect. I'd immediately been persuaded that the attack was intentional, soon followed by a disgraceful American cover-up,

and the three or four books I eventually read on the topic had merely filled in some blanks, while casting my original conclusions into solid concrete. The only remaining mystery was the Israeli motive for such an apparently reckless undertaking, and with three or four somewhat plausible possibilities having been suggested, there seemed to be no way of deciding between them. Not only did I regard the topic as closed, but I believed it had been closed for at least a decade or two. And that was my settled opinion until a month ago.

The story of a deadly Israeli attack upon America's own military and a long and shameful cover-up naturally provoked all sorts of wild speculation from conspiracy-minded individuals, who regularly expounded the most bizarre ideas on the comment-threads of any article discussing the topic. A couple of years ago, I noticed a flurry of such chatter, including claims of a diabolical plot by President Johnson to treacherously arrange the attack on his own ship as an excuse for starting World War III, with the theory having apparently been promoted by some recently published book.



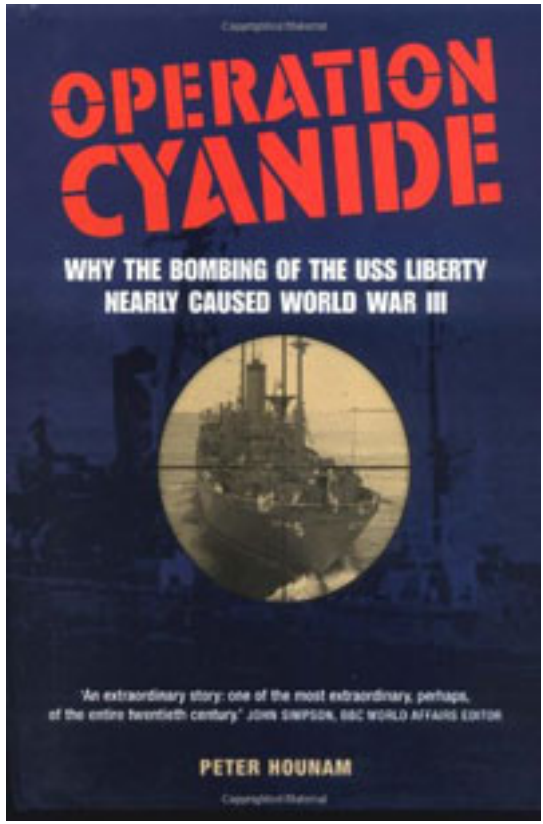
At first I paid no attention to such nonsense, but I eventually took a look at the Amazon page of *Blood in the Water* by Joan Mellen, an

author entirely unknown to me, and was shocked to discover lavish praise by Prof. Richard Falk of Princeton, an eminent international legal scholar. Thinking that the theory might be less absurd than it seemed, I clicked a button, bought it, and suspended my disbelief during the two days it took me to read the text.

Unfortunately, the contents were almost exactly as I had originally assumed, filled with implausible speculations, unwarranted assertions, and huge leaps of logic. Unsubstantiated claims were endlessly repeated, apparently in hopes of bludgeoning the reader into eventual acceptance. And although the text was purportedly written by a tenured professor of English at a small university, the editing was among the worst of any professionally-published book I had ever encountered, with the same sentence—or even the same short paragraph—sometimes duplicated on consecutive pages; such severe stylistic flaws merely deepened my skepticism about the credibility of the substantive material presented. Prof. Falk was an esteemed scholar, but he had also been in his late 80s when the book was released, and I assumed that he hadn't actually read the text apart from a few small extracts, while his outrage at a half-century of governmental injustice had secured his endorsement of such a poor quality expose. I felt that my time reading it had been wasted, and I became more firmly convinced than ever that the story of the *Liberty* was closed.

Then earlier this year I once more began seeing some chatter about a very similar theory regarding the *Liberty*, again advanced by an author totally unknown to me and presented in a book bearing an especially lurid title. I naturally dismissed such nonsense under the principle of "once bitten, twice shy."

However, a month or two ago, I happened to be reading a work by Michael Collins Piper, a conspiracy-researcher who had earned my considerable respect, and in a couple of sentences he alluded to the book in question, greatly praising its "astonishing" findings. So I looked it up on Amazon and found that it had been released in 2003. A book published 18 years ago by a tiny press that made such wild charges but had never attracted any attention nor reviews was hardly likely to be very persuasive, but since I had some time on my hands, I ordered a copy and a few days later took a look.



OPERATION CYANIDE
WHY THE BOMBING OF THE USS LIBERTY NEARLY CAUSED WORLD WAR III
'An extraordinary story: one of the most extraordinary, perhaps, of the entire twentieth century' JOHN SIMPSON, BBC WORLD AFFAIRS EDITOR
PETER HOUNAM

I had never heard of Peter Hounam and a book entitled *Operation Cyanide* containing wild talk of World War III in the subtitle certainly multiplied my doubts, but the cover carried a glowing endorsement by the BBC World Affairs Editor, hardly the sort of individual likely to lend his name to crackpots. Moreover, according to the back flap, Hounam had spent thirty years in mainstream British journalism, including a long stint as Chief Investigative Journalist at the *London Sunday Times*, so he obviously possessed serious credentials.

A bit of casual Googling confirmed these facts and also revealed that in 1987 Hounam had led the *Sunday Times* team that broke the huge story of Israel's nuclear weapons program, with the evidence provided by Israeli technician Mordechai Vanunu, just before he was kidnapped by Mossad, returned to Israel, and given a twenty year prison sentence. Hounam certainly had a much more impressive background than I had initally assumed.

The book itself was of moderate length, running perhaps 100,000 words, but quite professionally written. The author carefully distinguished between solid evidence and cautious speculation, while also weighing the credibility of the various individuals whom he had

interviewed and the other material used to support his conclusions. He drew upon most of the same earlier sources with which I was already familiar, as well as a few others that were new to me, generally explaining how he reached his conclusions and why. The overall text struck me as having exactly the sort of solid workmanship that one might expect from someone who had spent three decades in British investigative journalism, including a position near the top of the profession.

As Hounam explained on the first page, he had been approached in 2000 by a British television producer, who recruited him for a project to uncover the truth of the attack on the *Liberty*, an incident then entirely unfamiliar to him. His research of the history occupied the next two years, and included travels throughout the United States and Israel to interview numerous key figures. The result was an hour-long BBC documentary *Dead in the Water*, eventually shown on British television, as well as the book he concurrently produced based upon all the research he had collected.

As I began the text, the first pages of the Introduction immediately captured my attention. In late 2002, with the book almost completed, Hounam was contacted by Jim Nanjo, a 65-year-old retired American pilot with an interesting story to tell. During the mid-1960s he had served in a squadron of strategic nuclear bombers based in California, always on alert for the command to attack the USSR in the event of war. On three separate occasions during that period, he and the other pilots had been scrambled into their cockpits on a full-war alert rather than a training exercise, sitting in the planes for hours while awaiting the signal to launch their nuclear attack. Each time, they only discovered the event that had triggered the red alert after they received the stand-down order and walked back to their base. Once it had been the JFK assassination and another time the North Korean seizure of the U.S.S. *Pueblo*, with the third incident being the 1967 attack upon the *Liberty*.

All of this made perfect sense, but when Hounam checked the pilot's reported chronology, he discovered that the squadron had actually been put on full war-alert status at least an hour *before* the *Liberty* came under Israeli attack, an astonishing logical inconsistency if correct.

Memories may easily grow faulty after 35 years, but this strange anomaly was merely one of many that Hounam encountered during his exhaustive investigation and the facts that he uncovered gradually resolved themselves into the outline of a radically different

reconstruction of historical events. Although more than half the book recounts the standard elements of the *Liberty* story that I had already read many times before, the other material was entirely new to me, never mentioned elsewhere.

President Johnson was a notorious micro-manager, very closely monitoring daily casualties in Vietnam, as well as the sudden new outbreak of war in the Middle East, and he always demanded to be told immediately of any important development. Yet when America's most advanced spy ship with a crew of nearly 300 reported that it was under deadly attack by unknown enemy forces, he seems never to have been informed, at least according to the official White House logs. Instead, he supposedly spent the morning casually eating his favorite breakfast and then mostly engaging in domestic political chit-chat with various senators.

Declassified documents from the CIA, the NSA, and the Pentagon prove that red-alert messages had been sent to the White House Situation Room almost immediately, and American military policy is that any flash message reporting an attack on a U.S. naval vessel must be immediately passed to the president, even if he is asleep. Yet according to the official records, Johnson—wide awake and alert—received no notice until almost two hours later, after the assault on the *Liberty* had ended. Moreover, even when finally informed, he seemed to pay little attention to the most serious naval attack our country had suffered since World War II, instead focusing upon minor domestic political issues. Johnson did put in two calls to Secretary of Defense Robert McNamara, who according to naval logs minutes later ordered the recall of the carrier planes sent to rescue the *Liberty*, and Secretary of State Dean Rusk later stated that McNamara would never have made that decision without first discussing it with his president. But based upon the official records Johnson himself had not yet been informed that any attack had occurred.

Indeed, according to the later recollections of Rusk and top intelligence advisor Clark Clifford, during the morning Situation Room meeting two hours later, the Soviets were still believed responsible for the attack, and the participants had a sense that war might have already broken out. Although the Israeli identity of the attackers had been known for more than an hour, most of our top government leaders still seemed to be contemplating World War III with the USSR.

Hounam believes that these numerous, glaring discrepancies indicated the official logs had been altered in potentially very serious ways, apparently with the intent of insulating President Johnson from

having learned of the attack and its crucial details until long after that had occurred. The author's analysis of these severe chronological discrepancies seems quite meticulous to me, covering several pages, and should be carefully read by anyone interested in these highly suspicious events and the seemingly doctored record.

Hounam also focused upon several unexplained elements presented in the books by Ennes and others. There does seem solid if very fragmentary evidence that the *Liberty*'s positioning off the Egyptian coast was part of some broader American strategic plan, whose still classified details remain largely obscure to us. Ennes' book briefly mentioned that an American submarine had secretly joined the *Liberty* as it traveled to its destination, and had actually been present throughout the entire attack, with some of the sailors seeing its periscope. Although one of the crew had been privy to the classified details, he later refused to divulge them to Ennes when asked. According to some accounts, the sub had even used a periscope camera to take photographs of the attack, which various individuals later claimed to have seen. The official name for that secret submarine project was "Operation Cyanide," which Hounam used for the title of his book. One heavily-redacted government document obtained by Hounam provides tantalizing clues as to why the *Liberty* had officially been sent to the coast, but anything more than that is speculation.

There were other strange anomalies. A senior NSA official had been strongly opposed to sending the *Liberty* into a potentially dangerous war-zone but had been overruled, while the ship's request for a destroyer escort from the Sixth Fleet had been summarily refused. The day before the attack, top NSA and Pentagon officials had recognized the obvious peril to the ship, even receiving a CIA intelligence report that the Israelis planned to attack, and this led to several urgent messages being sent from Washington, ordering the captain to withdraw to a safe distance 100 miles from the coast; but through a bizarre and inexplicable series of repeated routing errors, none of those messages had ever been received. All of these seemingly coincidental decisions and mistakes had ensured that the *Liberty* was alone and defenseless in a highly vulnerable location, and that it remained there until the Israeli attack finally came.

Hounam also sketched out the broader geopolitical context to the events he described. Although originally open to friendly relations with America, Egyptian leader Gamal Nasser had been denied promised US assistance due to the pressure of our powerful Israel Lobby and was therefore pushed into the arms of the USSR, becoming

a key regional ally, arming his military forces with Soviet weaponry and even allowing nuclear-capable Soviet strategic bombers to be based on his territory. As a consequence, Johnson became intensely hostile towards Nasser, regarding him as "another Castro" and seeking the overthrow of his regime. This was one of the major reasons his administration offered a green-light to Israel's decision to launch the Six Day War.

In the opening hours of that conflict, Israel's surprise attack had destroyed the bulk of the Egyptian and Syrian air forces on the ground, and these devastating losses soon led Nasser and other Arab leaders to publicly accuse the American military of having entered the war on Israel's side, charges almost universally dismissed as ridiculous both by journalists at the time and by later historians. But Hounam's detailed investigation uncovered considerable evidence that that Nasser's claims may have been true, at least with regard to aerial reconnaissance and electronic communications.

According to the statements of former American airman Greg Reight, he and his aerial photo reconnaissance unit were secretly deployed to Israel, assisting the attack by determining enemy losses and helping to select subsequent targets. This personal account closely matched the details of the overall operation previously described in Green's book almost two decades earlier. All these claims were supported by the extremely sharp photos of destroyed Egyptian airfields later released by Israel and published in American news magazines since experts agreed that the Israeli air force did not then possess any of the necessary camera equipment.

A successful Florida businessman named Joe Sorrels provided a very detailed account of how his American intelligence unit had been infiltrated into Egypt's Sinai Peninsula before hostilities began and set up electronic monitoring and "spoofing" equipment, which may have played a crucial strategic role in enabling the sweeping Israeli victory. There were even claims that American electronic expertise helped locate the crucial gaps in the radar defenses of the Egyptian airfields that allowed Israel's surprise attack to become so successful.

Hounam also emphasized the likely political motive behind Johnson's possible decision to directly back Israel. By 1967 the Vietnam War was going badly, with mounting American losses and no victory in sight, and if this quagmire continued, the president's reelection the following year might become very difficult. But if the Soviets suffered a humiliating setback in the Middle East, with their Egyptian and

Syrian allies crushed by Israel, perhaps culminating in Nasser's overthrow, that success might compensate for the problems in Southeast Asia, diverting public attention toward much more positive developments in a different region. Moreover, the influential Jewish groups that had once been among Johnson's strongest supporters had lately become leading critics of the continuing Vietnam conflict; but since they were intensely pro-Israel, success in the Middle East might bring them back into the fold.

This provides the background for one of Hounam's most controversial suggestions. He notes that in 1964, Johnson had persuaded Congress to pass the Tonkin Gulf Resolution by a near-unanimous vote, authorizing military strikes against North Vietnam, but based upon an alleged attack upon American destroyers that most historians now agree was fictional. Although the resulting Vietnam War eventually became highly unpopular, Johnson's initial "retaliatory" airstrikes just three months before the 1964 election rallied the country around him and helped ensure his huge landslide reelection victory against Sen. Barry Goldwater. And according to Ephraim Evren, a top Israeli diplomat in the U.S., just a few days before the outbreak of the Six Day War Johnson met with him privately and emphasized the urgent need "to get Congress to pass another Tonkin resolution," but this time with regard to the Middle East. An excuse for direct, successful American military intervention on Israel's behalf would obviously have solved many of Johnson's existing political problems, greatly boosting his otherwise difficult reelection prospects the following year.

We must always keep in mind that only a miracle kept the *Liberty* afloat, and if it had been sunk without survivors as expected, almost no one in American media or government would have dared accuse Israel of such an irrational act. Instead, as Stephen Green had first suggested in 1984, Egyptian forces would very likely have been blamed, producing powerful demands for immediate American retaliation, but probably on a vastly greater scale than the fictional Tonkin Gulf attack, which had inflicted no injuries.

Indeed, Hounam's detailed investigation discovered strong evidence that a powerful American "retaliatory" strike against Egypt had already been put into motion from almost the moment that the *Liberty* was first attacked. Paul Nes then served as charge d'Affaires at the U.S. Embassy in Cairo, and in a taped interview he recalled receiving an urgent flash message alerting him that the *Liberty* had been attacked, presumably by Egyptian planes, and that bombers from an American carrier were already on their way to strike Cairo in

retaliation. With an American-Egyptian war about to break out, Nes and his subordinates immediately began destroying all their important documents. But not long afterward, another flash message arrived, identifying the attackers as Israeli and saying that the air strike had been called off. According to some accounts, the American warplanes were just minutes from Egypt's capital city when they were recalled.

Let us consider this. In a taped interview a former top American diplomat revealed that in 1967 America came very close—perhaps even within minutes—of attacking Egypt in retaliation for the *Liberty*. Surely a revelation of this magnitude from such a credible source might be expected to reach the front page of the *New York Times* and other leading world newspapers. But instead I had never heard a word about it during the past 18 years, and a little Googling suggests that it has received virtually no discussion anywhere, except within the most obscure fringes of the Internet.

Most of this seems like very solid factual material, and although the resulting interpretations may differ, I think the hypothesis advanced by Hounam is quite plausible. He suggested that President Johnson helped arrange the attack on the *Liberty*, hoping to orchestrate a new Tonkin Gulf Resolution but on a much grander scale, allowing him to attack and oust Nasser in retaliation. An American military assault against such an important regional Soviet ally would certainly have raised the risk of a much broader conflict, so our strategic bomber force had been put on full war-alert an hour or more before the *Liberty* incident unfolded. However, the *Liberty* and its crew of eyewitnesses somehow managed to stay afloat and survive, and eventually word that their attackers had been Israeli rather than Egyptian reached our top political and military leadership ranks, so the plan had to be abandoned.

Our mainstream media has spent decades scrupulously avoiding the slightest hint that the attack on the Liberty had been part of a broader plot to unseat Nasser, one that probably involved President Johnson. But as the testimony of several eyewitnesses above indicates, many of these facts would have been known at least to the circle of military men and intelligence operatives involved in the project. So we should not be entirely surprised that elements of the story gradually leaked out, though often in garbled, inaccurate, and disjointed fashion.

Indeed, the first substantial account claiming that the *Liberty* attack had been intentional rather than accidental appeared in the writings of independent journalist Anthony Pearson, who in 1976 published a couple of long articles in *Penthouse*, allegedly based upon British

intelligence sources, and he later incorporated these into his 1978 book *Conspiracy of Silence*. His account lacked any references, was written in a breathlessly conspiratorial fashion, and contained a number of glaring errors, so it was hardly reliable and usually dismissed. But it did seem to also contain a good deal of material that was only later confirmed by more reliable research, demonstrating that he had access to some knowledgeable individuals. And in his account, Pearson claimed that the attack had been part of a much broader American plan to overthrow Nasser, which suggests such rumors were circulating among his sources.

Bourne's very thorough research mentioned that similar claims suggesting that the *Liberty* fell victim to an American-Israeli plan to bring down Nasser had also appeared in two books on intelligence matters published in 1980, Richard Deacon's *The Israeli Secret Service* and Stewart Steven's *The Spymasters of Israel*. These accounts similarly provided no sources and since they appeared too early to make use of Ennes' detailed narrative, contained numerous factual errors, but they do further suggest that such theories, whether correct or not, had become quite widespread within intelligence circles.

## A Nuclear Strike Against Egypt?

If this were the extent of the historical hypothesis advanced in Hounam's relatively short book, his work would certainly rank as a remarkable piece of investigative journalism, possibly overturning decades of assumptions about the *Liberty* incident, and perhaps uncovering one of the most shocking examples of government treachery in American history. But there are additional elements, and although they are far less solidly established, they should not be ignored.

Recollections can easily fade over more than three decades, but some memories remain indelible. Hounam provides a great deal of testimony indicating that the bombers dispatched to strike Egypt in retaliation for its assumed attack on the *Liberty* may have been armed with nuclear warheads.

Mike Ratigan, a catapult operator on board the U.S.S. *America*, recalls that his entire ship was put into "Condition November," a top alert status only used in connection with armed nuclear warheads, and that the special bombs being loaded onto the A-4 Skyhawk bombers were unlike any he had previously seen, while also being escorted by Marine guards, another very unusual situation. There was a

widespread belief on the ship that a nuclear attack was about to be launched. For obvious reasons, the Navy had absolute rules that bombers carrying armed nuclear warheads were prohibited from landing on carriers, and after the flight was dispatched and then recalled, the planes were all diverted to a land airbase to be off-loaded, not returning to their carrier for four or five days.

That same carrier had been hosting 28 journalists from British and American media outlets, and some of these invididuals also had strong recollections. Jay Goralski, a U.S. reporter, remembered that the bombers were launched in a retaliatory strike against shore targets and that they were only recalled and the strike aborted "at the last moment, just before they would have lost radio contact." A UPI reporter named Harry Stathos saw the nuclear-armed aircraft being launched, and was told by the deck crew that the strike was targeting Cairo, though he agreed at the time not to disclose any of this information.

*Liberty* survivor Chuck Rowley later spoke to a carrier pilot who claimed he had flown one of the jets that day, saying he had been carrying nuclear weapons and had been ordered to target Cairo. Other *Liberty* survivors heard similar stories over the years from naval personnel who described the special alert status that day, as nuclear warheads were armed and loaded onto the bombers preparing to launch. Moe Shafer had been transferred to the Sixth Fleet flagship for treatment of his injuries, and he claimed that the commanding admiral mentioned to him that several of his bombers had been three minutes away from a nuclear attack on Cairo when they were recalled.

Joe Meadors, another former *Liberty* crewman, later heard from military personnel on Crete their astonishment at having to unload the armed nuclear warheads of bombers that had been diverted there rather than allowed to directly return to the carrier, and they were told that the planes had been sent to strike Cairo in retaliation for the *Liberty*.

All of this evidence is merely circumstantial, with much of it amounting to hearsay, often reported second or third hand by ordinary servicemen rather than by trained journalists or researchers. But there does seem to be quite a lot of it. Hounam remains somewhat agnostic about whether Cairo had indeed been targeted for a nuclear attack in retaliation for the *Liberty*, but he does not believe that the possibility can be entirely disregarded.

We must also keep in mind that a nuclear strike against Cairo would

not necessarily mean the destruction of the densely populated urban center. The author notes that a squadron of nuclear-capable Soviet strategic bombers were based at a West Cairo airfield far from the urban core, and their presence in the Middle East had aroused great American concerns. He speculates that their destruction in a nuclear attack might have been seen as a very potent demonstration of supreme American power across the entire region but without inflicting the massive casualties of a bombing closer to the center of the city. Admittedly, all of this is pure conjecture, and until additional documents are declassified and made available, we lack the necessary means of forming any solid conclusions.

It is a truism that extraordinary claims require extraordinary evidence, and while the hypothesis that America in 1967 came very close to launching a nuclear attack against Nasser's Egypt certainly falls into the former category, the evidence that Hounam has accumulated does not come close to meeting the requirements of the latter. However, while a month ago I would have regarded such a theory as utterly preposterous lunacy, not warranting a moment's thought, I now view it as a serious possibility worth considering.

The absolute and total blackout that seems to have immediately enveloped Hounam's remarkable book hardly increased the likelihood that many new sources would come forward, but the accompanying BBC documentary *Dead in the Water* was released and aired, becoming the first and only professional media treatment of that important historical episode.

As was appropriate, the bulk of the film covered the basic elements of the *Liberty* story, though including the suggestion that the motive of the Israeli action had been to provoke an American attack against Egypt and even raising the possibility that the use of nuclear weapons might have been planned. However, any speculation that President Johnson had been involved in the plot was left on the cutting-room floor, and perhaps this was the correct decision to make. The first serious documentary on a highly controversial but almost ignored historical event should probably stick close to the basics and not overly challenge its previously uninformed audience.

Although the documentary was never broadcast on American television, the rights were eventually transferred to the Liberty Veterans Association, which for many years sold the videocassette. A version of adequate quality is now available on Youtube, so those

interested in the story of the *Liberty* may watch it and decide for themselves.

There is also an intriguing backstory both to Hounam's book and to the British documentary that had originally brought the author into the topic. The entire project apparently came about through the efforts of Richard Thompson, a former American Intelligence officer, who later became a highly successful international businessman. For years he had been a determined champion of the *Liberty* issue and the surviving crew members, and he organized and funded the film project, investing a total of $700,000 of his own money to bring it to fruition. After the documentary was complete, Jewish groups in Britain went to court to block its release, forcing Thompson to spend $200,000 in legal fees to overcome their challenge and allow the broadcast. And although Thompson's name is not listed on the cover of the accompanying book, he seems to have played a major role in providing some of the underlying research and he shared the copyright with Hounam.

Thompson had regularly attended annual *Liberty* reunions, and at the 40th in 2007, he arranged to meet with Mark Glenn, a journalist for *American Free Press*, an alternative tabloid newsweekly, known for its willingness to cover controversial issues, including those portraying Israel in a negative light. Thompson claimed to have important new information about the backstory to the *Liberty* incident, facts that

further extended Hounam's findings, and he promised to provide the material to Glenn in a series of interviews. However, while driving home from Washington the following morning, Thompson died in a strange one-car accident, as his vehicle crossed the dividing meridian of the interstate highway and collided with a tree. Although aged 76, Thompson had seemed in perfect health and he had previously reported being stalked by individuals apparently connected to Israel, so Glenn found his death suspicious, as did Michael Collins Piper, a noted conspiracy-researcher. More of his background was provided in a fairly lengthy obituary that appeared in the *Washington Report on Middle East Affairs*, a well-regarded and somewhat establishmentarian publication critical of Israel.

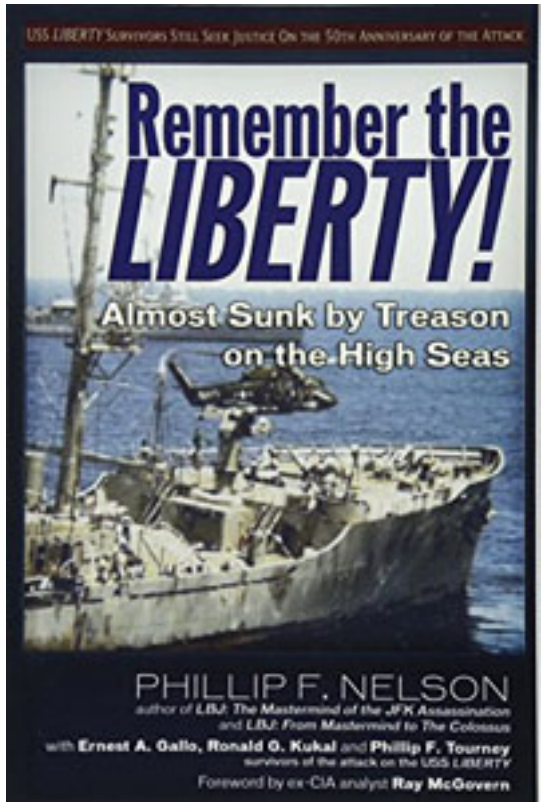
This possibly suspicious death was not the only one associated with the *Liberty* issue. Anthony Pearson's articles in *Penthouse* and his subsequent book had been the first to claim that the Israeli attack was deliberate, and a few years later he began to complain of persecution by the Mossad; soon afterwards, he was dead, allegedly having been poisoned. Bourne's research reported that a rather dubious individual involved in numerous unsuccessful attempts during the mid-1980s to raise funding for a film on the *Liberty* was found shot to death in his Pasadena home in 1988, though the motive for the unsolved homicide may have been entirely unconnected.

## Means, Motive, and Opportunity

The especially controversial elements of the theories propounded in Hounam's 2003 book probably precluded any discussion by most others writing on the *Liberty* incident, which is why the work never came to my attention until quite recently. In his comprehensive 2009 book, Scott thanked Thompson for having provided him with numerous out-takes from his *Dead in the Water* documentary, but neither Thompson's name nor that of Hounam appeared anywhere else in the text, perhaps because such a reference might have alarmed the very mainstream publisher, Simon and Schuster. Hounam's name also is nowhere to be found on Alison Weir's website nor that of the U.S.S. *Liberty* memorial organization. Even individuals who had published several articles on the *Liberty* were completely unfamiliar with Hounam's ground-breaking research when I queried them.

However during the last few years, this situation has begun to change. Mellen's 2018 book had developed a theory quite similar to the one that Hounam had published fifteen years earlier, and she repeatedly referenced him. As I now reread her work, all the severe

flaws I had previously noticed were still just as apparent, but I also recognized that she did provide a considerable amount of additional useful information, supplementing Hounam.



USS LIBERTY Survivors Still Seek Justice On the 50th Anniversary of the Attack
Remember the LIBERTY!
Almost Sunk by Treason on the High Seas
PHILLIP F. NELSON
author of LBJ: The Mastermind of the JFK Assassination and LBJ: From Mastermind to The Colossus
with Ernest A. Gallo, Ronald O. Kukal and Phillip F. Tourney
survivors of the attack on the USS LIBERTY
Foreword by ex-CIA analyst Ray McGovern

The previous year had been the 50th anniversary of the *Liberty* incident and noted conspiracy researcher Phillip F. Nelson had marked the occasion by releasing a far stronger book on the incident. The author fully acknowledged that he was closely following the trail blazed by Hounam, whose work he repeatedly characterized as "seminal." *Remember the Liberty!* was written in association with several of the *Liberty* survivors and included a Foreword by highly-regarded former CIA analyst Ray McGovern.

Nelson was an especially harsh critic of Lyndon Johnson, probably best known for his 2010 and 2014 books marshaling the considerable evidence implicating LBJ in the assassination of his predecessor John F. Kennedy, and at certain points he seemed insufficiently cautious about accepting some of less solidly-attested accusations in the case of the *Liberty*. But the author does provide a great deal of important information on the president's very difficult political situation in 1967, persuasively extending Hounam's argument that a new Tonkin

Gulf type event in the Middle East and a sweeping American military victory might have been crucial to Johnson's prospects for reelection in 1968.

During the three generations since World War II, America has ranked as the world's leading superpower, with its military possessing unmatched global reach and strength. Although the *Liberty* was a nearly defenseless intelligence ship sailing international waters, our powerful Sixth Fleet was nearby, so the deadly attack upon the vessel was not merely an obvious war-crime, but a very strange one, perhaps the most serious that our forces had suffered in decades, yet still entirely unpunished even today.

Solving such a crime usually involves a careful consideration of means, motive, and opportunity. There is no doubt that Israel's military deliberately attacked our ship, but the other two legs of the tripod remain puzzling. The risks that Israel took in its unprovoked attack against the ship of its sole ally were enormous. And the opportunity to sink the *Liberty* only came about due to a long and very strange series of supposed American communication errors. But if we accept the framework proposed by Hounam, Nelson, Mellen, and their adherents and postulate the secret involvement of President Lyndon Johnson, both these difficulties immediately disappear.

Planning to sacrifice a few hundred American lives and risk World War III to bolster his reelection chances would obviously add a very black mark to the reputation of our 36th president. But based upon my extensive historical research, I do not think he would have been the first American leader to have followed this sort of callous political calculus, although such decisions were afterward concealed by later generations of historians. Indeed, a couple of years ago, I came to very similar conclusions regarding the primary architect behind the outbreak of World War II:

> During the 1930s, John T. Flynn was one of America's most influential progressive journalists, and although he had begun as a strong supporter of Roosevelt and his New Deal, he gradually became a sharp critic, concluding that FDR's various governmental schemes had failed to revive the American economy. Then in 1937 a new economic collapse spiked unemployment back to the same levels as when the president had first entered office, confirming Flynn in his harsh verdict. And as I wrote last year:

Indeed, Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after a top Roosevelt adviser had privately boasted to him that a large bout of "military Keysianism" and a major war would cure the country's seemingly insurmountable economic problems. At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.

The last point is an important one since the confidential opinions of those closest to important historical events should be accorded considerable evidentiary weight. In a recent article John Wear mustered the numerous contemporaneous assessments that implicated FDR as a pivotal figure in orchestrating the world war by his constant pressure upon the British political leadership, a policy that he privately even admitted could mean his impeachment if revealed. Among other testimony, we have the statements of the Polish and British ambassadors to Washington and the American ambassador to London, who also passed along the concurring opinion of Prime Minister Chamberlain himself. Indeed, the German capture and publication of secret Polish diplomatic documents in 1939 had already revealed much of this information, and William Henry Chamberlin confirmed their authenticity in his 1950 book. But since the mainstream media never reported any of this information, these facts remain little known even today.

# Giants Silenced by Pygmies

*The Media Suppression of Our Leading Journalists and Scholars*

***The Unz Review*** • November 22, 2021 • 12,200 Words

## Glenn Greenwald and *The Intercept*

During the height of the NSA disclosures a few years ago, Glenn Greenwald probably ranked as the world's most famous journalist, and his entire career had seemed something out of a left-liberal storybook.

Becoming disenchanted with his corporate law career at a top firm, he co-founded a small practice specializing in First Amendment issues, then started a personal blog denouncing the civil liberties violations of the Bush Administration. He gained such recognition for his insightful commentary that he was hired by *Salon*, the premier leftist webzine, and a couple of years later was recruited by the liberal *Guardian*, then

at the height of its international reputation. His high-profile writings on governmental abuses drew the attention of Edward Snowden, the young NSA whistleblower, who offered him the story of a lifetime, complete with its James Bond flourishes in Hong Kong, and worldwide fame together with a Pulitzer Prize soon followed. No sooner had the echoes of those establishment accolades begun to fade than he returned to the front-pages as co-founder of a new international media organization aimed at providing honest reporting free from any political restrictions, an enterprise backed by a pledge of $150 million in future funding from a public-spirited Silicon Valley multi-billionaire. That truly seemed a Cinderella tale complete with happy ending, fit to inspire future generations of liberal young journalists.

However, the story didn't end at that point. The old *Rocky & Bullwinkle* cartoons of my childhood always included a "Fractured Fairy Tales" segment, providing a satirical account of what probably happened after the curtain came down, and over the past year Greenwald's personal trajectory unexpectedly swerved into that territory. In late 2020, he angrily departed the sizable anti-censorship media empire he had helped to create because his own writing was being censored, choosing to return to his roots as an independent blogger on the new Substack platform.

As far as I can tell, none of his ideological positions had shifted more than a whit over the last decade or more, but the same views that had once enshrined him as the conquering hero of liberal and left-liberal journalists have now suddenly rendered him toxic and unwanted in those same quarters, with his sole remaining foothold in the traditional media being his regular appearances on *Tucker Carlson Tonight*, a FoxNews broadcast regularly attacked as representing the most extreme rightwing fringe still found on television. For at least three generations, American liberals had regarded our national security organs—the CIA, the NSA, and the FBI—as some of their greatest villains, with such hostile sentiments reaching their peak just a few years ago when Greenwald and Snowden revealed the massive scale of illegal NSA spying. Yet these days, former high-ranking CIA, NSA, and FBI officials are regularly featured and employed at liberal CNN and MSNBC, while it is Greenwald and Snowden who have become completely unwelcome. So we have a fable that ends with the brave knight slaying the beautiful princess and marrying the hideous dragon, quite an unexpected turn of events.

The breaking point for Greenwald came with the 2020 election. During the Democratic primaries, the reigning political oligarchs of the liberal establishment had faced down the unexpectedly strong Bernie Sanders insurgency by desperately employing every possible connivance to drag the widely unpopular Joe Biden across the finish line, then coupled him with Kamala Harris, a candidate so unappealing that she had dropped out of the presidential race long before the first vote had even been cast in Iowa. These arrogant Democratic kingmakers then discovered to their horror that although Donald Trump was greatly disliked, their own hand-picked candidates fell into the same category. An extremely dishonest racial media narrative had provoked America's greatest wave of urban riots and looting in two generations, and while 200 of our cities suffered such severe unrest, a number of prominent Democratic activists responded to the scenes of chaos and disorder by loudly proclaiming that the solution was to "defund the police."

Under such circumstances, many voters understandably began to wonder whether Trump—notwithstanding his disastrous four years in office—might actually be the lesser of the two evils. So to forestall that dangerous possibility, Big Media and Big Tech colluded to ensure that Americans voted the right way, imposing the most extreme political censorship of any modern election, yet even so their efforts nearly fell short.

According to the post-election media headlines, Biden won the 2020 race by a substantial margin and Trump's claims of a stolen presidential vote represented the final proof of his criminal insanity, blatant lies that eventually provoked his deluded followers into storming the Capitol on January 6th. But as I pointed out a few days after that event, the official vote count told an entirely different story:

> Incumbent Donald Trump lost Arizona, Georgia, and Wisconsin by such extremely narrow margins that a swing of less than 22,000 votes in those crucial states would have gotten him reelected. With a record 158 million votes cast, this amounted to a victory margin of around 0.01%. So if just one American voter in 7,000 had changed his mind, Trump might have received another four years in office. ***One American voter in 7,000.***
>
> Such an exceptionally narrow victory is extremely unusual in modern American history…Indeed, with the sole exception of the notorious "dangling chads" Florida decision of the 2000 Bush-Gore election, no American presidential candidate in over 100 years had lost by so narrow a voter margin as Donald J. Trump…

> Not long before the election, the hard drive of an abandoned laptop owned by Joe Biden's son Hunter revealed a gigantic international corruption scheme, quite possibility involving the candidate himself. But the facts of this enormous political scandal were entirely ignored and boycotted by virtually every mainstream media outlet. And once the story was finally published in the pages of the *New York Post*, America's oldest newspaper, all links to the *Post* article and its website were suddenly banned by Twitter, Facebook, and other social media outlets to ensure that the voters remained ignorant until after they had cast their ballots.
>
> Renowned international journalist Glenn Greenwald was hardly a Trump partisan, but he became outraged that the editors of the *Intercept*, the $100 million publication he himself had co-founded, refused to allow him to cover that massive media scandal, and **he angrily resigned in protest.** In effect, America's media and tech giants formed a united front to steal the election and somehow drag the crippled Biden/Harris ticket across the finish line.
>
> The Hunter Biden corruption scandal seemed about as serious as any in modern presidential election history and Biden's official victory margin was just 0.01%. So if the American voters had been allowed to learn the truth, Trump almost certainly would have won the election, quite possibly in an Electoral College landslide. Given these facts, anyone who continues to deny that the election was stolen from Trump is simply being ridiculous.

Although Greenwald was certainly the most prominent liberal journalist to find himself censored and left ideologically homeless for remaining true to his longstanding principles, other significant figures shared his plight. During the Financial Meltdown a decade ago, Matt Taibbi of *Rolling Stone* had gained widespread attention for his trenchant description of Goldman Sachs as "a great vampire-squid" and during his years as a Middle East correspondent for the *New York Times*, Chris Hedges had become a folk-hero to the Left for his incisive reporting on the plight of the Palestinians, with his later books cementing that reputation. In the wake of Greenwald's angry departure from the *Intercept*, these two individuals spent a half-hour condemning the severe regime of self-censorship that was increasingly constricting the world of mainstream American journalism, with the conversation taking place on Russia's *RT* channel, the only venue that

would permit such a candid discussion. And Taibbi soon joined Greenwald in making his new home on Substack.

As the first anniversary of his personal strike for editorial freedom came around, Greenwald published a very long and interesting column analyzing what had happened, including an examination of the underlying problems he had faced at his own publication.

His difficulties had begun in 2015 with the rise of Donald Trump, a development that provoked a hysterical reaction in the establishment wings of both the Democratic and Republican parties, which became far more severe after Trump's unexpected 2016 victory over Hillary Clinton.

Instead of asking themselves why they and their policies had grown so unpopular that a brash outsider who had been massively outspent on advertising could win, leading Democrats instead curled themselves into a fetal ball, adopting the lunatic excuse that Russian President Vladimir Putin had arranged Trump's elevation, somehow managing to overcome their multi-billion-dollar presidential campaign with the help of a few thousand dollars of display ads on Facebook.

Only individuals with no sense of reality or no self-respect could swallow such absurdity with a straight face, but those debilitating conditions turned out to be widespread within our establishment

media and political worlds, and this bizarre Russiagate narrative dominated the first couple of years of the Trump presidency, reducing American politics to a laughingstock. Those few prominent journalists such as Greenwald who refused to endorse such conspiratorial nonsense and pointed to the total lack of supporting evidence were increasingly ostracized as heretics and excluded from most mainstream outlets.

Greenwald provided a very revealing analysis of the internal dynamics at his own publication, *The Intercept*, so lavishly funded by its billionaire-donor Pierre Omidyar. All of us have particular areas of focus and expertise, possessing solid knowledge in those matters while remaining ignorant and easily misled in others. So while Omidyar probably had a good personal understanding of technology, business, and investment, he was politically unsophisticated and therefore accepted the overwhelming media narrative that Russia with Trump as its agent was plotting to subvert our American freedoms, just as the *New York Times*, the *Washington Post*, and *CNN* all loudly proclaimed. Over the years I have had a few dealings with individuals very high in the worlds of business and finance, and in most cases I think their political sophistication approximated that of your pleasant next-door neighbor, so Greenwald's account rings very true to me.

Shrewd political operatives are always seeking out such wealthy, public-spirited individuals, hoping to help lighten the burdensome weight of their excessive bank balances, and Omidyar soon became a leading funder of the various organizations established to save our country from the looming Russian takeover, including those staffed by the Bush Neocons whose horrific policies had originally inspired Greenwald's own journalism.

Outside observers began noting the considerable irony that Greenwald had become one of the foremost critics of his own patron's political organizations, and wondered how much longer such apparent insubordination would be tolerated. To Omidyar's enormous personal credit, he repeatedly emphasized that the journalists he supported had the absolute right to take whatever positions they wished even if these directly contradicted his own personal beliefs, and he never hinted that Greenwald should curb his outspokenness.

But star reporters with global reputations may be willing to take professional risks that their less talented counterparts would shun, and Greenwald was much less kind in describing the behavior of his colleagues on the *Intercept*, especially the very well paid and top-heavy senior editorial staff. After Greenwald's departure, his ally Max

Blumenthal Tweeted out his outrage at the unjustified salaries of Omidyar's beneficiaries:

> The Intercept's Betsy Reed, who earns $427,419 a year & produces zero journalism of her own, mocks independent journalists who rely on Substack & Patreon to get by. Not everyone has a reclusive billionaire to pay them huge sums to edit stuff no one reads. https://t.co/TdnjrDdinw pic.twitter.com/83FMDhpRgQ
>
> — Max Blumenthal (@MaxBlumenthal) October 30, 2020

These are difficult times for the journalistic profession, with low salaries and widespread layoffs, but so long as Omidyar's funding continued, the employees of the *Intercept* enjoyed lavish compensation, generous expense accounts, and total job security despite the extremely meager readership of their uninspiring output. Therefore, as Greenwald explained, their entire writing became directed at a total audience of one, Pierre Omidyar, who constituted the god of their universe, and they naturally catered to every whim of his views, as regularly revealed on his Twitter feed. If the billionaire's swarm of courtiers and consultants had persuaded him that Trump and Russia were the greatest twin threats to American freedom, the writers and editors drawing his paychecks would eagerly produce a mountain of words saying exactly that. Applying another one of Greenwald's metaphors, they realized that they had been lucky enough to win the Omidyar Lottery, and were fearful of risking that golden meal-ticket.

And although he is too charitable to say so, I think Greenwald must have realized that his colleagues probably considered him a dangerous threat to their own job security. By a very wide margin, he was the most prominent journalist on Omidyar's payroll, and perhaps at some point his argument that Russiagate was indeed a ridiculous hoax might carry the day in the public arena. But if the naive billionaire eventually concluded that he had been hoodwinked, he might grow angry at the legions of his well-paid yes-men who had spent years participating in that deception, and perhaps cancel their generous sinecures.

## Julian Assange and WikiLeaks

Greenwald may have been cast into the outer darkness by most of the mainstream liberal establishment, but he ultimately suffered little

damage. His angry departure from the *Intercept* unleashed a media thunderclap, and from the moment he regained his editorial freedom on Substack, he began producing a series of lengthy and remarkably incisive columns, so that within a couple of weeks I read more of his work than I had in the previous five or six years. Others seem to have had the same reaction, and his personal Substack subscription revenue quickly exceeded a million dollars a year, an achievement that surely aroused enormous envy from the multitude of timorous and mercenary journalists content to churn out safe and inoffensive blather.

But while Greenwald probably ranked as the world's most famous journalist, he was always paired in my mind with the world's most famous publisher, and the latter had suffered a far worse fate the previous year. On April 11, 2019 British police physically dragged Julian Assange, bearded and disheveled, out of the room in London's Ecuadorean Embassy that had become his refuge turned prison cell

during the previous seven years.

Assange had founded the WikiLeaks website in 2006, allowing disgruntled individuals to anonymously deposit confidential information embarrassing to governments and other powerful entities, with that content then made available to journalists and activists across the world. In 2010, an American intelligence analyst had provided a huge cache of Iraq and Afghanistan War documents and videos that rocketed the website to worldwide fame and inflicted a massive propaganda defeat upon our national security establishment. Assange and his tiny band of volunteer collaborators immediately became the toast of left-liberals in America and throughout the world, hailed as a journalistic pioneer and hero. Such strong public support partly shielded Assange from immediate retaliation, but the minions of our Deep State regarded him as their sworn enemy, and they relentlessly began seeking revenge.

Allegations of Assange's sexual misconduct while visiting Sweden led to his late 2010 detention in Britain, and his supporters correctly suspected the entire judicial maneuver was merely a ploy to have him extradited to stand trial in America. Facing a losing legal battle, he broke the terms of his bail in 2012 and sought sanctuary at the local Ecuadorean Embassy, whose government granted him asylum. Over the years, Greenwald and numerous others have noted that Assange's publication of confidential documents was no different than the regular activities of ordinary journalists and in 2013 the U.S. Justice Department even admitted that fact, but our national security establishment still sought to make an example of him as a powerful deterrent to others.

The political landscape drastically changed in 2016 when WikiLeaks published a huge trove of Democratic Party emails, including revelations that the DNC leadership had collaborated with Hillary Clinton to defeat Bernie Sanders. This confidential material proved extremely embarrassing to the Clinton campaign as it was released during the months prior to the November vote and certainly contributed to Trump's upset victory. As a result, Democratic partisans and the liberal establishment began regarding Assange as their enemy.

Following the disclosures, the DNC claimed that its servers had been hacked by Russian spies, who then provided the material to WikiLeaks in order to assist Trump, and this became a major pillar of the subsequent Russiagate narrative in our media. The CIA and other intelligence agencies publicly endorsed that accusation of Russian

involvement in American politics, an important step in the formation of what amounted to a Democrat/CIA/NSA/FBI political alliance hostile to both Trump and Russia.

However, various individuals associated with WikiLeaks suggested a different story. Not long after the original release of the emails, Assange strongly hinted that instead of having been obtained by overseas hackers, the material had actually been leaked by a disgruntled DNC staffer named Seth Rich, who had been murdered soon afterward, and WikiLeaks offered a $20,000 reward for information on that unsolved DC street killing. Although the mainstream media fiercely denounced such allegations as a ridiculous "conspiracy theory," they were taken up by many rightwing activists and Trump partisans, and the details of the case fill an entire 10,000 word Wikipedia page entitled "The Murder of Seth Rich," which includes more than 150 references.

The controversy is a complex one, with enormous numbers of claims and counter-claims, and I haven't devoted even a fraction of the time necessary to unravel it. But the total collapse of the remainder of the Russiagate narrative leaves me skeptical about this element. Furthermore, Craig Murray, a former British ambassador and close WikiLeaks ally, generally strikes me as a credible individual, and back in 2016 he claimed from personal knowledge that the DNC documents had been leaked by an angry Democratic whistleblower rather than hacked by foreign agents, while last year he further emphasized the highly-suspicious nature of Rich's murder and the new evidence that the FBI had been taking that theory seriously.

We must consider statistics and unlikely coincidences. There were only 136 DC homicides that year, and the victims were almost entirely restricted to the city's impoverished non-white population or its criminal underclass. Indeed, although the city is still dangerous it wouldn't surprise me if in 2016 Rich were the only middle-class white in DC randomly murdered while innocently walking the streets. The fact that he was a DNC insider and a technically-savvy Sanders partisan who died in an unsolved street killing so soon after the documents in his office were leaked certainly raises large suspicions. Billions of dollars were spent to put Hillary Clinton in the White House, and her victory would have meant many thousands of good jobs and appointments for her army of loyal camp-followers, plus oceans of possible graft, so the motive would be a strong one. As I speculated earlier this year:

> Incidentally, I'd guess that DC is a very easy place to arrange a

> killing, given that until the heavy gentrification of the last dozen years or so, it was one of America's street-murder capitals. It seems perfectly plausible that some junior DNC staffer was at dinner somewhere, endlessly cursing Seth Rich for having betrayed his party and endangered Hillary's election, when one of his friends said he knew somebody who'd be willing to "take care of the problem" for a thousand bucks …

I should also mention the conclusions of some prominent intelligence experts whose opinion I take seriously. Ray McGovern had served for more than a quarter-century as a CIA analyst, specializing in the Soviet Union, and by the late 1980s was chairing the National Intelligence Estimate and personally briefing President George H.W. Bush, while William Binney had been a top NSA intelligence officer, retiring in 2001. In 2017, the two of them, backed by dozens of other veteran American intelligence professionals, raised serious doubts about whether the WikiLeaks documents had been transferred locally to a thumb-drive rather than pulled across the Internet, suggesting that such technical evidence favored a leak rather than the hack proposed by the Russiagate narrative. Their claims have been disputed and the software evidence challenged, but the fact that such striking findings by these senior experts were almost totally ignored by our mainstream media demonstrated its enormous bias on the subject.

Assange's dissemination of pilfered Democratic Party materials had probably helped to elect Trump in November 2016, thereby enraging liberals and Democrats. But just a few months later, the continuing hostility of America's national security apparatus had been reignited when WikiLeaks began releasing the CIA's "Vault 7" documents, providing the technical details of hacking capabilities and software tools targeting smartphones, computers, and other Internet devices. This represented the largest and most damaging leak in the history of the CIA, and its leadership publicly declared WikiLeaks a hostile intelligence service, while quietly considering plans to kidnap or assassinate Assange.

Democratic Party political operatives and our intelligence services each possess a great deal of influence over the American mainstream media, and with both those groups having become so intensely hostile to Assange's activities, the rapid transformation of his public image from hero to villain became almost assured. Many of the same journalists or publications that had once lionized him or even benefited from direct collaboration now regularly blackened his name and ignored his difficult plight.

## Prof. Stephen Cohen and *The Nation*

The sudden burst of intense hostility towards Russia that swept through liberal circles during the mid-2010s had earlier eroded the position of another important figure once high within the liberal foreign policy firmament.

For decades Prof. Stephen Cohen of Princeton and New York University had ranked as one of America's leading Russia scholars, and certainly the most prominent such figure in left-liberal circles. As far back as the 1970s his *Sovieticus* columns had regularly appeared in the pages of *The Nation*, our premier leftwing opinion magazine, and during the Gorbachev Era and the ensuing collapse of the USSR, I often saw him on the *PBS Newshour*, debating America's Soviet policy with his conservative counterparts. Meanwhile, his numerous scholarly books on Soviet and Russian history were respectfully reviewed in elite mainstream publications. Not only was Cohen clearly the foremost Russia expert within the American Left, but no other name of even remotely comparable stature came to mind, and

his 1988 second marriage to Katrina vanden Heuvel, who went on to serve as Publisher and Editor of *The Nation* for nearly a quarter-century, certainly cemented that impression of his influence.

Cohen had devoted his entire career to fostering an amicable relationship between Russia and America. But when Victoria Nuland and other Neocons gained influence during the late Obama Administration, they shattered that dream in an instant by orchestrating the violent early 2014 uprising and coup that replaced Ukraine's independent-minded government with what amounted to an American quasi-puppet regime. Not only did this development threaten to push NATO to Russia's border in absolute violation of the guarantees once given to Gorbachev, but it seemed likely to place the West in control of overwhelmingly Russian Crimea, home to Russia's most important naval base, and only Putin's quick moves forestalled that risk by restoring the peninsula to his country through annexation. A violent civil war and secessionist movement in the remainder of Ukraine quickly broke out, costing the lives of many thousands of ethnic Russians over the next few years, while periodically threatening to ignite a full scale war between Russia and the West.

Although this anti-Russian reversal seemed to attract near-unanimous support from America's political and media establishment, in May 2014 Cohen had joined with his wife in publishing a *Nation* column denouncing the sudden eruption of this new Cold War against Russia. A few months later, Malaysian Airlines Flight 17 was shot down over Eastern Ukraine, and although I and others emphasized the uncertainty about which side had been responsible, virtually our entire media blamed pro-Russian forces, harshly condemning Cohen when he quietly expressed serious doubts. Indeed, his Wikipedia page catalogs the numerous attacks he endured, even citing a *Chronicle of Higher Education* article claiming that his writings had provoked the *Nation*'s staffers into "openly revolting against the magazine's pro-Russian tilt." These lock-step young liberal and left-liberal journalists condemned him for continuing to advocate rational policies towards a Russia whose huge nuclear arsenal could annihilate our own country. After the 2016 election, nearly all Democrats eagerly embraced the Russiagate hoax and the hostility towards naysayers such as Cohen became even more strident. Except for his regular weekly appearances on New York's John Batchelor radio show, hosted by one of his former Princeton students, he was virtually excluded from the American media.

A lengthy 2017 *Slate* interview by Isaac Chotiner typified his

treatment. The author expressed stunned disbelief that Cohen did not automatically accept the factual claims about Russia, Russiagate, Trump, and Putin that were so universally believed and promoted within mainstream liberal circles, failing to recognize that a scholar with decades of expertise in that country and an ability to read Russian was able to tap non-American sources of information.

Just a few weeks earlier, *Times* media columnist Jim Rutenberg had published a long article in his own newspaper, describing his own visit to Moscow and his astonishment that the media there presented an "alternative truth" so different from his own belief that the Russian-backed Syrian government had recently launched a poison gas attack against its own people. Days before that article ran, we had published a 6,900 word article by eminent national security scholar Theodore A. Postol of MIT, heavily debunking the reality of that alleged Syrian gas attack, but since such contrary views never penetrated into Rutenberg's media-bubble, he was entirely unaware of them, and having begun his journalistic career as a gossip-columnist, perhaps he anyway wouldn't have known the difference. So Chotiner read Rutenberg and Rutenberg read Chotiner, and the resulting incestuous cult of ignorance had no place for the dissenting views of genuine experts such as Cohen or Postol.

In his 2017 Chotiner interview, Cohen emphasized that the combination of a relentless media demonization of Putin's Russia and the creation of potential military flashpoints in Syria and Ukraine was producing an extremely dangerous world situation, a warning he regularly repeated in his weekly radio discussions. In one of his last broadcasts prior to his death from cancer last year at age 81, Cohen suggested that our current confrontation with Russia might be even more perilous than what we had faced at the height of the Cuban Missile Crisis in 1962, yet almost none of our insouciant media outlets recognized that our government policies were threatening to unleash a new world war.

Unfortunately, the editorial decisions of Cohen's own magazine may have considerably diminished the impact of his very important message. The scholar was arguing our media and political policies were raising the terrible risk of war with nuclear-armed Russia, yet I don't recall any *Nation* cover-stories highlighting that danger, and although its website hosted his weekly podcasts and very occasionally ran his articles, such material was usually buried in obscurity so that it attracted minimal coverage and discussion. Although this defensiveness may have been necessary to avoid a backlash from angry subscribers, the obvious result was to minimize the gravity of

Cohen's message. Why should *Nation* readers take his dire warnings of global war seriously if *Nation* editors apparently did not? Indeed, once I made arrangements in late 2019 to begin republishing and regularly featuring Cohen's columns and radio shows, they attracted far more interest and supportive comments on our website than they did on his own, demonstrating the huge ideological hurdles he had faced from his own community.

Cohen may or may not have been aware of the eerie parallel between his own predicament and a similar situation that had unfolded at that same publication around the time of his birth in 1938. From 1900 to the mid-1930s, the *Nation* had been owned and edited by Oswald Garrison Villard, a name now almost forgotten but once one of the leading liberal figures of the era, co-founder of the NAACP and grandson of famed Abolitionist William Lloyd Garrison, while also ranking as one of America's foremost anti-imperialists and anti-militarists. His father had been a German immigrant, and when he published writings critical of American involvement in World War I, his magazine was legally suppressed by the harsh wartime censorship laws, being temporarily banned from the US mails. But by the mid-1920s, the overwhelming majority of both elite and ordinary Americans had swung around to his position, and concluded that his opposition to our participation in the Great War had been correct all along.

Although he finally sold the *Nation* in 1935 during the depths of the Great Depression, the magazine he had run for more than three decades continued to feature his weekly commentary, which strongly supported FDR's New Deal policies and fiercely criticized Hitler and the Nazis. But near the end of the 1930s, he grew alarmed that another world war might be on the horizon, once again involving America, and his anti-war views began sharply diverging from those of the other writers, so that his decades-long column was finally dropped in 1940. Diverting a sweeping ideological tide had proved as difficult for Villard in the late 1930s as it became for Cohen three generations later.

## Sydney Schanberg, John McCain, and the Vietnam POWs

Cohen's dire warnings about America's anti-Russia policies gained little traction in the public debate, partly because the dismissive placement of his articles severely undercut their impact. About a decade earlier I had come across a very similar example, also

involving the *Nation*:

As the winner of the Pulitzer Prize and two George Polk awards, the late Sydney Schanberg was widely regarded as one of the greatest American war correspondents of the twentieth century. His exploits during our ill-fated Indo-Chinese War had become the basis of the Oscar-winning film *The Killing Fields*, which probably established him as the most famous journalist in America after Woodward and Bernstein of Watergate fame, and he had also served as a top editor at *The New York Times*. A decade ago, he published his greatest expose, providing a mountain of evidence that America had deliberately left behind hundreds of POWs in Vietnam and he fingered then-presidential candidate John McCain as the central figure in the subsequent official cover-up of that monstrous betrayal. The Arizona senator had traded on his national reputation as our best-known former POW to bury the story of those abandoned prisoners, permitting America's political establishment to escape serious embarrassment. As a result, Sen. McCain earned the lush rewards of our generous ruling elites, much like his own father Admiral John S. McCain,

> Sr., who had led the cover-up of the deliberate 1967 Israeli attack on the U.S.S. Liberty, which killed or wounded over 200 American servicemen.
>
> As publisher of *The American Conservative*, I ran Schanberg's remarkable piece as a cover story, and across several websites over the years it has surely been read many hundreds of thousands of times, including a huge spike around the time of McCain's death. I therefore find it rather difficult to believe that the many journalists investigating McCain's background might have remained unaware of this material. Yet no hints of these facts were provided in any of the articles appearing in any remotely prominent media outlet as can be verified by searching for web pages containing "McCain and Schanberg" dated around the time of the Senator's passing.
>
> - John McCain and the POW Cover-Up
> Sydney Schanberg • May 25, 2010 • 8,200 Words

Schanberg's remarkable material surely constituted one of the greatest American scandals of the second half of the twentieth century but despite his repeated efforts, almost our entire media avoided considering the information. As he recounted in 2010:

> In recent years, I have offered my POW stories to a long list of editors of leading newspapers, magazines, and significant websites that do original reporting. And when they decline my offerings, I have urged them to do their own POW investigation with their own staff under their own supervision.
>
> The list of these news organizations includes the *New York Times,* the *Washington Post,* the *Los Angeles Times, New York magazine, The Atlantic, The New Yorker, Harper's, Rolling Stone, Mother Jones, Vanity Fair, Salon, Slate, Talking Points Memo, ProPublica, Politico*, and others. To my knowledge, none have attempted or produced a piece.
>
> Their explanations for avoiding the story have never rung true. I have chosen not to use the names of the editors or the texts of their rejection messages, which could embarrass some of them. This is not a personal difference, but a professional one. I have decided instead to summarize their comments.
>
> Some said they didn't have enough staff to do the story. Others said the story was "old"—even though we have never found out

what happened to the missing prisoners. I sensed often that these news people were afraid—that the story was too hot for them to handle because it could cause too many repercussions. Aren't journalists supposed to look into difficult stories and the wrongdoings of important people? Aren't they also supposed to expect blowback?

I asked these editors about the mountain of hard evidence attesting to the existence of abandoned men. In particular, I asked about the witness evidence, the 1,600 firsthand live sightings of American prisoners after the war. Did these journalists believe that every last one of the 1,600 witnesses was lying or mistaken? Many of these Vietnamese witnesses were interrogated by U.S. intelligence officers. Many were given lie-detector tests. They passed. The interrogators' reports graded the bulk of the witnesses "credible." A few of the journalists I have nudged to go after the story acknowledged that their paper or magazine or TV network had "blind spots." But again and again, the vast majority have hemmed and hawed and said they had "doubts" about the POW information. Isn't doing the reporting the best way to confirm or dispel doubts?

I would run through the long gamut of known intelligence—official radio intercepts of prisoners being moved to and from labor camps in Laos, satellite photos, conversations overheard by Secret Service agents inside the White House, ransom offers from Hanoi through third parties, sworn public testimony by three U.S. defense secretaries who served during the Vietnam era that "men were left behind." The press wasn't and isn't interested.

Sen. John McCain had been a central figure in the POW Cover-Up, and his nomination as the Republican candidate for president in 2008 seemed to make it impossible for the media to ignore Schanberg's remarkable findings as I explained in my introduction to our cover symposium:

In the closing days of the 2008 presidential campaign, I clicked an ambiguous link on an obscure website and stumbled into a parallel universe.

During the previous two years of that long election cycle, the media narrative surrounding Sen. John McCain had been one of unblemished heroism and selfless devotion to his fellow servicemen. Thousands of stories on television and in print had told of his brutal torture at the hands of his North Vietnamese

> captors, his steely refusal to crack, and his later political career aimed at serving the needs of fellow Vietnam veterans. This storyline had first reached the national stage during his 2000 campaign, then returned with even greater force as he successfully sought the 2008 Republican nomination. Seemingly accepted by all, this history became a centerpiece of his campaign. McCain's supporters touted his heroism as proof that he possessed the character to be entrusted with America's highest office, while his detractors merely sought to change the subject.
>
> Once I clicked that link, I encountered a very different John McCain…
>
> Yet what I found most remarkable about Schanberg's essay were not its explosive historical claims but the absolute silence with which they were received in the mainstream media. In 2008, John McCain's heroic war record and personal patriotism were central to his quest for supreme power—a goal he came very close to achieving. But when one of America's most eminent journalists published an exhaustive report that the candidate had instead served as one of the leading figures in a monumental act of national treachery, our media took no notice. McCain's public critics and the operatives of his Democratic opponent might eagerly seize upon every rumor that the senator had had a private lunch with a disreputable corporate lobbyist, but they ignored documented claims that he had covered up the killing of hundreds of American POWs. These allegations were serious enough and sufficiently documented to warrant national attention —yet they received none.

Despite the enormous relevance to the 2008 Republican presidential campaign, almost every publication in America still shut its doors to Schanberg's explosive material. As a highly-ideological and partisan magazine, the *Nation* had hardly been his first choice—or even his fifth—but only its editors eventually agreed to run Schanberg's massive expose against the Republican candidate whom they were already attacking on all other possible grounds. However, once they did so, they sat on the story and repeatedly delayed publication, apparently fearful of the controversy that the article would unleash, while demanding that the text be cut and cut again. Thus, Schanberg's landmark expose appeared only in severely mutilated form, slashed by 70% in length and released only a few weeks before the vote. The piece was buried on a couple of inside pages, while the website version was hedged about with the disclaimers of opposing perspectives.

By running the piece in such an attenuated condition and understated manner, the *Nation* editors were strongly suggesting that they themselves seriously doubted its conclusions, naturally raising the question of why any of their readers should react differently. I think that an article with such massive implications should either appear as a high-profile cover-story or else be rejected outright. And for the record, I should note that the *Nation*'s Executive Editor at the time was the same Betsy Reed whom Greenwald and his allies would treat with such scorn at the *Intercept* a dozen years later. The complete version of Schanberg's work only survived because Hamilton Fish was willing to run it separately on his affiliated Nation Institute website, which is where I encountered it and later arranged for its republication.

## Nicholas Wade and the Origins of Covid

A dozen years after Schanberg had encountered such enormous obstacles in getting his important work published, similar difficulties befell one of his former *Times* colleagues, but this time ending with a surprising twist.

Nicholas Wade certainly ranks as one of America's most distinguished science journalists, having spent forty-five years at *Nature*, *Science*, and the *New York Times*, including serving as the Science Editor of our national newspaper of record. He is also an award-winning author, whose numerous books that have attracted glowing praise.

After retiring from the *Times* in 2012, he began focusing entirely upon book projects, but the global Covid epidemic that began in early 2020 naturally attracted his attention, and he gradually became skeptical of the media coverage, which almost uniformly portrayed the virus as natural. Instead, his review of the published sources together with his own analysis convinced him that the virus that had already killed many hundreds of thousands of Americans and millions around the world had probably been produced in a laboratory. Finally, on May 2, 2021, he quietly released his closely-reasoned 11,000 word article on the *Medium* blogging website, lacking any endorsements or prestigious imprimatur, and it was republished a couple of days later by the low-traffic website of the *Bulletin of Atomic Scientists*:

- Origin of Covid — Following the Clues
  *Did people or nature open Pandora's box at Wuhan?*
  Nicholas Wade • *Medium* • May 2, 2021 • 11,000 Words

As I described what followed:

> Despite such extremely inauspicious beginnings and the cautious and subdued tone of his text, the consequences were dramatic. Although nearly all the facts and evidence that Wade discussed had already been publicly available for most of the past year, his careful analysis and considerable journalistic credibility quickly transformed the intellectual landscape. He began his long article by explaining that from February 2020 onward a huge ideological bubble had been inflated by political propaganda masquerading as science, a bubble that was afterwards maintained through a combination of journalistic cowardice and incompetence. President Donald Trump had proclaimed that the virus was artificial, so our media therefore insisted that it must be natural, even if all the evidence seemed to suggest otherwise.
>
> The floodgates soon opened and over the next few weeks far more was written on that subject than had been produced during the previous twelve months combined. In just one example, Donald G. McNeil, Jr., the forty-five year veteran of the *Times* who had spearheaded his paper's Covid coverage, published a striking *mea culpa* and embraced the lab-leak hypothesis, admitting that he and other *Timesmen* had previously dismissed the idea as "far right" lunacy, closely associated with "Pizzagate, the Plandemic, Kung Flu, Q-Anon, Stop the Steal, and the January 6 Capitol invasion."
>
> - How I Learned to Stop Worrying And Love the Lab-Leak Theory
> Donald G. McNeil, Jr. • *Medium* • May 17, 2021 • 4,700 Words

Within another week, Glenn Greenwald was highlighting the ongoing upheaval in the views of America's media and scientific establishment:

> It's stunning how quickly, in mainstream sectors, this traveled from "insane unhinged conspiracy theory that must be censored from the internet as harmful disinformation" to "serious and plausible possibility for which rational evidence exists."
>
> Let's learn lessons from this. https://t.co/aPnY0JLRJX
>
> — Glenn Greenwald (@ggreenwald) May 25, 2021

By May 26th, the White House announced that President Joe Biden had ordered America's intelligence agencies to produce a comprehensive report on the true origins of the Covid outbreak, and a couple of days later, the *Wall Street Journal* carried the headline "Facebook Ends Ban on Posts Asserting Covid-19 Was Man-Made."

So in less than one month a self-published article had already changed what nearly three billion individuals around the world were allowed to read and write.

Facebook Ends Ban on Posts Asserting Covid-19 Was Man-Made
Social media titan's policy shift reflects a deepening debate over the origins of the virus first identified in Wuhan, China
Facebook

A media analyst subsequently described the stiking impact Wade's article was having upon other journalists:

> Notable left-wing journalists like Thomas Frank (**Guardian**, 6/1/21) and Jonathan Cook (6/1/21) have cited Wade's article as having "dynamited" their "complacency" on the debate, with Cook claiming that it "blew open the doors that had been kept tightly shut on the lab-leak hypothesis."

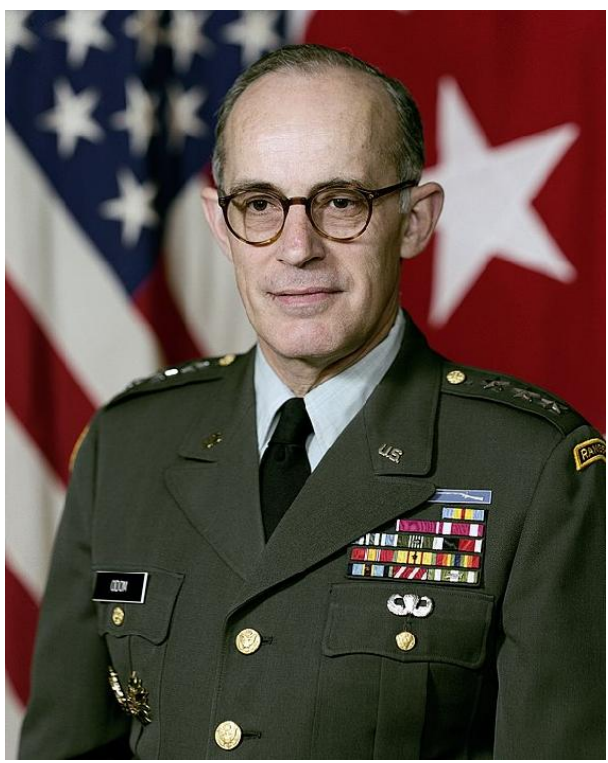
Considering the millions of deaths and massive disruption, the Covid epidemic is arguably the most important global event since World War II. Wade's lengthy article was certainly not the sole cause of the sweeping reassessment of its origins, but it did catalyze the process, being widely cited by opinion-leaders to explain their changed perspective. Given the importance of the topic, the magnitude of the public reversal, and the speed with which the transformation occurred, I can think of no other article in recent decades that had a greater immediate impact upon the world.

But there was also a revealing backstory to its appearance. I later learned that during 2021, Wade had actually submitted his seminal

piece to a wide range of different publications across the ideological spectrum, all of which rejected it, so that he ultimately abandoned his efforts and simply posted what he had written on the *Medium* website, where he assumed it would vanish without a trace. Thus, the obstacles he faced were quite similar to those that Schanberg had encountered a decade earlier with his own important analysis, but this time events followed the happy ending of a Hollywood script. Apparently the most significant articles by distinguished journalists are sometimes the ones that meet the greatest resistance from timorous and complacent editors.

## Lt. Gen. William Odom and the Iraq War

The crippled version of Schanberg's important article had appeared in the October 6, 2008 edition of *The Nation*, buried deep in the back pages. At that time, I was entirely unfamiliar with either the author or his remarkable findings, but by coincidence just the previous week I had published my first article in many years, a cover story in *The American Conservative* that paid tribute to an individual whose equally fierce determination to speak the truth on crucial matters had led to his own blacklisting from the mainstream media.



My old friend Bill Odom, the three star general who ran the NSA for Ronald Reagan, had spent years as one of the most respected figures on national security issues within the East Coast establishment, directing those studies at the Hudson Institute while serving as an adjunct professor at Yale. But once the Neocons seized control of the Bush Administration in the aftermath of the 9/11 attacks and moved our country towards its disastrous Iraq War, his strong opposition to that misbegotten project led to his complete media blacklisting, forcing him to publish his dissenting views on a small website rather than in the pages of our most influential newspapers. As a consequence, our country careened towards that foreign policy disaster without any adequate public debate:

> The circumstances surrounding our Iraq War demonstrate this, certainly ranking it among the strangest military conflicts of modern times. The 2001 attacks in America were quickly ascribed to the radical Islamists of al-Qaeda, whose bitterest enemy in the Middle East had always been Saddam Hussein's secular Baathist regime in Iraq. Yet through misleading public statements, false press leaks, and even forged evidence such as the "yellowcake" documents, the Bush administration and its neoconservative allies utilized the compliant American media to persuade our citizens that Iraq's nonexistent WMDs posed a deadly national threat and required elimination by war and invasion. Indeed, for several years national polls showed that a large majority of conservatives and Republicans actually believed that Saddam was the mastermind behind 9/11 and the Iraq War was being fought as retribution. Consider how bizarre the history of the 1940s would seem if America had attacked China in retaliation for Pearl Harbor.
>
> True facts were easily available to anyone paying attention in the years after 2001, but most Americans do not bother and simply draw their understanding of the world from what they are told by the major media, which overwhelmingly—almost uniformly—backed the case for war with Iraq; the talking heads on TV created our reality. Prominent journalists across the liberal and conservative spectrum eagerly published the most ridiculous lies and distortions passed on to them by anonymous sources, and stampeded Congress down the path to war.
>
> The result was what my late friend Lt. Gen. Bill Odom rightly called the "greatest strategic disaster in United States history." American forces suffered tens of thousands of needless deaths and injuries, while our country took a huge step toward national

> bankruptcy. Economics Nobel Laureate Joseph Stiglitz and others have estimated that with interest the total long-term cost of our two recent wars may reach as high as $5 or $6 trillion, or as much as $50,000 per American household, mostly still unpaid. Meanwhile, economist Edward Wolff has calculated that the Great Recession and its aftermath cut the personal net worth of the median American household to $57,000 in 2010 from a figure nearly twice as high three years earlier. Comparing these assets and liabilities, we see that the American middle class now hovers on the brink of insolvency, with the cost of our foreign wars being a leading cause.
>
> But no one involved in the debacle ultimately suffered any serious consequences, and most of the same prominent politicians and highly paid media figures who were responsible remain just as prominent and highly paid today. For most Americans, reality is whatever our media organs tell us, and since these have largely ignored the facts and adverse consequences of our wars in recent years, the American people have similarly forgotten. Recent polls show that only half the public today believes that the Iraq War was a mistake.
>
> Author James Bovard has described our society as an "attention deficit democracy," and the speed with which important events are forgotten once the media loses interest might surprise George Orwell.

And Odom was just one of many who suffered that fate as I noted a couple of years ago:

> In the patriotic fervor following the 9/11 attacks, few national media figures dared challenge the plans and proposals of the Bush Administration, with Paul Krugman's column at the *Times* being the rare exception; expressing "unpatriotic sentiments" as very broadly defined could severely impact a career. This was especially true of the electronic media, with its vastly greater reach and therefore subject to more extreme pressure. During 2002 and 2003, it was very uncommon to find an Iraq War naysayer anywhere on network television or among the fledgling cable alternatives, and even MSNBC, the least popular and most liberal of the latter soon began a sharp ideological crackdown.
>
> For decades, Phil Donahue had pioneered the daytime television talk show, and in 2002 he revived it to high ratings on MSNBC, but in early 2003 his show was canceled, with a leaked memo

indicated that **his opposition to the looming war was the cause**. Conservative Pat Buchanan and liberal Bill Press, both Iraq War critics, hosted a top-rated debate show on the same network, allowing them to spar with their more pro-Bush opponents, but **it too was cancelled for similar reasons**. If the cable network's most famous hosts and highest rated programs were subject to summary termination, lesser ranking personalities surely drew the appropriate conclusions about the risks of crossing particular ideological lines.

## America's Great Purge of the 1940s

Although the Internet was merely in its infancy during the years after 9/11 and still lacked the political weight of traditional television and newspapers, it did exist, so individuals purged for their political opinions could make their views known or at least explain what had befallen them. But in previous generations, no such effective means of direct communication was available, and dissenting voices simply disappeared, with few members of the educated public becoming aware of what had taken place.

Even most well-informed Americans have probably lived their lives in considerable ignorance of some of the great ideological purges of their own country's twentieth century history, notably that of the early 1940s and World War II. Two decades ago I began building a digitized content system incorporating the near-complete archives of many of our leading periodicals of the last 150 years, and the scale of those past events soon became very apparent to me, as I have described:

> I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other figures—Zinoviev, Kamenev, Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been

such an idiot to have surrounded himself almost exclusively with traitors and spies?

But unlike their Stalinist analogs from a couple of years earlier, the American victims who disappeared around 1940 were neither shot nor Gulaged, but merely excluded from the mainstream media that defines our reality, thereby being blotted out from our memory so that future generations gradually forgot that they had ever lived.

John T. Flynn

A leading example of such a “disappeared” American was journalist **John T. Flynn**, probably almost unknown today but whose stature had once been enormous. As **I wrote** last year:

So imagine my surprise at discovering that throughout the 1930s he had been one of the single most influential *liberal* voices in American society, a writer on economics and politics whose status may have roughly approximated that of Paul Krugman, though with a strong muck-raking tinge. His weekly column in *The New Republic* allowed him to serve as a lodestar for America’s progressive elites, while his regular appearances in *Colliers*, an illustrated mass circulation weekly reaching many millions of Americans, provided him a platform comparable to that of an major television personality in the later heyday of network TV.

To some extent, Flynn’s prominence may be objectively quantified. A few years ago, I happened to mention his name to a well-read and committed liberal born in the 1930s, and she unsurprisingly drew a complete blank, but wondered if he might have been a little like **Walter Lippmann**, the very famous columnist of that era. When I checked, I saw that across the

hundreds of periodicals in my archiving system, there were just 23 articles by Lippmann from the 1930s but fully 489 by Flynn.

An even stronger American parallel to Taylor was that of historian Harry Elmer Barnes, a figure almost unknown to me, but in his day an academic of great influence and stature:

Harry Elmer Barnes

Imagine my shock at later discovering that **Barnes** had actually been one of the most frequent early contributors to *Foreign Affairs*, serving as a primary book reviewer for that venerable publication from its 1922 founding onward, while his stature as one of America's premier liberal academics was indicated by his scores of appearances in *The Nation* and *The New Republic* throughout that decade. Indeed, he is credited with having played a central role in "revising" the history of the First World War so as to remove the cartoonish picture of unspeakable German wickedness left behind as a legacy of the dishonest wartime propaganda produced by the opposing British and American governments. And his professional stature was demonstrated by his thirty-five or more books, many of them influential academic volumes, along with his numerous articles in *The American Historical Review*, *Political Science Quarterly*, and other leading journals.

A few years ago I happened to mention Barnes to an eminent

American academic scholar whose general focus in political science and foreign policy was quite similar, and yet the name meant nothing. By the end of the 1930s, Barnes had become a leading critic of America's proposed involvement in World War II, and was permanently "disappeared" as a consequence, barred from all mainstream media outlets, while a major newspaper chain was heavily pressured into abruptly terminating his long-running syndicated national column in May 1940.

Many of Barnes' friends and allies fell in the same ideological purge, which he described in his own writings and which continued after the end of the war:

Over a dozen years after his disappearance from our national media, Barnes managed to publish ***Perpetual War for Perpetual Peace***, a lengthy collection of essays by scholars and other experts discussing the circumstances surrounding America's entrance into World War II, and have it produced and distributed by a small printer in Idaho. His own contribution was a 30,000 word essay entitled **"Revisionism and the Historical Blackout"** and discussed the tremendous obstacles faced by the dissident thinkers of that period.

The book itself was dedicated to the memory of his friend, historian **Charles A. Beard**. Since the early years of the 20th century, Beard had ranked as an intellectual figure of the greatest stature and influence, co-founder of The New School in New York and serving terms as president of both The American Historical Association and The American Political Science Association. As a leading supporter of the New Deal economic policies, he was overwhelmingly lauded for his views.

Yet once he turned against Roosevelt's bellicose foreign policy, publishers shut their doors to him, and only his personal friendship with the head of the Yale University Press allowed his critical 1948 volume *President Roosevelt and the Coming of the War, 1941* to even appear in print. Beard's stellar reputation seems to have begun a rapid decline from that point onward, so that by 1968 historian Richard Hofstadter **could write**: "Today Beard's reputation stands like an imposing ruin in the landscape of American historiography. What was once the grandest house in the province is now a ravaged survival". Indeed, Beard's once-dominant "economic interpretation of history" might these days almost be dismissed as promoting "dangerous conspiracy theories," and I suspect few non-historians have even heard of

him.

> Another major contributor to the Barnes volume was **William Henry Chamberlin**, who for decades had been ranked among America's leading foreign policy journalists, with more than 15 books to his credit, most of them widely and favorably reviewed. Yet ***America's Second Crusade***, his critical 1950 analysis of America's entry into World War II, failed to find a mainstream publisher, and when it did appear was widely ignored by reviewers. Prior to its publication, his byline had regularly run in our most influential national magazines such as *The Atlantic Monthly* and *Harpers*. But afterward, his writing was almost entirely confined to small circulation newsletters and periodicals, appealing to narrow conservative or libertarian audiences.
>
> In these days of the Internet, anyone can easily establish a website to publish his views, thus making them immediately available to everyone in the world. Social media outlets such as Facebook and Twitter can bring interesting or controversial material to the attention of millions with just a couple of mouse-clicks, completely bypassing the need for the support of establishmentarian intermediaries. It is easy for us to forget just how extremely challenging the dissemination of dissenting ideas remained back in the days of print, paper, and ink, and recognize that an individual purged from his regular outlet might require many years to regain any significant foothold for the distribution of his work.

During that period, pioneer aviator Charles Lindbergh was a national hero of the greatest stature, regularly ranked among the most admired men in America and the anti-war policies he publicly espoused probably had 80% popular support.  But he too fell in that political purge:

> Alarmed by their growing fear that America might be drawn into another world war without voters having had any say in the matter, a group of Yale Law students launched an anti-interventionist political organization that they named "The America First Committee," and it quickly grew to 800,000 members, becoming the largest grass-roots political organization in our national history. Numerous prominent public figures joined or supported it, with the chairman of Sears, Roebuck serving as its head, and its youthful members included future presidents John F. Kennedy and Gerald Ford as well as other notables such as Gore Vidal, Potter Stewart, and Sargent Schriver. Flynn served

as chairman of the New York City chapter, and the organization's leading public spokesman was famed aviator Charles Lindbergh, who for decades had probably ranked as America's greatest national hero.

Throughout 1941, enormous crowds across the country attended anti-war rallies addressed by Lindbergh and the other leaders, with many millions more listening to the radio broadcasts of the events. Mahl shows that British agents and their American supporters meanwhile continued their covert operations to counter this effort by organizing various political front-groups advocating American military involvement, and employing fair means or foul to neutralize their political opponents. Jewish individuals and organizations seem to have played an enormously disproportionate role in that effort.

At the same time, the Roosevelt Administration escalated its undeclared war against German submarines and other naval forces in the Atlantic, unsuccessfully seeking to provoke an incident that might stampede the country into war. FDR also promoted the most bizarre and ridiculous propaganda inventions aimed at terrifying naive Americans, such as claiming to have proof that the Germans—who possessed no large surface navy and were completely stymied by the English Channel—had formulated concrete plans to leap across two thousand miles of the Atlantic Ocean and seize control of Latin America. British agents supplied some of the crude forgeries he cited as evidence.

These facts, now firmly established by decades of scholarship, provide some necessary context to Lindbergh's famously controversial speech at an America First rally in September 1941. At that event, he charged that three groups in particular were "pressing this country toward war[:] the British, the Jewish, and the Roosevelt Administration," and thereby unleashed an enormous firestorm of media attacks and denunciations, including widespread accusations of anti-Semitism and Nazi sympathies. Given the realities of the political situation, Lindbergh's statement constituted a perfect illustration of Michael Kinsley's famous quip that "a gaffe is when a politician tells the truth  some obvious truth he isn't supposed to say." But as a consequence, Lindbergh's once-heroic reputation suffered enormous and permanent damage, with the campaign of vilification echoing for the remaining three decades of his life, and even well beyond. Although he was not entirely purged from public life, his standing was certainly never even remotely the same.

## A.J.P. Taylor and David Irving

The controversies surrounding America's entrance into World War II had toppled some of our most influential figures in journalism and

academia as well as politics, but echoes of that Great Purge also continued into later generations as well.

More than twenty years after the start of that worldwide conflict, renowned Oxford historian A.J.P. Taylor published his classic 1961 work *Origins of the Second World War*. As I wrote two years ago:

> Hitler's final demand, that 95% German Danzig be returned to Germany just as its inhabitants desired, was an absolutely reasonable one, and only a dreadful diplomatic blunder by the British had led the Poles to refuse the request, thereby provoking the war. The widespread later claim that Hitler sought to conquer the world was totally absurd, and the German leader had actually made every effort to avoid war with Britain or France. Indeed, he was generally quite friendly towards the Poles and had been hoping to enlist Poland as a German ally against the menace of Stalin's Soviet Union.
>
> The recent 70th anniversary of the outbreak of the conflict that consumed so many tens of millions of lives naturally provoked numerous historical articles, and the resulting discussion led me to dig out my old copy of Taylor's short volume, which I reread for the first time in nearly forty years. I found it just as masterful and persuasive as I had back in my college dorm room days, and the glowing cover-blurbs suggested some of the immediate acclaim the work had received. *The Washington Post* lauded the author as "Britain's most prominent living historian," *World Politics* called it "Powerfully argued, brilliantly written, and always persuasive," *The New Statesman*, Britain leading leftist magazine, described it as "A masterpiece: lucid, compassionate, beautifully written," and the august *Times Literary Supplement* characterized it as "simple, devastating, superlatively readable, and deeply disturbing." As an international best-seller, it surely ranks as Taylor's most famous work, and I can easily understand why it was still on my college required reading list nearly two decades after its original publication.
>
> Yet in revisiting Taylor's ground-breaking study, I made a remarkable discovery. Despite all the international sales and critical acclaim, the book's findings soon aroused tremendous hostility in certain quarters. Taylor's lectures at Oxford had been enormously popular for a quarter century, but as a direct result of the controversy "Britain's most prominent living historian" **was summarily purged** from the faculty not long afterwards. At the beginning of his first chapter, Taylor had noted how strange he

found it that more than twenty years after the start of the world's most cataclysmic war no serious history had been produced carefully analyzing the outbreak. Perhaps the retaliation that he encountered led him to better understand part of that puzzle.

A generation later, a much more extreme fate claimed one of Taylor's fellow countrymen in the same academic discipline. With the possible exception of Arnold Toynbee, I think that David Irving probably ranks as the most internationally successful British historian of the last one hundred years, and his ground-breaking archival discoveries will surely constitute a central pillar of our future understanding of World War II long after almost all of his current contemporaries have been forgotten. Having now read a dozen of his important volumes, I can certainly attest to the quality of his work.

But his research findings challenged official orthodoxy even far more strongly than did those of Taylor, and while the latter was merely purged from his quarter-century of teaching at Oxford, Irving was denounced, vilified, and blacklisted from all mainstream publishers, then eventually bankrupted and even imprisoned.

Indeed, Irving has now suffered the fate of a double purge. By the late 1990s his relentless enemies had successfully excluded him from the elite newspapers and book publishers that he had once dominated, but after his riveting public lectures began gaining him a renewed following on Youtube a few years ago, these were also purged from the Internet.

Irving's towering historical scholarship was regarded as so threatening to our ruling elites that gangs of violent young thugs were enlisted to break up his public talks, and the report of such an attack on a private restaurant in Chicago a dozen years ago was probably the first time I had ever seen mention of "antifa" in print.

Now in his mid-80s, Irving stands at the very twilight of his six decade scholarly career, but his dozens of lengthy historical volumes constitute his legacy, while some of his important lectures from thirty years ago are still available for watching on Bitchute:

David Irvi

examines the 'Holocaust'

## The Strategy of Dynamic Silence

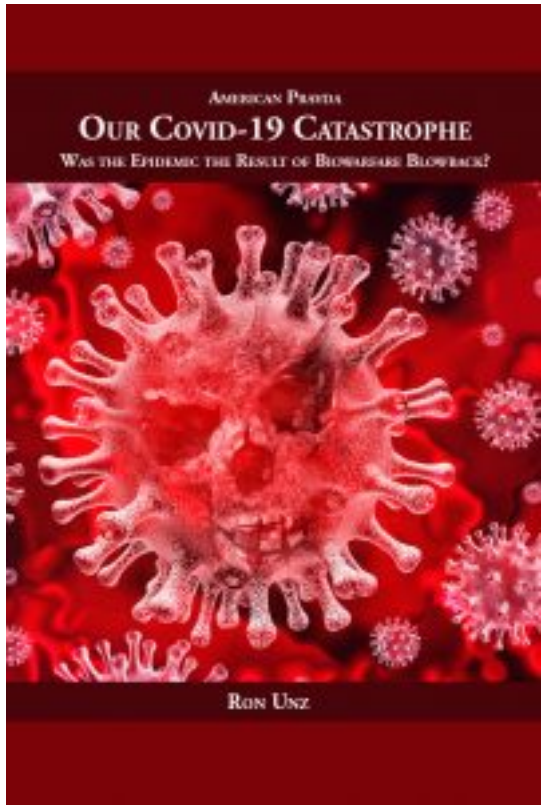
The long list of cases I have discussed includes many of our most illustrious journalists, academics, and other public figures, and the reasons they received such treatment is hardly difficult to understand.

Sensible people do not let themselves fall prey to rule by authority, and if the arguments advanced by these highly-regarded individuals had been weak or fallacious, they could and should have been effectively refuted. But the problem faced by their powerful opponents was that the evidence and analysis they presented was extremely strong, and backed by their credibility and past record, might easily have carried the day even against the multitude of their public opponents. So the answer was not to debate them—a debate that might easily be lost—but instead to "disappear" them.

The effectiveness of such disappearance techniques has varied considerably with the changes in communication technologies and the acceptable social customs in restricting them. Throughout most of the last century, popular information came from radio, television, and film together with the less ephemeral print media of newspapers, books, and magazines. Ownership of these means of communications was heavily concentrated and huge capital costs were required to launch any new competitor, so our media infrastructure included a series of powerful choke-points on public discussion, with ideological purges being relatively easy to implement.

The rise of the Internet over the last generation completely upended

this framework, destroying the power of many existing media organs and allowing individuals to create their own alternative outlets almost on a shoestring. With capital costs so greatly reduced as a factor, credible individuals with important things to say could almost single-handedly launch a significant media operation. A year after leaving the *Intercept*, Glenn Greenwald today probably has far more public impact through his own Substack columns than does the entire media enterprise he abandoned, despite the later's many dozens of staffers and $100 million in invested funding. Two or three decades ago, his situation would have been entirely different.



But over the last few years, new controls have been reimposed upon the once untrammeled Internet through the rise of dominant gatekeepers such as Google, Facebook, and Twitter, and the increasing willingness of these corporate monopolies to exercise that power and silence the voices of those who strayed too far outside the acceptable line.

I would hardly place myself in the august company of most of the figures whose media histories I have described, but I have experienced similar obstacles. Just days after writing my first April 2020 article

presenting some of the important, unreported facts about the global Covid epidemic, our entire website was suddenly banned by Facebook and deranked by Google. This harsh blow has drastically reduced the distribution of the crucial information I have spent the last year attempting to disseminate:

> For example, in 2017 Trump brought in Robert Kadlec, who since the 1990s had been one of America's leading biowarfare advocates. The following year in 2018 a mysterious viral epidemic hit China's poultry industry and in 2019, another mysterious viral epidemic devastated China's pork industry …
>
> From the earliest days of the administration, leading Trump officials had regarded China as America's most formidable geopolitical adversary, and orchestrated a policy of confrontation. Then from January to August 2019, Kadlec's department ran the "Crimson Contagion" simulation exercise, involving the hypothetical outbreak of a dangerous respiratory viral disease in China, which eventually spreads into the United States, with the participants focusing on the necessary measures to control it in this country. As one of America's foremost biowarfare experts, Kadlec had emphasized the unique effectiveness of bioweapons as far back as the late 1990s and we must commend him for his considerable prescience in having organized a major viral epidemic exercise in 2019 that was so remarkably similar to what actually began in the real world just a few months later.
>
> With leading Trump officials greatly enamored of biowarfare, fiercely hostile to China, and running large-scale 2019 simulations on the consequences of a mysterious viral outbreak in that country, it seems entirely unreasonable to completely disregard the possibility that such extremely reckless plans may have been privately discussed and eventually implemented, though probably without presidential authorization.
>
> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to

protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by "the second week of November" our Defense Intelligence Agency was already preparing a secret report warning of a "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious. Furthermore:

As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hated Iranian enemies were now dropping like flies.

Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have

America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

# Vaxxing, Anthony Fauci, and AIDS

*The Unz Review* • December 6, 2021 • 6,100 Words

## RFK, Jr. and the Anti-Vaxxing Movement

Over the last year or so, fervent anti-vaxxers have become a major presence on our alt-media website, a situation I found very disagreeable. Many of our longtime columnists—Mike Whitney, Paul Craig Roberts, Linh Dinh, Gilad Atzmon, and Israel Shamir—had also moved strongly into that ideological camp, with Whitney's long articles drawing enormous readership from across the Internet.

I've never paid any attention to vaccines and my own views on the role they might play against Covid were entirely mainstream and conventional, as I explained a couple of months ago in a candid 9,000 word interview:

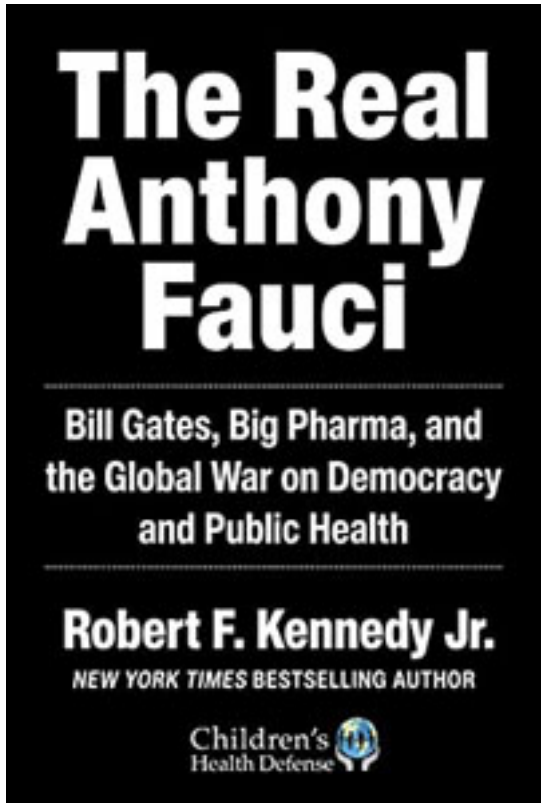
- Are the Opponents of the Covid Injections "Anti-Vaxx Crackpots"?
  *Interview with Ron Unz*
  Mike Whitney • *The Unz Review* • August 1, 2021 • 9,000 Words

The resulting comment-thread—heavily laced with ferocious attacks against me—soon exceeded 200,000 words and became quite sluggish, so I was forced to follow it up with two successive Open Threads on the vaxxing controversy. Several of the anti-vaxxing articles by Whitney, Roberts, and Dinh also provoked enormously long exchanges.

The commenting-software I've developed for this website is quite powerful and flexible, allowing meaningful debates that may easily reach the length of a hefty book, a situation quite rare elsewhere on the Internet. As a consequence, some of the anti-vaxxers declared that our million or two million words of anti-vaxxing discussions probably constituted the largest such repository in existence, an achievement that gave me rather mixed feelings.

I'd gradually discovered that Robert F. Kennedy, Jr., heir to the famous family, was a leading public figure in the anti-vaxx movement, and he released his lengthy book on the subject last month. A commenter whose opinion I respect had strongly endorsed it, so I decided to get a better sense of the issue directly from that source, and

bought it by clicking a button.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

Others apparently shared my interest. For ten days or so, *The Real Anthony Fauci* became the #1 bestseller on Amazon, and it has now accumulated over 1,500 reviews, 95% of them five-stars, which must be close to a record. The work also carried a couple of dozen strong endorsement-blurbs, mostly from medical doctors or scientists, including a Nobel Laureate, but also from public figures across the ideological spectrum including Oliver Stone, Tucker Carlson, Naomi Wolf, and Mark Crispin Miller. Meanwhile, despite its huge success and the famous name of its author, the work seems to have been greeted by almost total silence across the media.

I found the book itself rather unprepossessing. Although the text seemed fine and generally well-edited, I noticed some peculiar stylistic quirks. The text-margins were extremely narrow, so narrow that the pages lacked any chapter-headings, while the font-size was also smaller than normal, and tiny for the quoted passages. These unusual choices allowed a work that should have filled 600 or 650 pages to be squeezed down to just 480, but at the cost of some readability, with the intent probably being to minimize the length and the price. There

were a couple of thousand reference-notes, but instead of being shown on each page or grouped together at the end, they were distributed chapter-by-chapter, which I found inconvenient. Worse still, the book lacked any index, severely diminishing the usefulness of the hard copy version, which I prefer reading. All of this suggests that the book was produced in considerable haste, but I think it would have been worth the effort to take an extra week to produce an index or reorganize the notes, and perhaps this will be done in a second edition.

However, none of these flaws nor the apparent near-total lack of any media coverage or advertising seem to have hindered the rise of this gigantic #1 bestseller, proving that controversial content does still sometimes triumph over anything else.

But evaluating that content is another matter entirely, especially for an ignorant layman such as myself. A sizable fraction of the author's two thousand source-references are to academic journal articles or discussions of other scientific studies, and I am neither a medical doctor nor a biological researcher, so even if I had tried to check any of them—which I did not—I wouldn't have been able to properly weigh their evidence against that on the other side. Therefore, all my remarks, at least with regard to the scientific issues, should be taken with a large grain of salt.

Surprisingly enough, and very contrary to my expectations, Kennedy's stated position on vaccines seemed rather mild, quite different from the wild fear-mongering so regularly encountered on the Internet. He claimed that many vaccines weren't properly tested, often had harmful side-effects, and were promoted mostly due to the profiteering of greedy pharmaceutical corporations and their subverted governmental regulators, accusations far more moderate—and far more plausible—than I had assumed he would make. While it's not at all uncommon for wild-eyed anti-vaxxers to warn of millions—or even billions!—of deaths due to the current Covid vaccination drive, I didn't see any such egregious claims in the carefully-documented chapters of this book.

Some of his theories about vaccination efforts over the last couple of decades do seem rather implausible to me. He regards Microsoft founder Bill Gates as a nefarious mastermind behind the global vaccination project, though Gates' suggested motive is the multiplication of his wealth and power rather than a diabolical plot to exterminate most of the human race, with the latter allegation being widespread among the more excitable anti-vaxxers. But despite reading Kennedy's account with an open mind, I saw nothing to

seriously challenge my own much more mundane explanation. After having been vilified in the 1990s as a monopolist who had become the wealthiest man in the world by selling mediocre, buggy software, Gates may have simply sought to redeem his reputation by funding completely innocuous do-good projects, and he selected public health and vaccines as obvious choices, never dreaming that two decades later these efforts would have become so exceptionally controversial.

Similarly, although there is certainly much to condemn in the responses of the American and European governments to the Covid epidemic, my own interpretation sharply diverges from that of the author. In his opinion, the lockdowns and other disease control measures taken by our political elites represented a planned, sinister strategy for destroying all our traditional freedoms and establishing a totalitarian police state, while what I saw instead was utter incompetence.

China had responded brilliantly to the totally unexpected threat of a mysterious, highly-contagious disease, imposing an extremely severe short-term lockdown a thousand times larger than anything seen in world history; this allowed the government to completely stamp out the virus with minimal human losses, while restoring normal life for almost all Chinese within a month or two. But when the West tried to mimic that successful approach, the lockdowns imposed were so haphazard and disorganized that they proved entirely ineffective at controlling the virus, and since our flummoxed leaders had no other solution, they kept those lockdowns in place for a year or more, so that millions died while the lives of many hundreds of millions were severely disrupted.

My analysis is obviously quite different from Kennedy's. But if we merely disagree about whether our ruling elites should be condemned and punished for their evil subversion or instead for their criminal incompetence, we are obviously allies in every practical sense, and disputing such matters of interpretation serves no purpose.

This relates to a broader criticism. Though many of the substantive, factual claims Kennedy makes seem reasonably plausible and are usually well-documented, they are often presented in an overly shrill tone that I found distracting, a tone that at times almost lapses into hysteria. Given the enormity of the issues involved and the millions of lives at stake, his tendency is quite understandable, but I think the book would have been strengthened if the same material had been presented in a more restrained manner.

RFK Jr. clearly ranks as a leader of America's anti-vaxxer movement, which may broadly encompass 20-30% of our population, and his massive bestseller seems likely to become its seminal text. Meanwhile, I would regard myself as very much on the other side, but after carefully considering his views, I think the disagreements may be more apparent than real. I lack the scientific expertise to evaluate 95% of his claims. Yet even if many or most of them were correct, I do not think I would need to retract any of the statements I made in my long August interview denouncing "anti-vaxx crackpots."

His first and longest chapter discussed the various proposed responses to the Covid epidemic, arguing that the use of extremely cheap but reasonably effective medical treatments such as Hydroxychloroquine (HCQ) and Ivermectin (IVM) had been torpedoed by the vested interests of the powerful pharmaceutical industry, eager for lucrative profits from experimental vaccines and their own patented and very expensive drugs. This exact debate has been raging on the Internet since the early months of 2020, and I have never taken a stand on the contentious issue. But although I can't weigh the credibility of the scientific studies he cites against those on the other side, I thought he made a reasonably persuasive case, especially with regard to IVM.

Unlike some of his more extreme supporters, Kennedy seemed to fully admit that Covid is a dangerous disease, but correctly emphasized its extreme age-skew. He pointed out that the vaccines have proven far less effective than originally predicted, and he noted that they were rushed into widespread release without sufficient testing, which may eventually lead to major future health problems. The legal fig-leaf that allowed the normal regime of patient trials to be set aside was the claim that no other medical treatment existed, and this probably explains the widespread attacks on the use of IVM. Moreover, the vaccination of children or the youthful seemed very misguided given mildness of the illness for those age-cohorts.

Mandatory vaccination efforts enforced by serious legal or employment sanctions are the explosive flashpoint of the anti-vaxxer movement, but these never made any sense to me. The vaccines appear ineffective in preventing infection or transmission, and their main benefit is to greatly reduce the risk of serious illness or death. So the vaccinated have little to fear from those who reject the needle, while the latter can made an informed—or perhaps emotional—choice in weighing the risks of a relatively untested vaccine against those of severe Covid illness. Given the extreme paranoia of a considerable segment of anti-vaxxers, heavy governmental pressure may even be proving counter-productive.

## The Hidden Background of American Biological Warfare Programs

Kennedy is most closely identified with Covid vaccine issues, and I was pleasantly surprised to discover few sharp disagreements on those matters, but I was even more pleased with his discussion of one of my own areas of focus. I regard the long-obscured history of America's massive biowarfare program as central to properly understanding the global epidemic currently ravaging the world, but any such association has been almost entirely avoided by mainstream journalists and even within the alternative media very few have been willing to broach that subject. Yet Kennedy squarely confronts the reality, devoting his last and second-longest chapter to this topic, ensuring that many millions will probably now encounter it for the first time.

Although the author is a liberal Democrat, with deep ideological roots and the strongest of family pedigrees, in today's topsy-turvy America his only significant mainstream media coverage came from an hour-long interview by Tucker Carlson of *FoxNews*, who praised him as "one of the bravest and most honest people" he'd ever met. And near the end of that broadcast, listeners were told that if they only read one chapter of the book, the section on American biowarfare was the most important:

That chapter begins with a brief overview of the World War II origins and later growth of those controversial military programs, noting that they were officially abolished by President Richard Nixon in 1969,

and afterwards banned by international treaty. But those prohibitions contained a large loophole, allowing the continuing existence of "dual use" biodefense projects, so much of what had been biological warfare development was simply rechristened "vaccine research" and shifted from the Pentagon to the National Institutes of Health.

Kennedy then focuses his attention on Dr. Robert Kadlec, a central figure in the story he tells. From the late 1990s onward, Kadlec had been one of America's leading advocates of biowarfare, arguing that the technology offered the possibility of launching powerful attacks against the food supply or population of global adversaries while minimizing the risk of direct retaliation. As he wrote in 1998:

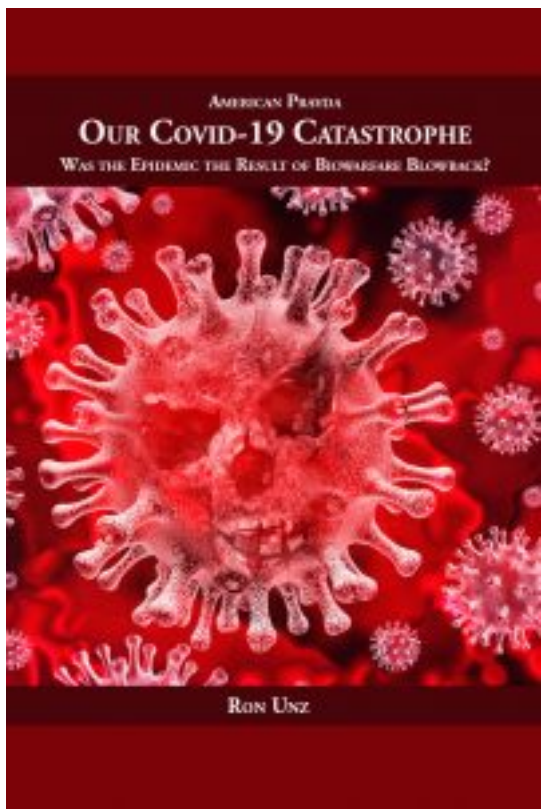
> Biological weapons under the cover of an endemic or natural disease occurrence provides an attacker the potential for plausible denial. Biological warfare's potential to create significant economic losses and consequent political instability, coupled with plausible deniability, exceeds the possibilities of any other human weapon.

Over the last few decades, our biowarfare programs have absorbed well over $100 billion in government funding, yet ironically the only known victims have been the American citizens who died in the false flag anthrax attacks that quickly followed 9/11. As Kennedy explains, those deadly bioweapon mailings to leading U.S. Senators and journalists stampeded Congress into passing the controversial Patriot Act and although purportedly from Islamic terrorists, the FBI later determined that the spores had been drawn from our own biowarfare stockpiles, possibility the one at Ft. Detrick. Although I had always been aware of these facts, until reading Kennedy's book I hadn't known that Kadlec's business associates benefited enormously from those mysterious attacks, which panicked the government into rescuing their BioPort corporation from the brink of bankruptcy with huge and lucrative new biodefense contracts.

During the years that followed, Kadlec regularly switched back and forth between senior roles in America's federal biowarfare programs and in the private corporations that received related contracts, with investigative journalist Whitney Webb providing a very detailed account of his activities. After the Trump Administration came into office, some of its leading elements began immediately mobilizing for a global confrontation against China, and Kadlec was brought back into government in 2017. Then in 2018 and 2019, China's food supply was severely impacted by mysterious viral epidemics that destroyed much of its poultry industry and 40% of its entire pig herd,

by far the largest in the world.

During these years, Kadlec was also heavily involved in a number of different biowarfare drills, intended to help prepare American society for the outbreak of dangerous and mysterious new viruses. In particular, he ran the large-scale "Crimson Contagion" simulation exercise from January to August 2019, in which federal and local authorities practiced a coordinated defense of their communities against risk of infection from the hypothetical outbreak of a dangerous respiratory virus in China; and two months after this major drill ended, a mysterious virus of exactly those characteristics suddenly appeared in the Chinese city of Wuhan.



EPub Format • Mobi/Kindle

The chapter also notes the close links between America's biowarfare establishment and the Wuhan lab, which held the closest genetic match to the Covid virus and also received American funding to undertake the "gain of function" experiments that many experts now believe produced the enhanced virus that created the current pandemic. The author is very careful to avoid including any of the explicit accusations or scenarios that have been the centerpiece of my

own series of articles over the past 18 months, but he provides a enormous amount of important information spread across those 65 pages and nearly 300 source references. This conveniently allows thoughtful readers to easily connect the dots.

## The HIV/AIDS Crisis as a Medical Media Hoax?

Based upon Kennedy's public focus and the individuals championing his book, I had expected it would contain a detailed critique of vaccines and the controversial public health measures Western governments had implemented to control the Covid epidemic, and so it did. I was pleased to also see a lengthy chapter on the substantial nexus between the mysterious new virus that had devastated the world and America's longstanding biological warfare programs. But a major portion of the text was devoted to an entirely different topic, one that I had not expected to see and found completely astonishing.

The eponymous target of Kennedy's book is Dr. Anthony Fauci, who had spent five decades playing a leading role in the public health activities of the American government before he became the official face of our response to the Covid epidemic. With the calm, soothing demeanor of an experienced physician and his ubiquitous presence on TV, he was elevated as a national hero by the political mainstream, which endorsed the policies he advocated, but eventually attracted huge hostility from those segments of the population that vehemently opposed lockdowns, masking, and vaccinations.

Since I don't watch cable news and hadn't paid much attention to the details of our Covid public health response, I completely missed most of Fauci's burgeoning fame, and never had strong feelings about him one way or the other. However, his name was already somewhat familiar to me from three or four decades earlier when he had played a similar governmental role in America's AIDS crisis, and he'd always been vaguely associated with that disease in my mind.

Given that Fauci was Kennedy's primary target and AIDS had launched his career, I might have expected some discussion of that topic, but what I encountered were seven full chapters running nearly 200 pages and constituting almost half the entire book. The incendiary claims that Kennedy makes about AIDS and Fauci's role in that human disaster were entirely new to me, and I lack even a sliver of the technical expertise to properly evaluate them. But if even 10% of his accusations are correct, his portrait is an absolutely devastating one.

Almost half of Kennedy's book may be devoted to AIDS, but this shocking material seems to have been studiously avoided by most who have discussed it or interviewed the author, and it receives negligible attention on the Amazon sales page. Indeed, when I mentioned some of his claims to an academic I know, he checked around a bit, found no mention of them anywhere, and almost seemed to suspect that I had been hallucinating. Kennedy opens one of this AIDS chapters with the phrase "I hesitated to include this chapter…" and I can easily understand why.

As all of us know from the media, AIDS is a deadly auto-immune disease that was first diagnosed in the late 1970s, primarily afflicting gay men and intervenous drug users. Transmitted by body fluids, the disease usually spread through sexual activity, blood transfusions, or the sharing of needles, and HIV, the virus responsible, was finally discovered in 1984. Over the years, a variety of medical treatments were developed, mostly ineffective at first, but more recently so successful that although being HIV-positive was once considered a death-sentence, the infection has now become a chronic, controllable condition. The current Wikipedia page on HIV/AIDS runs more than 20,000 words including over 300 references.

Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis, for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.

I found Kennedy's account as shocking as anything I have ever encountered.

Extraordinary claims obviously require extraordinary evidence.

Kennedy's chapters on AIDS include more than 900 source-references, many of them to academic journal articles or other sources of supposedly authoritative scientific information. But although I have a strong science background, with my original academic training having been in theoretical physics, I am not a medical doctor nor a virologist, let alone someone with specialized expertise in AIDS research, and these articles would mean nothing to me even if I had attempted to read them. So I was forced to seek other indications that Kennedy's 200 pages on AIDS represented something more than sheerest lunacy.

His book carries glowing praise from a long list of medical doctors and scientists, but their names and backgrounds are completely unknown to me, and with nearly a million practicing physicians in America, a few could surely be found to endorse almost anything. However, the first endorsement on the back cover is from Prof. Luc Montagnier, the medical researcher who won a Nobel Prize for discovering the HIV virus in 1984, and he writes: "Tragically for humanity, there are many, many untruths emanating from Fauci and his minions. RFK Jr. exposes the decades of lies." Moreover, we are told that as far back as the San Francisco International AIDS Conference of June 1990, Montagnier had publicly declared "the HIV virus is harmless and passive, a benign virus."

Perhaps the Nobel Laureate endorsed the book for other reasons and perhaps the meaning of his striking 1990 statement has been misconstrued. But surely the opinion of the researcher who won a Nobel Prize for discovering the HIV virus should not be totally ignored in assessing its possible role.

And he was hardly alone. Kennedy explains that the following year, a top Harvard microbiologist organized a group containing some of the world's most distinguished virologists and immunologists and they issued a public statement, endorsed by three additional science Nobel Laureates, that raised the same questions:

> It is widely believed by the general public that a retrovirus called HIV causes a group of diseases called AIDS. Many biomedical scientists now question this hypothesis. We propose a thorough reappraisal of the existing evidence for and against this hypothesis, to be conducted by a suitable independent group. We further propose that the critical epidemiological studies be designed and undertaken.

As Kennedy tells the story, by that point AIDS researchers and the mainstream media were completely in thrall to the ocean of

government funding and pharmaceutical advertising controlled by Fauci and his corporate allies, so these calls by eminent scientists were almost entirely ignored and unreported. According to one journalist, some two trillion dollars has been spent on HIV/AIDS research and treatment over the decades, and with so many research careers and personal livelihoods dependent upon what amounts to an "HIV/AIDS industrial-complex," few have been willing to critically examine the basic foundations of that empire.

Until a couple of weeks ago, I had never given any thought to questioning AIDS orthodoxy. But discovering the longstanding scientific skepticism of so many knowledgeable experts, including four Nobel Laureates, one of them the actual discoverer of the HIV virus, has completely shifted my perspective. I cannot easily ignore or dismiss the theories Kennedy presents, but can only briefly summarize them and leave it to individual readers to investigate further then decide for themselves. And in basic fairness to the author, he himself also repeatedly emphasizes that he can "take no position on the relationship between HIV and AIDS" but is simply disturbed that Fauci has successfully used his government funding and media clout to suppress an ongoing and perfectly legitimate scientific debate. According to Kennedy, his book is intended "to give air and daylight to dissenting voices."

His narrative of the origins of the HIV/AIDS connection is absolutely stunning and seems well-documented. Dr. Robert Gallo, an NIH researcher in Fauci's orbit, originally announced HIV as the apparent cause of AIDS at a packed 1984 press conference, which he held before any of his supportive research findings had actually been published and reviewed by his scientific peers. Only long after the theory had become firmly embedded in the national media did it come out that only 26 of the 76 AIDS victims in his seminal study showed any traces of the HIV virus, an extremely slender reed for such a momentous conclusion.

Furthermore, critics eventually noted that many thousands of documented AIDS victims similarly lacked any signs of the HIV virus, while millions of those infected by HIV exhibited absolutely no symptoms of AIDS. Correlation does not imply causality, but in this case, even the correlation seemed a very loose one. According to Kennedy, fully orthodox AIDS researchers grudgingly admit that no scientific study has ever demonstrated that HIV causes AIDS. The widespread accusations of serious scientific misbehavior and outright intellectual theft that long swirled around Gallo's laboratory research were eventually confirmed by legal proceedings, and that helped

explain why his name was not included on the Nobel Prize for the HIV discovery.

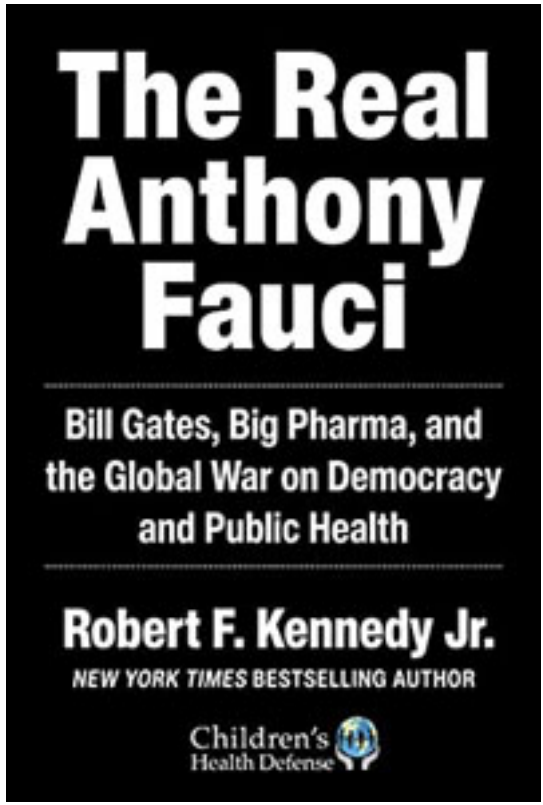
AIDS had originally come under the purview of the National Cancer Institute, but once it was blamed on a virus, Fauci's own infectious disease center managed to gain control. That resulted in an enormous gusher of Congressional funding and media attention for what had previously been a sleepy and obscure corner of the NIH, and Fauci soon established himself as America's reigning "AIDS Czar." The HIV-AIDS link may or may not be scientifically valid, but it carried enormous political and financial implications for Fauci's career.

In 1985 AZT, an existing drug, was found to kill the HIV virus in laboratory tests. Fauci then made tremendous efforts to speed it through clinical trials as an appropriate treatment for healthy, HIV-positive individuals, with FDA approval finally coming in 1987, producing Fauci's first moment of triumph. Priced at $10,000/year per patient, AZT was one of the most expensive drugs in history, and with the cost covered by health insurance and government subsidies, it produced an unprecedented financial windfall for its manufacturer.

Kennedy devotes an entire chapter to the story of AZT, and the tale he tells is something out of Kafka or perhaps Monty Python. Apparently, Fauci had been under enormous pressure to produce medical breakthroughs justifying his large budget, so he manipulated the AZT trials to conceal the extremely toxic nature of the drug, which rapidly killed many of the patients who received it, with their symptoms being ascribed to AIDS. So following FDA approval in 1987, hundreds of thousands of perfectly healthy individuals found to be infected with HIV were placed on a regimen of AZT, and the large number of resulting deaths was misattributed to the virus rather than to the anti-viral drug. According to the scientific experts cited in the book, the vast majority of post-1987 "AIDS deaths" were actually due to AZT.

One of the major scientific heroes in Kennedy's account is Prof. Peter H. Duesberg of Berkeley. During the 1970s and 1980s, Duesberg had been widely regarded as among the world's foremost virologists, elected to the prestigious National Academy of Sciences at age 50, making him one of the youngest members in history. As early as 1987 he began raising serious doubts about the HIV/AIDS hypothesis and highlighting the dangers of AZT, eventually making his case in a series of journal articles, which gradually won over many others, including Montagnier. In 1996 he published *Inventing the AIDS Virus*, a massive 712 page volume setting out his case, with the introduction provided by Nobel Laureate Kary Mullis, the renowned inventor of PCR

technology and himself another leading public critic of the HIV/AIDS hypothesis. Duesberg even underscored the confidence of his HIV skepticism by offering to be injected with HIV-tainted blood.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

But rather than openly debate such a strong scientific opponent, Fauci and his allies blacklisted Duesberg from receiving any government funding, thereby wrecking his research career, while also vilifying him and pressuring others to do the same. According to fellow researchers quoted by Kennedy, Duesberg was destroyed as a warning and an example to others. Meanwhile, Fauci deployed his influence to have his critics banned from the major national media, ensuring that outside a narrow segment of the scientific community few ever even became aware of the continuing controversy.

These elements merely scrape the surface of Kennedy's remarkable story and I would urge those interested to buy and read the book, then decide for themselves, an inexpensive option since the Kindle version sells for just $2.99. For further information, they can also consult the lengthy review we published a week ago by French writer Laurent Guyénot, which focuses on exactly the HIV/AIDS chapters that are the most explosive but under-reported elements:

## Contemplating a Complete Inversion of Scientific Reality

I found the medical history presented by Kennedy absolutely extraordinary, representing as it did a near-total inversion of the scientific reality that I had always accepted until just a couple of weeks ago. I do vaguely recall that my newspapers had occasionally included some mention of these sorts of AIDS controversies 25 or 30 years ago, but I had assumed that such disputes had long been resolved. Although I have now read all his AIDS chapters twice and found his narrative disturbingly credible and persuasive, I would obviously need to read several books on the other side before I could hope to form an intelligent opinion.

But suppose that despite Kennedy's wealth of factual material we assume that there is an 80% chance that the theory he presents is overwhelmingly wrong. That necessarily means that there is also a 20% chance that it is substantially correct, and such a conclusion would be staggering. Prior to the Covid outbreak, AIDS had spent almost four decades as the world's highest-profile disease, absorbing perhaps a couple of trillion dollars of funding and becoming the central focus of an army of scientists and medical experts. It simply boggles the mind for someone to suggest that HIV/AIDS might have largely been a hoax, and that the vast majority of deaths were not from the illness but from the drugs taken to treat it.

My science textbooks sometimes mentioned that during the benighted 18th century, leading Western physicians treated all manner of ailments with bleeding, a quack practice that regularly caused the deaths of their patients, with our own George Washington often numbered among the victims. Indeed, some have argued that for several centuries prior to modern times, standard medical treatments inadvertently took far more lives than they saved, and those too poor or backward to consult a doctor probably benefited from that lack. But I had never dreamed that this same situation might have occurred during the most recent decades of our modern scientific age.

According to Kennedy, the extremely lucrative nature of AZT and other early AIDS treatments blinded their manufacturers to the

obvious harm they were inflicting, and that situation recalls the similar case of Vioxx, a heavily-marketed pain medication eventually removed from use. As I discussed in a 2012 article, Merck had continued to promote that very profitable drug in a massive advertising campaign long after learning of its sometimes deadly side-effects. By the time the FDA finally demanded that it be withdrawn, government studies indicated that Vioxx had already caused tens of thousands of premature deaths, while my own examination of the mortality statistics suggested that the true figure may have been in the hundreds of thousands.

- Chinese Melamine and American Vioxx: A Comparison
  Ron Unz • *The American Conservative* • April 17, 2012 • 1,800 Words

Kennedy's account emphasizes that those who challenged the reigning HIV/AIDS orthodoxy included top scientific experts, and Fauci and his allies overcame their criticism not by refuting their arguments but by instead by blacklisting them in the media and working to destroy their careers. Just two weeks ago I had published an article discussing the very similar fate that befell leading journalists and scholars who had questioned establishmentarian doctrines on controversial political and historical topics, but I am surprised to discover this parallel in the supposedly more objective world of medical science.

- American Pravda: Giants Silenced by Pygmies
  Ron Unz • *The Unz Review* • November 22, 2012 • 12,200 Words

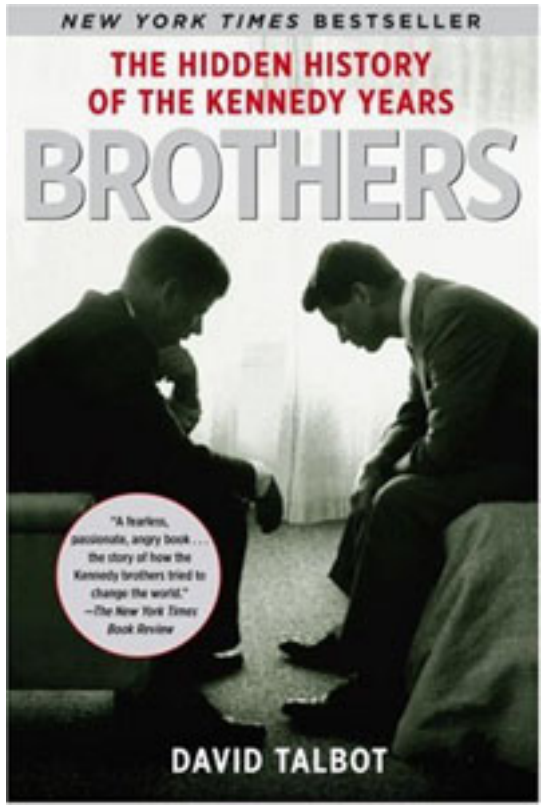
In all these examples, powerful critiques by influential adversaries were greeted by absolute silence, and that silence suggested that the arguments they made were not easily refuted by evidence or logic. I now see exactly the same response to Kennedy's national bestseller and the seemingly impossible HIV/AIDS "conspiracy theory" that it presents at such length.

Robert F. Kennedy, Jr. is a top figure in America's much-vilified anti-vaxx movement and his book is becoming a major element of that cause. His strident attacks against pharmaceutical companies, medical orthodoxy, and Fauci have earned him numerous, powerful enemies. If his AIDS claims were as ridiculous as they might seem, would they not have already been made a lightning rod for attacks against him? Suppose that his anti-vaxx tome had devoted 200 pages to arguing that our world was secretly controlled by invisible 12-foot-tall Reptilians from another dimension. Surely Kennedy's enemies would have unleashed a huge storm of media ridicule against him for that

lunacy, thereby discrediting his critique of vaccination campaigns. Yet instead complete silence has greeted his AIDS claims, raising questions in my mind of whether the medical establishment realizes that it has a great deal to hide and that many of Kennedy's accusations might be correct.

As an outside observer with no special expertise in these areas of medicine, I was impressed by much of the evidence that Kennedy presented in support of his unorthodox views on vaccines and Covid treatments, but found the evidence he provided on HIV and AIDS vastly more comprehensive and persuasive, while being backed by far more authoritative experts. And if as he argues, the truth about HIV and AIDS has been successfully suppressed for decades by the entire medical industry, we must naturally become very suspicious about their other claims, including those regarding Covid and vaccinations.

I even wonder if this may not represent part of the hidden subtext of the bitter current battle over vaxxing and the almost paranoid reaction of so many opponents. Those who have challenged the official scientific dogma on AIDS have long since been driven out of the public square so that few who draw their information from the mainstream media are even aware of the dispute. But the sort of divergent theories presented by Kennedy have probably circulated for years in particular segments of the population, and these individuals have become firmly convinced that huge numbers of Americans died because the medical establishment inflicted the deadly AZT treatment to combat the harmless HIV virus. So they would grow extremely suspicious when they learned that a low-mortality Covid virus was being treated by the widespread use of experimental new vaccines that had completely circumvented the usual testing process through a set of emergency waivers. After absorbing the remarkable contents of Kennedy's important book, I think these are not unreasonable questions to ask.

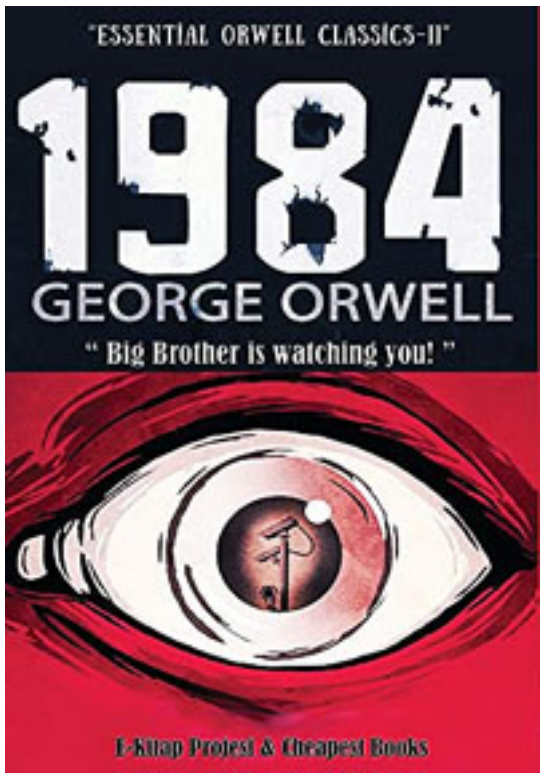


NEW YORK TIMES BESTSELLER
THE HIDDEN HISTORY
OF THE KENNEDY YEARS
BROTHERS
"A fearless, passionate, angry book . . . the story of how the Kennedy brothers tried to change the world."
—The New York Times Book Review
DAVID TALBOT

Prior to opening his book, I'm not sure I'd ever read anything by Kennedy, and although he is in his late sixties and carries one of the most famous political names in modern American history, I was only slightly aware of his activities. Until about a decade ago, I had remained almost as ignorant of the actual circumstances surrounding the assassinations of his famous father and uncle, casually accepting the soothing media narrative that both their tragic deaths had been at the hands of deranged lone gunmen. As I emphasized in my original American Pravda article, once we pierce our media veil of ignorance on several important matters, we become much more willing to recognize that other surprises may await our investigation. Although his book deals with subjects outside my expertise and which I have never explored, I think it may be as important as any of the works of history and politics that I have read over the years. And although Robert F. Kennedy, Jr. has never held any public office, this book by itself demonstrates that he is absolutely worthy of his family name.

# Confronting Covid Crimestop

***The Unz Review*** • December 13, 2021 • 6,400 Words



In George Orwell's classic dystopian novel *1984*, one of the many interesting concepts was the notion of "Crimestop," the ability of well-trained citizens to self-censor their thoughts before they strayed into dangerous and forbidden territory. As conveniently summarized in the Wikipedia entry, Orwell wrote:

> *Crimestop* means the faculty of stopping short, as though by instinct, at the threshold of any dangerous thought. It includes the power of not grasping analogies, of failing to perceive logical errors, of misunderstanding the simplest arguments if they are inimical to Ingsoc, and of being bored or repelled by any train of thought which is capable of leading in a heretical direction. *Crimestop*, in short, means protective stupidity.

Given the existing and ever-growing number of forbidden topics in contemporary Western society, this concept may or may not be

applicable. Perhaps thoughts are being self-censored or perhaps merely words. Lacking eyes into human souls, it's obviously difficult for us to distinguish between the two cases.

In any event, that concept entered my mind near the end of November when I began reading a full page of book reviews in the *Wall Street Journal* entitled "What Happened in Wuhan," with the descriptive subtitle "Four books pursue theories of possible origins of the Covid-19 virus—and the question of cover-ups."

Our global Covid catastrophe is probably the most important historical event since the end of World War II, and with its second anniversary now upon us, serious books analyzing the origin have finally begun to appear in print. I have extensively written on exactly this topic since April 2020, so the *Journal* review afforded me an excellent opportunity to compare my own analysis with those of the leading mainstream authors.

Until recently the media might have relegated any such discussion of Covid origins to the "fever swamps" of the conspiratorial fringe. The scientific establishment uniformly proclaimed that the virus was natural, randomly crossing over from some animal species in late 2019, and that was that. But then in early May, an 11,000 word essay by Nicholas Wade, a longtime science journalist, punctured that ideological bubble and persuaded a large and growing segment of the media that the virus had been the human product of some laboratory, a shocking possibility that launched a fierce public debate on its origins, including the question of who might have created it and why.

- Origin of Covid — Following the Clues
  *Did people or nature open Pandora's box at Wuhan?*
  Nicholas Wade • *Medium* • May 2, 2021 • 11,000 Words

Pride of place in the *Journal* review was given to a paperback version of Wade's seminal essay, so only three new books were actually discussed.

Although they took a variety of different approaches, all three supported the so-called "lab-leak hypothesis," the perceived alternative to the natural virus theory. Under this reconstruction, Covid is believed to have been accidentally released by China's Wuhan Institute of Virology, which contained the closest genetic match of the Covid virus and whose researchers were also known to have been involved in exactly the sort of "gain of function" experiments that might have produced it.

This evidence is purely circumstantial, but fairly compelling nonetheless, and the *Journal* reviewer certainly seemed to accept it. Given the magnitude of the global disaster, it is hardly surprising that the Chinese government has fiercely denied that any such lab-leak occurred. According to *The Economist*'s detailed worldwide analysis of "excess deaths," the Covid outbreak has already claimed up to twenty million lives, and enormously disrupted the activities of many billions more, so if Chinese government were proven guilty, the world's geopolitical landscape might certainly shift.

One of the books discussed is by Jasper Becker, a British journalist who had spent 18 years as a Beijing correspondent, and the closing paragraph of the review quotes him as suggesting that a Chinese admission of responsibility could even lead to the downfall of the ruling regime:

> The national shame might spell the end of the Chinese Communist Party's seventy-year rule. It would start a political earthquake which would begin in China but spread around the world.

The reviewer notes that Becker draws upon history to suggest that China's current denials cannot be trusted, emphasizing that during the Korean War the Chinese Communists had launched a major propaganda offensive, falsely claiming that the American military had used illegal "germ warfare" to attack China's own forces:

> This is one reason why Western intelligence agencies are likely to doubt or at least question official accounts about the origin of the virus and the role of the Wuhan Institute of Virology…While the Chinese and Soviet governments pushed a completely false story of its enemies waging war with bioweapons against civilians, they actively pursued their own germ warfare programmes in secrecy.

Becker and the reviewer both reasonably argue that if a government has been caught lying in the past about biological warfare, its current claims about the Covid outbreak cannot be trusted.

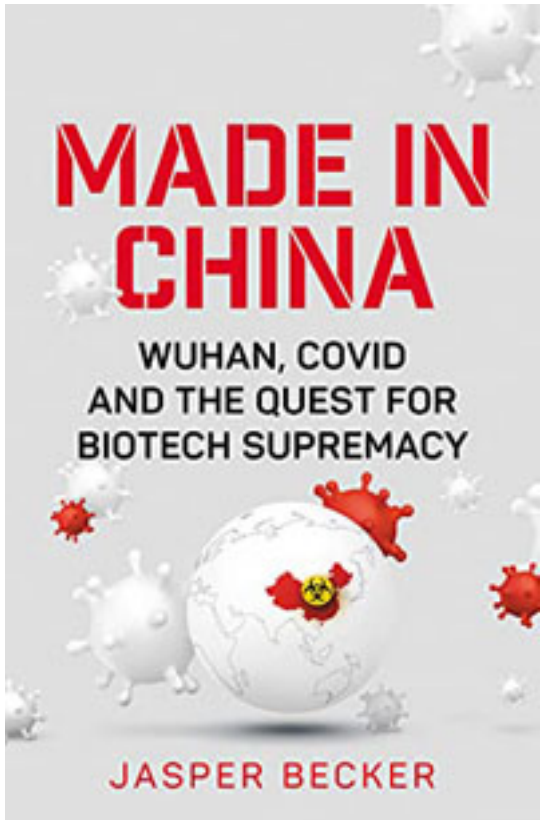
I am sure that the vast majority of readers simply nodded their heads at all of these statements and earlier this year I would have done the same. But several months ago I had carefully investigated the history of American biological warfare and discovered that the story I had casually absorbed from our media was the exact opposite of the historical truth. Based upon declassified government documents and other fully mainstream sources, there was actually overwhelming

evidence that the Chinese had been telling the truth during the Korean War while our own denials had been false. America had indeed used illegal biological warfare during that conflict.

- American Pravda: Waging Biological Warfare
  Ron Unz • *The Unz Review* • August 9, 2021 • 7,500 Words

I have no doubt that Becker was being entirely sincere, and his statements on that specialized historical question were simply due to his acceptance of the conventional media narrative rather than any deliberate deception. But suppose we now apply his own standard. Once we recognize that China had been truthful in the past, while America had both employed illegal bioweapons and then lied about their use, these disturbing facts must inform our own analysis of the Covid outbreak.

Perhaps Covid was a natural virus and perhaps it accidentally leaked out of a Wuhan lab. But there is also a third logical possibility, that it was deliberately released in one of China's largest cities as a planned biowarfare attack. The Covid outbreak occurred at the height of China's ongoing international conflict with America, so elements of our own hostile government would be the obvious suspects. None of the three books seemed to recognize the existence of this hypothetical possibility even merely to dismiss it, an enormous blind spot that may or may not be due to the constraints of the American publishing industry.



Becker's own book is entitled *Made in China*, and seems to focus very heavily upon the real or imagined iniquities of America's giant global adversary, while glossing over contrary or contextualizing material.

His major blunder regarding our own biowarfare attacks during the Korean War comes early in the book and sets the general tone. A little later he criticizes the damaging adulteration of Chinese consumer products, highlighting the deaths of several infants in the notorious Melamine scandal, while entirely ignoring America's own Vioxx disaster a few years earlier, whose forgotten body-count had been more than 10,000 times larger.

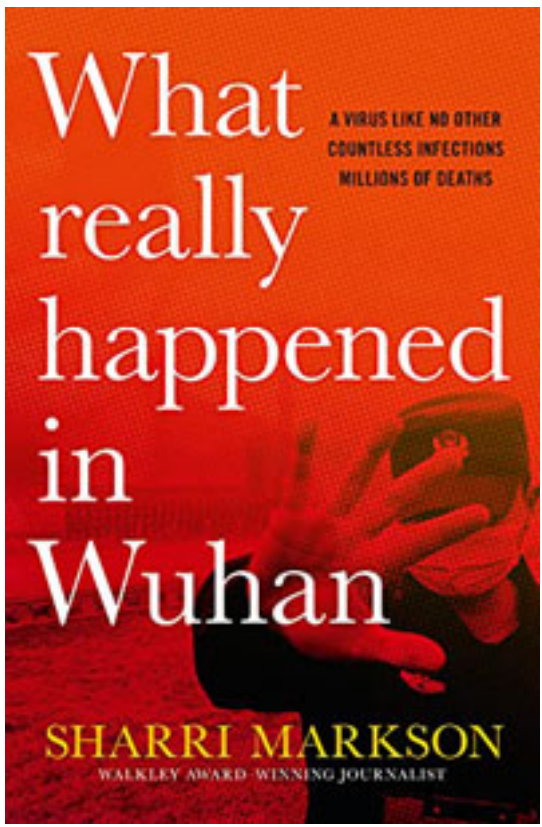
- Chinese Melamine and American Vioxx: A Comparison
  Ron Unz • *The American Conservative* • April 17, 2012 • 1,800 Words

One of Becker's areas of particular interest is China's biowarfare development efforts, but although such a program probably exists, he seemed to provide little hard evidence demonstrating that fact. Meanwhile, America's own biowarfare infrastructure, certainly the largest in the world, went entirely unremarked, except for those

erroneous Korean War denials. Indeed, I noticed that his lengthy index contains no mention of our own Ft. Detrick, which certainly ranks as the world's oldest continuous biowarfare facility, now approaching its eighth decade.

The author also seems quite credulous in accepting evidence supporting his lab-leak hypothesis, swallowing highly-implausible suggestions that by September 2019 the Covid epidemic in Wuhan had already reached such an enormous size that it could be detected by satellite imagery, which I've demonstrated seems very likely to be an intelligence hoax.

My own rather dismissive appraisal of this book may have been shared by others. Except for this combined *Journal* review, I haven't seen it discussed anywhere else, and with a current Amazon sales rank of over 400,000, few copies seem to have been purchased.



Equally hostile to China is *What Really Happened in Wuhan* by Sharri Markson, an Australian journalist for Rupert Murdoch's Sky TV network and his flagship newspaper in that country.

The *Journal* reviewer suggests that her "whodunit" with its "fast-paced narrative" might be attractive to a Hollywood movie studio, and the story told by this television journalist does seem to feature numerous James Bond elements. Although the book lacks any individual source notes or index, it fills its text with dramatic speculation intensely hostile to China. In the very first chapter, a couple of Chinese exiles speculated that Covid was a Chinese bioweapon deliberately released by its own government, perhaps due to an internal power-struggle, a suggestion repeatedly presented at length elsewhere in the narrative; but such a notion was so wildly implausible that even the author's own hard-line anti-China government and intelligence sources uniformly rejected it.

The key figures in the anti-China faction of the Trump Administration seem to have provided much of Markson's information, with Secretary of State and former CIA Director Mike Pompeo and his top aides being especially important conduits, which raises all sorts of doubts.

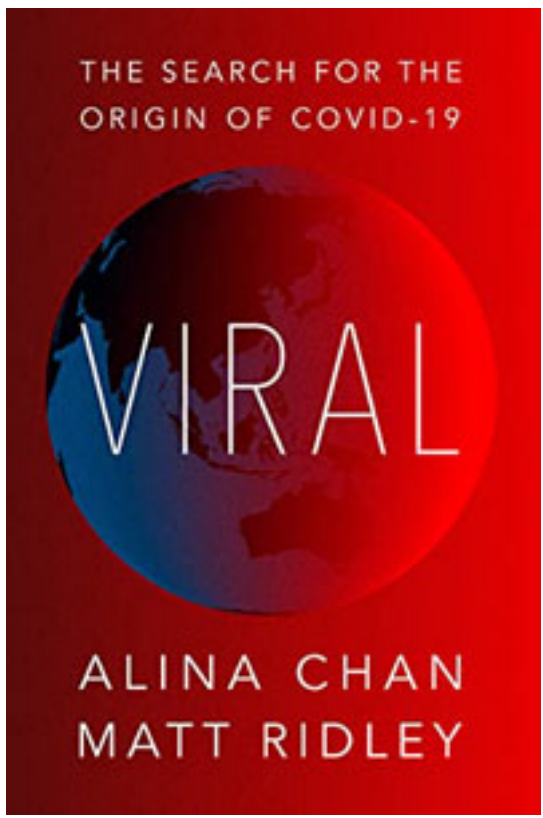
For example, on the 30th anniversary of the notorious Tienanmen Square Massacre, Markson breathlessly reported Pompeo's fierce denunciation of that horrific atrocity, including his claims that up to 10,000 innocent Chinese civilians had been slaughtered in the incident. Yet as I have repeatedly noted, more than twenty years ago the former Beijing Bureau Chief of the *Washington Post*, who himself had personally covered the event, published a short article in the prestigious *Columbia Journalism Review* admitting that the supposed massacre had probably never happened and amounted to a Western media hoax.

There are even more serious problems with her apparent heavy reliance upon Pompeo and his senior staff. Biowarfare is a major element of Markson's account, which is replete with suggestions that Covid was designed as a bioweapon. But nowhere does she ever consider the possibility that it may have been an *American* bioweapon, deliberately released in Wuhan. And if such an attack had taken place, Pompeo would certainly rank near the very top of the list of likely suspects, so his role in guiding her investigation seems extremely problematic.

Although her book does provide a good deal of useful testimony indicating that Covid is probably an artificial virus, her lack of a science background weakens the credibility of such reporting, and most of the same material has also been presented in the work of Wade and others. Given all these flaws, I'm not surprised that the only major media review I located was a generally negative

one published in the *Guardian*.

The third book in the set is far more limited in scope than the other two but also far more effective for that same reason. While there is obviously a market for broad-brush attacks on China's government and policies, such an audience tends to cluster in a particular ideological niche, so that most of the readers probably agree with the conclusions before they have even opened the first page.



By contrast, *Viral*, co-authored by molecular biologist Alina Chan of the Broad Institute and British science journalist Matt Ridley, seems aimed at winning over fair-minded neutrals rather than providing additional ammunition to true believers. Released in mid-November, the text is much more scrupulous and careful in the material it presents, and focuses narrowly on mustering the strong arguments against the virus being natural, together with suggestive indications that it may have been a product of the Wuhan lab, from which it accidentally leaked. There has been considerable coverage of the book and its authors especially Chan in the *New York Times*, the

*Washington Post*, the *Guardian*, Reason, and other publications, some of these hostile but others quite friendly. The current Amazon sales rank is around 1,300, hardly making it a bestseller, but still a factor of seven better than the Markson book.

Credibility may be severely damaged by major errors of fact, and I noticed almost none of these, with my complaints being limited to errors of omission. At one point, the authors do acknowledge the swirling Internet accusations that Covid was a bioweapon—a *Chinese* bioweapon—but only to dismiss that notion as a "distraction." Given the often lurid nature of such claims, this approach is quite understandable, but it also automatically excludes any consideration that Covid might have had American origins.

Even merely raising that possibility would have obviously required such lengthy and specialized discussion that the book's tight focus would been completely disrupted. We must also recognize that Chan is a young researcher, in the early stages of her scientific career, which had already suffered a near-death experience last year when she challenged the official dogma of a natural virus, and she would naturally be reluctant to suggest that an illegal American bioweapon has now killed 20 million people worldwide. However, completely ignoring that possibility does sometimes undercut the book's analysis.

For example, the first scientific paper discussing the genetic structure of the virus was published in late January by a group of Wuhan lab researchers, and the authors consider it extremely odd and suspicious that these expert virologists ignored the remarkably unusual aspects of the genetic structure that seemed to imply an artificial origin. But at that point in time, the dangerous viral disease was already spreading into other parts of their country and threatening to become an uncontrollable national epidemic, so suggesting that it was bioengineered would have been tantamount to declaring that China was under deadly biowarfare attack, obviously the sort of momentous public decision that must be deferred to China's top political leaders.

Consider the broader aspects of that same issue. The authors of all these books and numerous other Western scientific observers have repeatedly stressed the highly-suspicious behavior of China's researchers and its government, arguing that the Chinese have been insufficiently willing to open the doors of all their research facilities and make available all confidential information that might be connected with the Covid outbreak.

But suppose that the evidence for the virus being artificial is actually

as strong as most of these analysts claim. The Chinese would know perfectly well that their own labs had not created the virus, so a biowarfare attack would be the only possible explanation, a blatant act of war with America as the obvious suspect. However, the West totally dominates the global media landscape, so leveling such incendiary accusations without solid proof would probably achieve nothing while being both dangerous and counter-productive, leaving silence as the wisest policy. But would it be rational for a country that knows it had suffered a potentially devastating biowarfare attack to open all its own scientific installations to teams of investigators and intelligence agents from the country that had probably launched that deadly attack?

Numerous puzzling issues become less puzzling under this biowarfare scenario. Mutational and epidemiological evidence strongly suggests that Patient Zero of the Wuhan outbreak probably became infected sometime during the period from mid-October to mid-November 2019. The authors note that the Wuhan lab's public virus database had been taken offline on September 12th, and they consider this quite suspicious, perhaps indicating that a lab-leak had just occurred. The official explanation provided was that the database had been repeatedly attacked by hackers, but they reject this as implausible: why would hackers have targeted the database months before the world learned of any outbreak? However, such an attempted hacking would make perfect sense in the context of a forthcoming biowarfare attack against China, which was intended to be blamed upon the Wuhan lab. Being scientists and science journalists, Chan and Ridley fail to consider events through the eyes of intelligence operatives or military planners.

I found another omission far more serious. Based almost entirely upon circumstantial evidence and speculation, the two authors have constructed a gossamer narrative that the Wuhan lab secretly created the Covid virus, which then accidentally escaped due to the poor laboratory safety conditions. Yet there exists a highly-credible Western eye-witness who directly contradicts all these claims. On June 27th, *Bloomberg* published a long interview with experienced Australian virologist Danielle Anderson, who was actually working at the Wuhan lab during exactly the period in question.

- The Last—And Only—Foreign Scientist in the Wuhan Lab Speaks Out
  *Virologist Danielle Anderson paints a very different picture of the*

Contrary to the claims of the book, Dr. Anderson described the Wuhan lab's safety protocols as outstanding, so good that she actually recommended that they be adopted at her own facility. She also encountered absolutely no rumors or other indications of any lab-leak nor any evidence that the Covid virus had been created at the facility, and she strongly believed that this information would have come to her attention while she was working there. Some Trump Administration intelligence operatives have floated the accusations that several lab workers became infected with Covid during 2019, but she said that nothing like that actually happened.

The book publishing industry involves long production lead-times, and although the crucial Anderson interview had appeared nearly five months before the book's release, perhaps the manuscript could not easily be modified to incorporate that important new factual information. But I have also Googled Anderson's name together with those of Chan or Ridley, and found no indication that they have ever acknowledged the existence of her eye-witness testimony, which seems so potentially damaging to their thesis. By failing to respond to this important development they tarnish their own credibility.

Other omissions are also quite serious, though perhaps more understandable. In describing the global spread of the epidemic, they write "Italy was devastated by the virus. Iran and the United States would soon follow."

But this is incorrect, or at least extremely misleading. The Iranian and Italian outbreaks occurred around the same time, while the US followed weeks afterward, and aspects of the Iranian outbreak were extremely unusual. As I wrote last year:

> As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hated Iranian enemies were now

dropping like flies.

> Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

The Northern Italian outbreak began with little media notice in a region containing 300,000 Chinese workers, many of whom had recently returned from their Lunar New Year travels to their home country, including the city of Wuhan. Meanwhile, the Iranian outbreak occurred in the Holy City of Qom, containing very few Chinese, and was centered upon the country's highest-profile political elites, which soon attracted worldwide attention.

These very strange circumstances aroused considerable suspicion in Iran, and led some of its top political and military leaders to publicly declare that they suspected that Covid was an American biowarfare attack against their own country and China, with their former president even lodging a formal complaint with the United Nations.

Although fully reported in our leading media outlets at the time, that extremely early and highly suspicious Iranian outbreak has long since been flushed down the media memory hole, and since both of the authors are narrowly focused on scientific matters rather than geopolitics, it seems quite possible that they are unaware of those facts, which anyway would be part of the biowarfare "distraction" they have explicitly excluded. But an early section of their Prologue is entitled "The importance of finding the origin of Covid-19" with the first sentence being "How the Covid-19 pandemic started may be the keenest mystery of our lifetime." Biowarfare may be a lurid subject that invites wild allegations, but completely excluding all such discussion may render that mystery insoluble.

We must place the important work of Chan and Ridley within its proper context. Both viral microbiology and national security matters are highly technical subjects that require a great deal of expertise, and

individuals who focus on the one may naturally tend to avoid the other, which is fine so long as we acknowledge that necessary division of labor. The first and most important question about the Covid virus is whether it came from nature or from a human lab, but once the microbiologists have had their say on that matter, I think their role is greatly diminished. Perhaps they can then argue that some of the scientific evidence points toward one particular lab rather than to another, but surely any professionals planning a biowarfare attack would have made considerable efforts to conceal its origins, and this might involve laying down false trails.

America's top virologists had long enjoyed a close working relationship with their Wuhan lab counterparts. Our leading biowarfare experts had regularly paid friendly visits and the American government had funded some of the lab's crucial research, so surely obtaining some Wuhan viral samples over the years would not have been difficult. And our biowarfare developers might then have decided to engineer Covid from one of those Chinese viruses as an ideal means of throwing suspicion in a different direction.

America's enormous and longstanding biological warfare program remains the elephant in the room for the media coverage of our global Covid epidemic, and almost no journalists nor authors are willing to acknowledge its presence, let alone finger it as a prime suspect. This state of Orwellian *crimestop* thinking is really quite remarkable, though occasionally hints of those dangerous and submerged thoughts do manage to poke through.

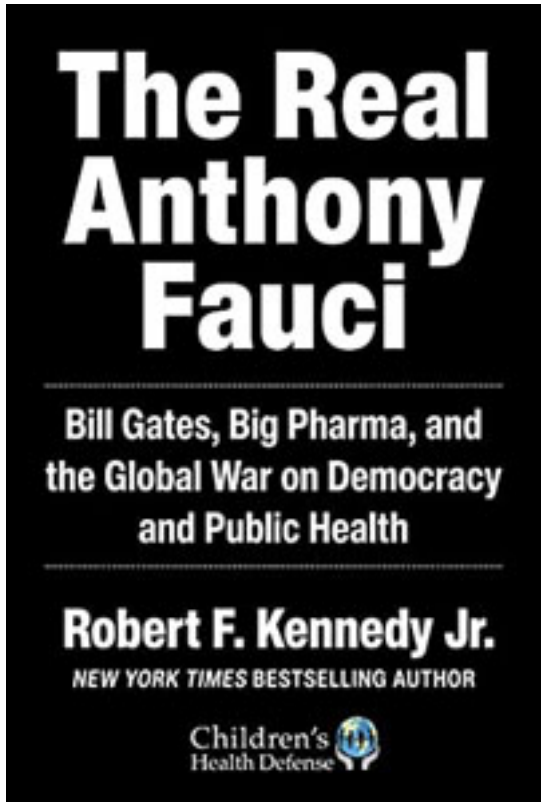
The *Wall Street Journal* review of these books on the origins of Covid seems the most comprehensive such discussion that has yet appeared in the major media. And although the text contains absolutely no suggestion that Covid might have been designed as a bioweapon, just above the title of the print version there appears the curious framing quote "Whenever you have a novel outbreak, it could be a bioweapon…" That statement was by Robert Kadlec, an individual whose name appears nowhere in the body of the review nor even in any of the books under discussion. So apparently some *Journal* editor actually knows far more about the subject than was covered in the books written by these particular authors. And as I've emphasized in my own writings, Kadlec's activities during the last few years certainly do raise all sorts of questions:

> For example, in 2017 Trump brought in Robert Kadlec, who since the 1990s had been one of America's leading biowarfare advocates. The following year in 2018 a mysterious viral

epidemic hit China's poultry industry and in 2019, another mysterious viral epidemic devastated China's pork industry …

From the earliest days of the administration, leading Trump officials had regarded China as America's most formidable geopolitical adversary, and orchestrated a policy of confrontation. Then from January to August 2019, Kadlec's department ran the "Crimson Contagion" simulation exercise, involving the hypothetical outbreak of a dangerous respiratory viral disease in China, which eventually spreads into the United States, with the participants focusing on the necessary measures to control it in this country. As one of America's foremost biowarfare experts, Kadlec had emphasized the unique effectiveness of bioweapons as far back as the late 1990s and we must commend him for his considerable prescience in having organized a major viral epidemic exercise in 2019 that was so remarkably similar to what actually began in the real world just a few months later.

With leading Trump officials greatly enamored of biowarfare, fiercely hostile to China, and running large-scale 2019 simulations on the consequences of a mysterious viral outbreak in that country, it seems entirely unreasonable to completely disregard the possibility that such extremely reckless plans may have been privately discussed and eventually implemented, though probably without presidential authorization.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

None of these books on the origins of Covid seems likely to reach a mass audience except through secondary media coverage. However, a colossal current bestseller by a prominent national figure falls into a different category. These days, Robert F. Kennedy, Jr. may best be known as a leading critic of our vaccination programs, but his #1 Amazon bestseller *The Real Anthony Fauci* devotes one of its longest chapters to the history of America's biological warfare programs and their close connection to the Covid epidemic, and Kadlec is one of the central figures in that narrative. When Kennedy was recently interviewed by Tucker Carlson, he pointed to that chapter on biowarfare as the most important in his book.

The Kindle edition of this crucial work is priced at just $2.99, but those who seek a briefer discussion can read my own recent review of the material:

- American Pravda: Vaxxing, Anthony Fauci, and AIDS
  *The Hidden Background of American Biological Warfare Programs*
  Ron Unz • *The Unz Review* • December 6, 2021 • 6,100 Words

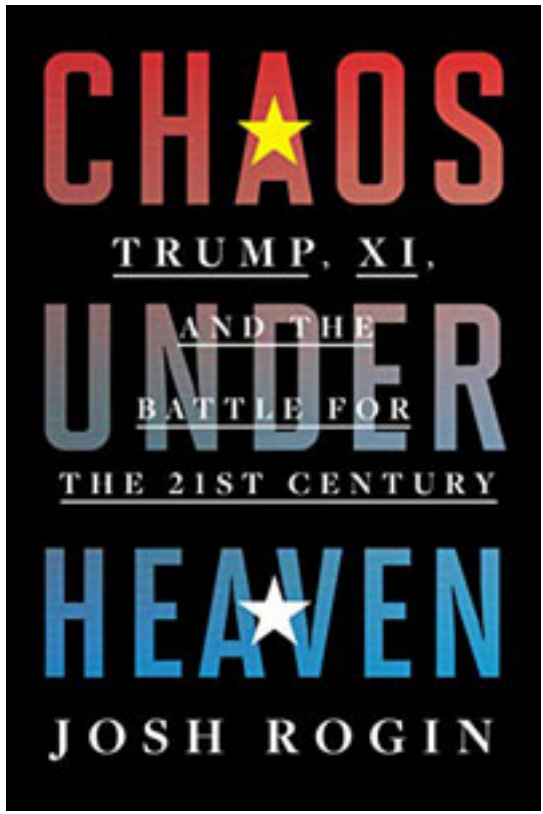
Several other books are also worth mentioning, as supplements to those already discussed.

Jeremy Farrar served as Director of Britain's Wellcome Trust, one of the world's largest funders of public health projects, and he played a crucial role in organizing the immediate measures taken to contain the Covid epidemic. *Spike*, co-authored by journalist Anjana Ahuja, is his short narrative account of those important events beginning in the last days of 2019, and it provides the useful perspective of a leading insider. I was also particularly interested to discover that Wellcome's chair was the former head of MI-5, Britain's domestic intelligence agency, who may have helped provide the author with some important insights on certain matters.

In his account, Farrar repeatedly emphasized that the Covid outbreak had hit China at the absolute worst possible time, appearing on the eve of Chinese Lunar New Year, when 450 million Chinese might be traveling. This seemed likely to spread the disease to every corner of the huge country, and that gigantic, looming disaster was only averted by an immediate public health lockdown unprecedented in all of human history.

Farrar is the most respectable of establishmentarian figures, and I was surprised to discover that in the early days of the epidemic he and his

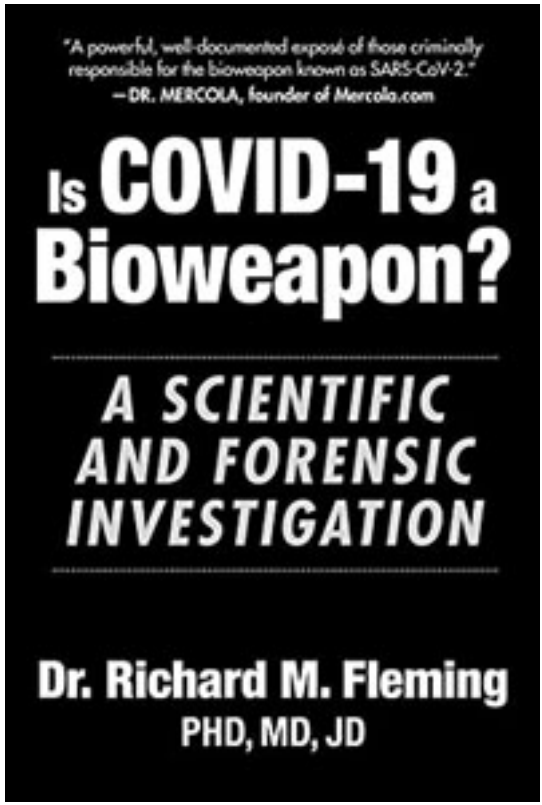
circle of leading scientific experts freely discussed whether the virus had been bioengineered, with some of them thinking that likely, and he even mentioned the speculation that it might have been a bioweapon, deliberately released. But as the practical needs of the terrible public health crisis facing Britain and the rest of the West began absorbing all of his concentration, these theoretical issues understandably faded from their discussions.



Josh Rogin is a *Washington Post* foreign policy columnist, who seems intensely hostile to China and its government and has broken a few Covid-related stories based upon intelligence leaks, which may or may not be reliable. I found his book *Chaos Under Heaven* to be a rather gossipy account of all the factional infighting of the Trump Administration with regard to its China policy, and only the last chapter focused on the Covid epidemic. Most of that material seemed similar in tone and content to what appears in the Becker and Markson books.

If the author's account can be credited, Trump was just as disengaged a president as many other journalists have alleged, with his top aides often ignoring his wishes or running circles around him in support of

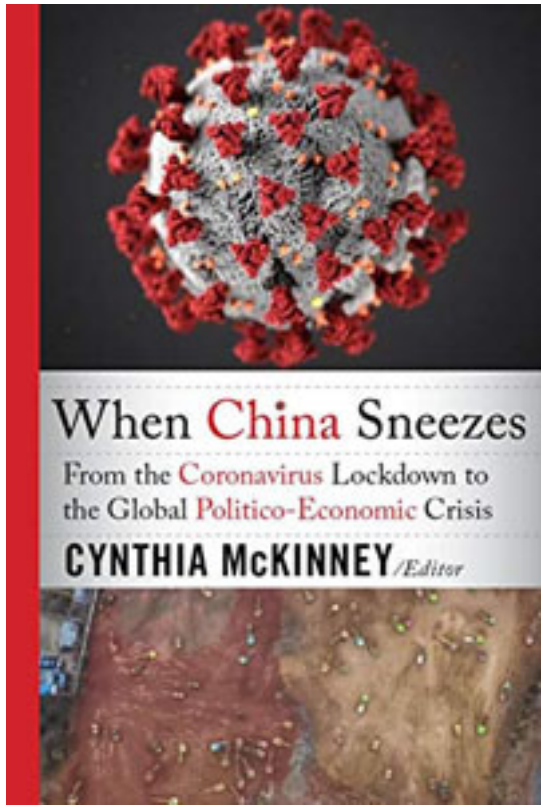
their own policies. This greatly magnifies the possibility that "rogue operations" of a potentially momentous nature might have been organized behind his back.



"A powerful, well-documented exposé of those criminally responsible for the bioweapon known as SARS-CoV-2."
—DR. MERCOLA, founder of Mercola.com
Is COVID-19 a Bioweapon?
A SCIENTIFIC AND FORENSIC INVESTIGATION
Dr. Richard M. Fleming
PHD, MD, JD

*Is COVID-19 a Bioweapon?* caught my eye because the cover style was identical to that of the Kennedy book, whose publisher it shared. Since it also featured the endorsement of a leading anti-vaxxer, I mistakenly assumed that author Dr. Richard M. Fleming was somehow associated with Kennedy. Unfortunately, I found this very short book heavily padded and largely useless, with one third of the pages merely being print-outs of government funding grants.

Despite the overwhelmingly "conspiratorial" tone, the author oddly enough still seems to shy away from any focus on America's own biological warfare programs, so that the "bioweapon" emphasized in the title must necessarily be a Chinese one.



Ideologically antipodal to several of the books already discussed is *When China Sneezes*, a collection of republished Internet essays, released in late 2020 and edited by Cynthia McKinney, a former Congresswoman and the 2008 Green Party presidential candidate.

Most of her contributors are intensely skeptical of American policies or even explicitly hostile to our government. Several of the pieces do focus on the origins of the epidemic, including claims that the Covid outbreak was an American biowarfare attack, though the arguments provided are of very mixed quality and have sometimes been swept away by subsequent events. For example, the suggestion is made that Covid was designed to be uniquely deadly to Asians and Chinese in particular, with Caucasians being largely immune, speculation that was once quite common but soon disappeared after Caucasians became the overwhelming majority of worldwide victims.

Among the essays, I would particularly recommend investigative journalist Whitney Webb's important discussion of the history of American biowarfare programs, which we ran on our own website, and the gripping, first-hand accounts of China's desperate effort to control the sudden disease outbreak by Larry Romanoff and other

Chinese local residents.

For unknown reasons, some of what I regard as the strongest evidence implicating America in the Covid outbreak has been almost totally ignored outside of my own series of articles, which began making those points in April 2020 and have continued to do so since.

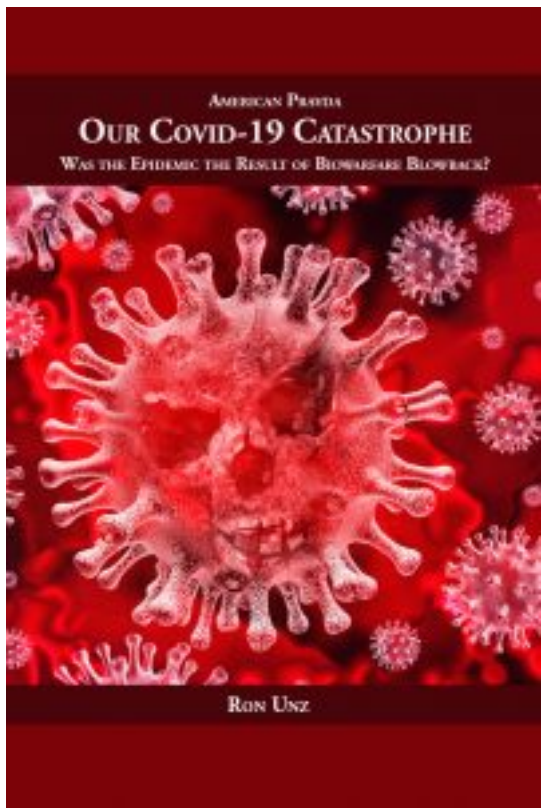
As already mentioned, Iran's ruling elites were struck down by Covid so soon after the virus had first appeared in China that the country's political leaders publicly accused America of a biowarfare attack, but that important history has completely disappeared from our media memory.

Furthermore, in April 2020 several American sources inadvertently disclosed crucial information that I have repeatedly highlighted in my writings, revelations that some have characterized as the "smoking gun" proof of an American role:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an ABC News story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original ABC News story and its several government sources.
>
> ***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for

the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by “the second week of November” our Defense Intelligence Agency was already preparing a secret report warning of a “cataclysmic” disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious.



EPub Format • Mobi/Kindle

Published over the last eighteen months, my Covid series now consists of more than a dozen articles and columns, and has been viewed a total of nearly 400,000 times, while attracting more than 10,000 comments, totaling over 1.5 million words.

The most substantial articles in the series have also been collected together into an eBook, conveniently available for downloading in both EPub and Mobi/Kindle formats, and I think this constitutes a

very useful supplement to both the mainstream and alternative books on the origins of Covid that have been discussed above.

Given the volume of this apparent readership and the time since the series first began, it is difficult to believe that too many individuals strongly interested in the origins of the Covid epidemic have remained entirely unaware of this material, but any mentions elsewhere, even highly critical ones, have been extremely rare.

In our increasingly Orwellian world, any hints that certain thoughts are even imaginable may sometimes be considered a fatal slip, and one noted public policy analyst flatly told me that even merely criticizing my analysis might seriously impact his career.

Such concerns are hardly implausible. A few years ago when Razib Khan was a blogger on our website, he was hired as a regular Opinion Columnist by the *New York Times*, then fired from that prestigious position less than 24 hours later after a hostile *Slate* journalist revealed that Khan had once left a lengthy, critical comment on the VDare website, thus fatally demonstrating that he was aware of its existence and sometimes read it. And a couple of years later, the writer who had denounced him, Jamelle Bouie, became a *Times* columnist in his stead.

This situation has surely grown worse under the current climate of deplatformings. Individuals who stray outside particular boundaries may sometimes be banned from the most basic Internet services, severely handicapping their ordinary activities, and this greatly increases the need to carefully maintain defensive *crimestop*. Days after I published my first Covid article, our entire website was banned by Facebook and all of its pages deranked by Google, with the latter action reducing our Google search traffic by around 99%.

Under these difficult conditions, even the boldest writers and analysts must necessarily choose to pick their fights carefully, avoiding the risk of squandering their influence and credibility on matters where they may have little chance of prevailing. But I suspect that when and if an opening arises, they would be fully prepared to take advantage of it.

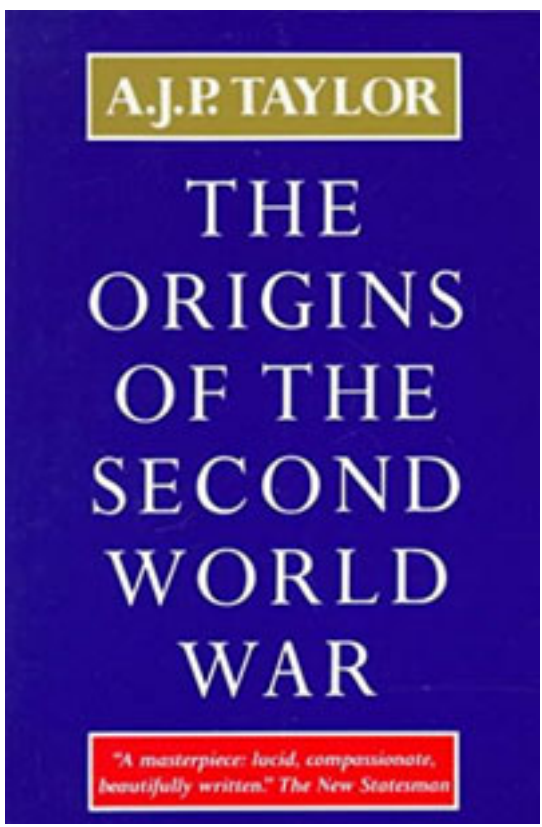
Consider Glenn Greenwald, one of the world's most courageous investigative journalists, who abandoned his position at the top of the *Intercept* because of his refusal to bow to the party line on Russiagate and the 2020 presidential election.

- American Pravda: Giants Silenced by Pygmies

*Glenn Greenwald and* The Intercept
Ron Unz • *The Unz Review* • November 22, 2021 • 12,200 Words

A few days after the appearance of the *Journal* review article on Covid's origins, he published a strong 4,100 word column sharply criticizing the *Times*, the *Post*, and other pillars of the mainstream media for their continuing use of dishonest arguments in support of their rear-guard effort to maintain that Covid was a natural virus, a viewpoint increasingly challenged by new disclosures and declassified documents. But although the title and text solely focus on the "lab-leak theory" as the only alternative, Greenwald must surely be aware that there is a third possibility as well, a possibility far more likely to be true but also vastly more dangerous to articulate.

- To Deny the "Lab Leak" COVID Theory, the NYT and WPost Use Dubious and Conflicted Sources
  Glenn Greenwald • *Substack* • December 5, 2021 • 4,100 Words



A.J.P. TAYLOR
THE ORIGINS OF THE SECOND WORLD WAR
"A masterpiece: lucid, compassionate, beautifully written." The New Statesman

I have hardly been alone in suggesting that no event since the end of the Second World War has had a greater global impact than the Covid outbreak, which continues to reshape both national destinies and

personal lives, and challenging the accepted narrative of such enormous events can often become a hazardous undertaking.

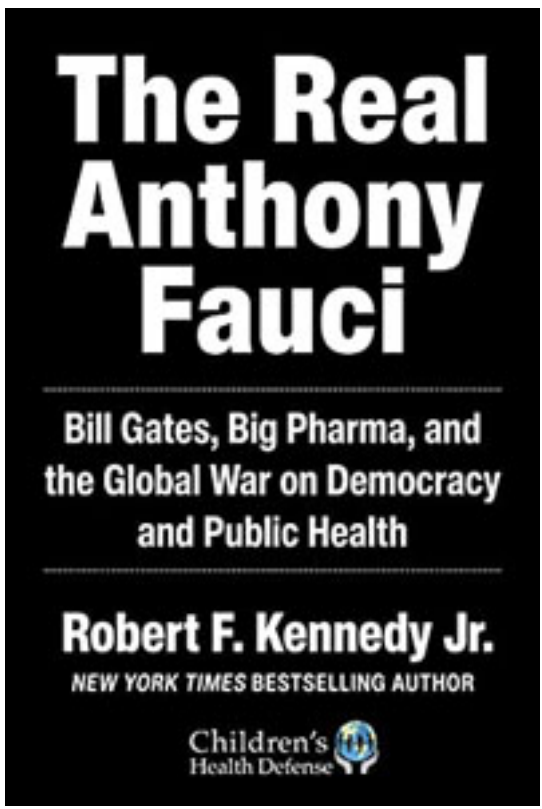
For example, more than twenty years after the start of World War II, A.J.P. Taylor wrote a classic account that carefully analyzed the origins of that conflict and this had unfortunate consequences for his career, as I discussed a couple of years ago:

> Yet in revisiting Taylor's ground-breaking study, I made a remarkable discovery. Despite all the international sales and critical acclaim, the book's findings soon aroused tremendous hostility in certain quarters. Taylor's lectures at Oxford had been enormously popular for a quarter century, but as a direct result of the controversy "Britain's most prominent living historian" **was summarily purged** from the faculty not long afterwards. At the beginning of his first chapter, Taylor had noted how strange he found it that more than twenty years after the start of the world's most cataclysmic war no serious history had been produced carefully analyzing the outbreak. Perhaps the retaliation that he encountered led him to better understand part of that puzzle.

# AIDS and the Revival of the Duesberg Hypothesis

***The Unz Review*** • December 27, 2021 • 3,700 Words

Last month I happened to read Robert F. Kennedy, Jr.'s new book *The Real Anthony Fauci*, which had almost immediately become a #1 Amazon bestseller.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

I was quite impressed with a great deal of the material presented, which sharply criticized our pharmaceutical industry and its close allies in the public health bureaucracy. But what completely shocked me was that nearly half the text—some 200 pages—was devoted to presenting and promoting the astonishing claim that everything we have been told about HIV/AIDS for more than 35 years probably constituted a hoax. This latter issue became a central focus of my own review.

- American Pravda: Vaxxing, Anthony Fauci, and AIDS

> Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis, for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.
>
> I found Kennedy's account as shocking as anything I have ever encountered.

Under normal circumstances, I would have been extremely reluctant to embrace such seemingly outlandish claims, but the credibility of some of the adherents was difficult to disregard.

> However, the first endorsement on the back cover is from Prof. Luc Montagnier, the medical researcher who won a Nobel Prize for discovering the HIV virus in 1984, and he writes: "Tragically for humanity, there are many, many untruths emanating from Fauci and his minions. RFK Jr. exposes the decades of lies." Moreover, we are told that as far back as the San Francisco International AIDS Conference of June 1990, Montagnier had publicly declared "the HIV virus is harmless and passive, a benign virus."
>
> Perhaps this Nobel Laureate endorsed the book for other reasons and perhaps the meaning of his striking 1990 statement has been misconstrued. But surely the opinion of the researcher who won a Nobel Prize for discovering the HIV virus should not be totally ignored in assessing its possible role.

As Kennedy explains, three additional science Nobel Laureates had also expressed similar public skepticism for the conventional HIV/AIDS narrative, one of them being Kary Mullis, the renowned creator of the revolutionary PCR test.

Despite the book's tremendous success, it was initially ignored by the mainstream media. That silence was finally broken a month after publication, when the *Associated Press* released a 4,000 word hit-piece harshly attacking the author and his controversial bestseller.

- How a Kennedy Built an Anti-Vaccine Juggernaut Amid COVID-19
  Michelle R. Smith et al • *The Associated Press* • December 15, 2021 • 4,000 Words

Yet as I noted in my response, that lengthy denunciation had entirely avoided the subject of HIV/AIDS, which surely constituted the most outrageous and explosive portion of Kennedy's text. Six *AP* journalists and researchers had spent at least ten days producing the article, so their total silence on that topic struck me as extremely suspicious. If almost half of Kennedy's book argued that HIV/AIDS was a medical media hoax and his harshest critics refused to challenge him on that score, any fair-minded reader must surely begin to suspect that at least some of the author's remarkable claims were probably correct.

- RFK Jr. as America's #1 HIV/AIDS Denier and the Sounds of Media Silence
  Ron Unz • *The Unz Review* • December 15, 2021 • 1,500 Words

Prior to the recent Covid outbreak, AIDS had spent nearly four decades as the world's highest-profile disease, and I began to wonder whether I could have been so completely misled for all those years by all the stories in my daily newspapers. I listened to Kennedy's lengthy interviews with with Tucker Carlson, Steve Bannon, and Jimmy Dore, but none of those hosts ever touched on the AIDS issue, perhaps because they regarded it as a distraction from the more urgent topic of Covid vaccines and other controversial public health measures. Anyway, Kennedy himself had never previously been associated with the HIV/AIDS topic and he emphasized that his coverage was merely intended "to give air and daylight to dissenting voices" so I would need to consult other sources for additional information. Fortunately, his book clearly identified the most important figure in the debate.

> One of the major scientific heroes in Kennedy's account is Prof. Peter H. Duesberg of Berkeley. During the 1970s and 1980s, Duesberg had been widely regarded as among the world's foremost virologists, elected to the prestigious National Academy of Sciences at age 50, making him one of its youngest members in history. As early as 1987 he began raising serious doubts about the HIV/AIDS hypothesis and highlighting the dangers of AZT, eventually publishing a series of journal articles on the subject that gradually won over many others, including Montagnier. In 1996 he published *Inventing the AIDS Virus*, a massive 712 page volume setting forth his case, with the Foreword provided by Nobel Laureate Kary Mullis, the renowned inventor of PCR technology and himself another leading public critic of the HIV/AIDS hypothesis. Duesberg even underscored the confidence of his HIV skepticism by offering to be injected with HIV-tainted blood.
>
> But rather than openly debate such a strong scientific opponent, Fauci and his allies blacklisted Duesberg from receiving any government funding, thereby wrecking his research career, while also vilifying him and pressuring others to do the same. According to fellow researchers quoted by Kennedy, Duesberg was destroyed as a warning and an example to others. Meanwhile, Fauci deployed his influence to have his critics banned from the major national media, ensuring that few outside a narrow segment of the scientific community ever even became aware of the continuing controversy.

So the subject I needed to investigate was the Duesberg Hypothesis, the long-suppressed challenger to our reigning HIV/AIDS orthodoxy.

Fortunately for my purposes, scientific heresies starved of research funding and blacklisted from leading journals tend to produce a very manageable body of work. The annual billions spent on orthodox AIDS research has spawned well over 100,000 academic journal articles, more than a diligent reader could digest in a dozen lifetimes. But the most recent academic publication I could locate on the other side was a lengthy review article published eighteen years ago by Duesberg and two of his collaborators. Indeed, according to their Epilogue, the authors had spent several years struggling to get their article into print against the unremitting hostility of the reigning AIDS establishment, which had successfully pressured two previous journals into cancelling publication.

- The chemical bases of the various AIDS epidemics: recreational

drugs, anti-viral chemotherapy and malnutrition (PDF)
Peter Duesberg, Claus Koehnlein, and David Rasnick • *Journal of Bioscience* • June 2003 • 24,000 Words

Although I have a strong scientific background, I lack the necessary expertise in medicine or microbiology to properly evaluate their paper. But reading it carefully as a layman, I found it solid and persuasive, certainly worthy of publication. And when I passed it along to someone with a strong medical background, he found it extremely impressive, a convincing exposition of the authors' revolutionary thesis.

One of Duesberg's central claims was that the disease known as "AIDS" didn't actually exist, but was merely the official label attached to a group of more than two dozen different illnesses, all of which had a variety of different causes, with only some of these being infectious agents. Indeed, most of these illnesses have been known and treated for many decades, but they were only designated "AIDS" if the victim was also found to test positive for the HIV virus, which probably had nothing to do with the condition.

In support of their contrary position, the authors note that the various groups at high-risk for "AIDS" only tend to get particular versions of the disease, with the "AIDS" suffered by hemophiliacs usually being very different from that of African villagers and only slightly overlapping with the diseases of gay men or intervenous drug addicts. Indeed, the pattern of "AIDS" in Africa seems utterly divergent from that in the developed world. So if all these different illnesses were actually caused by a single HIV virus, these would seem puzzling anomalies, difficult to explain from a scientific perspective.

In 2009, a half-dozen years after the publication of that lengthy article, an independent film-maker named Brent Leung produced a 90 minute documentary on AIDS, strongly sympathetic to Duesberg's thesis, and someone recently brought it to my attention. There is a great paucity of pro-Duesberg material, so although I only rarely find videos to be a useful source of information, this case was an important exception. The film highlighted the tremendous inconsistencies of the official scientific position, while also containing containing important interviews with Duesberg, Mullis, Fauci, and numerous other key researchers and journalists on all sides of the debate. The entire documentary is conveniently available on Youtube, so those interested can watch it and decide for themselves.

Journalist John Lauritsen had been covering the HIV/AIDS controversy for decades, writing two books on the subject and serving as an important source for Kennedy's own work. He joined one of the discussion-threads on our website, and suggested that I republish his 2018 conference talk, which helpfully summarizes the history and current state of the issue.

- Making Our Case In the Battle for Truth
  *Challenging Avaricious Viral Paradigms*
  John Lauritsen • *Vers Pont du Gard Conference* • June 16, 2018 • 2,500 Words

Although this pro-Duesberg material may be helpful in fleshing out the arguments, especially for those who have not read the Kennedy book, the analysis is necessarily one-sided. Under pressure of the medical establishment and its AIDS lobby, the mainstream media has almost entirely shut its doors to dissent on the issue and refuses to engage the critics, instead seeming to rely upon the blacklist and the boycott. This suggests the relative weakness of the orthodox case, but without the give-and-take of argument and counter-argument, we cannot easier weigh the strength of the two sides. Fortunately, I discovered that this situation had been much less true in the past.

I spent most of the early 2000s creating a content-archiving system that includes near-complete collections of a couple of hundred of our leading opinion magazines of the last 150 years, those influential publications that have shaped our understanding of the world. The project was nearly a total failure since very few people ever use it, but it still comes in handy when I want to investigate something, and I easily located a long list of articles focused on the Duesberg Hypothesis, mostly from the 1990s. During that period, the iron wall of censorship had not yet come down, and the topic seems to have been widely and respectfully discussed in major publications.

I carefully read more than a dozen of the most substantive articles, all of which had appeared in fully mainstream and respectable liberal, conservative, and libertarian publications. One major surprise was how little the debate seemed to have changed. The evidence and arguments that Duesberg and his scientific allies were making thirty years ago seemed remarkably similar to what was presented in Kennedy's book published just last month.

The Summer 1990 issue of *Policy Review*, one of America's most sober

and influential conservative policy journals, offered Duesberg and a co-author a platform to present their controversial theory, and the resulting piece ran nearly 9,000 words. According to the editor, this provoked more letters and responses—both positive and negative—than anything in the publication's history, and became one of their most talked-about articles. As a result, the next issue of the quarterly featured the most substantial reactions as well as the responses of the two authors, with the debate running almost 13,000 words.

Several years later, *Reason* magazine, the flagship publication of America's libertarian movement, ran a long cover story by three of Duesberg's scientific allies, one a former Harvard professor and another a recent Nobel Laureate, which once again provoked an outpouring of supportive and critical reactions, leading to another

lengthy debate.

*The Lancet* is one of the world's leading medical journals and the year after he become its chief editor, Richard Horton took to the pages of the intellectually-prestigious *New York Review of Books* to produce a 10,000 word discussion of Duesberg's theories, as propounded in three of his recent books and collections. Horton was obviously among the most respectable of establishmentarian figures, but although he mostly came down in support of the orthodox HIV/AIDS consensus, he presented Duesberg's entirely contrary view in a fair-minded fashion, respectfully but not uncritically.

However, what struck me most about Horton's very lengthy 1996 review article was how appalled he seemed by Duesberg's treatment at the hands of America's ruling medical-industrial complex, as was suggested by the title "Truth and Heresy about AIDS." The very first sentence of his review article mentioned the "vast academic and commercial industry built around…HIV" along with the fundamental challenge Duesberg posed to its scientific basis. As a consequence, the "brilliant virologist" had become "the most vilified scientist alive" and the subject of "excoriating attacks." The leading professional science journals had displayed an "alarmingly uneven attitude," and partly as a consequence, other potential dissidents had been dissuaded from pursuing their alternative theories. Financial considerations had become a central element of the scientific process, and Horton noted with horror that a press conference on research questioning the effectiveness of a particular anti-AIDS drug was actually packed with financial journalists, eager to report the efforts of the corporate executives to destroy the credibility of a study that they themselves had helped to design but which had now gone against their own product.

Most importantly, although Horton is generally skeptical of Duesberg's conclusions, he was absolutely scathing towards the opponents of the dissident virologist:

> One of the most disturbing aspects of the dispute between Duesberg and the AIDS establishment is the way in which

> Duesberg has been denied the opportunity to test his hypothesis. In a discipline governed by empirical claims to truth, experimental evidence would seem the obvious way to confirm or refute Duesberg's claims. But Duesberg has found the doors of the scientific establishment closed to his frequent calls for tests…
>
> Duesberg deserves to be heard, and the ideological assassination that he has undergone will remain an embarrassing testament to the reactionary tendencies of modern science…At a time when fresh ideas and new paths of investigation are so desperately being sought, how can the AIDS community afford *not* to fund Duesberg's research?"

That last sentence closed the entire review, which appeared in print over a quarter-century ago. And as near as I can tell, Horton's heartfelt criticism fell entirely on deaf ears, with the AIDS establishment simply ignoring the entire controversy while gradually pressuring the media to stop its coverage. This seems to absolutely confirm the claims made in Kennedy's new bestseller.

- Truth and Heresy About AIDS
  Richard Horton • *The New York Review of Books* • May 23, 1996 • 10,100 Words

Taken together, these five articles run more than 45,000 words, the length of a short book, and probably provide at least as good and even-handed a presentation of the debate for a general audience as can be found anywhere else. Individual readers may judge for themselves, but I thought the that Duesberg camp certainly got the better of all these exchanges.

According to the *AP* article, Kennedy's book probably sold nearly 200,000 copies during the first couple of weeks after its November 16th release. The book is back to #1 on Amazon and had held that spot during much of December, so sales may now be more than double that figure. But even if the total eventually reaches a million copies in print or more, that figure represents merely a tiny sliver of the many tens of millions reached each day by messages heavily promoted by the electronic and social media, which are blacklisting or boycotting the important information that Kennedy presents. So unless the defensive wall of the media can be successfully breached, the message of Kennedy's book may largely be restricted to that fraction of the entire population already attuned to it, perhaps

strengthening their resolve but gaining relatively few new adherents.

Several years ago I published a short strategy piece on exactly this issue, outlining these difficulties and the possible the approach to follow, and some of my suggestions are worth quoting at length:

> The mainstream media exists as a seamless whole, so weakening or discrediting the media in any particular area automatically reduces its influence everywhere else as well.
>
> The elements of the media narrative faced by a particular anti-establishment group may be too strong and well-defended to attack effectively, and any such attacks might also be discounted as ideologically motivated. Hence, the more productive strategy may sometimes be an indirect one, attacking the media narrative elsewhere, at points where it is much weaker and less well-defended. In addition, winning those easier battles may generate greater credibility and momentum, which can then be applied to later attacks on more difficult fronts.
>
> Certain portions of that media wall may be solid and vigorously defended by powerful vested interests, rendering assaults difficult. But other portions, perhaps older and more obscure, may have grown decrepit over time, with their defenders having drifted away. Breaching the wall at these weaker locations may be much easier, and once the barrier has been broken at several points, defending it at others becomes much more difficult.
>
> For example, consider the consequences of demonstrating that the established media narrative is completely false on some major individual event. Once this result has been widely recognized, the credibility of the media on all other matters, even totally unrelated ones, would be somewhat attenuated. Ordinary people would naturally conclude that if the media had been so wrong for so long on one important point, it might also be wrong on others as well, and the powerful suspension of disbelief that provides the media its influence would become less powerful. Even those individuals who collectively form the corpus of the media might begin to entertain serious self-doubts regarding their previous certainties.
>
> The crucial point is that such breakthroughs may be easiest to achieve in topics that seem merely of historical significance, and are totally removed from any practical present-day consequences.

Under the usual parameters of public debate, challenges to established orthodoxy are treated as “extraordinary claims” that must be justified by extraordinary evidence. This requirement may be unfair, but it constitutes the reality in many public exchanges, based upon the framework provided by the allegedly impartial media.

Since most of these controversies involve a wide range of complex issues and ambiguous or disputed evidence, it is often extremely difficult to conclusively establish any unorthodox theory, say to a confidence level of 95% or 98%. Therefore, the media verdict is almost invariably “Case Not Proven” and the challengers are judged defeated and discredited, even if they actually appear to have the preponderance of evidence on their side. And if they vocally contest the unfairness of their situation, that exact response is then subsequently cited by the media as further proof of their fanaticism or paranoia.

However, suppose that an entirely different strategy were adopted. Instead of attempting to make a case “beyond any reasonable doubt,” proponents merely provide sufficient evidence and analysis to suggest that there is a 30% chance or a 50% chance or a 70% chance that the unorthodox theory is true. The very fact that no claim of near certainty is being advanced provides a powerful defense against any plausible accusations of fanaticism or delusional thinking. But if the issue is of enormous importance and—as is usually the case—the unorthodox theory has been almost totally ignored by the media, despite apparently having at least a reasonable chance of being true, then the media may be effectively attacked and ridiculed for its laziness and incompetence. These charges are very difficult to refute and since no claim is being made that the unorthodox theory has necessarily been proven correct, merely that it might possibly be correct, any counter-accusations of conspiratorial tendencies would fall flat.

Indeed, the only means the media might have of effectively rebutting those charges would be to explore all the complex details of the issue (thereby helping to bring various controversial facts themselves to much wider attention) and then argue that there is only a negligible chance that the theory might be correct, perhaps 10% or less. Thus, the usual presumptive burden is completely reversed. And since most members of the media are unlikely to have ever paid much serious attention to the subject, their ignorant presentation may be quite weak and vulnerable to

a knowledgeable deconstruction. Indeed, the most likely scenario is that the media will just continue to totally ignore the entire dispute, thereby reinforcing those plausible accusations of laziness and incompetence.

- American Pravda: Breaching the Media Barrier
  Ron Unz • *The Unz Review* • October 24, 2016 • 2,500 Words

The primary audience of Kennedy's book is America's large and mobilized anti-vaxxing community, and many of those individuals may ignore his long discussion of the HIV/AIDS controversy, or even dismiss it as a distraction. But I think this is a serious strategic mistake. Instead, a major focus upon the questionable HIV/AIDS narrative and the contrary Duesberg Hypothesis may constitute the best means of discrediting America's dominant medical establishment, and thereby enabling a reassessment of our vaccination policy. As I explained near the end of my review:

> As an outside observer with no special expertise in these areas of medicine, I was impressed by much of the material that Kennedy marshaled in support of his unorthodox views on vaccines and Covid treatments, but found that the evidence he provided on HIV and AIDS was vastly more comprehensive and persuasive, while being backed by far more authoritative experts. But if as he argues, the truth about HIV and AIDS has been successfully suppressed for decades by the entire medical industry, we must necessarily become very suspicious about other medical claims, including those regarding Covid and vaccinations.
>
> I even wonder if this might not represent part of the hidden subtext of the bitter current battle over vaxxing and the almost paranoid reaction of so many opponents. Those who have challenged the official scientific dogma on AIDS have long since been driven out of the public square so that few who draw their information from the mainstream media are even aware of the dispute. But the sort of divergent theories presented by Kennedy have probably circulated for years within particular segments of the population, and these individuals have become firmly convinced that huge numbers of Americans died because the medical establishment inflicted the deadly AZT treatment to combat the harmless HIV virus. So they would now grow extremely suspicious when they learned that a low-mortality Covid virus was being treated by the widespread use of experimental new vaccines that had completely circumvented the usual testing process through a set of emergency waivers. After

absorbing the remarkable contents of Kennedy's important book, I think these are not unreasonable concerns to have

# Our Public Health Problems

***The Unz Review*** • January 10, 2022 • 5,500 Words

## Opioids as the White Death

All of us necessarily focus on different areas, and until quite recently I'd never paid much attention to public health issues, naively assuming that these were in the hands of reasonably competent and reasonably honest government servants, monitored by journalists and academics of similar reliability.

For many of us, myself included, an important crack in that assumption came in 2015, when the pages of the *New York Times* and our other major newspapers were filled with reports of a shocking new study by Anne Case and Angus Deaton, a married pair of eminent economists, with Deaton's career having been crowned a few weeks earlier by winning the Nobel Prize in his discipline.

Their remarkable finding was that during the previous 15 years, the health and survival rates of middle-aged white Americans had undergone a precipitous decline, completely breaking with the pattern of non-white American groups or with whites living in other developed nations. Moreover, this sharp fall in physical well-being represented a radical departure from the trends of the previous half-century, being almost unprecedented in modern Western history.

Although their short paper filled merely a half-dozen pages in the *Proceedings of the National Academy of Sciences*, it was quickly endorsed by a host of prominent public health experts and other scholars, who emphasized the dramatic nature of the discovery. A couple of Dartmouth professors told the *Times* "It is difficult to find modern settings with survival losses of this magnitude," while an expert in mortality trends exclaimed "Wow." Their striking results were illustrated by numerous simple graphs based upon easily obtained government statistics.

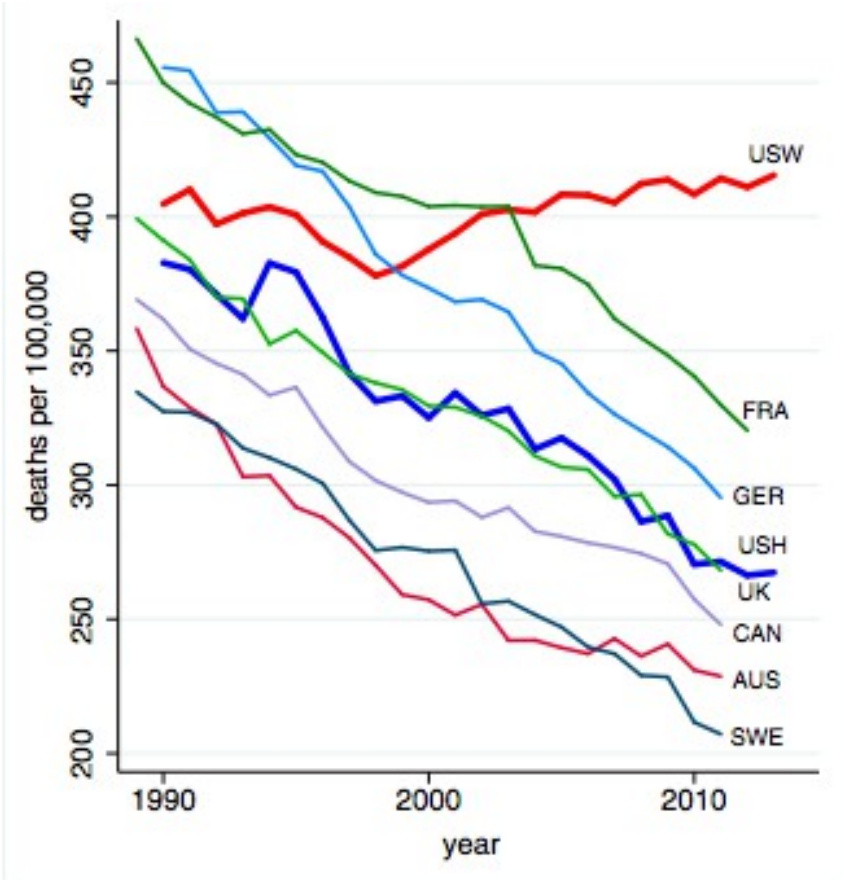

Fig. 1. All-cause mortality, ages 45–54 for US White non-Hispanics (USW), US Hispanics (USH), and six comparison countries: France (FRA), Germany (GER), the United Kingdom (UK), Canada (CAN), Australia (AUS), and Sweden (SWE).

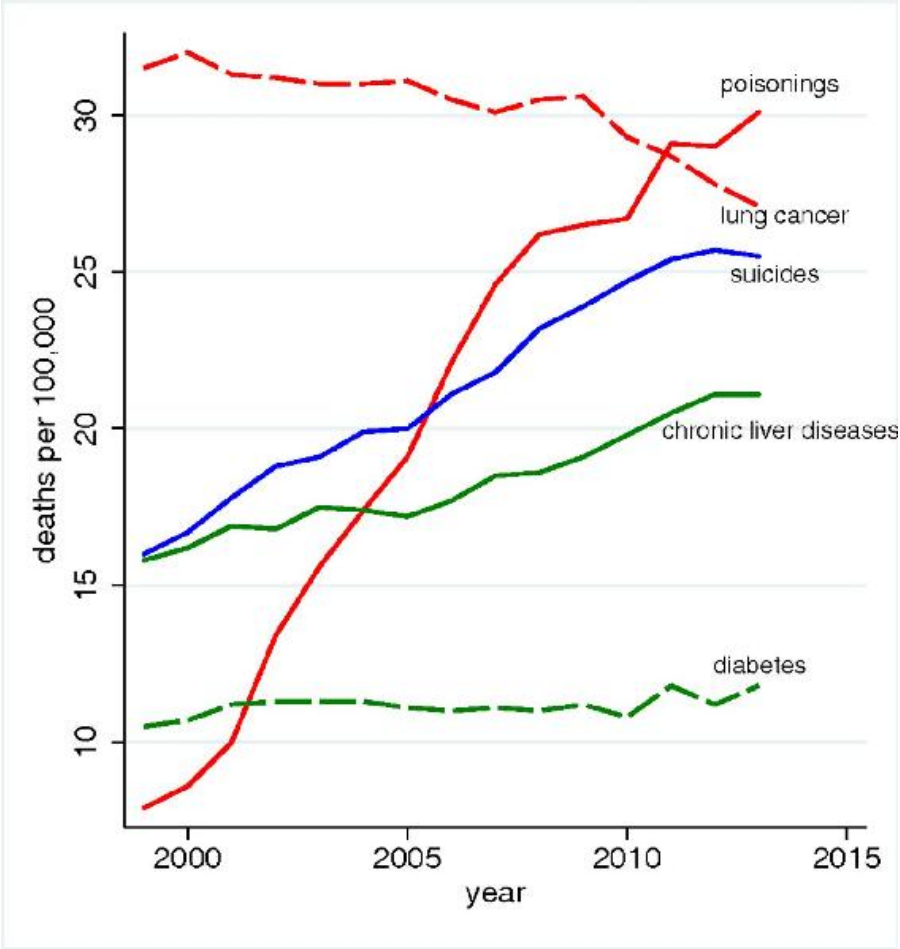
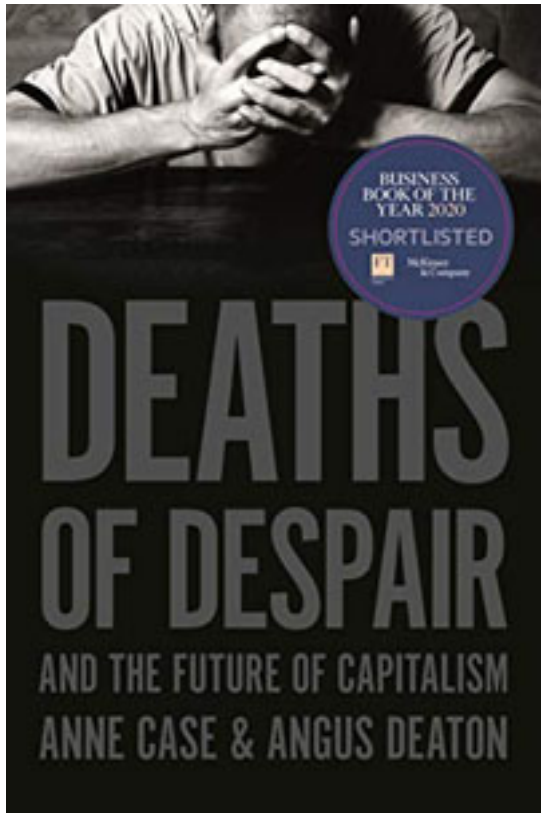
The two authors were both economists, whose normal work was distant from public health issues, and according to their account, they had stumbled into these remarkable results quite accidentally, while exploring a different topic. So the natural question that came to my mind was how such a momentous calamity affecting a large fraction of the American population could have been entirely ignored for so long by all the academics and researchers actually working in public health. Perhaps a short trend of three or four years might have escaped notice, but missing *fifteen years* of such a deadly national decline?

Moreover, the source of this drastic reversal in long-term mortality trends was narrowly confined to a few particular categories. For white Americans aged 45-54, deaths due to drug overdoses and other

poisonings had soared almost 10-fold during the period in question, easily overtaking lung cancer to become the leading cause of death.



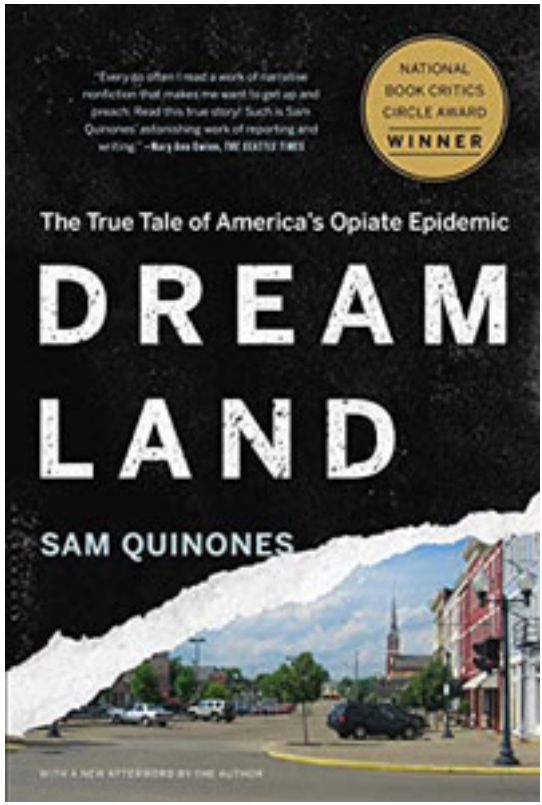
Together with the steep rise in suicides and chronic alcoholism, drug deaths accounted for the great change in life-expectancy. This situation was particularly acute for the working-class, with the death rates soaring a remarkable 22% for white Americans who lacked a college-education.



Case and Deaton grouped together drug overdoses, suicides, and chronic alcoholism as “deaths of despair,” and in 2020 they expanded their ground-breaking study into a book of that title, which was widely discussed and praised. Their subtitle emphasized “the Future of Capitalism” and they argued that the central cause of America’s deadly predicament was the opioid prescription drug epidemic, produced by the FDA’s 1996 approval of addictive OxyContin and its subsequent massive marketing by Purdue Pharmaceutical. Under the pressure of manipulative corporate lobbying, our government had “essentially legalized heroin,” with the consequences being exactly as might be expected. By 2015, 98 million Americans—more than one-third of all adults—had been prescribed opioids and the level of drug overdoses and other deaths of despair reached 158,000 per year by 2017.

Unlike other pharmaceutical giants, Purdue was privately owned by the Sackler family, who were the central villains in this story. The Sacklers earned more than $12 billion in profits from these drug sales and reached the pinnacle of American wealth even as millions of lives were destroyed, with sales of their OxyContin drug alone totaling as much as $50 billion. The authors drew a close analogy with the key

figures in the 19th century British East India company, who earned their huge fortunes by organizing the opium trade into China, despite the devastating social consequences for that country.

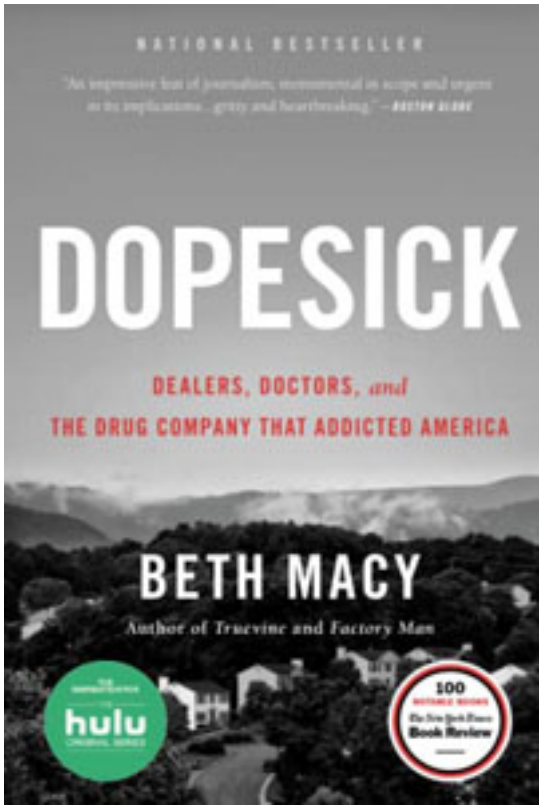


The same year that Case and Deaton published their seminal *PNAS* article, former *Los Angeles Times* reporter Sam Quinones released *Dreamland*, his deeply-reported account of the human side of our national opioid tragedy, which was widely praised and won the National Book Circle Award.

The most striking declines in life-expectancy had been among the working-class, but Quinones emphasized that unlike most previous drug epidemics, this one was not only entirely concentrated in America's white population, but even heavily afflicted the middle and upper-middle class whites of small towns and suburbia, among whom such hard drug use had previously been very rare.

These powerful opioids were massively marketed as legitimate pain medication, prescribed by doctors and obtained from pharmacies in bottles.  This entirely respectable distribution channel overcame the previous social stigma, but once the victims had become addicted,

large numbers began injecting the drugs and eventually turned to similar but far cheaper illegal heroin. So a star high school football player from a successful family would be given OxyContin to alleviate a minor injury, and within a couple of years he might have become a heroin junkie, dying of a drug overdose in his own bedroom. An unprecedented wave of such grisly heroin deaths suddenly flooded affluent white communities, which had never previously experienced such events.



Beth Macy's national bestseller *Dopesick* appeared in 2018 and covered some of the same ground, focused primarily upon the opioid and other drug addictions in Appalachia and nearby portions of Virginia. Her account seemed fully consistent with that of Quinones and was filled with numerous moving personal stories. However, since it was so overwhelmingly descriptive and anecdotal rather than analytical, I generally found it less useful.

Case and Deaton are among the most respectable of mainstream academics, but the historical narrative that they and their journalistic counterparts provide is a horrifying one, with millions of American families destroyed by the deliberate corporate policies that elevated

the Sacklers into becoming one of the world's wealthiest families, surpassing the Rockefellers and the Mellons. But in an unusual twist, a considerable slice of their victims were from affluent, well-educated backgrounds and thus could effectively articulate their rage over what had been done to their communities.

One such individual writes under the pen-name Giles Corey. Coming from a supportive, wealthy family in a small white Southern town, he says he began using heroin in high school and eventually spent years suffering from severe drug addiction. Having lost many of his friends to overdoses and suicides, he was intensely hostile to the Sacklers, and in 2020 he drew upon all these fully mainstream books as well as Gerald Posner's encyclopedic *Pharma: Greed, Lies, and the Poisoning of America* to produce a blistering 20,000 word portrayal of their business and political history, which we republished. Although obviously skewed by his extreme ideological views, he mined the 1,900 pages of those underlying sources to produce a gripping history of what he calls "the white plague" that can be read within a couple of hours.

## The Forgotten Vioxx Disaster

In 2015 I was greatly surprised to discover that these striking American mortality trends had been ignored for so many years by our media and research establishments, but perhaps I should not have been. The cause of this epidemic of death was the widespread use of dangerous but highly lucrative opioid prescription drugs, and just a few years earlier I had published an article about the similarly ignored public health consequences of Vioxx, another very profitable but harmful prescription drug. As I told the story in 2012:

> In September 2004, Merck, one of America's largest pharmaceutical companies, suddenly announced that it was voluntarily recalling Vioxx, its popular anti-pain medication widely used to treat arthritis-related ailments. This abrupt recall came just days after Merck discovered that a top medical journal was about to publish a massive study by an FDA investigator indicating that the drug in question greatly increased the risk of fatal heart attacks and strokes and had probably been responsible for at least 55,000 American deaths during the five years it had been on the market.

Within weeks of the recall, journalists discovered that Merck had found strong evidence of the potentially fatal side-effects of this drug even before its initial 1999 introduction, but had ignored these worrisome indicators and avoided additional testing, while suppressing the concerns of its own scientists. Boosted by a television advertising budget averaging a hundred million dollars per year, Vioxx soon became one of Merck's most lucrative products, generating over $2 billion in yearly revenue. Merck had also secretly ghostwritten dozens of the published research studies emphasizing the beneficial aspects of the drug and encouraging doctors to widely prescribe it, thus transforming science into marketing support. Twenty-five million Americans were eventually prescribed Vioxx as an aspirin-substitute thought to produce fewer complications.

Although the Vioxx scandal certainly did generate several days of newspaper headlines and intermittently returned to the front pages as the resulting lawsuits gradually moved through our judicial system, the coverage still seemed scanty relative to the number of estimated fatalities, which matched America's total losses in the Vietnam War. In fact, the media coverage often seemed considerably less than that later accorded to the Chinese infant food scandal, which had caused just a handful of deaths on the other side of the world.

The circumstances of this case were exceptionally egregious, with many tens of thousands of American deaths due to the sale of a highly lucrative but sometimes fatal drug, whose harmful effects had long been known to its manufacturer. But there is no sign that criminal charges were ever considered.

A massive class-action lawsuit dragged its way through the courts for years, eventually being settled for $4.85 billion in 2007, with almost half the money going to the trial lawyers. Merck shareholders also paid large sums to settle various other lawsuits and government penalties and cover the heavy legal costs of fighting all of these cases. But the loss of continuing Vioxx sales represented the greatest financial penalty of all, which provides a disturbing insight into the cost-benefit calculations behind the company's original cover-up.

This story of serious corporate malfeasance largely forgiven and forgotten by government and media is depressing enough, but it leaves out a crucial factual detail that seems to have almost totally escaped public notice. The year after Vioxx had been

pulled from the market, the *New York Times* and other major media outlets published a minor news item, generally buried near the bottom of their back pages, which noted that American death rates had suddenly undergone a striking and completely unexpected decline.

The headline of the short article that ran in the April 19, 2005 edition of *USA Today* was typical: "USA Records Largest Drop in Annual Deaths in at Least 60 Years." During that one year, American deaths had fallen by 50,000 despite the growth in both the size and the age of the nation's population. Government health experts were quoted as being greatly "surprised" and "scratching [their] heads" over this strange anomaly, which was led by a sharp drop in fatal heart attacks.

On April 24, 2005, the *New York Times* ran another of its long stories about the continuing Vioxx controversy, disclosing that Merck officials had knowingly concealed evidence that their drug greatly increased the risk of heart-related fatalities. But the *Times* journalist made no mention of the seemingly inexplicable drop in national mortality rates that had occurred once the drug was taken off the market, although the news had been reported in his own paper just a few days earlier.

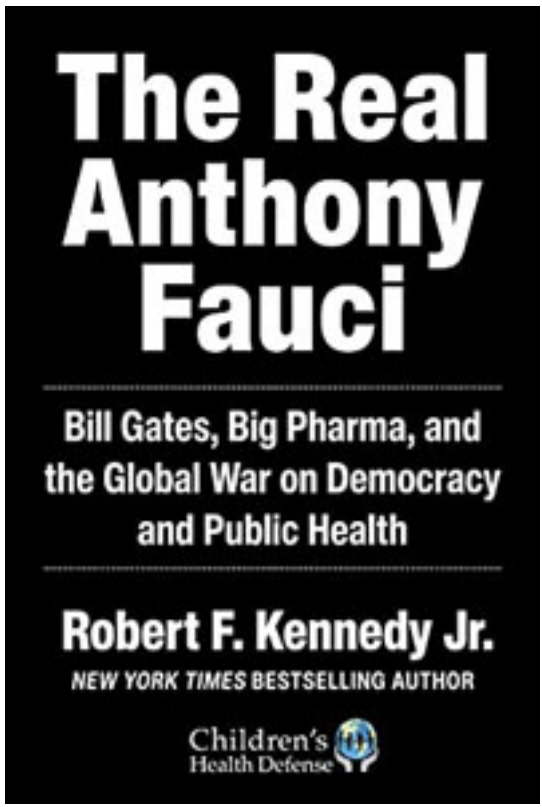
A cursory examination of the most recent 15 years worth of national mortality data provided on the Centers for Disease Control and Prevention website offers some intriguing clues to this mystery. We find the largest rise in American mortality rates occurred in 1999, the year Vioxx was introduced, while the largest drop occurred in 2004, the year it was withdrawn. Vioxx was almost entirely marketed to the elderly, and these substantial changes in national death-rate were completely concentrated within the 65-plus population. The FDA studies had proven that use of Vioxx led to deaths from cardiovascular diseases such as heart attacks and strokes, and these were exactly the factors driving the changes in national mortality rates.

The impact of these shifts was not small. After a decade of remaining roughly constant, the overall American death rate began a substantial decline in 2004, soon falling by approximately 5 percent, despite the continued aging of the population. This drop corresponds to roughly 100,000 fewer deaths per year. The age-adjusted decline in death rates was considerably greater.

- Chinese Melamine and American Vioxx: A Comparison
  Ron Unz • *The American Conservative* • April 17, 2012 • 1,800 Words

## AIDS and the Duesberg Hypothesis

I published my Vioxx analysis almost a decade ago, and although it generated some discussion at the time and even provoked a bit of secondary coverage in the mainstream media, the matter was soon once again forgotten. Vioxx had already been withdrawn years earlier, and whether its past use had resulted in tens of thousands or instead hundreds of thousands of premature American deaths among the elderly was merely water under the bridge, of little interest to most journalists.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

Over the years, I occasionally referred to my findings in subsequent articles, but hardly paid much attention to the related issues of prescription drugs or public health, even after the current Covid epidemic brought those topics back to center-stage.

However, in November I happened to read Robert F. Kennedy, Jr.'s

new book on exactly these issues, and was very impressed with the enormous amount of important material he provided, most of it entirely unfamiliar to me. As a result, I wrote a long and strongly favorable review which was widely read and even linked on the author's own website.

- American Pravda: Vaxxing, Anthony Fauci, and AIDS
  Ron Unz • *The Unz Review* • December 6, 2021 • 6,100 Words

Kennedy's central theme was the total corruption of the American public health system at the hands of profit-hungry corporations, which had effectively subverted the regulatory process to ensure that lucrative drugs—sometimes even dangerous ones—were mass-marketed to our unprotected citizenry like any other consumer product. The forgotten Vioxx Scandal seemed a perfect example of this, so I included a brief mention of my 2012 findings in the review, and was quite gratified a couple of weeks later when Kennedy resurrected the Vioxx story during his lengthy interview with Jimmy Dore.

Although I found much of Kennedy's criticism of the pharmaceutical industry reasonably persuasive, under normal circumstances his book would not have drawn me into public health issues, given my lack of familiarity with the topic. But what completely shocked me was that nearly half his text—some 200 pages—was devoted to presenting and promoting the astonishing claim that everything we have been told about HIV/AIDS for more than 35 years probably constituted a hoax. This issue became the heart of my review, especially because it had previously received almost no attention from his readers.

> Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis, for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in

> the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.
>
> I found Kennedy's account as shocking as anything I have ever encountered.

I was deeply impressed by the scientific credibility of some of the individuals supporting Kennedy's seemingly outlandish claims.

> However, the first endorsement on the back cover is from Prof. Luc Montagnier, the medical researcher who won a Nobel Prize for discovering the HIV virus in 1984, and he writes: "Tragically for humanity, there are many, many untruths emanating from Fauci and his minions. RFK Jr. exposes the decades of lies." Moreover, we are told that as far back as the San Francisco International AIDS Conference of June 1990, Montagnier had publicly declared "the HIV virus is harmless and passive, a benign virus."
>
> Perhaps this Nobel Laureate endorsed the book for other reasons and perhaps the meaning of his striking 1990 statement has been misconstrued. But surely the opinion of the researcher who won a Nobel Prize for discovering the HIV virus should not be totally ignored in assessing its possible role.

Kennedy noted that three additional science Nobel Laureates have expressed similar public skepticism for the conventional HIV/AIDS narrative, one of them being Kary Mullis, the renowned creator of the revolutionary PCR test.

The medical and media establishments were intensely hostile to Kennedy and his huge bestseller, and I became extremely suspicious when I noticed that their very harsh attacks scrupulously ignored the "HIV/AIDS Denialism" that constituted the largest and most explosive portion of his book, suggesting that they feared to challenge his claims.

Prior to the recent Covid outbreak, AIDS had probably spent four decades as the world's highest-profile disease, and I was staggered by the notion that I might have been completely misled for all those years by our dishonest public health establishment and its subservient media. So I began exploring that half-forgotten controversy of the 1990s, which I had largely ignored at the time.

One of the major scientific heroes in Kennedy's account is Prof. Peter H. Duesberg of Berkeley. During the 1970s and 1980s, Duesberg had been widely regarded as among the world's foremost virologists, elected to the prestigious National Academy of Sciences at age 50, making him one of its youngest members in history. As early as 1987 he began raising serious doubts about the HIV/AIDS hypothesis and highlighting the dangers of AZT, eventually publishing a series of journal articles on the subject that gradually won over many others, including Montagnier. In 1996 he published *Inventing the AIDS Virus*, a massive 712 page volume setting forth his case, with the Foreword provided by Nobel Laureate Kary Mullis, the renowned inventor of PCR technology and himself another leading public critic of the HIV/AIDS hypothesis. Duesberg even underscored the confidence of his HIV skepticism by offering to be injected with HIV-tainted blood.

But rather than openly debate such a strong scientific opponent, Fauci and his allies blacklisted Duesberg from receiving any government funding, thereby wrecking his research career, while also vilifying him and pressuring others to do the same. According to fellow researchers quoted by Kennedy, Duesberg was destroyed as a warning and an example to others. Meanwhile, Fauci deployed his influence to have his critics banned from the major national media, ensuring that few outside a narrow segment of the scientific community ever even became aware of the continuing controversy.

One of Duesberg's central claims was that the disease known as "AIDS" didn't actually exist, but was merely the official label attached to a group of more than two dozen different illnesses, all of which had a variety of different causes, with only some of these being infectious agents. Indeed, most of these illnesses had been known and treated for many decades, but they were only designated "AIDS" if the victim was also found to test positive for the HIV virus, which probably had nothing to do with the condition.

In support of their contrary position, the authors noted that the various groups at high risk for "AIDS" only tended to get particular versions of the disease, with the "AIDS" suffered by hemophiliacs usually being very different from the "AIDS" of African villagers and only slightly overlapping with the diseases of gay men or intervenous drug addicts. Indeed, the pattern of "AIDS" in Africa seemed utterly divergent from that in the

developed world. But if all these different illnesses were actually caused by a single HIV virus, such completely disparate syndromes would seem puzzling anomalies, difficult to explain from a scientific perspective.

- American Pravda: AIDS and the Revival of the Duesberg Hypothesis
  Ron Unz • *The Unz Review* • December 29, 2021 • 4,100 Words

As I discussed in this article, during the 1990s many fully mainstream publications had provided a public platform for Duesberg and his allies to make their case against their orthodox opponents, and when I read the resulting debates and discussions in *Policy Review*, *Reason*, the *New York Review of Books*, and several other publications, I felt that the Duesberg camp had generally gotten the better of the exchanges. Kennedy argued that the establishment had ultimately succeeded in suppressing the Duesberg Hypothesis only because of its vastly greater political power and funding rather than due to the evidence or logic behind its position, and this seemed plausible to me.

In 1996 Duesberg had published a book setting forth his controversial theories for a general audience, but its length of more than 700 pages initially intimidated me and the used copies on Amazon started at over $600. However, I soon learned that the public-spirited author had simultaneously released a freely downloadable PDF copy on the Internet, and I discovered that academic journal articles and end notes filled almost half the length, reducing the body of the main text to very manageable proportions, considerably shorter than the Kennedy book.

The endorsement and Foreword by Nobel Laureate Mullis persuaded me to try a chapter or two, and I found the material so fascinating I quickly read the entire work. Duesberg very persuasively placed the HIV/AIDS controversy within the broader context of past public health debacles and the massive professional pressures faced by infectious disease researchers. His book had apparently been produced under difficult political circumstances and was ultimately released by the Regnery Company, the leading conservative press, whose publisher provided an unusual explanatory Preface, containing the following paragraphs:

> The book you are about to read has been a long time in coming. Why? It is at once enormously controversial and impeccably

> documented. It comes from a scientist and writer of great ability and courage. It will cause, we believe, a firestorm of yet undetermined proportions in both the scientific and lay communities. And it is, I think I am safe in saying, about the most difficult book that the Regnery Company has published in nearly 50 years in the business.
>
> If Duesberg is right in what he says about AIDS, and we think he is, he documents one of the great science scandals of the century. AIDS is the first political disease, the disease that consumes more government research money, more press time, and indeed probably more heartache—much of it unnecessary—than any other. Duesberg tells us why.

Although the text is easy reading, well-written for a general audience, it contains a huge amount of surprising medical information difficult for the non-specialist to check, and this would normally leave me cautious. However, the *Lancet* is one of the world's leading medical journals, and although its editor was a strong supporter of the orthodox HIV/AIDS consensus, his 10,000 word review in the *New York Review of Books* treated both Duesberg and his book very respectfully, so I doubt the work contains any obvious errors or blatant falsehoods. Although Duesberg's opus is now a quarter-century old, as far as I can tell, very little has changed since it was written, and the same disputes of the mid-1990s are just as relevant today, so I would urge everyone interested in the subject to read it. Since the original PDF was so enormous, I have broken it up by chapters for the convenience of readers.

- Inventing the AIDS Virus
  Peter H. Duesberg • *Regnery Publishing* • 1996 • 712 Pages

For those more interested in the scientific details, Duesberg and two co-authors also published a very lengthy academic journal review article in 2003, summarizing their position, and as a non-specialist I found it very solidly presented.

- The chemical bases of the various AIDS epidemics: recreational drugs, anti-viral chemotherapy and malnutrition (PDF)
  Peter Duesberg, Claus Koehnlein, and David Rasnick • *Journal of Bioscience* • June 2003 • 24,000 Words

Celia Farber was a leading AIDS journalist during the 1990s, who covered Duesberg and the other main figures in the controversy, and just a few days ago she released on Substack a long 2004 article she

had originally written for *Harpers* on the controversial Berkeley researcher, which later became the first chapter of one of her books.

- The Passion of Peter Duesberg
  *How Anthony Fauci And His AIDS Industry Sacrificed One Of America's Greatest Cancer Scientists*
  Celia Farber • *Substack* • January 2, 2022 • 11,000 Words

Duesberg's writings provide by far the most comprehensive exposition of his material, but for those who prefer a different format, I would strongly recommend his hour-long *Red Ice* podcast interview from a decade ago, conveniently available on Youtube.

Youtube videos are widely popular among those less inclined to read, and the same year that Duesberg's opus was published, Starvision Productions released a two hour documentary entitled "HIV = AIDS: Fact or Fraud," which very effectively covers much of the same material. The feature includes interviews with the Berkeley researcher and several of his key scientific allies in the controversy, one of whom describes the scandal in American medical science as worse than the notorious Lysenko fraud of the old Soviet Union.

Among the many telling points, the documentary notes that although nearly 90% of those Americans suffering from AIDS are male, HIV tests administered to our new military recruits indicate that the general rate of HIV infection in the population is equal between men and women, a very strange divergence between the illness and its alleged cause. Furthermore, the incidence rates of sexually-transmitted diseases and HIV have sharply diverged over the years, raising serious doubts about whether the virus actually follows that mode of transmission.

Although both Duesberg and most of the other scientists in his camp seemed to be very conventional and even buttoned-down researchers, an important exception was Nobel Laureate Kary Mullis, widely regarded as a brilliant but eccentric and iconoclastic figure. For those interested in his views on the HIV/AIDS debate, I would recommend the following two hour interview by Dr. Gary Null, also released in 1996.

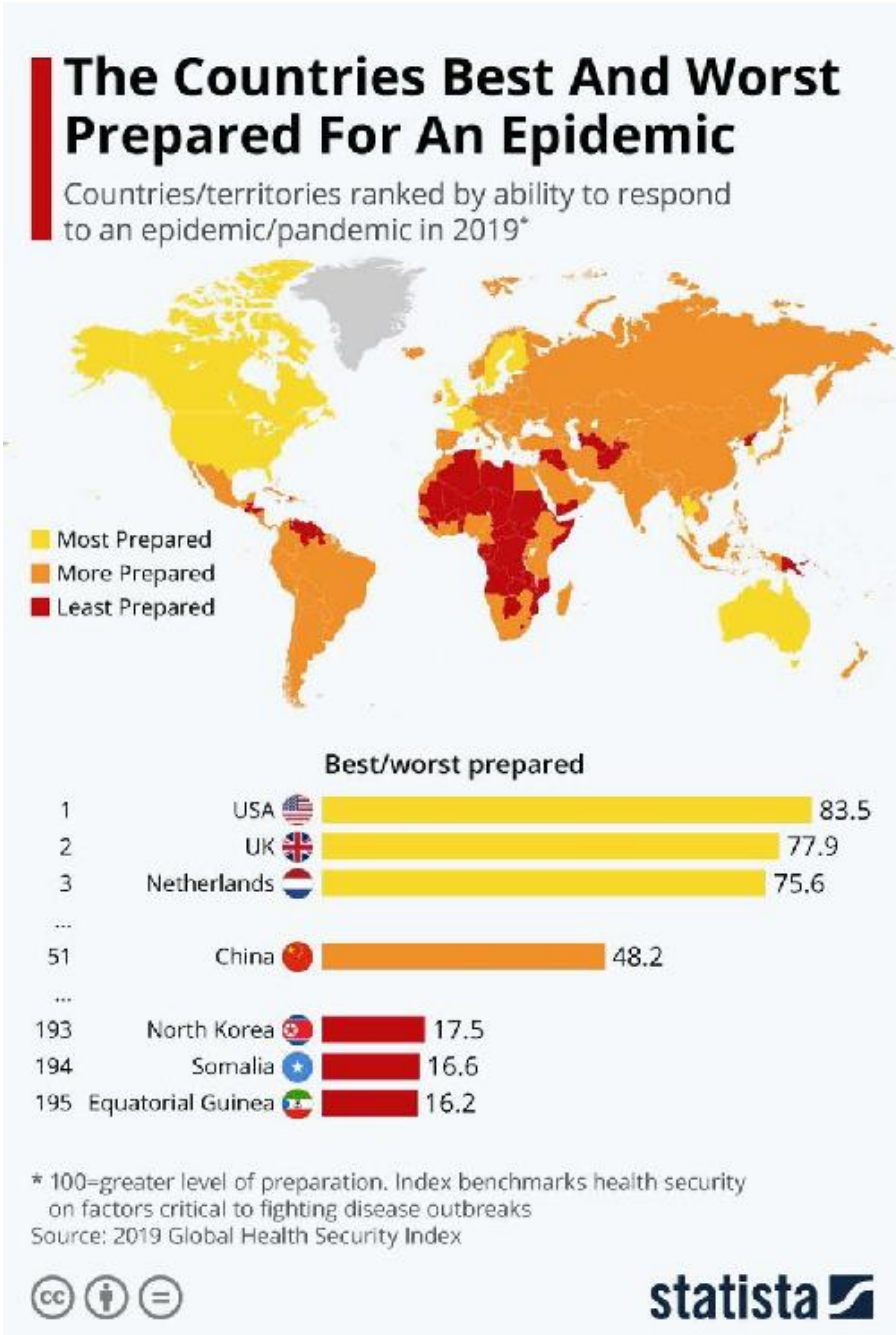
Mullis's demeanor is extremely informal and almost boyish, and some of the questions he raises have an "Emperor's New Clothes" feel about them. He notes that substantial numbers of the young military enlistees who annually test positive for HIV grew up in small rural towns that are hardly likely to be AIDS hotbeds, and suggests that their mothers be tested for the virus, which is known to be transmitted to the newborn. If those women also tested positive, that would prove the virus had already been widespread eighteen or twenty years earlier, completely demolishing the established AIDS narrative. Naturally, none of our many thousands of dedicated AIDS researchers showed any interest in implementing this extremely simple research proposal.

## Destroying Our Faith in American Public Health

The story that Duesberg tells is a simple one. After the successful eradication of polio in the 1950s, America's enormous existing infrastructure of infectious disease professionals lost most of the reason for its existence, and its leaders eventually began searching for some new means of justifying their continued government funding. The War on Cancer begun in the late 1960s proved a dismal failure and the massively-hyped warnings of a deadly Swine Flu epidemic in 1976 became a complete debacle, leading to the ouster of some top officials. So a few years later when the AIDS label was affixed to a

group of apparently unrelated illnesses, Anthony Fauci and others had a tremendous incentive to claim that the cause was an infectious agent, and despite the lack of any solid evidence soon fingered the HIV virus as the culprit. Once that original misdiagnosis had spawned an enormous multi-billion-dollar industry, its researchers, administrators, and corporate beneficiaries were committed to protecting it.

However, if so many of our infectious disease professionals have spent decades fighting the phantom of HIV, they must necessarily be less well prepared to cope with any real contagion that might appear. In late 2019 international organizations had ranked our country as the best prepared in the world to handle any epidemic outbreak, but the reality proved quite different.



The Countries Best And Worst Prepared For An Epidemic

statista

From the beginning, the public health measures America adopted to combat the Covid outbreak were extremely divisive, but I think that all ideological camps can agree that our national performance has been absolutely disastrous, leading to a combination of many hundreds of thousands of deaths, year-long lockdowns in much of the

country, and the continuing severe disruption to the daily lives of our entire population. By any reasonable standard of success, America's public health system has completely failed.

My own entrance into the long-dormant HIV/AIDS controversy came about after the current vaxxing debate prompted me to read Kennedy's recent book, only to discover that so much of it was actually focused on AIDS. Despite Kennedy's efforts, my own position on Covid vaccinations or other related public health measures still remains very conventional, not too different from what might be found in the pages of the *Times* or the *Economist*. But as I have previously emphasized, although my views haven't changed, my confidence in those views has been severely shaken:

> As an outside observer with no special expertise in these areas of medicine, I was impressed by much of the material that Kennedy marshaled in support of his unorthodox views on vaccines and Covid treatments, but found that the evidence he provided on HIV and AIDS was vastly more comprehensive and persuasive, while being backed by far more authoritative experts. But if as he argues, the truth about HIV and AIDS has been successfully suppressed for decades by the entire medical industry, we must necessarily become very suspicious about other medical claims, including those regarding Covid and vaccinations.
>
> I even wonder if this might not represent part of the hidden subtext of the bitter current battle over vaxxing and the almost paranoid reaction of so many opponents. Those who have challenged the official scientific dogma on AIDS have long since been driven out of the public square so that few who draw their information from the mainstream media are even aware of the dispute. But the sort of divergent theories presented by Kennedy have probably circulated for years within particular segments of the population, and these individuals have become firmly convinced that huge numbers of Americans died because the medical establishment inflicted the deadly AZT treatment to combat the harmless HIV virus. So they would now grow extremely suspicious when they learned that a low-mortality Covid virus was being treated by the widespread use of experimental new vaccines that had completely circumvented the usual testing process through a set of emergency waivers. After absorbing the remarkable contents of Kennedy's important book, I think these are not unreasonable concerns to have.

The corrupt machinations of Purdue Pharmaceutical destroyed

millions of American families with opioids while producing a multi-billion-dollar fortune for the Sackler family, but our national media and health establishments ignored the disaster for more than a dozen years.  Merck's Vioxx probably cut short the lives of hundreds of thousands of elderly Americans, but that transgression was quickly forgiven and forgotten. And I am now seriously starting to wonder whether the four decade campaign against HIV/AIDS, involving so many thousands of academics and researchers, may indeed be a scientific fraud on a par with the Lysenko scandal of the USSR.

Given such a dismal recent public health track-record, now capped by the Covid disaster, I have become much more sympathetic to the sometimes almost paranoid suspicions of so many of America's agitated anti-vaxxers.

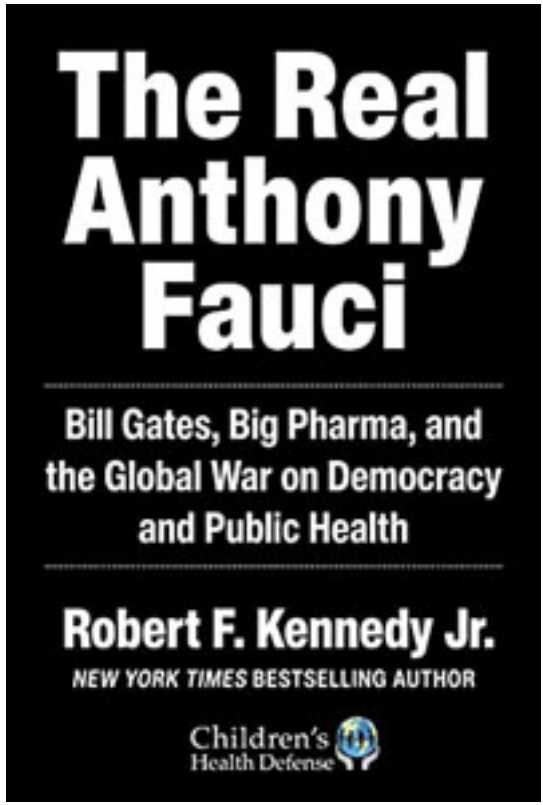
# Anne Frank, Sirhan Sirhan, and AIDS

***The Unz Review*** • January 31, 2022 • 3,600 Words

As an heir to the most famous political family in modern American history, Robert F. Kennedy, Jr. is hardly an obscure individual, and recent events have greatly elevated his national prominence.

Although he had spent most of his career as a highly-successful environmental attorney, during the early 2000s he gradually became involved with the grassroots movement questioning the safety and efficacy of our proliferating vaccines, a cause widely ridiculed or ignored by our national elites but increasingly resonating with many worried families.

Then the sudden Covid epidemic moved public health issues to the absolute center of the political debate, including the highly controversial steps taken to control the disease.  For the first time in history, most Americans were suddenly subjected to lockdowns, which imposed severe restrictions upon their freedom of movement and assembly, and although these were originally presented as temporary measures expected to last only a couple of weeks, across much of the country they actually remained in place for a year or longer. Moreover, the permanent solution proposed for the crisis was the largest mass-vaccination drive in world history, with the leading vaccines relying upon a new and relatively untested mRNA biotechnology developed by our profit-hungry pharmaceutical giants, a situation that raised deep suspicions among many citizens.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

Given these developments, the once marginal anti-vaxxing movement suddenly exploded onto the national stage, cutting across many existing political, social, and ideological fault-lines and encompassing perhaps 20-30% of America's population, with Kennedy and his Children's Health Defense non-profit soon becoming leading champions of these fearful individuals. Despite lacking any media coverage or a promotional advertising campaign, his book *The Real Anthony Fauci* sold over 500,000 copies by early January, spending two months on the Amazon bestseller list, much of that time at the very top.

The media establishment regards our vaccination drive as an absolutely crucial national priority and is intensely hostile to those who challenge it, so Kennedy soon became one of its leading villains. In mid-December, a team of six journalists and researchers at the *Associated Press* unleashed a ferocious 4,000 word assault, followed a few weeks later by a similar critique in leftist *Counterpunch*. But both these pieces attacked Kennedy on rather mundane grounds, claiming that his anti-vaccination arguments were wrong, dangerous, and possibly financially motivated, and neither gained much attention, nor seemed to damage his popular momentum.

  Michelle R. Smith et al • *The Associated Press* • December 15, 2021 • 4,000 Words
- Vaccines, RFK Jr. and The Science of Misinformation
  Joshua Frank • *Counterpunch* • January 14, 2022 • 2,000 Words

When the media targets an individual, it monitors his every utterance, seeking the slightest opening to vilify him, and last week an opportunity came as Kennedy spoke before a crowd of 30,000 anti-vaxxers at a rally in Washington, DC. Indulging in overly-heated rhetoric, he declared "We have witnessed over the last 20 months a coup d'état against democracy, and the controlled demolition of the United States Constitution and the Bill of Rights." He further suggested that that government requirements for vaccinations and mandates were imposing "fascism" on our society, with families having nowhere to escape: "Even in Hitler's Germany, you could cross the Alps to Switzerland. You could hide in an attic like Anne Frank did."

In our deeply secular society, Nazi Germany has replaced Satan as the epitome of pure evil, while Anne Frank—a Jewish teenager who died of typhus in a German hospital near the end of the war—has been elevated to the status of a sacred martyr. Although drawing such historical analogies is hardly uncommon in political rhetoric, it can sometimes produce angry reactions, especially if these are orchestrated by a hostile media, and Kennedy's supposedly scandalous references immediately provoked a firestorm of critical coverage, soon leading him to apologize.

With Kennedy's enemies fanning the flames, his brief reference to the sad fate of a girl who died three generations ago may have received a hundred times more media coverage than the large rally he had headlined or the huge sales of his national bestseller. When the media seeks to destroy someone's reputation, it will react with hair-trigger reflexes to his slightest misstep.

Yet oddly enough, the same media organs that created a major national controversy out of a few ill-chosen words at a political rally had previously allowed certain of Kennedy's other, seemingly far greater vulnerabilities to pass almost entirely unnoticed.

These days being labeled a "conspiracy theorist" is a particularly

serious charge, with the slur suggesting dangerous mental illness, and surely stigmatizing Kennedy in such a manner would have been an ideal means of discrediting him. But although the author had publicly proclaimed himself a conspiracy theorist of the most explicit sort last month, almost all our hostile journalists carefully averted their eyes.

In the 1960s the conspiratorial term of abuse was first applied to those who challenged the official story that President Kennedy had died at the hands of a deranged lone gunman, and was later broadened to include the many other assassinations that soon followed, including that of the president's own brother.  And on December 8th, nearly the entire Forum page of the *San Francisco Chronicle* was filled by a Kennedy column arguing that his father Sen. Robert F. Kennedy had been slain by a group of secret conspirators, with the convicted gunman merely being an innocent patsy who should finally be released from prison.

- Sirhan Sirhan didn't kill my father. Gov. Newsom should set him free

NEW YORK TIMES BESTSELLER
THE HIDDEN HISTORY OF THE KENNEDY YEARS
BROTHERS
"A fearless, passionate, angry book . . . the story of how the Kennedy brothers tried to change the world."
—The New York Times Book Review
DAVID TALBOT

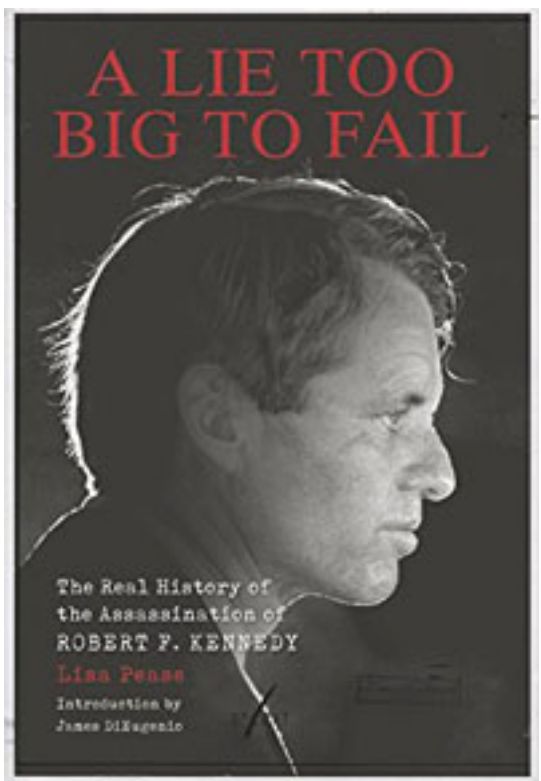
Yet although Kennedy's legion of media critics attacked him on almost all other grounds, fair or unfair, they carefully avoided that seemingly easy means of branding him as delusional. The long *AP* attack that ran a week later mentioned not a word, nor did the January *Counterpunch* piece. As a consequence, I doubt whether more than a tiny slice of the public is aware that Kennedy is a "conspiracy theorist."

The obvious reason for this strange media reticence was that Kennedy's position was very solidly grounded in hard factual evidence. In 2018 I drew upon some of the material in David Talbot's widely-praised 2008 book *Brothers* to describe the strange aspects of the assassination.

> If the first two dozen pages of the Talbot book completely overturned my understanding of the JFK assassination, I found the closing section almost equally shocking. With the Vietnam War as a political millstone about his neck, President Johnson decided not to seek reelection in 1968, opening the door to a last minute entry into the Democratic race by Robert Kennedy, who overcame considerable odds to win some important primaries. Then on June 4, 1968, he carried gigantic winner-take-all California, placing him on an easy path to the nomination and the presidency itself, at which point he would finally be in a position to fully investigate his brother's assassination. But minutes after his victory speech, he was shot and fatally wounded, allegedly by another lone gunman, this time a disoriented Palestinian immigrant named Sirhan Sirhan, supposedly outraged over Kennedy's pro-Israel public positions, although these were no different than those expressed by most other political candidates in America.
>
> All this was well known to me. However, I had not known that powder burns later proved that the fatal bullet had been fired directly behind Kennedy's head from a distance of three inches or less although Sirhan was standing several feet in front of him. Furthermore, eyewitness testimony and acoustic evidence indicated that at least twelve bullets were fired although Sirhan's revolver could hold only eight, and a combination of these factors led longtime LA Coroner Dr. Thomas Naguchi, who conducted the autopsy, to claim in his 1983 memoir that there was likely a second gunman. Meanwhile, eyewitnesses also reported seeing a security guard with his gun drawn standing immediately behind Kennedy during the attack, and that individual happened to have a deep political hatred of the Kennedys. The police investigators

seemed uninterested in these highly suspicious elements, none of which came to light during the trial. With two Kennedy brothers now dead, neither any surviving members of the family nor most of their allies and retainers had any desire to investigate the details of this latest assassination, and in a number of cases they soon moved overseas, abandoning the country entirely. JFK's widow Jackie confided in friends that she was terrified for the lives of her children, and quickly married Aristotle Onassis, a Greek billionaire, whom she felt would be able to protect them.

Over the years, the 1968 Robert Kennedy assassination has attracted merely a sliver of the books and research devoted to the earlier killing of his elder brother in Dallas, and Talbot's text spent only a few pages sketching out the strong evidence that the convicted gunman was merely an innocent dupe, manipulated by the true conspirators. But in 2018, two additional books appeared that were entirely focused on the case.

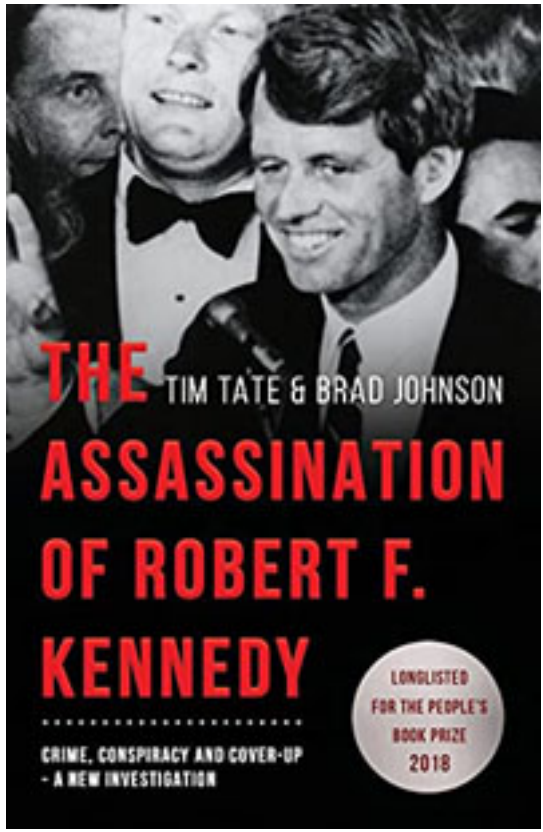


A LIE TOO BIG TO FAIL
The Real History of the Assassination of ROBERT F. KENNEDY
Lisa Pease
Introduction by James DiEugenio

*A Lie Too Big To Fail* by longtime journalist and conspiracy researcher Lisa Pease ran 500 pages and covered the events of that fatal California evening in exhaustive detail, winning the endorsements of filmmaker Oliver Stone and renowned JFK researcher James W.

Douglass. When I read it a few months ago, I found the huge volume of material quite useful but felt that it relied too heavily upon the recollections of eyewitnesses, which can easily grow attenuated over the decades. I was also disturbed to note that the text sometimes seemed to gradually transform reasonable suspicions into apparent certainties, eventually arguing that 3-4 different gunmen were probably firing at the presidential candidate that evening while Sirhan's own gun had held only blanks.

At the very end, the author also veered off into building castles in the air with regard to other assassinations, arguing that Oswald probably had multiple personalities and that Jack Ruby was operating under a post-hypnotic suggestion, thinly documented claims that seriously weakened her credibility, as did her earlier suggestion that John Lennon had been killed by a government-programmed assassin in 1980 for his past criticism of the Vietnam War. Sometimes less is better, and I think that Pease's book would have been much stronger if it had been heavily edited and substantially cut. All those extraneous elements should have been left on the cutting-room floor rather than distracting from the central evidence she provided regarding the existence of an RFK assassination conspiracy and Sirhan's likely innocence.

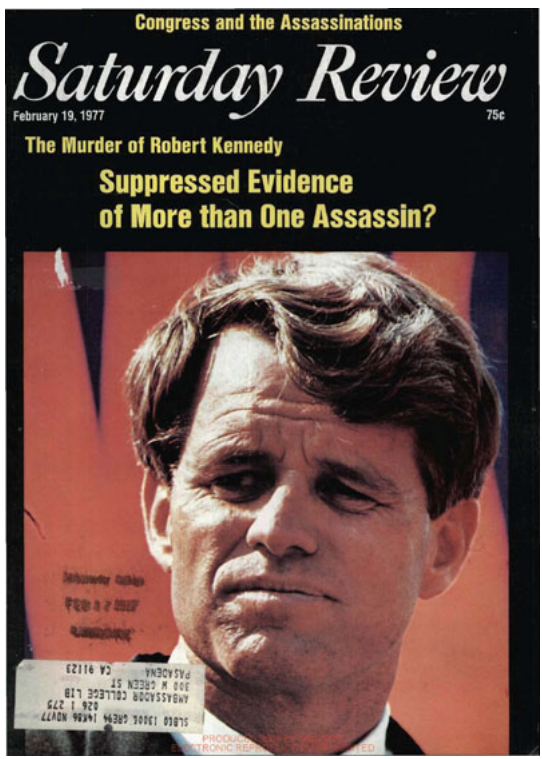


Meanwhile, *The Assassination of Robert F. Kennedy* by Tim Tate and the Brad Johnson was released that same year and suffered from none of these flaws. The two conspiracy researchers had spent some 25 years heavily involved in the case, and although their volume was only around half the length of the Pease book, it seemed a far more effective treatment of the topic, including eyewitness accounts but focused primarily upon the undeniable physical and forensic evidence while avoiding any damaging bouts of unwarranted speculation.

While working at *CNN*, one of the authors had originally obtained the audiotape establishing the number of shots fired, which probably constitutes the single strongest piece of evidence in the case. The book analyzed and evaluated that crucial item in tremendous detail, and also focused upon the fatal shot, which was fired at point-blank range from behind the candidate while Sirhan, the supposed gunman, was standing several feet in front. But since both the publisher and the lead author were British, the work seems to have received much less attention in this country, and I only discovered and read it after Kennedy cited it in his *SF Chronicle* column.

Unlike many other controversial American killings or terrorist attacks, the powerful evidence of a conspiracy in the case of the RFK assassination was physical and seemingly undeniable. Wikipedia is notoriously reluctant to promote conspiratorial narratives, but in this case the striking facts are presented with only rather weak challenges.

The conclusive proof from the audio recording only came to light in 2004, but I was surprised to discover that all the other strong evidence, including the large number of unexplained bullet holes, had already been known and reported for decades.



Former Congressman Allard K. Lowenstein had been heavily involved in the 1968 election campaign, playing a major role in the effort to unseat incumbent President Lyndon Johnson. In 1977 he published a long cover-story in the prestigious *Saturday Review*, setting forth the overwhelming evidence that a second gunman had been involved in the shooting, and my content-archiving system provides a convenient PDF copy. So nearly all the crucial facts in the case have been known for 45 years, but were almost always ignored by our dishonest or cowardly American media.

Three years after publicly revealing that explosive information, Lowenstein himself was dead, supposedly shot at the age of 51 by a

deranged lone gunman who had been a former student of his, but I have been informed that his personal friends never believed that story.

Given this massive preponderance of evidence, we can easily understand why the harsh media attacks upon Kennedy had so carefully avoided mentioning his conspiratorial beliefs regarding his father's assassination. Such criticism would have merely brought the issue to wider public attention, and anyone who began looking into the matter would have quickly concluded that Kennedy was probably correct while our media had spent a half-century covering up the true facts of the 1968 assassination. And if Kennedy were telling the truth and the media lying, many people would begin to wonder if the same might also be true on the vaxxing issue.

Over the last couple of months, I have noted that this pattern of media reticence has been even more pronounced with regard to the actual contents of Kennedy's landmark book. Perhaps one might argue that his statements about the death of his father were personal matters exempt from media scrutiny, or even that the details of a particular assassination so many decades ago had no relevance to his vaxxing arguments. But it seemed utterly bizarre that all of the harsh attacks on his book had carefully avoided mentioning its major theme.

I had opened Kennedy's book assuming that it would focus almost entirely on the vaccination issues with which the author had long been identified. Yet I soon discovered that nearly half the text—some 200 pages—was instead devoted to the disease of AIDS, an entirely different topic, and that the claims he made were absolutely incendiary. As I wrote in December:

> Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis,

for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.

I found Kennedy's account as shocking as anything I have ever encountered.

In 1985 AZT, an existing drug, was found to kill the HIV virus in laboratory tests. Fauci then made tremendous efforts to speed it through clinical trials as an appropriate treatment for healthy, HIV-positive individuals, with FDA approval finally coming in 1987, producing Fauci's first moment of triumph. Priced at $10,000/year per patient, AZT was one of the most expensive drugs in history, and with the cost covered by health insurance and government subsidies, it produced an unprecedented financial windfall for its manufacturer.

Kennedy devotes an entire chapter to the story of AZT, and the tale he tells is something out of Kafka or perhaps Monty Python. Apparently, Fauci had been under enormous pressure to produce medical breakthroughs justifying his large budget, so he manipulated the AZT trials to conceal the extremely toxic nature of the drug, which rapidly killed many of the patients who received it, with their symptoms being ascribed to AIDS. So following FDA approval in 1987, hundreds of thousands of perfectly healthy individuals found to be infected with HIV were placed on a regimen of AZT, and the large number of resulting deaths was misattributed to the virus rather than to the anti-viral drug. According to the scientific experts cited in the book, the vast majority of post-1987 "AIDS deaths" were actually due to AZT.

Prior to the Covid outbreak, AIDS had spent almost four decades as the world's highest-profile disease, absorbing perhaps a couple of trillion dollars of funding and becoming the central focus of an army of scientists and medical experts. It simply boggles the mind for someone to suggest that HIV/AIDS might have largely been a hoax, and that the vast majority of deaths were not from the illness but from the drugs taken to treat it.

My science textbooks sometimes mentioned that during the benighted 18th century, leading Western physicians treated all

> manner of ailments with bleeding, a quack practice that regularly caused the deaths of their patients, with our own George Washington often numbered among the victims. Indeed, some have argued that for several centuries prior to modern times, standard medical treatments inadvertently took far more lives than they saved, and those too poor or backward to consult a doctor probably benefited from that lack. But I had never dreamed that this same situation might have occurred during the most recent decades of our modern scientific age.

Since the 1980s AIDS has been an explosive topic in the public sphere, and anyone—whether scientist or layman—who questioned the orthodox narrative was viciously denounced as having blood on his hands. During the early 2000s South African President Thabo Mbeki had cautiously raised such possibilities and was massively vilified by the international media and the academic community. Yet when Kennedy's #1 Amazon bestseller went much farther, devoting seven full chapters to making the case that HIV/AIDS was merely a medical hoax, his media antagonists carefully avoided that subject even while they attacked him on all other grounds.

Once again, the only plausible explanation is that the hostile journalists and their editors have recognized that Kennedy's factual evidence was too strong and any such attacks might prove disastrously counter-productive. As far back as the 1990s, a former Harvard professor had publicly declared that the AIDS hoax was as great a scientific scandal as the notorious Lysenko fraud, and if a substantial portion of the American public concluded that AIDS was indeed a medical phantom that had been promoted for 35 years by our gullible and dishonest media, the credibility of the latter on current vaccination issues might be completely annihilated.

It would have been the easiest thing in the world for the media to accurately blast Kennedy as "a conspiracy theorist whose book claims that AIDS is a hoax," and that simple, short phrase would have immediately dealt a massive body-blow to his public reputation. But many people would then have begun looking into the facts, and once they did so, the tables might have quickly turned, destroying the credibility of his critics. The total silence of the media suggests that they greatly feared that possibility.

The hostile media demanded that Kennedy immediately apologize for his heated words regarding fascism and Anne Frank, and to his credit

he quickly did so. But I believe that he now has every right to demand that the same media publicly apologize for having spent the last fifty years concealing the true facts of his father's assassination from his own family and from the American people. And he and others should also begin demanding that the media and medical establishments apologize for the catastrophic HIV/AIDS disaster they inflicted upon our society, a disaster that probably led to the horrible deaths of hundreds of thousands of perfectly healthy Americans. These two matters carry vastly greater weight than a glancing spoken reference to the events of World War II.

One reason that the remarkable silence surrounding Kennedy's controversial disclosures was so easily apparent to me is that I have become familiar with that pattern. Over the last several years both media outlets and activist organizations have similarly shied away from the published contents of this website and my own writings, doing their best to avert their eyes from material that was many times more controversial than what they would have eagerly attacked and denounced elsewhere. I have discussed what I call this "Lord Voldemort Effect," and have described some notable examples in the media.

Many of my own essays have dealt directly with the same controversial topics highlighted in Kennedy's writings and public statements, and for those so interested in exploring them, they are conveniently grouped together in these categories:

- World War II Articles
- Conspiracy Theories
- Public Health Article

# Putin as Hitler?

***The Unz Review*** • March 7, 2022 • 7,900 Words

## The Demonization of Vladimir Putin as Another Hitler

For years the eminent Russia scholar Stephen Cohen had ranked President Vladimir Putin of the Russian Republic as the most consequential world leader of the early twenty-first century. He praised the man's enormous success in reviving his country after the chaos and destitution of the Yeltsin years and emphasized his desire for friendly relations with America, but increasingly feared that we were entering into a new Cold War, even more dangerous than the last.

As far back as 2017, the late Prof. Cohen argued that no foreign leader had been as greatly vilified in recent American history as Putin, and Russia's invasion of Ukraine two weeks ago has exponentially raised the intensity of such media denunciations, almost matching the hysteria our country experienced two decades ago after the 9/11 attack on New York City. Larry Romanoff has provided a useful catalog of some examples.

Until recently, this extreme demonization of Putin was largely confined to Democrats and centrists, whose bizarre Russiagate narrative had accused him of installing Donald Trump in the White House. But the reaction has now become entirely bipartisan, with enthusiastic Trump-backer Sean Hannity recently using his prime-time *FoxNews* show to call for Putin's death, a cry soon joined by Sen. Lindsey Graham, the ranking Republican on the Senate Judiciary Committee. These are astonishing threats to make against a man whose nuclear arsenal could quickly annihilate the bulk of the American population, and the rhetoric seems unprecedented in our postwar history. Even in the darkest days of the Cold War, I don't recall such public sentiments ever being directed towards the USSR or its top Communist leadership.

In many respects the Western reaction to Russia's attack has been closer to a declaration of war than merely a return to Cold War confrontation. Russia's massive foreign reserves held abroad have been seized and frozen, its civilian airlines excluded from Western

skies, and its leading banks disconnected from global financial networks. Wealthy Russian private citizens have had their properties confiscated, the national soccer team has been banned from the World Cup, and the longtime Russian conductor of the Munich Philharmonic was fired for refusing to denounce his own country.

Such international retaliation against Russia and individual Russians seems extremely disproportionate. As yet the fighting in Ukraine has inflicted minimal death or destruction, while the various other major wars of the last two decades, many of them American in origin, had killed millions and completely destroyed several countries, including Iraq, Libya, and Syria. But the global dominance of American media propaganda has orchestrated a very different popular response, producing this remarkable crescendo of hatred.

Indeed, the closest parallel that comes to mind would be the American hostility directed against Adolf Hitler and Nazi Germany after the outbreak of World War II, as indicated by the widespread comparisons between Putin's invasion of Ukraine and Hitler's 1939 attack on Poland. A simple Google search for "Putin and Hitler" returns tens of millions of webpages, with the top results ranging from the headline of a *Washington Post* article to the Tweets of pop music star Stevie Nicks. As far back as 2014, Andrew Anglin of the *Daily Stormer* had documented the emerging meme "Putin is the new Hitler."

Although enormously popular, such Putin-Hitler analogies have hardly gone unchallenged, and some media outlets such as the *London Spectator* have strongly disagreed, arguing that Putin's strategic aims have been quite limited and reasonable.

Many sober-minded strategic analysts have made this same point at length, and very occasionally their contrary views have managed to slip through the media blockade.

Although *FoxNews* has become one of the outlets most rabidly hostile to Russia, a recent interview with one of their regular guests provided a very different perspective. Col. Douglas Macgregor had been a former top Pentagon advisor and he forcefully explained that America had spent nearly fifteen years ignoring Putin's endless warnings that he would not tolerate NATO membership for Ukraine, nor the deployment of strategic missiles on his border. Our government had paid no heed to his explicit red-lines, so Putin was finally compelled to act, resulting in the current calamity:

Prof. John Mearsheimer of the University of Chicago, one of our most distinguished political scientists, had spent many years making exactly these same points and blaming America and NATO for the simmering Ukraine crisis, but his warnings had been totally ignored by our political leadership and media. His hour-long lecture explaining these unpleasant realities had quietly sat on Youtube for six years, attracting relatively little attention, but then suddenly exploded in popularity over the last few weeks as the conflict unfolded, and has now reached a worldwide audience of over 17 million. His other Youtube lectures, some quite recent, have been watched by additional millions.

Such massive global attention finally forced our media to take notice, and the *New Yorker* solicited an interview with Mearsheimer, allowing him to explain to his disbelieving questioner that American actions had clearly provoked the conflict. A couple of years earlier, that same interviewer had ridiculed Prof. Cohen for doubting the reality of Russiagate, but this time he seemed much more respectful, perhaps because the balance of media power was now reversed; his magazine's 1.2 million subscriber-base was dwarfed by the global audience listening to the views of his subject.

- Why John Mearsheimer Blames the U.S. for the Crisis in Ukraine
  Isaac Chotiner • ***The New Yorker*** • March 1, 2022 • 3,900 Words

During his long and distinguished career at the CIA, former analyst Ray McGovern had run the Soviet Policy Branch and also served as the Presidential Briefer, so under different circumstances he or someone like him would would currently be advising President Joe Biden. Instead, a few days ago he joined Mearsheimer in presenting his views in a video discussion hosted by the Committee for the Republic. Both leading experts agreed that Putin had been pushed beyond all reasonable limits, provoking the invasion.

Prior to 2014 our relations with Putin had been reasonably good. Ukraine served as a neutral buffer state between Russia and the NATO countries, with the population evenly divided between Russian-leaning and West-leaning elements, and its elected government oscillating between the two camps.

But while Putin's attention was focused on the 2014 Sochi Olympic Games, a pro-NATO coup overthrew the democratically-elected pro-Russian government, with clear evidence that Barbara Nuland and the other Neocons grouped around Secretary of State Hillary Clinton had orchestrated it. Ukraine's Crimea peninsula contains Russia's crucial Sevastopol naval base, and only Putin's swift action allowed it to remain under Russian control, while he also provided support for break-away pro-Russian enclaves in the Donbass region. The Minsk agreement later signed by the Ukrainian government granted autonomy to those latter areas, but Kiev refused to honor its commitments, and instead continued to shell the area, inflicting serious casualties upon the inhabitants, many of whom held Russian passports. Diane Johnstone has aptly characterized our policy as years of Russian bear-baiting.

As Mearsheimer, McGovern, and other observers have persuasively argued, Russia invaded Ukraine only after such endless provocations and warnings were always ignored or dismissed by our American leadership. Perhaps the final straw had been the recent public

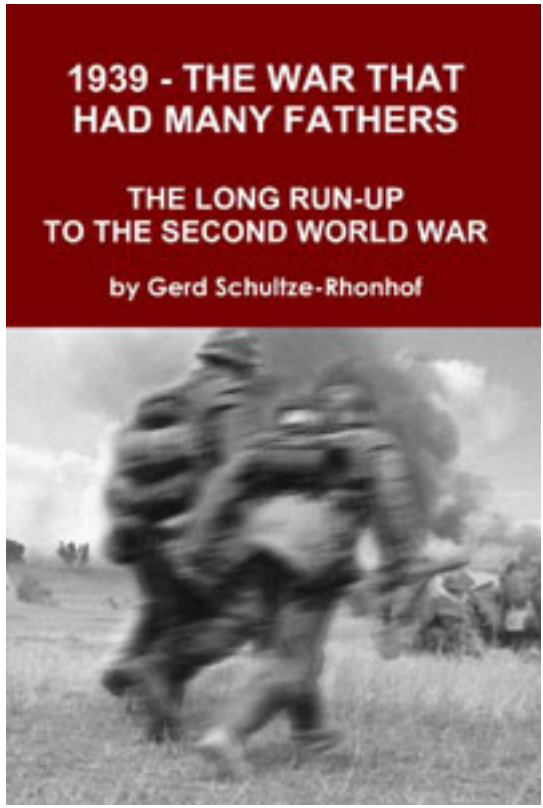
statement by Ukraine President Volodymyr Zelenskyy that he intended to acquire nuclear weapons. How would America react if a democratically-elected pro-American government in Mexico had been overthrown in an coup backed by China, with the fiercely hostile new Mexican government spending years killing American citizens in its country and then finally announcing plans to acquire a nuclear arsenal?

Moreover, some analysts such as economist Michael Hudson have strongly suspected that American elements deliberately provoked the Russian invasion for geostrategic reasons, and Mike Whitney advanced similar arguments in a column that went super-viral, accumulating over 800,000 pageviews. The Nord Stream 2 pipeline carrying Russian natural gas to Germany had finally been completed last year and was about to go into operation, which would have greatly increased Eurasian economic integration and Russian influence in Europe, while eliminating the potential market for more expensive American natural gas. The Russian attack and the massive resulting media hysteria have now foreclosed that possibility.

So although it was Russian troops who crossed the Ukrainian border, a strong case can be made that they did so only after the most extreme provocations, and these may have been deliberately intended to produce exactly that result. Sometimes the parties responsible for starting a war are not necessarily those that eventually fire the first shot.

## Hitler and the Origins of World War II

Ironically enough, the arguments of Mearsheimer and others that Putin was greatly provoked or possibly even manipulated into attacking Ukraine raise certain intriguing historical parallels. The legions of ignorant Westerners who mindlessly rely upon our disingenuous media may be denouncing Putin as “another Hitler” but I think they may have inadvertently backed themselves into the truth.



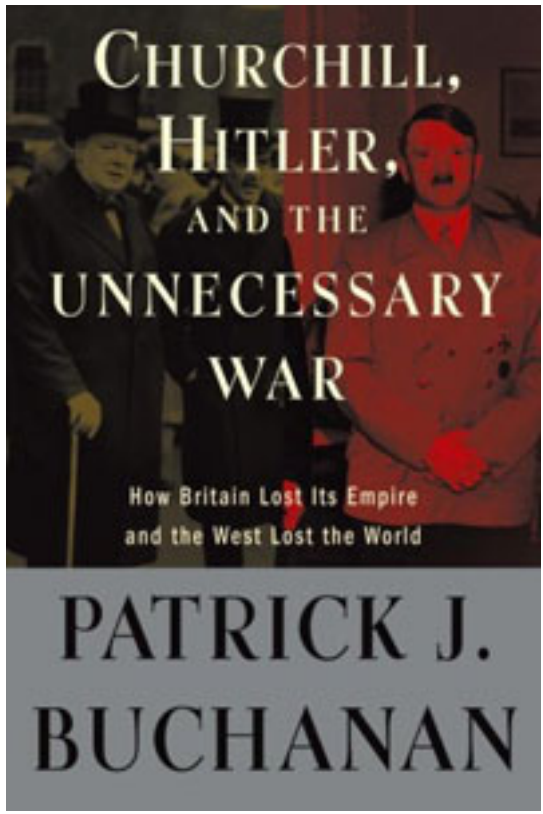
A couple of months ago I finally read Gerd Schultze-Rhonhof's outstanding 2011 volume analyzing the years leading up to the outbreak of World War II, a work that I would highly recommend. The author spent his career as a fully mainstream professional military man, rising to the rank of major general in the German army before retiring, and his account evoked eerie parallels to the current conflict with Russia.

As most of us know, the Second World War began when Germany attacked Poland in 1939 over Danzig, an almost entirely German border city controlled by the Poles.

But less well known is that Hitler had actually made enormous efforts to avoid war and settle that dispute, spending many months on fruitless negotiations and offering extremely reasonable terms. Indeed, the German dictator had made numerous concessions that none of his democratic Weimar predecessors had been willing to consider, but these were all rejected, while provocations increased until war with Poland seemed the only possible option. And just as in the case of Ukraine, politically influential elements in the West almost certainly sought to provoke that war, using Danzig as the spark to

ignite the conflict much like the Donbass may have been used to force Putin's hand.

We should recognize that in many respects the standard historical narrative of World War II is merely a congealed version of the media propaganda of that era. If Russia were defeated and destroyed as a result of the current conflict, we can be sure that the subsequent history books would utterly demonize Putin and all the decisions that he had taken.



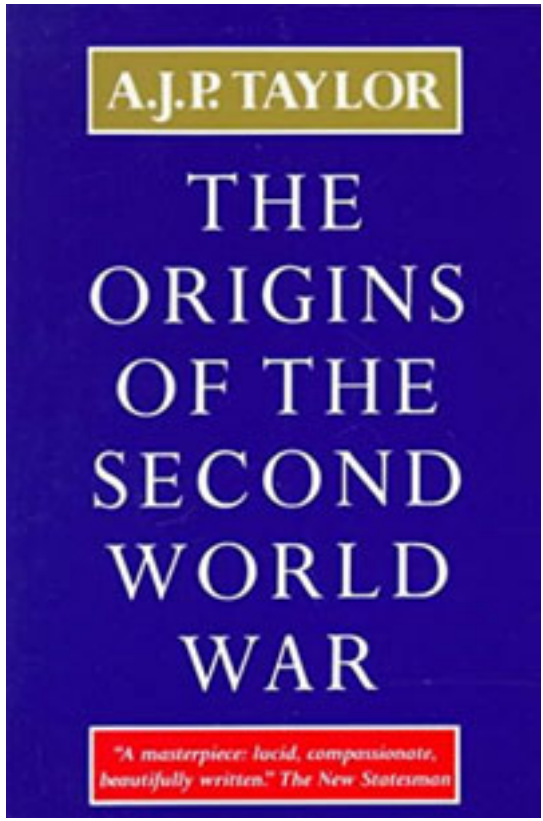
Although I was very impressed by Schultze-Rhonhof's meticulously detailed analysis of the circumstances leading up to the outbreak of war in 1939, his account merely reinforced my existing views, which had already been along entirely similar lines.

For example, back in 2019 I had used Pat Buchanan's controversial 2008 bestseller on World War II as the starting point for a very long and detailed discussion of the true origins of that conflict:

> However, the bulk of the book focused on the events leading up to the Second World War, and this was the portion that had

inspired such horror in McConnell and his colleagues. Buchanan described the outrageous provisions of the Treaty of Versailles imposed upon a prostrate Germany, and the determination of all subsequent German leaders to redress it. But whereas his democratic Weimar predecessors had failed, Hitler had managed to succeed, largely through bluff, while also annexing German Austria and the German Sudetenland of Czechoslovakia, in both cases with the overwhelming support of their populations.

Buchanan documented this controversial thesis by drawing heavily upon numerous statements by leading contemporary political figures, mostly British, as well as the conclusions of highly-respected mainstream historians. Hitler's final demand, that 95% German Danzig be returned to Germany just as its inhabitants desired, was an absolutely reasonable one, and only a dreadful diplomatic blunder by the British had led the Poles to refuse the request, thereby provoking the war. The widespread later claim that Hitler sought to conquer the world was totally absurd, and the German leader had actually made every effort to avoid war with Britain or France. Indeed, he was generally quite friendly towards the Poles and had been hoping to enlist Poland as a German ally against the menace of Stalin's Soviet Union.



A.J.P. TAYLOR
THE ORIGINS OF THE SECOND WORLD WAR
"A masterpiece: lucid, compassionate, beautifully written." The New Statesman

Although many Americans might have been shocked at this account of the events leading up to the outbreak of the Second World War, Buchanan's narrative accorded reasonably well with my own impression of that period. As a Harvard freshman, I had taken an introductory history course, and one of the primary required texts on World War II had been that of A.J.P. Taylor, a renowned Oxford University historian. His famous 1961 work *Origins of the Second World War* had very persuasively laid out a case quite similar to that of Buchanan, and I'd never found any reason to question the judgment of my professors who had assigned it. So if Buchanan merely seemed to be seconding the opinions of a leading Oxford don and members of the Harvard history faculty, I couldn't quite understand why his new book would be regarded as being beyond the pale.

The recent 70th anniversary of the outbreak of the conflict that consumed so many tens of millions of lives naturally provoked numerous historical articles, and the resulting discussion led me to dig out my old copy of Taylor's short volume, which I reread for the first time in nearly forty years. I found it just as masterful

and persuasive as I had back in my college dorm room days, and the glowing cover-blurbs suggested some of the immediate acclaim the work had received. *The Washington Post* lauded the author as "Britain's most prominent living historian," *World Politics* called it "Powerfully argued, brilliantly written, and always persuasive," *The New Statesman*, Britain leading leftist magazine, described it as "A masterpiece: lucid, compassionate, beautifully written," and the august *Times Literary Supplement* characterized it as "simple, devastating, superlatively readable, and deeply disturbing." As an international best-seller, it surely ranks as Taylor's most famous work, and I can easily understand why it was still on my college required reading list nearly two decades after its original publication.

Yet in revisiting Taylor's ground-breaking study, I made a remarkable discovery. Despite all the international sales and critical acclaim, the book's findings soon aroused tremendous hostility in certain quarters. Taylor's lectures at Oxford had been enormously popular for a quarter century, but as a direct result of the controversy "Britain's most prominent living historian" was summarily purged from the faculty not long afterwards. At the beginning of his first chapter, Taylor had noted how strange he found it that more than twenty years after the start of the world's most cataclysmic war no serious history had been produced carefully analyzing the outbreak. Perhaps the retaliation that he encountered led him to better understand part of that puzzle.

I very recently reread Pat Buchanan's 2008 book harshly condemning Churchill for his role in the cataclysmic world war and made an interesting discovery. Irving is surely among the most authoritative Churchill biographers, with his exhaustive documentary research being the source of so many new discoveries and his books selling in the millions. Yet Irving's name never once appears either in Buchanan's text or in his bibliography, though we may suspect that much of Irving's material has been "laundered" through other, secondary Buchanan sources. Buchanan extensively cites A.J.P. Taylor, but makes no mention of Barnes, Flynn, or various other leading American academics and journalists who were purged for expressing contemporaneous views not so dissimilar from those of the author himself.

During the 1990s, Buchanan had ranked as one of America's most prominent political figures, having an enormous media footprint in both print and television, and with his remarkably strong

insurgent runs for the Republican presidential nomination in 1992 and 1996 cementing his national stature. But his numerous ideological foes worked tirelessly to undermine him, and by 2008 his continued presence as a pundit on the MSNBC cable channel was one of his last remaining footholds of major public prominence. He probably recognized that publishing a revisionist history of World War II might endanger his position, and believed that any direct association with purged and vilified figures such as Irving or Barnes would surely lead to his permanent banishment from all electronic media.

A decade ago I had been quite impressed by Buchanan's history, but I had subsequently done a great deal of reading on that era and I found myself somewhat disappointed the second time through. Aside from its often breezy, rhetorical, and unscholarly tone, my sharpest criticisms were not with the controversial positions that he took, but with the other controversial topics and questions that he so carefully avoided.

Perhaps the most obvious of these is the question of the true origins of the war, which laid waste to much of Europe, killed perhaps fifty or sixty million, and gave rise to the subsequent Cold War era in which Communist regimes controlled half of the entire Eurasian world-continent. Taylor, Irving, and numerous others have thoroughly debunked the ridiculous mythology that the cause lay in Hitler's mad desire for world conquest, but if the German dictator clearly bore only minor responsibility, was there indeed any true culprit? Or did this massively-destructive world war come about in somewhat similar fashion to its predecessor, which our conventional histories treat as mostly due to a collection of blunders, misunderstandings, and thoughtless escalations.

During the 1930s, John T. Flynn was one of America's most influential progressive journalists, and although he had begun as a strong supporter of Roosevelt and his New Deal, he gradually became a sharp critic, concluding that FDR's various governmental schemes had failed to revive the American economy. Then in 1937 a new economic collapse spiked unemployment back to the same levels as when the president had first entered office, confirming Flynn in his harsh verdict. And as I wrote last year:

> Indeed, Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the

country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after a top Roosevelt adviser had privately boasted to him that a large bout of "military Keynesianism" and a major war would cure the country's seemingly insurmountable economic problems. At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.

The last point is an important one since the confidential opinions of those closest to important historical events should be accorded considerable evidentiary weight. In a recent article John Wear mustered the numerous contemporaneous assessments that implicated FDR as a pivotal figure in orchestrating the world war by his constant pressure upon the British political leadership, a policy that he privately even admitted could mean his impeachment if revealed. Among other testimony, we have the statements of the Polish and British ambassadors to Washington and the American ambassador to London, who also passed along the concurring opinion of Prime Minister Chamberlain himself. Indeed, the German capture and publication of secret Polish diplomatic documents in 1939 had already revealed much of this information, and William Henry Chamberlin confirmed their authenticity in his 1950 book. But since the mainstream media never reported any of this information, these facts remain little known even today.

## The Hidden Jewish Role in Orchestrating These Conflicts

Roosevelt's economic problems had led him to seek a foreign war, but it was probably the overwhelming Jewish hostility to Nazi

Germany that pointed him in that particular direction. The confidential report of the Polish ambassador to the U.S. as quoted by John Wear provides a striking description of the political situation in America at the beginning of 1939:

> There is a feeling now prevalent in the United States marked by growing hatred of Fascism, and above all of Chancellor Hitler and everything connected with National Socialism. Propaganda is mostly in the hands of the Jews who control almost 100% [of the] radio, film, daily and periodical press. Although this propaganda is extremely coarse and presents Germany as black as possible—above all religious persecution and concentration camps are exploited—this propaganda is nevertheless extremely effective since the public here is completely ignorant and knows nothing of the situation in Europe.
>
> At the present moment most Americans regard Chancellor Hitler and National Socialism as the greatest evil and greatest peril threatening the world. The situation here provides an excellent platform for public speakers of all kinds, for emigrants from Germany and Czechoslovakia who with a great many words and with most various calumnies incite the public. They praise American liberty which they contrast with the totalitarian states.
>
> It is interesting to note that in this extremely well-planned campaign which is conducted above all against National Socialism, Soviet Russia is almost completely eliminated. Soviet Russia, if mentioned at all, is mentioned in a friendly manner and things are presented in such a way that it would seem that the Soviet Union were cooperating with the bloc of democratic states. Thanks to the clever propaganda the sympathies of the American public are completely on the side of Red Spain.

Given the heavy Jewish involvement in financing Churchill and his allies and also steering the American government and public in the direction of war against Germany, organized Jewish groups probably bore the central responsibility for provoking the world war, and this was surely recognized by most knowledgeable individuals at the time. Indeed, the Forrestal Diaries recorded the very telling statement by our ambassador in London: "Chamberlain, he says, stated that America and the Jews had forced England into the war."

LATE NEWS

The ongoing struggle between Hitler and international Jewry had been receiving considerable public attention for years. During his political rise, Hitler had hardly concealed his intent to dislodge Germany's tiny Jewish population from the stranglehold they had gained over German media and finance, and instead run the country in the best interests of the 99% German majority, a proposal that provoked the bitter hostility of Jews everywhere. Indeed, immediately after he came into office, a major London newspaper had carried a memorable 1933 headline announcing that the Jews of the world had declared war on Germany, and were organizing an international boycott to starve the Germans into submission.

In recent years, somewhat similar Jewish-organized efforts at international sanctions aimed at bringing recalcitrant nations to their knees have become a regular part of global politics. But these days the Jewish dominance of the U.S. political system has become so overwhelming that instead of private boycotts, such actions are directly enforced by the American government. To some extent, this had already been the case with Iraq during the 1990s, but became far more common after the turn of the new century.

Although our official government investigation concluded that the total financial cost of the 9/11 terrorist attacks had been an absolutely trivial sum, the Neocon-dominated Bush Administration nonetheless used this as an excuse to establish an important new Treasury Department position, the Under Secretary for Terrorism and Financial Intelligence. That office soon began utilizing America's control of the global banking system and dollar-denominated international trade to enforce financial sanctions and wage economic warfare, with these measures typically being directed against individuals, organizations, and nations considered unfriendly towards Israel,

notably Iran, Hezbollah, and Syria.

Perhaps coincidentally, although Jews comprise merely 2% of the American population, all four individuals holding that very powerful post over the last 15 years since its inception—Stuart A. Levey, David S. Cohen, Adam Szubin, Sigal Mandelker—have been Jewish, with the most recent of these being an Israeli citizen. Levey, the first Under Secretary, began his work under President Bush, then continued without a break for years under President Obama, underscoring the entirely bipartisan nature of these activities.

Most foreign policy experts have certainly been aware that Jewish groups and activists played the central role in driving our country into its disastrous 2003 Iraq War, and that many of these same groups and individuals have spent the last dozen years or so working to foment a similar American attack on Iran, though as yet unsuccessfully. This seems quite reminiscent of the late 1930s political situation in Britain and America.

Individuals outraged by the misleading media coverage surrounding the Iraq War but who have always casually accepted the conventional narrative of World War II should consider a thought-experiment I suggested last year:

> When we seek to understand the past, we must be careful to avoid drawing from a narrow selection of sources, especially if one side proved politically victorious in the end and completely dominated the later production of books and other commentary. Prior to the existence of the Internet, this was an especially difficult task, often requiring a considerable amount of scholarly effort, even if only to examine the bound volumes of once popular periodicals. Yet without such diligence, we can fall into very serious error.
>
> The Iraq War and its aftermath was certainly one of the central events in American history during the 2000s. Yet suppose some readers in the distant future had only the collected archives of *The Weekly Standard*, *National Review*, the *WSJ* op-ed page, and *FoxNews* transcripts to furnish their historical understanding of that period, perhaps along with the books written by the contributors to those outlets. I doubt that more than a small fraction of what they would read could be categorized as outright lies. But the massively skewed coverage, the distortions, exaggerations, and

> especially the breathtaking omissions would surely provide them with an exceptionally unrealistic view of what had actually happened during that important period.

Another striking historical parallel has been the fierce demonization of Russian President Vladimir Putin, who provoked the great hostility of Jewish elements when he ousted the handful of Jewish Oligarchs who had seized control of Russian society under the drunken misrule of President Boris Yeltsin and totally impoverished the bulk of the population. This conflict intensified after Jewish investor William F. Browder arranged Congressional passage of the Magnitsky Act to punish Russian leaders for the legal actions they had taken against his huge financial empire in their country. Putin's harshest Neocon critics have often condemned him as "a new Hitler" while some neutral observers have agreed that no foreign leader since the German Chancellor of the 1930s has been so fiercely vilified in the American media. Seen from a different angle, there may indeed be a close correspondence between Putin and Hitler, but not in the way usually suggested.

Knowledgeable individuals have certainly been aware of the crucial Jewish role in orchestrating our military or financial attacks against Iraq, Iran, Syria, and Russia, but it has been exceptionally rare for any prominent public figures or reputable journalists to mention these facts lest they be denounced and vilified by zealous Jewish activists and the media they dominate. For example, a couple of years ago a single suggestive Tweet by famed CIA anti-proliferation operative Valerie Plame provoked such an enormous wave of vituperation that she was forced to resign her position at a prominent non-profit. A close parallel involving a far more famous figure had occurred three generations earlier:

> These facts, now firmly established by decades of scholarship, provide some necessary context to Lindbergh's famously controversial speech at an America First rally in September 1941. At that event, he charged that three groups in particular were "pressing this country toward war[:] the British, the Jewish, and the Roosevelt Administration," and thereby unleashed an enormous firestorm of media attacks and denunciations, including widespread accusations of anti-Semitism and Nazi sympathies. Given the realities of the political situation, Lindbergh's statement constituted a perfect illustration of Michael Kinsley's famous quip that "a

gaffe is when a politician tells the truth ◆ some obvious truth he isn't supposed to say." But as a consequence, Lindbergh's once-heroic reputation suffered enormous and permanent damage, with the campaign of vilification echoing for the remaining three decades of his life, and even well beyond. Although he was not entirely purged from public life, his standing was certainly never even remotely the same.

With such examples in mind, we should hardly be surprised that for decades this huge Jewish involvement in orchestrating World War II was carefully omitted from nearly all subsequent historical narratives, even those that sharply challenged the mythology of the official account. The index of Taylor's iconoclastic 1961 work contains absolutely no mention of Jews, and the same is true of the previous books by Chamberlin and Grenfell. In 1953, Harry Elmer Barnes, the dean of historical revisionists, edited his major volume aimed at demolishing the falsehoods of World War II, and once again any discussion of the Jewish role was almost entirely lacking, with only part of one single sentence and Chamberlain's dangling short quote appearing across more than 200,000 words of text. Both Barnes and many of his contributors had already been purged and their book was only released by a tiny publisher in Idaho, but they still sought to avoid certain unmentionables.

Even the arch-revisionist David Hoggan seems to have carefully skirted the topic of Jewish influence. His 30 page index lacks any entry on Jews and his 700 pages of text contain only scattered references. Indeed, although he does quote the explicit private statements of both the Polish ambassador and the British Prime Minister emphasizing the enormous Jewish role in promoting the war, he then rather questionably asserts that these confidential statements of individuals with the best understanding of events should simply be disregarded.

In the popular Harry Potter series, Lord Voldemort, the great nemesis of the young magicians, is often identified as "He Who Must Not Be Named," since the mere vocalization of those few particular syllables might bring doom upon the speaker. Jews have long enjoyed enormous power and influence over the media and political life, while fanatic Jewish activists demonstrate hair-trigger eagerness to denounce and vilify all those suspected of being insufficiently friendly towards their ethnic group. The combination of these two factors has therefore induced such a

> "Lord Voldemort Effect" regarding Jewish activities in most writers and public figures. Once we recognize this reality, we should become very cautious in analyzing controversial historical issues that might possibly contain a Jewish dimension, and also be particularly wary of arguments from silence.

## The Demonization of Adolf Hitler

Another aspect of Schultze-Rhonhof's important study that was new to me but further solidified my previous conclusions was his analysis of Hitler's public speeches. Although the German Fuhrer is notoriously portrayed as a horrific warmonger, his actual statements provide absolutely no evidence of any plans for aggressive war, and instead emphasized the importance of maintaining international peace in order to foster internal German economic development. In another 2019 article, I had similarly suggested that any examination of the reputable contemporary sources reveals that the Hitler of our history books is merely a grotesque political cartoon, similar to the one now increasingly drawn of Putin:

> Although the demonic portrayal of the German Kaiser was already being replaced by a more balanced treatment within a few years of the Armistice and had disappeared after a generation, no such similar process has occurred in the case of his World War II successor. Indeed, Adolf Hitler and the Nazis seem to loom far larger in our cultural and ideological landscape today than they did in the immediate aftermath of the war, with their visibility growing even as they become more distant in time, a strange violation of the normal laws of perspective. I suspect that the casual dinner-table conversations on World War II issues that I used to enjoy with my Harvard College classmates during the early 1980s would be completely impossible today.
>
> To some extent, the transformation of "the Good War" into a secular religion, with its designated monsters and martyrs may be analogous to what occurred during the final decay of the Soviet Union, when the obvious failure of its economic system forced the government to increasingly turn to endless celebrations of its victory in the Great Patriotic War as the primary source of its legitimacy. The real wages of ordinary American workers have been stagnant for fifty years and most adults have less than $500 in available savings, so this widespread impoverishment may be forcing our own leaders into adopting a similar strategy.

But I think that a far greater factor has been the astonishing growth of Jewish power in America, which was already quite substantial even four or five decades ago but has now become absolutely overwhelming, whether in foreign policy, finance, or the media, with our 2% minority exercising unprecedented control over most aspects of our society and political system. Only a fraction of American Jews hold traditional religious beliefs, so the twin worship of the State of Israel and the Holocaust has served to fill that void, with the individuals and events of World War II constituting many of the central elements of the *mythos* that serves to unify the Jewish community. And as an obvious consequence, no historical figure ranks higher in the demonology of this secular religion than the storied Fuhrer and his Nazi regime.

However, beliefs based upon religious dogma often sharply diverge from empirical reality. Pagan Druids may worship a particular sacred oak tree and claim that it contains the soul of their tutelary dryad; but if an arborist taps the tree, its sap may seem like that of any other.

Our current official doctrine portrays Adolf Hitler's Nazi Germany as one of the cruelest and most relentlessly aggressive regimes in the history of the world, but at the time these salient facts apparently escaped the leaders of the nations with which it was at war. *Operation Pike* provides an enormous wealth of archival material regarding the secret internal discussions of the British and French governmental and military leadership, and all of it tends to suggest that they regarded their German adversary as a perfectly normal country, and perhaps occasionally regretted that they had somehow gotten themselves involved a major war over what amounted to a small Polish border dispute.

During late 1939, a major American news syndicate had sent Stoddard to spend a few months in wartime Germany and provide his perspective, with his numerous dispatches appearing in *The New York Times* and other leading newspapers. Upon his return, he published a 1940 book summarizing all his information, seemingly just as even-handed as his earlier 1917 volume. His coverage probably constitutes one of the most objective and comprehensive American accounts of the mundane domestic nature of National Socialist Germany, and thus may seem rather shocking to modern readers steeped in eighty years of increasingly unrealistic Hollywood propaganda.

- Into the Darkness
  *An Uncensored Report from Inside the Third Reich At War*
  Lothrop Stoddard • 1940 • 79,000 Words

And although our standard histories would never admit this, the actual path toward war appears to have been quite different than most Americans believe. Extensive documentary evidence from knowledgeable Polish, American, and British officials demonstrates that pressure from Washington was the key factor behind the outbreak of the European conflict. Indeed, leading American journalists and public intellectuals of the day such as John T. Flynn and Harry Elmer Barnes had publicly declared that they feared Franklin Roosevelt was seeking to foment a major European war in hopes that it would rescue him from the apparent economic failure of his New Deal reforms and perhaps even provide him an excuse to run for an unprecedented third term. Since this is exactly what ultimately transpired, such accusations would hardly seem totally unreasonable.

And in an ironic contrast with FDR's domestic failures, Hitler's own economic successes had been enormous, a striking comparison since the two leaders had come to power within a few weeks of each other in early 1933. As iconoclastic leftist Alexander Cockburn once noted in a 2004 *Counterpunch* column:

> When [Hitler] came to power in 1933 unemployment stood at 40 per cent. Economic recovery came without the stimulus of arms spending…There were vast public works such as the autobahns. He paid little attention to the deficit or to the protests of the bankers about his policies. Interest rates were kept low and though wages were pegged, family income increased by reason of full employment. By 1936 unemployment had sunk to one per cent. German military spending remained low until 1939.
>
> Not just Bush but Howard Dean and the Democrats could learn a few lessons in economic policy from that early, Keynesian Hitler.

By resurrecting a prosperous Germany while nearly all other countries remained mired in the worldwide Great Depression, Hitler drew glowing accolades from individuals all across the ideological spectrum. After an extended 1936 visit, David Lloyd George, Britain's former wartime prime minister, fulsomely praised the chancellor as "the George Washington of Germany," a national hero of the greatest stature. Over the years, I've seen plausible claims here and there that during the 1930s Hitler was widely acknowledged as the world's most popular and successful national leader, and the fact that he was selected as *Time Magazine's* Man of the Year for 1938 tends to support this belief.

Only International Jewry had remained intensely hostile to Hitler, outraged over his successful efforts to dislodge Germany's 1% Jewish population from the stranglehold they had gained over German media and finance, and instead run the country in the best interests of the 99% German majority. A striking recent parallel has been the enormous hostility that Vladimir Putin incurred after he ousted the handful of Jewish Oligarchs who had seized control of Russian society and impoverished the bulk of the population. Putin has attempted to mitigate this difficulty by allying himself with certain Jewish elements, and Hitler seems to have done the same by endorsing the Nazi-Zionist economic partnership, which lay the basis for the creation of the State of

Israel and thereby brought on board the small, but growing Jewish Zionist faction.

In the wake of the 9/11 Attacks, the Jewish Neocons stampeded America towards the disastrous Iraq War and the resulting destruction of the Middle East, with the talking heads on our television sets endlessly claiming that "Saddam Hussein is another Hitler." Since then, we have regularly heard the same tag-line repeated in various modified versions, being told that "Muammar Gaddafi is another Hitler" or "Mahmoud Ahmadinejad is another Hitler" or "Vladimir Putin is another Hitler" or even "Hugo Chavez is another Hitler." For the last couple of years, our American media has been relentlessly filled with the claim that "Donald Trump is another Hitler."

During the early 2000s, I obviously recognized that Iraq's ruler was a harsh tyrant, but snickered at the absurd media propaganda, knowing perfectly well that Saddam Hussein was no Adolf Hitler. But with the steady growth of the Internet and the availability of the millions of pages of periodicals provided by my digitization project, I've been quite surprised to gradually also discover that Adolf Hitler was no Adolf Hitler.

It might not be entirely correct to claim that the story of World War II was that Franklin Roosevelt sought to escape his domestic difficulties by orchestrating a major European war against the prosperous, peace-loving Nazi Germany of Adolf Hitler. But I do think that picture is probably somewhat closer to the actual historical reality than the inverted image more commonly found in our textbooks.

## America and the Current Balance of Power Against Russia

For more than a hundred years, all of America's many wars have been fought against totally outmatched adversaries, opponents that possessed merely a fraction of the human, industrial, and natural resources that we and our allies controlled. This massive advantage regularly compensated for many of our serious early mistakes in those conflicts. So the main difficulty our elected leaders faced was merely persuading the often very reluctant American citizenry to support a war, which is why many historians have alleged that such incidents as the sinkings of *Maine* and the *Lusitania*, and the attacks in Pearl Harbor and Tonkin Bay were orchestrated or manipulated for exactly

that purpose.

This huge advantage in potential power was certainly the case when World War II broke out in Europe, and Schultze-Rhonof and others have emphasized that the British and French empires backed by America commanded potential military resources vastly superior to those of Germany, a mid-size country smaller than Texas. The surprise was that despite such overwhelming odds Germany proved highly successful for several years, before finally going down to defeat.

However, matters almost took a very different turn. As I discussed in a 2019 article, for more than three generations all our history books have entirely excluded any mention of one of the most crucial turning points of the twentieth century. In early 1940, the British and French were on the very verge of launching a major attack against the neutral USSR, hoping to destroy Stalin's Baku oil fields by means of the largest strategic bombing campaign in world history, and perhaps overthrow his regime as a consequence. Only Hitler's sudden invasion of France forestalled this plan, and if that Panzer thrust had been delayed for a few weeks, the Soviets would have been forced into the war on Germany's side. A full German-Soviet military alliance would have easily matched the resources of the Allies including America, thereby probably ensuring Hitler's victory.

But this very narrow escape from strategic disaster in World War II has been entirely flushed down the memory-hole, and I doubt whether one current DC policy-maker in a hundred is even aware of it, let alone properly recognizes its significance. This reinforces the enormous hubris that America will never have to confront opposing forces of comparable power.

Consider the attitude taken during the current conflict with Russia, a severe Cold War confrontation that might conceivably turn hot. Despite its great military strength and enormous nuclear arsenal, Russia seems just as out-matched as any past American foe. Including the NATO countries and Japan, the American alliance commands a 6-to-1 advantage in population and 12-to-1 superiority in economic product, the key sinews of international power. Such an enormous disparity is implicit in the attitudes of our strategic planners and their media mouthpieces.

But this is a very unrealistic view of the true correlation of forces. Prior to the outbreak of the Ukraine war, America had spent years primarily focusing its hostility against China, forming a military

alliance against that country, deploying sanctions to cripple Huawei, China's global technological champion, and working to ruin the Beijing Olympics, while also drawing very near to the red-line of actively promoting Taiwanese independence. I have even argued that there is strong perhaps overwhelming evidence that the Covid outbreak in Wuhan was probably the result of a biowarfare attack by rogue elements of the Trump Administration. So just two weeks before the Russian attack on Ukraine, Putin and Chinese leader Xi Jinping held their 39th personal meeting in Beijing and declared that their partnership had "no limits." China will certainly support Russia in any global conflict.

Meanwhile, America's endless attacks and vilification of Iran have gone on for decades, culminating in our assassination two years ago of the country's top military commander, Qasem Soleimani, who had been mentioned as a leading candidate in Iran's 2021 presidential elections. Together with our Israeli ally, we have also assassinated many of Iran's top scientists over the last decade, and in 2020 Iran publicly accused America of having unleashed the Covid biowarfare weapon against their country, which infected much of their parliament and killed many members of their political elite. Iran would certainly side with Russia as well.

America, together with its NATO allies and Japan, does possess huge superiority in any test of global power against Russia alone. However, that would not be the case against a coalition consisting of Russia, China, and Iran, and indeed I think the latter group might actually have the upper hand, given its enormous weight of population, natural resources, and industrial strength.

Since the fall of the Soviet Union in 1991, America has enjoyed a unipolar moment, reigning as the world's sole hyperpower. But this status has fostered our overweening arrogance and international aggression against far weaker targets, finally leading to the creation of a powerful block of states willing to stand up against us.

One of America's greatest strategic assets has been our overwhelming control of the global media, which shapes the perceived nature of reality for many billions, including most of the world's elites. But one inherent danger of such unchallenged propaganda-power is the likelihood that our leaders may eventually come to believe their own lies and exaggerations, thereby making decisions based upon assumptions that do not match reality.

When we finally departed Afghanistan after twenty years of

occupation and trillions of dollars spent, our military planners were confident that the heavily-armed client regime we had left behind would remain in power for at least six months or more; instead, it fell to the Taliban within days.

A much more important example was highlighted by Ray McGovern in his March 3nd presentation. During last June's Biden-Putin summit, our president told the Russian leader that we fully understood the terrible pressure he was facing from the Chinese, and his fear of their military threat. Such statements must have been regarded as sheer lunacy by the Russian national security leadership, and a strong sign of the completely delusional nature of the American foreign policy establishment they faced. Since such bizarre beliefs might prompt America to take actions detrimental to Russian interests, Putin attempted to puncture this bubble of unreality by organizing a joint public statement with his close Chinese counterpart affirming that their relationship was "more than an alliance."

This highly visible declaration was intended to force the DC establishment to recognize the existence of a powerful Russia-China block, and thereby persuade it to secure important concessions from its Ukraine client state, but apparently to no avail. Instead, Ukraine publicly declared its intention to acquire nuclear weapons, and Putin decided that war was his only option.

Bismarck allegedly once quipped that there is a special Providence for drunkards, fools, and the United States of America.  But I fear that we have now drawn down on that Providence one too many times, and may now suffer the consequences.

# Alex Jones, Cass Sunstein, and "Cognitive Infiltration"

***The Unz Review*** • August 8, 2022 • 5,400 Words

Late last week a Texas jury ordered Alex Jones to pay nearly $50 million in compensatory and punitive damages to the parents of a child killed in the Sandy Hook shootings, with two more trials still scheduled. These awards may be sharply reduced, but if they are not, the result will probably mean the destruction of Jones' media empire.

For decades Jones has been one of America's most prominent conspiracy theorists, and although I've never watched his show nor scarcely ever visited his website, under ordinary circumstances I would be quite sympathetic to his plight, given the tremendous record of dishonesty by his arch-enemies in the mainstream media.

From what I've read, Jones came to major national prominence in the early 2000s when he became a leading skeptic of the official 9/11 narrative, widely promoting public criticism of that official fairy tale when no one in the mainstream media and even few alternative journalists were willing to do so. I myself only became aware of these issues long afterward, and if I'd been listening to Jones at the time I would have learned some important facts years earlier.

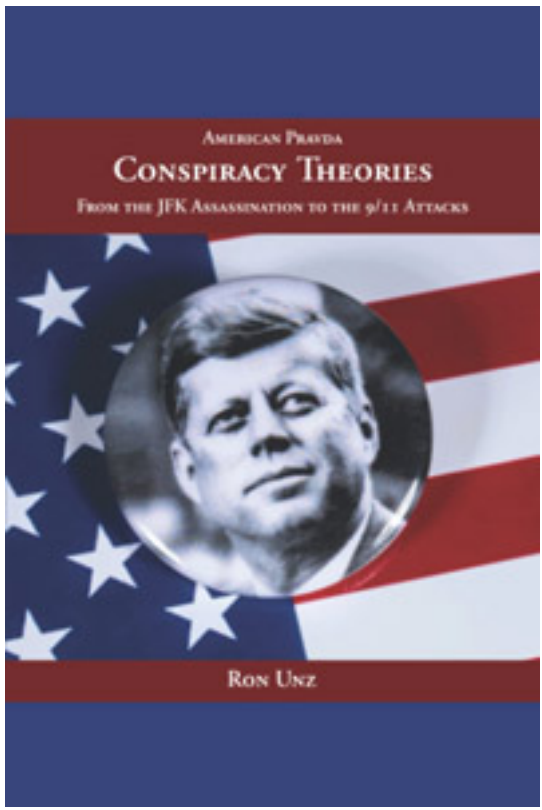
- American Pravda: Seeking 9/11 Truth After Twenty Years
  Ron Unz • ***The Unz Review*** • September 7, 2021 • 7,800 Words

However, even a broken clock is right twice each day, and the conspiracy community seems plagued by individuals who tend to believe that almost everything is a conspiracy and that reality can be determined simply by inverting the statements of government officials or mainstream journalists. Jones represents an unfortunate example of this tendency, probably egged on by his numerous agitated followers.

Soon after the 2012 shootings at Sandy Hook Elementary School took the lives of 26 students, Jones and various other prominent conspiracy-activists began denying the reality of the massacre. They focused upon initial inconsistencies in the mainstream media reports and what they considered suspicious video footage to claim that the killings had never occurred, and that the incident was merely a hoax concocted by powerful groups for sinister reasons, with the allegedly

grief-stricken parents actually being “crisis actors” recruited to play a role for the national television cameras. Indeed, Prof. James Fetzer, who held similar beliefs, entitled his controversial book *Nobody Died at Sandy Hook,* and he subsequently lost a defamation lawsuit similar to that of Jones.

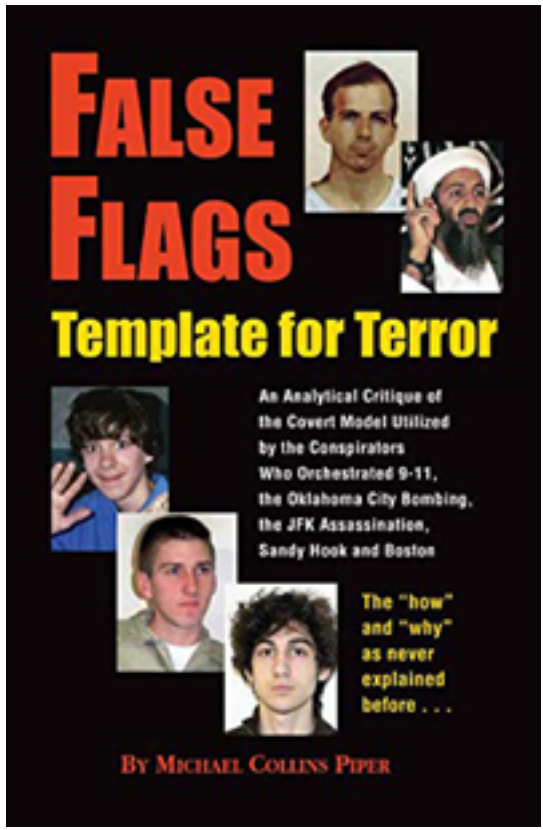
The parents of murdered children are highly sympathetic victims, and publicly accusing them of being paid actors with imaginary children seems legally actionable, especially after they were bombarded with death threats by Jones’ legion of devoted followers. Under American libel law, even the wildest accusations may be freely made against public figures without much fear of legal consequences; but the parents of murdered schoolchildren are private individuals, so Jones appears to deserve his fate.



Any sympathy I might have had for Jones in this current case vanished during my extensive reading of the last few years, although almost none of the material had anything to do with the particular details of what actually happened at Sandy Hook.

After I gradually became aware of the conspiratorial reality behind much of modern American history, one particular figure earned a great deal of my respect, and I featured him in the dedication of my recent collection of articles on this topic:

> *To the Memory of Michael Collins Piper,*
> *Who Pinned the Tail on the Donkey Almost Thirty Years Ago*



FALSE FLAGS
Template for Terror
An Analytical Critique of the Covert Model Utilized by the Conspirators Who Orchestrated 9-11, the Oklahoma City Bombing, the JFK Assassination, Sandy Hook and Boston
The "how" and "why" as never explained before . . .
By Michael Collins Piper

For decades, journalist Michael Collins Piper of the *Spotlight* and the *American Free Press* had ranked as one of America's foremost conspiracy-researchers. Although I was only slightly aware of his work prior to his 2015 death at age 54, since that time I've read nearly a dozen of his books and been very impressed by his knowledge and reliability, with the latter trait being all too rare within the conspiracy-community.

One of his last published works was *False Flags*, a 2013 compendium of the most important events that he believed involved hidden conspiracies, including the JFK assassination, the Oklahoma City bombing, and the 9/11 attacks. Despite its blemishes, I'd highly recommend this book, which is available on this website in HTML

format:

- False Flags
  *Template for Terror*
  Michael Collins Piper • 2013 • 136,000 Words

The bulk of his text dealt with those major events of recent American history, but the last chapters focused on what he regarded as a new and particularly threatening conspiratorial technique, a very effective means of confusing and frustrating all investigatory efforts by citizen-activists.

The growth of the Internet had made it increasingly difficult to suppress the distribution of information, so he suspected that a different approach was being used:

> But the plan—as we shall see—was not just simply standing back and loudly and repeatedly denying the existence of conspiracies. Instead, the course of action was far more subtle—some might even say Talmudic (and, if truth be told, it was a stroke of genius).
>
> The intriguers effectively determined that "if you can't lick 'em, join 'em" (as the old saying goes).
>
> That is, rather than working to REFUTE conspiracy theories, the solution would be to INFECT them and MISDIRECT them and add utter confusion to the mix.
>
> The consequence would be that conspiracy theories would look so ridiculous that no broad swath of people in the general public might one day actually begin to have any belief in their credibility.

In Piper's opinion, the Sandy Hook school shootings represented the first real-life test of this new strategy, which he believed had been masterminded by Cass Sunstein of the Obama Administration:

> The Sandy Hook affair was tailor-made for putting the Sunstein gang's experiment in motion. It involved violence. It involved the explosive issue of gun control, inasmuch as the incident was said to have been a mass shooting. And it was another sensational school shooting—and one at a grade school, no less.

> The dynamics were absolutely on target—no pun intended—for the Sunstein thesis to be put to the test.
>
> And, quite predictably, the mass media—as a consequence of its typically reckless nature—played right into the scheme. The frenzied rush in the heat of the moment to get "the scoop" led to sloppy, reporting and presumably otherwise honest mistakes by journalists.
>
> And naturally, a lot of these errors were quickly the subject of discussion among emailers and those participating on Internet discussion forums who were concerned about the obvious push for further gun control that was accompanying the media reportage relating to the events at Sandy Hook.

Piper argued that a small group of establishment operatives successfully manipulated the conspiracy community on the Internet, promoting ideas that soon captured the imagination of these activists, many of whom were excitable and overly gullible:

> One of the first and most outrageous of these Internet "revelations" that did so much to make sincere truth seekers look foolish was the oft-repeated theme that "Sandy Hook was a hoax" and that no children were even killed there. (Yes, that was a frequently repeated allegation.)
>
> Even the introduction of the word "hoax" was carefully calculated and with the mass media reporting that "conspiracy theorists" were using that term to describe the tragedy, many in the general public began to doubt the sanity of a lot of good people who were rightfully raising questions about what happened at Sandy Hook and the way that it was being exploited…
>
> This was their first big "test tube" case and it was proving to be a success, perhaps beyond even their wildest dreams.

Piper followed the events closely at the time, and he described how waves of Sandy Hook rumors and theories were deployed to swamp those websites following the story:

> The Crisis Management Conspirators mesmerized and manipulated American patriots and other skeptics via a non-stop wave of Sandy Hook "factoids" that quickly spread like wildfire across the Internet. And patriot websites by the hundreds—by the thousands—were picking them up and reporting them. These legends—spawned by the Crisis Management folks—became the

> staple daily diet of email addicts who were eagerly helping distribute the latest Sandy Hook "revelations"…
>
> Precisely because so much disinformation was being repeated by well-meaning and entirely innocent folks, a lot of good patriots concluded that something had to be amiss with the "official" Sandy Hook story or otherwise—they said—so many good patriots on so many websites and elsewhere wouldn't be raising these questions.

The penultimate chapter of Piper's book focuses upon a particularly pernicious element of the Sandy Hook controversy, namely the widespread belief that the parents of the children killed were actually "crisis actors" hired to play that role, an idea that soon became endemic throughout the conspiracy community and was also applied to the victims of the Boston Marathon Bombing a few months later:

> The manipulation by the Crisis Management Conspirators of the events at Sandy Hook was, in retrospect, a quite logical response to the phenomenon of 9-11 truthseeking (much of it Internet-based) which, in turn, had its own antecedents in the search for the truth surrounding the Oklahoma City bombing and the JFK assassination so many years before.
>
> In that sense, we might suggest, there was indeed a secret connection, so to speak, between 9-11 and Sandy Hook—but it's one that even the most fervent believers in the "big" story of Sandy Hook never realized, precisely because of the fact they had found themselves (most of them, to this day, unknowingly) caught in the web of disinformation being spun by the high-level Crisis Management Conspirators.
>
> And one of the biggest cons of all perpetrated upon the legitimate truth seekers was the legend of "The Crisis Actors"—mentioned earlier—that came to be an article of faith surrounding Sandy Hook and later again, even more so, following the events at the Boston Marathon.
>
> And as we've already noted (perhaps all too often) in the wake of Sandy Hook many people actually believed that there hadn't even been any gunplay at all—that no children and no adults were shot that day, that it was all a big staged event, with the purported victims and their families (along with law enforcement) in on the

deal.

> This is where the now much-discussed topic of "The Crisis Actors" was brought into play. And, in many respects, it may have been one of the most ingenious scams ever pawned off on American patriots designed to misdirect their attention.

Piper noted how odd it was that nobody seemed to take personal credit for introducing the "crisis actors" theory, which suddenly seemed to blossom across numerous websites and email groups. This led him to suspect it was a deliberate attempt at organized manipulation, an attempt that succeeded brilliantly.

> The Crisis Management Conspirators inserted the legend of the Crisis Actors onto the Internet with the expectation that it would become a part of the lore of Sandy Hook and help add confusion and—more importantly—play a significant part in discrediting conspiracy theories and conspiracy theorists in the minds of the broad general public…
>
> Yet, the Crisis Management Conspirators successfully distracted truth seekers—who were convinced that, once again, the authorities were covering up the truth about the Boston bombing—by cranking up the Crisis Actors legend (first spawned in the wake of Sandy Hook)…
>
> There were people from all over the United States who had come to the Boston Marathon and they went home to tell friends and family about their narrow brush with disaster, only to hear that there were conspiracy theorists on the Internet who were saying that the bombing didn't happen and that nobody really lost an arm or a leg

Our own website draws a wide range of alt-media columnists and commenters, and for years afterwards I would see most terrorist attacks both in American and overseas regularly denounced as hoaxes, with all the victims supposedly being "crisis actors."

But the simplest application of common-sense showed the implausibility of these theories. Surely it was far easier and cheaper to hire a couple of paid killers to mount a deadly attack than to recruit a large group of actors, make-up artists, and special effects wizards to stage a faked incident, afterward having to hope that none of them would ever reveal their participation in the high-profile fraud.

But as Piper points out, the ultimate result was to severely damage the

credibility of all “conspiracy theories”:

> But what a growing number of Americans *do* believe—as a consequence of propaganda from the Controlled Media—is that those people who are called “conspiracy theorists” by the media have some really crazy ideas and that they don’t believe that there was really a shooting in Sandy Hook that took the lives of 20 little children or that there wasn’t even really a bombing in Boston.
>
> And many Americans now believe that *anything* that reeks of a conspiracy theory—even relating to the JFK assassination or the Oklahoma bombing or 9-11—is the work of paranoid minds whose opinions are to be dismissed, along with (in particular) the idea that Israel had anything to do with those tragedies.
>
> That was precisely the design of those who helped make the truth seekers look “crazy” by feeding them a diet of extraordinary claims about Sandy Hook and Boston that took hold on the Internet like wildfire, even as the Crisis Management Conspirators were monitoring the communication networks between patriots here in the United States (and around the world) who were disseminating these stories.
>
> The bottom line is that what many came to believe about Crisis Actors at Sandy Hook and Boston (along with other similar nonsense) is just one big fat fraud—a lie—a distraction—deliberately perpetrated by the Crisis Management Conspirators to make truth seekers look silly.

The supposed villain of Piper’s narrative is former Obama official Cass Sunstein, whose name would mean nothing to most of the public but remains very well-known within conspiratorial and alternative media circles. He taught constitutional law for 27 years in Chicago then served as Administrator of the Office of Information and Regulatory Affairs from 2009 to 2012. But his enormous prominence had little connection to the three years he had spent running an obscure agency with a mind-numbingly bureaucratic title, nor to his later best-selling books on behavioral economics, the most recent entitled *The World According to Star Wars*.

Instead, his entire fame traces back to a single paper he co-authored in 2008 suggesting a strategy by which the government could disrupt

and defeat the increasingly troublesome movement of "conspiracy theorists," especially those who questioned the official story of the 9/11 attacks a few years earlier. Last year I described this approach under the heading "Diverting 'Conspiracy Theorists' into Dead-Ends":

> In the years following the 9/11 attacks, a vibrant movement of "conspiracy theorists" developed on the Internet, arguing that the true facts had been quite different than the official story, with most of them suggesting heavy American government involvement in those momentous events.
>
> Back then, the Internet was far less channeled and regulated than it eventually became, and few effective means existed for the political establishment to shut down such troubling discussions. Therefore Harvard Law professor Cass Sunstein, soon to become a top Obama aide, shrewdly suggested that the activities of those energetic individuals could best be undermined and disrupted by means of "cognitive infiltration." Agents of the government or its close allies should join those online communities and promote a wide range of additional theories, often rather absurd ones, thereby stirring up internal conflicts, diverting the members into theoretical dead-ends, and heavily discrediting them with the broader American public.

Conspiracy theorists have a notable tendency towards paranoia, but as a wit once observed "Even paranoids have enemies." Once it became known that a high-ranking Obama Administration official had previously suggested that the government employ online operatives to infiltrate and disrupt the conspiracy community, the story spread like wildfire, with rival individuals and factions sometimes accusing each other of serving as such "cognitive infiltrators."

David Ray Griffin then stood as one of the foremost figures of the 9/11 Truth movement, and one of his books was entirely devoted to describing the elements of the 9/11 case within the framework of Sunstein's alleged strategy for suppressing it.

- Cognitive Infiltration
  *An Obama Appointee's Plan to Undermine the 9/11 Conspiracy Theory*
  David Ray Griffin • 2011 • 66,000 Words

During that period, I was paying little attention to the 9/11 issue and was barely aware of the existence of a 9/11 Truth movement. But individuals who were very actively involved at the time have told me

that they believe much of their movement's momentum was lost when certain prominent figures were diverted into various bizarre theories of what had happened.

Some began to argue that no actual planes had hit the towers in New York City, and the images seen were merely holograms. Others claimed that nuclear explosions or mysterious energy-weapons had inflicted the destruction. And naturally enough, the more exciting and shocking the theory, the more it tended to capture the imagination and enthusiasm of the rank-and-file activists. Moreover, many of these different factions bitterly opposed each other, and the resulting infighting together with the sometimes outlandish nature of the claims soon cost the 9/11 Truth movement much of the little support it had gained in media circles and among the public.

Within a few years, the broader conspiracy movement was also swept by widespread beliefs that the Sandy Hook shooting, the Boston Bombing, and various other rampages or terrorist attacks were faked events, with the participants being paid "crisis actors." It's hardly surprising that Piper would regard this as an implementation of Sunstein's strategy of "cognitive infiltration," and even assume that Sunstein himself must have been personally involved.

Different figures reacted differently to these widely popular beliefs. Alex Jones eagerly surfed those waves of nonsense, becoming "a useful idiot" in what was very likely an orchestrated disinformation operation, and the revenues of his conspiracy media empire climbed into the millions or tens of millions of dollars per year. Meanwhile, Michael Collins Piper did his best to debunk those theories, often being bitterly attacked for doing so and eventually dying in poverty:

> In a radio broadcast on Jan. 20, 2013 I had urgently warned truth seekers not to be taken in by all of this emerging nonsense and came under a great deal of criticism from many good folks who were fervent believers in the theory that no children had died and that the stories told by surviving Sandy Hook teachers (and children) were all lies.

The controversies surrounding Sandy Hook, the Boston Bombing, and "crisis actors" have largely been forgotten, only momentarily revived by the legal verdict against Alex Jones. But techniques that proved themselves very successful in smothering and defeating past challenges to establishment narratives may be deployed for similar

purposes against later ones.

During the 2016 election drive, John Podesta served as campaign chairman for Hillary Clinton and his personal email account was hacked, with the contents posted on Wikileaks. His correspondence suggested extremely nefarious activities among DC's political elites, with considerable evidence that this involved widespread pedophilia. Although totally ignored by the mainstream media, this "Pizzagate Scandal" became an enormous sensation in rightwing circles.

The almost hysterical response of the media and political establishments to these accusations suggested that they had considerable merit. As I later wrote:

> Around the same time that I first became familiar with the details of the Pizzagate controversy, the topic also started reaching the pages of my morning newspapers, but in an rather strange manner. Political stories began giving a sentence or two to the "Pizzagate hoax," describing it as a ridiculous right-wing "conspiracy theory" but excluding all relevant details. I had an eerie feeling that some unseen hand had suddenly flipped a switch causing the entire mainstream media to begin displaying identical brightly flashing neon signs declaring "Pizzagate Is False —Nothing To See There!" I couldn't recall any previous example of such a strange media reaction to some obscure Internet controversy.

Meanwhile, a wave of severe media repression began. Youtube first broke its longstanding tradition of non-censorship by purging the extremely popular videos presenting the Pizzagate evidence, while an award-winning *CBS* journalist who aired a story on the scandal was immediately fired.

A couple of years later, I recounted these events in the context of the unfolding Jeffrey Epstein scandal and other shocking revelations regarding America's political elites, drawing upon the major Pizzagate articles our website had previously published:

Words

Seen with the benefit of hindsight, the suppressive response of the establishment may have followed two separate but parallel tracks.

On the one hand, an unprecedented degree of Internet censorship was soon applied, with the previously reigning free speech policies on social media completely reversed in order to choke off any attempts to discuss the scandal or present the evidence to a broader audience.

But at the same time, a somewhat related version of those same ideas appeared on the Internet in late 2017, based upon the alleged disclosures of an anonymous high-level pro-Trump government official styling himself "Q."

The QAnon Movement he launched soon incorporated those original political pedophilia accusations into a huge mass of other bizarre theories and conspiratorial beliefs, many of them utterly absurd but still wildly popular among grassroots pro-Trump activists and members of the conspiracy community. This resulting QAnon activism dominated much of the populist rightwing political landscape for the next couple of years, only fading away in the aftermath of Trump's removal from the White House.

Thus, while efforts to investigate the very real evidence behind the original Pizzagate accusations were entirely suppressed, a somewhat similar movement covering somewhat similar issues suddenly appeared and rapidly grew, absorbing the energy of potential activists but laced with such ridiculous elements that it severely discredited all related ideas. Although I paid little attention to QAnon at the time, this twin-track process may have constituted a classic example of the political strategy originally proposed by Sunstein and later described by Piper.

Finally, I noted the eerie parallels I encountered regarding the Covid epidemic. As I wrote in July 2021:

> There is no evidence that Sunstein himself ever attempted to implement that project, nor did he pioneer the idea. Such an approach was hardly new, and J. Edgar Hoover's notorious Cointelpro program of the late 1950s and 1960s had used quite similar methods, though the FBI had targeted real-life activist organizations rather than any non-existent online communities of those pre-Internet days. Indeed, the use of agents provocateurs

has always been a standard operating technique of domestic intelligence services. But we should keep these obvious tactics in mind as we consider the vast profusion of diverse conspiratorial theories that have sprung up like mushrooms in the wake of the global Covid epidemic and the severe stresses that it imposed on the ordinary lives of so many Americans.

Many, perhaps most individuals are quite reluctant to embrace any theory not blessed by their personal figures of authority, whether these be the editors of the *New York Times* or the pundits of *FoxNews*. Only a small minority of the population is willing to cross such ideological boundaries and risk the stinging epithet of being labeled "a conspiracy theorist."

Transgressive individuals who adhere to some heterodox beliefs are also usually willing to accept many others as well, and are often quite eager to do so, sometimes exhibiting the troubling lack of logical thinking and careful analytical judgment that may taint their entire community. This leaves them open to eagerly nibbling the poisoned bait of fraudulent but attractive theories, whether these are advanced by well-meaning advocates, self-serving charlatans, or covert agents of the establishment engaged in "cognitive infiltration." The vast profusion of unorthodox Covid theories, heavily promoted in videos, Tweets, and websites, may derive from all three of these different sources.

Some individuals have claimed that Covid does not exist, or that it is almost harmless, being little more dangerous than the ordinary flu, with our alleged death-toll merely a product of fraud and media propaganda. Others have taken this notion even further, arguing that viruses in general do not exist. Such sentiments have been all too annoyingly frequent on the very lightly moderated comment-threads of this website…

Not having devoted much time to these matters, I can only say that a great deal of the agitated commentary on this subject appears outlandish and implausible. Many activists seem to assume a unified worldwide conspiracy involving China, America, Russia, Israel, Iran, and virtually every other nation, all secretly working together to pretend that Covid is dangerous and that the vaccines against it are not, even though the truth is exactly the reverse. But the notion of all these mutually-hostile countries collaborating in such a bizarre scheme seems extremely unlikely, and Russian President Vladimir Putin recently made exactly this important point in his long annual presentation to his concerned

citizens:

> I heard: that there is nothing at all, in reality there is no epidemic. When you tell them that this is happening all over the world, they reply: "Right, country leaders have come into collusion." Do they have any idea of what is happening in the world, of the contradictions that are plaguing today's world, where all leaders allegedly upped and conspired with each other? It is absolute rubbish.

Particularly absurd has been the cast of primary villains for many of these agitated activists, who often focus upon Klaus Schwab of the World Economic Forum and Microsoft founder Bill Gates as the diabolical masterminds of our global calamity, with their plot identified as "the Great Reset." A couple of months ago I addressed some of these claims in one of my comments:

I'll admit that the whole Great Reset/Agenda 2021/World Economic Forum stuff has always seemed like total crackpottery to me, so ridiculous that I never looked into it other than sometimes reading some of the articles or discussion on my own website. I also put all the "Bill Gates' diabolical plot to exterminate mankind" stuff in pretty much the same category.

My very strong suspicion is that these sorts of (in my opinion) implausible and ridiculous "conspiracy theories" are probably promoted to divert attention from the very real and strong evidence of Covid-19 having been an American biowarfare attack. After all, wouldn't the CIA or whomever prefer that agitated activists on the Internet spend all their time ranting about some 83-year-old Swiss international banker named Klaus Schwab who holds annual public conferences in Davos rather than paying attention to all the numerous pieces of evidence I've accumulated implicating America's national security apparatus in the gigantic global disaster?

In fact, didn't that Cass Sunstein fellow years ago say that the using "cognitive infiltration" to promote ridiculous nonsense was the best means of defeating "conspiracy theorists" on the Internet? It worked pretty well for 9/11, so why not apply it to Covid-19 as well?

I'd be the first to admit that various groups and individuals are certainly taking advantage of the viral epidemic, notably getting the Federal Reserve to spend many trillions of dollars bailing out

> their businesses and loans, and massively boosting their stock prices. But after the 2008 Financial Meltdown, they used their political power to loot the American Treasury in exactly the same way and got a huge government bailout without the need for any disease outbreak. So I doubt they created Covid-19 for that purpose.
>
> Most recently, Dr. Anthony Fauci of our NIH has become demonized as a particular target, partly because he had already been hated by many activists for his association with our unpopular lockdowns and other measures to control the epidemic.

When I wrote those words over a year ago, most of those challenging the mainstream narrative of the Covid epidemic were focused on the disease itself, claiming that it wasn't dangerous or could easily be treated or didn't even exist.

But soon afterwards, the vaccination issue became dominant, with anti-vaxxing sentiments crowding out almost every other issue in anti-establishment circles, especially among those open to conspiratorial notions. I've regularly challenged these ideas, drawing ferocious hostility as a consequence, much like Piper had received when he disputed the Alex Jones narrative of Sandy Hook.

- Are the Opponents of the Covid Injections "Anti-Vaxx Crackpots"?

Having now reread some of Piper's account of how "cognitive infiltration" may have been used to severely damage the conspiracy-investigation community by sending so many of its activists down blind alleys, the parallels with recent events seemed quite remarkable. Indeed, I think that many of the same individuals who six or seven years ago were obsessed with "crisis actors" have now become equally obsessed with the diabolical vaccination plots of Klaus Schwab or Bill Gates. People have a limited attention-span, and if

they are preoccupied with certain issues they cannot pay much attention to others. As I recently explained:

Consider that according to the official narrative, Covid has now killed at least 15 million people around the world, including more than a million Americans, an unprecedented global public health disaster.

Meanwhile, for well over two years, there's been almost overwhelming evidence that the Covid outbreak was due to an American biowarfare attack against China (and Iran), just as the Iranians had claimed at the time.

All of the very considerable evidence of American guilt was available in the establishment MSM, and therefore could not easily be denied.

- Covid/Biowarfare Series
  Ron Unz • ***The Unz Review*** • April 2020-December 2021 • 60,000 Words

> So how to conceal these remarkable facts? So long as the MSM itself avoided connecting the dots or considering obvious, logical possibilities, most "respectable" people would never entertain the idea. But there also exist many thousands of determined conspiracy-activists, who are always looking for suspicious examples of governmental criminality, and how could they be diverted? More than a dozen years ago Obama official Cass Sunstein had famously suggested that the best way to defeat "conspiracy theorists" was to have the government or its allies actively promote a wide range of their own conspiratorial theories, especially ridiculous ones, thereby contaminating and discrediting the plausible accusations that they actually feared.
>
> When a mysterious, dangerous virus suddenly struck both China and Iran at the peak of American international hostility toward those countries, the most obvious possibility could best be concealed by releasing a swarm of other theories, mutually contradictory though they might be. Perhaps a Chinese lab accidentally leaked a Covid virus bioweapon or Covid doesn't exist or viruses don't exist or Covid isn't dangerous or Covid vaccines are part of a diabolical plot by Bill Gates to exterminate most of the human race. And sure enough, that plethora of competing conspiratorial notions has completely absorbed the attention of nearly all those conspiratorially-minded individuals who fall outside the ideological mainstream.

> As a result, for more than two years social media and podcasts have been awash with almost every possible permutation of Covid conspiracy or anti-vaxxing belief. Yet earlier this year when I began doing video interviews with alternative podcasters presenting the very considerable evidence of an American biowarfare attack, I was surprised to discover that most of them had never previously encountered that obvious scenario.

However, once obvious ideas about such massively matters are suddenly made available for the first time, they may attract large audiences, and my presentations on Rumble have now been viewed well over 900,000 times, including more than 400,000 views since the beginning of July. And just a few days ago, the Russian Defense Ministry publicly suggested that the American government had been directly responsible for the emergence of Covid.

Perhaps at some point, additional writers or podcasters in the alternative media will finally become willing to discuss this important possibility.

# Of Pipelines and Plagues

***The Unz Review*** • October 3, 2022 • 3,900 Words

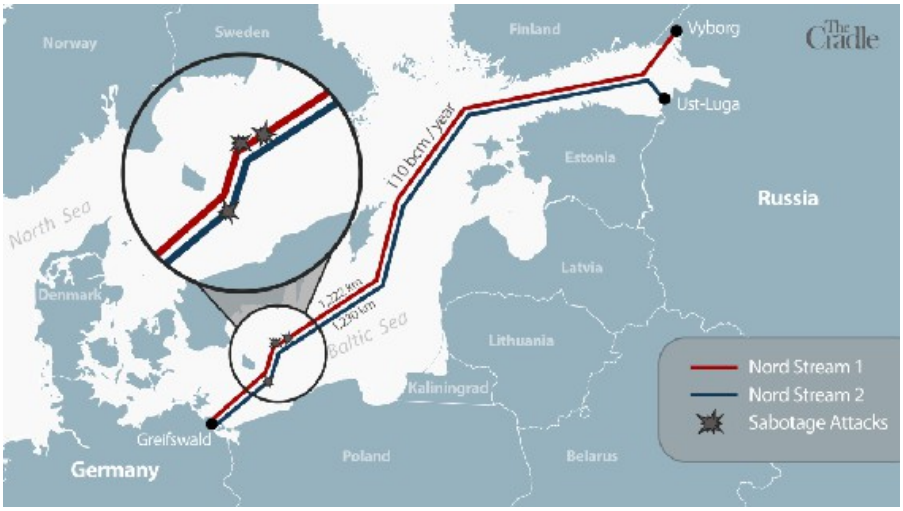
Europe is facing its worst energy crisis in generations, with numerous factories shutting down and severe hardship expected during the approaching winter. Heavily-industrialized Germany has been especially hard hit, with more than half of all small- and mid-sized businesses fearful that they might be forced to close, an economic catastrophe of Great Depression proportions. The only near-term hope of salvation had been an end to the self-destructive energy sanctions these countries had imposed upon Russia, which would have allowed plentiful and cheap Russian natural gas to resume flowing through the Russian-owned Nord Stream pipelines.

Although the European governments remained firmly opposed to that solution, many ordinary Europeans felt differently, and in recent days large public demonstrations in Germany and the Czech Republic had demanded that the sanctions be lifted. There was widespread speculation that such popular protests would eventually carry the day, if not immediately then once winter hardship became too severe. The outcome would be a negotiated end to the Ukraine war along the general lines suggested by Russia, resulting in a strategic defeat for America and NATO.

> Thousands of people in Gera in Germany against Olaf Scholz's policy and the explosion of energy and gas prices. They demand an end to sanctions on Russia and the reopening of the Nord Stream 2 gas pipeline. Demonstrations also in other German cities but EU media censors them. pic.twitter.com/dmTMLY11jn
>
> — RadioGenova (@RadioGenova) September 26, 2022

Then on September 26th, this geopolitical landscape was upended as a series of large explosions severely damaged the huge Russian pipelines, putting them out of commission indefinitely, probably even permanently. With the pipelines no longer operational, Europe would have to make due with the limited supply of American gas that can be shipped by tanker, at a cost many times greater. The massive explosive attacks on the undersea pipelines—rather euphemistically characterized as “sabotage” in the media headlines—had occurred near the coastal waters of Denmark and Sweden, in an area of the

Baltic heavily monitored and patrolled by NATO warships.



Given these simple, undeniable facts, the likely suspects were rather obvious, but they still remained almost completely unmentionable in the Western media coverage. Instead, the *Washington Post*, hometown newspaper of the American government, ran an article with the headline "European leaders blame Russian 'sabotage' after Nord Stream explosions," quoting a long list of anonymous government sources making that nonsensical claim, which was widely echoed across most Western media outlets. Our political elites apparently assumed that their tight media control will ensure that their ignorant citizenry could be made to believe—or at least pretend to believe—almost anything, even that the Russians had destroyed their own pipelines.

But public media statements do not necessarily reflect private beliefs. Prominent Neocon journalist Anne Applebaum had spent years on the Editorial Board of the *Washington Post* and her husband is Radek Sikorski, Poland's former Foreign and Defense Minister and someone with the strongest possible ties to the America's political and national security establishment. Twitter allows individuals to casually blurt out statements that they may later regret, and the day after the pipeline explosions he issued a series of Tweets celebrating the attacks, including one showing a photo of the resulting destruction with the telling caption "Thank You, USA." That last Tweet soon went super-viral with some 13,500 Retweets and 44,200 Likes, leading him to quickly delete it.

Someone else on Twitter shrewdly described that desperate back-peddling:

> After the US destroyed the pipelines there was radio silence as the regime was trying to determine their narrative. This delay caused a Polish official to publicly thank the US for the attack.
>
> Then word went out yesterday to deny the attack. The NATO propaganda bots are out. pic.twitter.com/RboCLPTkBy
>
> — RAMZPAUL (@ramzpaul) September 29, 2022

Given the near-unanimous media drumbeat that the Russians had destroyed their own multi-billion-dollar pipelines, presumably because

of their evil insanity, it's quite possible that a majority, perhaps even a large majority of our citizens will blandly accept that story, just as they have so many other, equally ridiculous concoctions of the past. But I would think that nearly all our elites who are paying any attention to the issue strongly suspect or even flatly assume that elements of the American government played a central role in the attacks, though almost none of them would publicly admit such a thing.

One of the tiny handful of brave exceptions to this enforced silence and perhaps the only such individual with a large media platform was Tucker Carlson, and a couple of days after the attack, he broadcast a segment on the topic to his audience of millions. He noted that although it might seem unimaginable that the American government would commit such an act of international terrorism as illegally destroying pipelines so important to Europe's industrial economy, perhaps that might be what actually happened.

Among other things, he showed clips of both President Joe Biden and Assistant Secretary of State Victoria Nuland explicitly threatening to eliminate the Nord Stream pipelines if a Russia-Ukraine broke out.

> BIDEN admits US behind sabotage of Nordstream 1 and 2.
>
> Biden: "If Russia invades…then there will be no longer a Nord

> Stream 2."
>
> Reporter: "But how will you do that, it's in germany's control?"
>
> Biden: "I promise you, we will be able to do that."
> pic.twitter.com/idlxQYuAqU
>
> — Syrian Girl ?????? (@Partisangirl) September 27, 2022

> Victoria Nuland: “If Russia invades Ukraine, one way or another, Nord Stream 2 will not move forward”
>
> Also this is the same Victoria Nuland who said fuck the EU, and she sure did it to you Germany.#NordStream2 #Nordstream #Nordstream1pic.twitter.com/GGMzrSbwT7
>
> — Syrian Girl ?????? (@Partisangirl) September 28, 2022

And immediately following the attacks, Secretary of State Antony Blinken mentioned that the bombing would greatly benefit American interests, offering our country “tremendous strategic opportunity for the years to come.”

> According to @SecBlinken, the Nord Stream pipeline bombing "offers tremendous strategic opportunity for the years to come." Too bad that this tremendous opportunity for DC bureaucrats will come at the expense of everyone else, especially this coming winter. pic.twitter.com/T2eacQUuBF
>
> — Aaron Maté (@aaronjmate) October 1, 2022

Despite his past public statements, I tend to doubt that Biden himself had played any role in the decision-making process, or that he was even personally informed of the planned attack. He is merely a figurehead, an elderly non-entity who generally says whatever he is told to say, but he has also become notorious for making public statements that his horrified subordinates must immediately “clarify” and that would have been an obvious risk in this situation. So to the extent that our President is even aware that Europe’s largest energy pipelines were attacked and severely damaged, it’s quite possible that he is in that small minority of high-ranking individuals who has no idea of who may have been responsible or even blames it on the Russians, because his handlers have told him so.

The vacuum left by an almost entirely dishonest or timorous media has been filled by a handful of courageous independent bloggers, with *Moon of Alabama* and John Helmer probably providing some of the best early analysis of what had probably happened:

- The War On Germany Just Entered Its Hot Phase
  ***Moon of Alabama*** • September 27, 2022 • 1,200 Words
- The Bornholm Blow-Up Repeats the Bornholm Bash—Poland Attacks Germany and Blames Russia
  John Helmer • ***Dances With Bears*** • September 27, 2022 • 1,900 Words
- Whodunnit? – Facts Related to The Sabotage Attack On The Nord Stream Pipelines
  ***Moon of Alabama*** • September 28, 2022 • 2,600 Words

The particular details of the attacks have relatively little importance and the early speculation has gone in several directions. The theory advanced by Helmer, a longtime American correspondent based in Moscow, is that the actual operation was carried out by Polish forces with America's intelligence and technical support. This seems quite plausible since Poland has been fiercely hostile to Russia and the Russian pipelines, which would annually cost the country many hundreds of millions of dollars in lost future pipeline transit fees. The Poles had made every possible effort to block the Nord Stream project and Poland's nearby coast would provide an ideal staging ground for the attack. Moreover, by an astonishing coincidence, the attack occurred exactly as Poland had opened a much smaller pipeline, allowing it to supply its own energy needs from Norway, completely independent of Nord Stream.

But whether or not the operation was carried out by Polish proxies or even Ukrainians, those local allies are totally dependent upon our goodwill for their survival, and it is inconceivable that they would have taken this momentous step without the approval and supervision of powerful elements of the American national security establishment, so debating who actually planted the explosives is merely a red herring.

Despite the lack of any hard evidence, the likelihood that America played a central role in the attacks seems a near-certainty. Means, motive, and opportunity all point so strongly in a single direction that I doubt that there are too many rational, intelligent individuals who sincerely believe otherwise, although for obvious reasons they

may mouth deceptive evasions or choose to keep silent. Yet virtually no one in the major media is willing to recognize this obvious reality.

And this disingenuous reaction has even extended to large segments of the supposedly fearless alternative media. Although these enormously important attacks reached the front pages of the *New York Times* and the *Wall Street Journal*, not a word about them appeared in *Counterpunch*, the *Nation*, or the *New Republic*, and barely any mention at *Antiwar.com*, presumably for fear that their pieces would necessarily have to mention the prime suspect. Various Internet pundits have promoted the most absurd alternate possibilities in order to avoid fingering the American government. This widespread "See No Evil" response is illustrated by a popular Internet meme:

Let us step back and place this incident in its proper historical context, recognizing the astonishing recklessness. We are not currently at war with Russia let alone Germany, and a $20 billion energy project important to both those countries has been wrecked, with a

potentially devastating impact upon the European economy. Not only is this probably the greatest peacetime military attack upon civilian infrastructure in world history, but if we exclude the 9/11 attacks—officially ascribed to a non-state terrorist organization—nothing even remotely comparable comes to mind.

Consider the obvious possibility of retaliation. Russia possesses a very powerful and sophisticated military with excellent special forces, and the West's own energy infrastructure is woefully vulnerable and unprotected. Moreover, our heavily financialized economy might collapse like a house of cards if it were struck a tiny blow in the right location, with Tucker Carlson noting that if Russia merely cut the transatlantic fiber-optic cables connecting financial markets in the US and Europe, Wall Street would suffer gigantic losses.

But I think the greatest risk our country faces is an automatic consequence of our attacks on Europe's critical energy infrastructure even absent any significant Russian reprisals.

If Germany and the rest of Europe undergo an economic collapse, the American economy can hardly avoid severe damage as well, but I think the more important impact will be upon the longer-term geopolitical alignment of that continent. Europeans will suffer greatly this winter and despite the solid wall of media propaganda, more and more of them may begin to recognize the architect of their distress.

For nearly three generations, our NATO allies have constituted a crucial element of America's global military and economic power, and if they see their repayment as being a treacherous, criminal attack with devastating consequences, they may eventually decide to shift their allegiance in a different direction. The hashtag #Kriegserklaerung—"declaration of war"—was recently trending for several days on Twitter, with numerous Germans saying that America had declared war against their country. Overwhelming control over electronic and social media represents a powerful brain-washing tool, but at some point its effectiveness may be overwhelmed by miserable reality. The old Soviet Union never inflicted such deliberate suffering upon its Warsaw Pact vassals and that alliance collapsed in 1989, so if some of the more dismal economic predictions for Europe are realized, I wonder if NATO will long survive.

From a broader perspective, industrialized Germany and resource-rich Russia are natural trading partners, and as Mike Whitney so presciently argued back in February, much of America's recent European strategy has been aimed at blocking their growing economic

ties. Our destruction of the Nord Stream pipelines may have temporarily prevented any immediate German defection, but the bitterness we will have earned may be even more significant in the future. If Germany shifted its political ties eastward, America's power in Europe would be shattered, and German voters do have a say in such matters, especially if they begin to suffer Depression-like conditions in the next few months.

The establishment of a full-fledged Russian-German alliance would completely reshape the geopolitics of Eurasia, but I suspect that our ignorant government leaders would dismiss such a possibility as an absurd fantasy given what they imagine is the deep traditional hostility between those two populations. However, as I explained a few years ago, this is completely incorrect, being based upon an extremely skewed misreading of European history:

> In my unjustified arrogance, I also sometimes relished a sense of seeing obvious things that magazine or newspaper journalists got so completely wrong, mistakes which often slipped into historical narratives as well. For example, discussions of the titanic 20th century military struggles between Germany and Russia quite often made casual references to the traditional hostility between those two great peoples, who for centuries had stood as bitter rivals, representing the eternal struggle of Slav against Teuton for dominion over Eastern Europe.
>
> Although the bloodstained history of the two world wars made that notion seem obvious, it was factually mistaken. Prior to 1914, those two nationalities had not fought against each other for the previous 150 years, and even the Seven Years' War of the mid-18th century had involved a Russian alliance with Germanic Austria against Germanic Prussia, hardly amounting to a conflict along civilizational lines. Russians and Germans had been staunch allies during the endless Napoleonic wars and closely cooperated during the Metternich and Bismarck eras that followed, while even as late as 1904, Germany had supported Russia in its unsuccessful war against Japan. During the 1920s, Weimar Germany and Soviet Russia had a period of close military cooperation, the Hitler-Stalin Pact of 1939 marked the beginning of the Second World War, and throughout the long Cold War, the USSR had no more loyal a satellite than East Germany. Perhaps two dozen years of hostility over the last three centuries, with good relations or even outright alliance during most of the remainder, hardly suggested that Russians and Germans were hereditary enemies.

> Moreover, during much of that period, Russia's ruling elite had had a considerable Germanic tinge. Russia's legendary Catherine the Great had been a German princess by birth, and over the centuries so many Russian rulers had taken German wives that the later Czars of the Romanov dynasty were usually more German than Russian. Russia itself had a substantial but heavily assimilated German population, which was very well represented in elite political circles, with German names being quite common among government ministers and sometimes found among important military commanders. Even a top leader of the Decembrist revolt of the early 19th century had had German ancestry but was a zealous Russian-nationalist in his ideology.

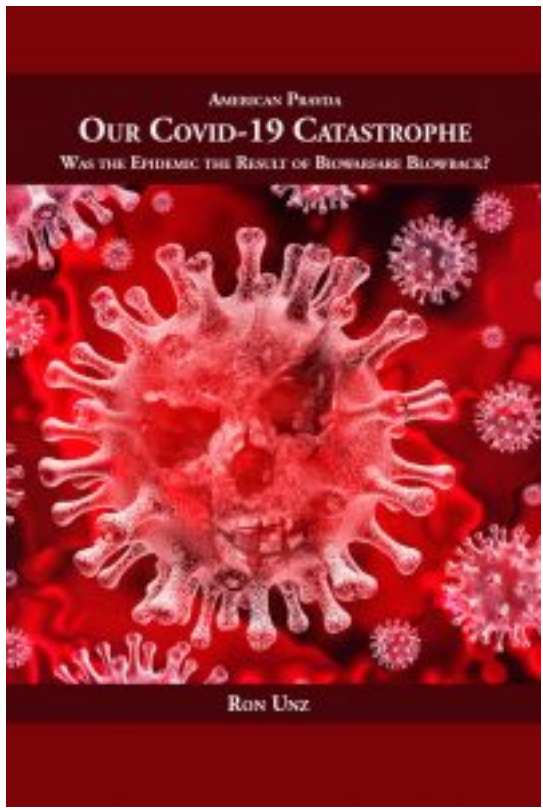
If the looming economic calamity does eventually shift Germany to a Russian alliance, the American attacks on the Nord Stream pipelines will be remembered as the blow that altered the entire trajectory of global politics.

To this point, most readers will probably be nodding their heads at the factual observations I have made even if they doubt some of the suggested possible consequences. Perhaps America's destruction of Europe's energy pipelines and the resulting economic devastation of Germany will lead to a permanent rupture in the Western alliance, or perhaps not; the future is difficult to predict.

But although there is not a single shred of hard evidence indicating American involvement, the circumstantial case is so overwhelmingly strong that no sensible person can come to any other conclusion. Whether or not we acted through local proxies, our government was clearly responsible for the destruction of Europe's most important energy infrastructure, an act of absolutely colossal criminality and recklessness, which may have enormously negative consequences for our own national interests. Virtually all Western mainstream media outlets and many alternative ones may scrupulously avoid this reality and paid propagandists may energetically dispute it, but it remains the obvious truth.

And here's the rub. This entire scenario seems remarkably similar to another that I have advanced over the last couple of years on an entirely different topic. Beginning in April 2020, I have published a long series of articles arguing that the global Covid epidemic was the result of an American biowarfare attack against China (and Iran).

Just as with President Biden, Donald Trump himself was similarly out of the loop, but the attack was probably orchestrated by top figures in his administration, who immediately tried (somewhat successfully) to blame the Chinese for the viral epidemic that began in their own country. Once again, virtually all of the relevant facts have been ignored by the Western media, but can easily be found and connected together. And once again, the weight of circumstantial evidence seems overwhelming, indeed in many respects far stronger than that for the pipeline attacks.



EPub Format • Mobi/Kindle

During the thirty months I have been making this case, the only strong argument ever presented against it was the claim that not even rogue elements of the Trump administration could have been so reckless as to launch a biowarfare attack, an attack whose unintended blowback eventually killed over a million Americans and disrupted the lives of billions worldwide. But our destruction of Europe's most crucial energy infrastructure demonstrates the true depths of the criminal recklessness sometimes found in the American government.

Once individuals have fully absorbed the broader implications of the

Nord Stream attacks, including the widespread but ridiculous media claims that the Russians destroyed their own pipelines, they should reassess their assumptions regarding American governmental behavior and also reexamine the circumstances of the Covid outbreak with a fresh eye.

In particular, they should note the strikingly clear evidence of American foreknowledge of the outbreak, which can be summarized in just a few hundred words:

> For example, in 2017 Trump brought in Robert Kadlec, who since the 1990s had been one of America's leading biowarfare advocates. The following year in 2018 a mysterious viral epidemic hit China's poultry industry and in 2019, another mysterious viral epidemic devastated China's pork industry…
>
> From the earliest days of the administration, leading Trump officials had regarded China as America's most formidable geopolitical adversary, and orchestrated a policy of confrontation. Then from January to August 2019, Kadlec's department ran the "Crimson Contagion" simulation exercise, involving the hypothetical outbreak of a dangerous respiratory viral disease in China, which eventually spreads into the United States, with the participants focusing on the necessary measures to control it in this country. As one of America's foremost biowarfare experts, Kadlec had emphasized the unique effectiveness of bioweapons as far back as the late 1990s and we must commend him for his considerable prescience in having organized a major viral epidemic exercise in 2019 that was so remarkably similar to what actually began in the real world just a few months later.
>
> With leading Trump officials greatly enamored of biowarfare, fiercely hostile to China, and running large-scale 2019 simulations on the consequences of a mysterious viral outbreak in that country, it seems entirely unreasonable to completely disregard the possibility that such extremely reckless plans may have been privately discussed and eventually implemented, though probably without presidential authorization.
>
> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense

Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

According to these multiply-sourced mainstream media accounts, by “the second week of November” our Defense Intelligence Agency was already preparing a secret report warning of a

> "cataclysmic" disease outbreak taking place in Wuhan. Yet at that point, probably no more than a couple of dozen individuals had been infected in that city of 11 million, with few of those yet having any serious symptoms. The implications are rather obvious. Furthermore:
>
> As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hated Iranian enemies were now dropping like flies.
>
> Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?
>
> The Iranians themselves were well aware of these facts, and their top political and military leaders publicly accused America of an illegal biowarfare attack against their own country and China, with their former president even filing an official protest with the United Nations. But although these explosive charges were widely reported in the Iranian press, they were completely ignored by the American media so that almost no Americans ever became aware of them.

# World War III and World War II?

***The Unz Review*** • October 24, 2022 • 4,700 Words

Every now and then, I rediscover the vastness of the Internet.

All this year I'd been quite interested in our conflict with Russia over Ukraine and I'd also begun separately following the public statements of Prof. Jeffrey Sachs of Columbia University, but until last week I hadn't noticed his late August interview on exactly that subject. Although his appearance on Amy Goodman's *Democracy Now!* show had accumulated more than two million views, I'd never come across it.

I'd highly recommend listening to his remarks, as well as his similar presentations from earlier this month at the *Grayzone* and on Tulsi Gabbard's new show.

Sachs has spent decades as an elite government insider, whose important and controversial role in Russia began in the early 1990s, so his views on our current predicament should be taken with the utmost seriousness.  And they are stark.

As he explains it, America and its NATO allies are currently at war with nuclear-armed Russia on Russia's own border.  Although for now the actual fighting on the ground has been left to our Ukrainian proxies, we are providing all the other military elements—weapons,

ammunition, funding, training, intelligence, and coordination—as well as contributing some of the actual combatants. During our long Cold War against the Soviets, such a scenario would have been considered the stuff of nightmares, but it is now the deliberate goal of the American government. The Tulsi Gabbard interview is appropriately entitled "Russia, Ukraine and Preventing Nuclear Holocaust."

Sachs himself was born in 1954, so he had been a child during the terrifying days of the Cuban Missile Crisis, and that instance of nuclear brinksmanship naturally dominates his thoughts when he considers our current confrontation with Russia. He notes how close the world came to destruction in 1962, saved only by the caution of President John F. Kennedy. Such sentiments are utterly different than those animating today's Neocon-dominated Biden Administration, which seems eager to escalate the conflict and recently spent days casually discussing the use of nuclear weapons against our Russian adversary.

Understanding the past better allows us to assess our current circumstances. But except for the risk of nuclear war, I think that today's situation is entirely different from that faced during Kennedy's presidency. In 1962, we almost blundered into a war with the Soviets, a conflict that neither side had actually sought, and our President managed to pull us back from the brink. But in our present confrontation, we have spent years deliberately provoking Russia, avoiding all attempts at achieving a diplomatic resolution and even torpedoing Russian-Ukrainian peace talks when they began in March. Today's war with Russia is not a mistake, but instead is almost entirely the result of intentional American policy.

Rather than pointing to the 1962 crisis as a model, many leading advocates of our current Ukraine strategy claim that the proper analogy to consider is that of the Second World War, waged against the wanton aggression of Hitler's Germany. Although Sachs, John Mearsheimer and other knowledgeable individuals have demonstrated that the historical facts are otherwise, nearly all American mainstream media accounts describe the Russian invasion of Ukraine as "completely unprovoked," often comparing it to the German attack on Poland that unleashed World War II. A couple of weeks after the war began, I published a long article arguing that the latter analogy was actually much more appropriate than many might realize, though not in the way usually understood by its current advocates.

- American Pravda: Putin as Hitler?
  Ron Unz • ***The Unz Review*** • March 7, 2022 • 7,900 Words

Early in my analysis, I had emphasized an important point:

> We should recognize that in many respects the standard historical narrative of World War II is merely a congealed version of the media propaganda of that era. If Russia were defeated and destroyed as a result of the current conflict, we can be sure that the subsequent history books would utterly demonize Putin and all the decisions that he had taken.

I explained:

> As most of us know, the Second World War began when Germany attacked Poland in 1939 over Danzig, an almost entirely German border city controlled by the Poles.
>
> But less well known is that Hitler had actually made enormous efforts to avoid war and settle that dispute, spending many months on fruitless negotiations and offering extremely reasonable terms. Indeed, the German dictator had made numerous concessions that none of his democratic Weimar predecessors had been willing to consider, but these were all rejected, while provocations increased until war with Poland seemed the only possible option. And just as in the case of Ukraine, politically influential elements in the West almost certainly sought to provoke that war, using Danzig as the spark to ignite the conflict much like the Donbass may have been used to force Putin's hand.

Prof. Sachs correctly points to our own government having done everything it could to goad the Russians into invading Ukraine, but over the last few years my careful investigation of the outbreak of World War II has led me to a very similar conclusion. If we consider the most reputable contemporaneous sources, we easily discover that the Roosevelt Administration played a central role in instigating the war and also its motive for doing so.

> During the 1930s, John T. Flynn was one of America's most influential progressive journalists, and although he had begun as a strong supporter of Roosevelt and his New Deal, he gradually became a sharp critic, concluding that FDR's various governmental schemes had failed to revive the American economy. Then in 1937 a new economic collapse spiked

unemployment back to the same levels as when the president had first entered office, confirming Flynn in his harsh verdict. And as I wrote last year:

> Indeed, Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after a top Roosevelt adviser had privately boasted to him that a large bout of "military Keynesianism" and a major war would cure the country's seemingly insurmountable economic problems. At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.
>
> The last point is an important one since the confidential opinions of those closest to important historical events should be accorded considerable evidentiary weight. In a recent article John Wear mustered the numerous contemporaneous assessments that implicated FDR as a pivotal figure in orchestrating the world war by his constant pressure upon the British political leadership, a policy that he privately even admitted could mean his impeachment if revealed. Among other testimony, we have the statements of the Polish and British ambassadors to Washington and the American ambassador to London, who also passed along the concurring opinion of Prime Minister Chamberlain himself. Indeed, the German capture and publication of secret Polish diplomatic documents in 1939 had already revealed much of this information, and William Henry Chamberlin confirmed their authenticity in his 1950 book. But since the mainstream media never reported any of this information, these facts remain little known even today.

During 2018 and 2019, I had discussed the origins of World War II and our entrance into that conflict in a couple of lengthy review

articles:

- American Pravda: Our Great Purge of the 1940s
  Ron Unz • ***The Unz Review*** • June 11, 2018 • 5,500 Words
- American Pravda: Understanding World War II
  Ron Unz • ***The Unz Review*** • September 23, 2019 • 20,500 Words

Once the war began, FDR's government sought to directly join it on the Allied side but was frustrated by overwhelming public opposition.

> Alarmed by their growing fear that America might be drawn into another world war without voters having had any say in the matter, a group of Yale Law students launched an anti-interventionist political organization that they named "The America First Committee," and it quickly grew to 800,000 members, becoming the largest grass-roots political organization in our national history. Numerous prominent public figures joined or supported it, with the chairman of Sears, Roebuck serving as its head, and its youthful members included future presidents John F. Kennedy and Gerald Ford as well as other notables such as Gore Vidal, Potter Stewart, and Sargent Schriver. Flynn served as chairman of the New York City chapter, and the organization's leading public spokesman was famed aviator Charles Lindbergh, who for decades had probably ranked as America's greatest national hero.
>
> Throughout 1941, enormous crowds across the country attended anti-war rallies addressed by Lindbergh and the other leaders, with many millions more listening to the radio broadcasts of the events. Mahl shows that British agents and their American supporters meanwhile continued their covert operations to counter this effort by organizing various political front-groups advocating American military involvement, and employing fair means or foul to neutralize their political opponents. Jewish individuals and organizations seem to have played an enormously disproportionate role in that effort.
>
> At the same time, the Roosevelt Administration escalated its undeclared war against German submarines and other naval forces in the Atlantic, unsuccessfully seeking to provoke an incident that might stampede the country into war. FDR also promoted the most bizarre and ridiculous propaganda inventions

aimed at terrifying naive Americans, such as claiming to have proof that the Germans—who possessed no large surface navy and were completely stymied by the English Channel—had formulated concrete plans to leap across two thousand miles of the Atlantic Ocean and seize control of Latin America. British agents supplied some of the crude forgeries he cited as evidence.

These facts, now firmly established by decades of scholarship, provide some necessary context to Lindbergh's famously controversial speech at an America First rally in September 1941. At that event, he charged that three groups in particular were "pressing this country toward war[:] the British, the Jewish, and the Roosevelt Administration," and thereby unleashed an enormous firestorm of media attacks and denunciations, including widespread accusations of anti-Semitism and Nazi sympathies. Given the realities of the political situation, Lindbergh's statement constituted a perfect illustration of Michael Kinsley's famous quip that "a gaffe is when a politician tells the truth 🡒 some obvious truth he isn't supposed to say." But as a consequence, Lindbergh's once-heroic reputation suffered enormous and permanent damage, with the campaign of vilification echoing for the remaining three decades of his life, and even well beyond. Although he was not entirely purged from public life, his standing was certainly never even remotely the same.

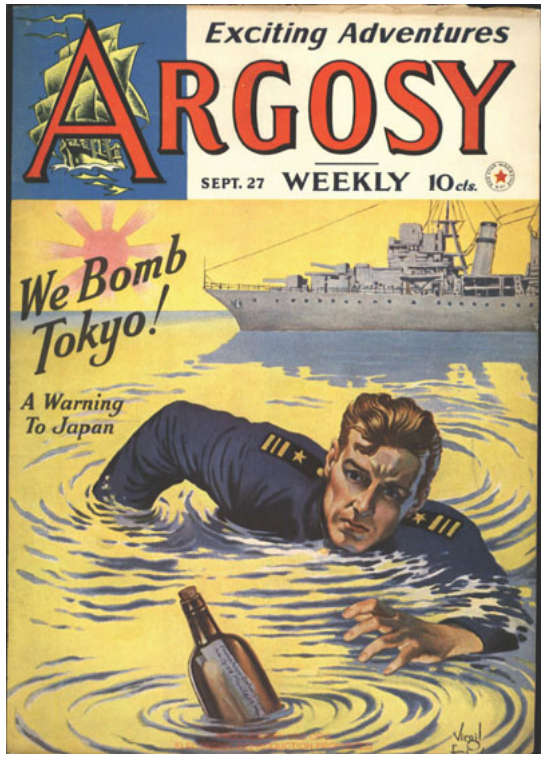
From 1940 onward, FDR had been making a great political effort to directly involve America in the war against Germany, but public opinion was overwhelmingly on the other side, with polls showing that up to 80% of the population were opposed. All of this immediately changed once the Japanese bombs dropped on Hawaii, and suddenly the country was at war.

Given these facts, there were natural suspicions that Roosevelt had deliberately provoked the attack by his executive decisions to freeze Japanese assets, embargo all shipments of vital fuel oil supplies, and rebuff the repeated requests by Tokyo leaders for negotiations. In the 1953 volume edited by Barnes, noted diplomatic historian Charles Tansill summarized his very strong case that FDR sought to use a Japanese attack as his best "back door to war" against Germany, an argument he had made the previous year in a book of that same name. Over the decades, the information contained in private diaries and government documents seems to have almost conclusively established this interpretation, with Secretary of War Henry Stimson indicating that the plan was to "maneuver [Japan] into firing the first

shot"…

> By 1941 the U.S. had broken all the Japanese diplomatic codes and was freely reading their secret communications. Therefore, there has also long existed the widespread if disputed belief that the president was well aware of the planned Japanese attack on our fleet and deliberately failed to warn his local commanders, thereby ensuring that the resulting heavy American losses would produce a vengeful nation united for war. Tansill and a former chief researcher for the Congressional investigating committee made this case in the same 1953 Barnes volume, and the following year a former US admiral published *The Final Secret of Pearl Harbor*, providing similar arguments at greater length. This book also included an introduction by one of America's highest-ranking World War II naval commanders, who fully endorsed the controversial theory.
>
> In 2000, journalist Robert M. Stinnett published a wealth of additional supporting evidence, based upon his eight years of archival research, which was discussed in a recent article. A telling point made by Stinnett is that if Washington had warned the Pearl Harbor commanders, their resulting defensive preparations would have been noticed by the local Japanese spies and relayed to the approaching task force; and with the element of surprise lost, the attack probably would have been aborted, thus frustrating all of FDR's long-standing plans for war. Although various details may be disputed, I find the evidence for Roosevelt's foreknowledge quite compelling.

This historical reconstruction is strongly supported by much additional material. During this period, Prof. Revilo P. Oliver had held a senior position in Military Intelligence, and when he published his memoirs four decades later, he claimed that FDR had deliberately tricked the Japanese into attacking Pearl Harbor. Knowing that Japan had broken Portugal's diplomatic codes, FDR informed the latter country's ambassador of his plans to wait until the Japanese had over-extended themselves, then order the Pacific Fleet to launch a devastating surprise attack against their home islands. According to Oliver, Japan's subsequent diplomatic cables revealed they had successfully been convinced that FDR planned to suddenly attack them.



Indeed, just a couple of months before Pearl Harbor, *Argosy Weekly*, one of America's most popular magazines, carried a fictional cover story describing exactly such a devastating surprise attack on Tokyo in retaliation for a naval incident, with the powerful bombers of our Pacific Fleet inflicting huge damage upon the unprepared Japanese capital. I wonder whether the Roosevelt Administration didn't have a hand in getting that story published.

As early as May 1940, FDR had ordered the Pacific Fleet relocated from its San Diego home port to Pearl Harbor in Hawaii, a decision strongly opposed as unnecessarily provocative and dangerous by James Richardson, its commanding admiral, who was fired as a result. Moreover:

> There was also a very strange domestic incident that immediately followed the Pearl Harbor attack, one which seems to have attracted far too little interest. In that era, films were the most powerful popular media, and although Gentiles constituted 97% of the population, they controlled only one of the major studios; perhaps coincidentally, Walt Disney was also the only high-ranking Hollywood figure perched squarely within the anti-war camp. And the day after the surprise Japanese attack, hundreds

> of U.S. troops seized control of Disney Studios, allegedly in order to help defend California from Japanese forces located thousands of miles away, with the military occupation continuing for the next eight months. Consider what suspicious minds might have thought if on September 12, 2001, President Bush had immediately ordered his military to seize the CBS network offices, claiming that such a step was necessary to help protect New York City against further Islamicist attacks.

Pearl Harbor was bombed on a Sunday and unless FDR and his top aides were fully aware of the pending Japanese assault, they surely would have been totally preoccupied with the aftermath of the disaster. It seems highly unlikely that the U.S. military would have been ready to seize control of Disney studios early Monday morning following an actual "surprise" attack.

Just as America had made every effort to provoke a war with Japan in 1941, we seem to be following a similar playbook these days with regard to China. As I wrote earlier this year:

> Prior to the outbreak of the Ukraine war, America had spent years primarily focusing its hostility against China, forming a military alliance against that country, deploying sanctions to cripple Huawei, China's global technological champion, and working to ruin the Beijing Olympics, while also drawing very near to the red-line of actively promoting Taiwanese independence. I have even argued that there is strong perhaps overwhelming evidence that the Covid outbreak in Wuhan was probably the result of a biowarfare attack by rogue elements of the Trump Administration.

These extremely provocative actions under Trump have only accelerated after he left office, including Speaker Nancy Pelosi's inflammatory official visit to Taiwan a couple of months ago. Then last week, the Biden Administration declared its intent to totally cripple China's vital domestic microchip industry, issuing new regulations banning all American citizens from any involvement and extending that restriction to all other global companies doing business with Chinese manufacturers. This unprecedented action has been characterized as a sudden "thermonuclear attack" against a vital Chinese industry:

- Biden's Tech-War Goes Nuclear

Mike Whitney • ***The Unz Review*** • October 17, 2022 • 1,900 Words

As Prof. Sachs emphasized in his late August discussion, we seem to be deliberately provoking a simultaneous confrontation with both Russia and China on issues that they regard as vital to their national security interests.

It might seem utterly irrational for America to force those two world powers into a direct alliance against us, but I suspect that our political elites have become intoxicated from their misreading of American history, including the World War II example they so regularly cite. As I explained soon after the outbreak of the Ukraine War.

> For more than a hundred years, all of America's many wars have been fought against totally outmatched adversaries, opponents that possessed merely a fraction of the human, industrial, and natural resources that we and our allies controlled. This massive advantage regularly compensated for many of our serious early mistakes in those conflicts. So the main difficulty our elected leaders faced was merely persuading the often very reluctant American citizenry to support a war, which is why many historians have alleged that such incidents as the sinkings of Maine and the Lusitania, and the attacks in Pearl Harbor and Tonkin Bay were orchestrated or manipulated for exactly that purpose.
>
> This huge advantage in potential power was certainly the case when World War II broke out in Europe, and Schultze-Rhonof and others have emphasized that the British and French empires backed by America commanded potential military resources vastly superior to those of Germany, a mid-size country smaller than Texas. The surprise was that despite such overwhelming odds Germany proved highly successful for several years, before finally going down to defeat…
>
> Consider the attitude taken during the current conflict with Russia, a severe Cold War confrontation that might conceivably turn hot. Despite its great military strength and enormous nuclear arsenal, Russia seems just as out-matched as any past American foe. Including the NATO countries and Japan, the American alliance commands a 6-to-1 advantage in population and 12-to-1 superiority in economic product, the key sinews of international power. Such an enormous disparity is implicit in the attitudes of our strategic planners and their media mouthpieces.

> But this is a very unrealistic view of the true correlation of forces…just two weeks before the Russian attack on Ukraine, Putin and Chinese leader Xi Jinping held their 39th personal meeting in Beijing and declared that their partnership had "no limits." China will certainly support Russia in any global conflict.
>
> Meanwhile, America's endless attacks and vilification of Iran have gone on for decades, culminating in our assassination two years ago of the country's top military commander, Qasem Soleimani, who had been mentioned as a leading candidate in Iran's 2021 presidential elections. Together with our Israeli ally, we have also assassinated many of Iran's top scientists over the last decade, and in 2020 Iran publicly accused America of having unleashed the Covid biowarfare weapon against their country, which infected much of their parliament and killed many members of their political elite. Iran would certainly side with Russia as well.
>
> America, together with its NATO allies and Japan, does possess huge superiority in any test of global power against Russia alone. However, that would not be the case against a coalition consisting of Russia, China, and Iran, and indeed I think the latter group might actually have the upper hand, given its enormous weight of population, natural resources, and industrial strength.
>
> Since the fall of the Soviet Union in 1991, America has enjoyed a unipolar moment, reigning as the world's sole hyperpower. But this status has fostered our overweening arrogance and international aggression against far weaker targets, finally leading to the creation of a powerful block of states willing to stand up against us.

I wrote those words just two weeks after the war began, and as is inevitable in any conflict, various matters have gone differently than anyone originally predicted.

The Russians had been widely expected to sweep the Ukrainians before them, but instead they have encountered very determined resistance, suffering heavy casualties as they made slow progress. Generously resupplied with advanced weaponry from NATO stockpiles, the Ukrainians recently launched successful counter-attacks, forcing Russian President Vladimir Putin to call up 300,000 reserves.

But although Russia's military efforts have only been partially successful, on all other fronts, America and its allies have suffered a series of strategic geopolitical defeats.

At the start of the war, most observers believed that the unprecedented sanctions imposed by America and its NATO allies would deal a crippling blow to the Russian economy. Instead, Russia has escaped any serious damage, while the loss of cheap Russian energy has devastated the European economies and severely hurt our own, resulting in the highest inflation rates in forty years. The Russian Ruble was expected to collapse, but is now stronger than it was before.

Germany is the industrial engine of Europe and the sanctions imposed on Russia were so self-destructive that popular protests began demanding that they be lifted and the Nord Stream energy pipelines reopened. To forestall any such potential defection, those Russian-German pipelines were suddenly attacked and destroyed, almost certainly with the approval and involvement of the U.S. government. America is not legally at war with Russia let alone Germany, so this probably represented the greatest peacetime destruction of civilian infrastructure in the history of the world, inflicting enormous, lasting damage upon our European allies. Our total dominance over the global media has so far prevented most ordinary Europeans or Americans from recognizing what transpired, but as the energy crisis worsens and the truth gradually begins to emerge, NATO might have a hard time surviving. As I discussed in a recent article, America may have squandered three generations of European friendship by destroying those vital pipelines.

- American Pravda: Of Pipelines and Plagues
  Ron Unz • ***The Unz Review*** • October 3, 2022 • 3,900 Words

Meanwhile, many years of arrogant and oppressive American behavior towards so many other major countries has produced a powerful backlash of support for Russia. According to news reports, the Iranians have provided the Russians with large numbers of their advanced drones, which have been effectively deployed against the Ukrainians. Since World War II, our alliance with Saudi Arabia has been a linchpin of our Middle Eastern policy, but the Saudis have now repeatedly sided with the Russians on oil production issues, completely ignoring America's demands despite threats of retaliation from Congress. Turkey has NATO's largest military, but it is closely cooperating with Russia on natural gas shipments. India has also moved closer to Russia on crucial issues, ignoring the sanctions we

have imposed on Russian oil. Except for our political vassal states, most major world powers seem to be lining up on Russia's side.

Since World War II one of the central pillars of global American dominance has been the status of the US dollar as the world's reserve currency and our associated control over the international banking system. Until recently we always presented our role as neutral and administrative, but we have increasingly begun weaponizing that power, using our position to punish those states we disliked, and this is naturally forcing other countries to seek alternatives. Perhaps the world could tolerate our freezing the financial assets of relatively small countries such as Venezuela or Afghanistan, but our seizure of Russia's $300 billion in foreign reserves obviously tipped the balance, and major countries are increasingly seeking to shift their transactions away from the dollar and the banking network that we control. Although the economic decline of the EU has caused a corresponding fall in the Euro and driven up the dollar by default, the longer-term prospects for our continued currency hegemony hardly seem good. And given our horrendous budget and trade deficits, a flight from the dollar might easily collapse the US economy.

Soon after the outbreak of the Ukraine War, the eminent historian Alfred McCoy argued that we were witnessing the geopolitical birth of a new world order, one built around a Russia-China alliance that would dominate the Eurasian landmass. His discussion with Amy Goodman has been viewed nearly two million times.

Our relentlessly aggressive foreign policy towards Russia and China today constitutes an enormous threat to world peace and our own national future, yet half my article focused on events from more than seven decades ago, presenting a highly unorthodox narrative of the origins of World War II. Many might regard this material as completely irrelevant, but I disagree.

Consider our Secretary of State Antony Blinken, one of the key figures formulating our current policies. Prior to his appointment, I'd never heard of him, but I soon discovered that he'd attended the same college that I did, graduating one year later. We may have even shared some classes, though since my major was Theoretical Physics and his was Social Studies, probably not. But I do think that I have a very good understanding of his view of the world and the history of the twentieth century since until the last decade or so mine was probably not too different. Most of the other senior figures in the Biden Administration seem to fall into that same category.

These individuals have a fixed set of particular beliefs regarding America's role in the world, beliefs shared by their entire ideological circle, and I'm sure that they would immediately reject any challenges to that framework with regard to Russia or China. Such challenges are probably not uncommon, but are regularly dismissed and ignored.

However, I suspect that none of them have ever imagined that the deepest foundations of their belief-system—their assumed history of World War II—is actually false and rotten to the core. They have probably never encountered such ideas in their entire lives, and as a consequence, their psychological defenses might be much weaker. And if any of them begins to even consider the slightest possibility that every source of information they have absorbed since elementary school has been based upon the same underlying set of falsehoods, that realization might shake their confidence in contemporary matters, including the circumstances surrounding the current war in Ukraine.

Mules are stubborn animals. But there's a classic joke that they can be persuaded to follow directions if you first get their attention by hitting them on the head with a two-by-four. For most American policy-experts discovering that their entire accepted history of World War II is upside-down and backwards amounts to being hit on the head with a two-by-four.

# Elon Musk, Kanye West, and Much Riskier Targets

***The Unz Review*** • November 21, 2022 • 3,800 Words

Although it's too soon to be sure, the early signs are not looking good for Elon Musk's $44 billion purchase of Twitter, thereby demonstrating once again how easily the concentrated power of the media can destroy those whom it turns against.

The South African-born Tech entrepreneur entered the fray having several seemingly huge advantages. He already ranked as the wealthiest person in the world by a considerable margin. His Tesla Motor Company, constituting the bulk of his fortune, pioneered the electric vehicles that have become a major status symbol of affluent liberals, and despite a considerable decline in its stock, was still comparable in value to the combined total of the world's next half-dozen automobile manufacturers. He simultaneously served as CEO of SpaceX, America's best hope for continued domination of space, and its associated Starlink satellite network had recently proven itself a huge factor in modern warfare. Musk was not only considered an enormous technological hero, but he had also accumulated considerable media influence of his own, with his 118 million followers on Twitter probably giving him the reach of a major television celebrity or even an entire broadcast network.

Indeed, Twitter had become so important to him that earlier this year he boldly offered to buy the struggling social media giant and take it private. A decade ago, a leading Twitter executive had memorably characterized his company as representing "the free speech wing of the free speech party," and Musk seemingly intended to roll back the mounting tide of censorship and restore it to that position.

For generations "free speech" had been one of the most universally cherished American values, but after Donald Trump used the power of his free speech on Twitter to unexpectedly win the White House, those prevailing sentiments very rapidly changed, and the need to exclude "fake news" and suppress "hate speech" became the accepted priority of all right-thinking individuals obedient to the narrative of the mainstream media. Beginning with a few extreme cases here and there, the volume of Twitter purges grew exponentially, until by early 2020 they had finally claimed the sitting President of the United

States, and powerful elements of American society were very concerned that Musk might try to reverse that process. So his takeover of Twitter, substantially funded from his own pocket, was viewed by many as a horrifying and potentially dangerous threat to American values, with Musk himself increasingly portrayed as a Bond-style super-villain by the buzzing media beehive, an interloper whose nefarious plans had to be frustrated at all costs.

Twitter had already been losing money and the $14 billion in debt Musk took on to help fund his purchase made the situation far worse. Once the media painted him as a dangerous bad-thinker and Twitter suddenly became "controversial" his timorous advertisers—who provided nearly all of Twitter's existing revenue—began dropping away, with each public declaration being loudly broadcast by the hostile media megaphone.

All of these major blows came despite Musk's partial reversal of his proclaimed "free speech absolutism," as he promised to maintain many of Twitter's existing restrictions and except for a certain former President only reinstated the most milquetoast of purged Tweeters. This pull back quickly resulted in angry denunciations from some of the same individuals who had previously championed his takeover.

When expenses rise and revenue falls, financial problems result, and journalists reported that Musk had privately warned of the risk of bankruptcy as he prepared his drastic cuts to Twitter's bloated workforce, even as most of the company's previous top executives were fired or quit.

Earlier this month, Musk had intentionally reduced Twitter's headcount by 50%, but on Thursday his media critics gleefully reported that one-third of his remaining staff had suddenly quit, with many of his crucial software engineering teams having almost totally disappeared. The front-page headline in the hostile *New York Times* was "Twitter Teeters on the Edge" and it darkly suggested that the company might be entering a software death-spiral, hardly encouraging news for the remaining corporate advertisers who were so necessary for the company's survival. I've never much used Twitter myself, but if I'd invested years of my time and effort in building up millions of followers, I'd be feeling pretty worried right now.

Perhaps Musk will ultimately triumph against the odds once again, and successfully create the universal WeChat-type service he has envisioned. But right now, I think it much more likely that the apparently fragile social media giant will continue to decline, before

ultimately winding up in different hands. And if our media can so quickly and easily crush the aspirations of the wealthiest man in the world, perhaps costing him and his financial backers the $44 billion they had invested, who in the future would risk such a challenge?

Perhaps by coincidence, a somewhat similar controversy had recently played out in the case of another high-profile individual, the billionaire black rapper and fashion designer Kanye West. Although I'd only had the vaguest impression of him until now, he was apparently a towering international celebrity, as well as being among the wealthiest black Americans who had ever lived, while having tens of millions of followers on Twitter and other networks.

Apparently for some reason or other, he became angry and agitated over what he saw as the overwhelming Jewish influence in the worlds of business and media, and began loudly saying so in various venues and on his social networks. As might be expected, the media reaction was swift and devastating, portraying him as a moral leper, and thereby forcing most of his business partners to cut their ties, often at enormous financial cost. Apparently 25% of the profits of footware giant Adidas came from West's line of sneakers, but they abandoned the longtime deal at a total cost of almost $650 million when their media masters proclaimed it as a fundamental issue of morality. At the other end of the spectrum, Goodwill Industries announced that they would no longer offer their impoverished clientele the donated cast-offs associated with such a fiend. The rapper's longtime bank even closed his accounts and would no longer provide a haven for his money.

The immediate result of all these coordinated blows was that the bulk of West's large fortune suddenly evaporated, while his (Jewish) personal trainer publicly declared that if he continued his bad behavior the erstwhile billionaire might end up spending the rest of his life heavily drugged and imprisoned in a mental institution. Almost none of his fellow black celebrities rallied to his side, or if they did, I didn't hear about it. The story soon dropped from the media, perhaps permanently taking with it the once-iconic global black celebrity.

West's high-profile transgressions had put our ideological watchmen on full alert and this probably accounted for the echoing controversy that soon engulfed black basketball star Kyrie Irving, who ran into a media buzz-saw for merely Tweeting out a link to an Afrocentric

documentary available on Amazon. The controversial claims made in that video riled up the ADL, and Irving quickly offered public apologies and a payment of $500,000 to salvage his sports career. But that tentative deal then unraveled due to his subsequent impolitic remarks, and he was suspended from basketball, while his personal line of sneakers was cancelled by Nike. Yet another abject lesson proving that even the highest and the mightiest should think twice before exercising their right to free speech. The media creates reality and if they decide to declare you a target, you quickly become a human pin-cushion.

Back in the 1990s, Bill Gates was much in the news, with his $100 billion fortune then ranking him as the wealthiest man in the world, a position he had held for so many years that it seemed permanent. His Windows operating system enjoyed a near-monopoly on all the world's computers, so his products controlled the technological infrastructure of every country, just as every writer and financier depended upon his ubiquitous Word and Excel programs. Given such potent assets, he was sometimes half-jokingly described as the most powerful person in the world, having clout that dwarfed that of any President or Pope.

While I did not necessarily dispute such an appraisal, I would always point out the severe limitations of his position. I proposed a thought-experiment in which the Monarch of Microsoft carelessly voiced some highly untoward views on any one of a number of sufficiently touchy subjects. For all his money and influence, he probably would have quickly been annihilated, fried to a crisp by a concentrated media blast and then overwhelmed by the massive wave of public revulsion that it generated, quite possibly losing control of his company and much of his massive fortune in the process. Bill Gates might have been powerful, but the media could have destroyed him at a stroke, snuffing him out like a candle in a gale-force wind. The current fates of Elon Musk, Kanye West, and others suggest that I was probably correct.

The ADL seems to have played a central role in all these current controversies discussed above, with Musk quickly bowing to its authority and soliciting its advice, while the organization led the successful attacks on West and Irving. These developments were hardly surprising given its notorious reputation, but the ADL's reaction to my own past activities had followed a strikingly different trajectory. As I wrote four years ago:

In our modern era, there are surely few organizations that so terrify powerful Americans as the Anti-Defamation League (ADL) of B'nai B'rith, a central organ of the organized Jewish community.

Mel Gibson had long been one of the most popular stars in Hollywood and his 2004 film *The Passion of the Christ* became among the most profitable in world history, yet the ADL and its allies destroyed his career, and he eventually donated millions of dollars to Jewish groups in desperate hopes of regaining some of his public standing. When the ADL criticized a cartoon that had appeared in one of his newspapers, media titan Rupert Murdoch provided his personal apology to that organization, and the editors of *The Economist* quickly retracted a different cartoon once it came under ADL fire. Billionaire Tom Perkins, a famed Silicon Valley venture capitalist, was forced to issue a heartfelt apology after coming under ADL criticism for his choice of words in a *Wall Street Journal* column. These were all proud, powerful individuals, and they must have deeply resented being forced to seek such abject public forgiveness, but they did so nonetheless. The total list of ADL supplicants over the years is a very long one.

Given the fearsome reputation of the ADL and its notorious hair-trigger activists, there was a widespread belief that my small webzine would be completely annihilated when I first launched my recent series of controversial articles in early June by praising the works of historian David Irving, a figure long demonized by the ADL. Yet absolutely nothing happened.

During the next three months my subsequent articles directly challenged nearly every hot-button issue normally so fiercely defended by the ADL and its lackeys, so much so that a friendly journalist soon described me as the "Kamikaze from California." Yet despite my 90,000 words of text and the 13,000 comments I had attracted, the continuing silence of the ADL was absolutely deafening. Meanwhile, my articles were read more than half a million times…

When divine wrath fails to smite the heretic and terrifying enforcers of official dogma seem to have suddenly lost their taste for battle, others gradually begin to take notice and may grow emboldened. Eventually leading pro-Russian and Libertarian websites such as *Russia Insider* and *LewRockwell* began republishing some of my most controversial American Pravda articles, thus bringing my factual claims to the attention of

> broader audiences. After the conclusion of my series, I began directly ridiculing my strangely timorous ADL opponents, publishing a short column entitled "Has the ADL Gone Into Hiding?" which led the redoubtable Paul Craig Roberts to describe me as "the bravest man I know."
>
> Apparently the combination of all these factors at long last grew too worrisome for the ADL, and stirring from their secret hiding place, its activists have now finally released a short and rather milquetoast response to my material, one which hardly much impresses me. A few days ago, they Tweeted out their column, together with a photo of their new nemesis.

>
> — ADL (@ADL) October 8, 2018

Those were the opening paragraphs of my reply to that foolhardly ADL attack, which had provided me an excellent opportunity to publish a lengthy response recounting the extremely sordid history of that powerful organization. My article presented many important facts previously only little known and drew considerable interest, eventually being read nearly 50,000 times:

- American Pravda: The ADL in American Society
  *From the Leo Frank Case to the Present Day*
  Ron Unz • ***The Unz Review*** • October 15, 2018 • 7,300 Words

After that initial exchange, the ADL apparently reevaluated their media strategy and concluded that discretion was the better part of valor, slinking back into their secret hiding place. Indeed, the highly counter-productive consequences of any challenge either to myself or to my publication became so obvious that they seem to have issued a general edict, forbidding any mention whatsoever in all the media outlets under their editorial influence. They rightly recognized that although we might suffer from their attacks, by drawing much greater attention to our information, such actions might prove severely damaging or even fatal to their long-term interests.

The reality of that presumably ADL-enforced media blockade became apparent in 2020, when the SPLC and its journalistic allies launched a ferocious wave of coordinated attacks aimed at forcing the resignation

of Stephen Miller, perhaps the most hated member of the Trump Administration, a drive that came just a few months before the presidential election. The central charge against Miller was that in his private emails he had promoted several controversial posts by blogger Steve Sailer, all of which had originally been published on our website.

Such attacks typically rely upon guilt by association, and the Sailer pieces in question had run on the same page as articles promoting Holocaust Denial and various other exceptionally controversial topics, so the connection was undeniable. And if those other issues had been publicly linked to Miller, his political fall would have become certain. But the lengthy research report denouncing Miller and the pieces he had endorsed scrupulously excluded any mention of our website or the vastly more controversial material it contained, and as a consequence Miller managed to survive. Apparently maintaining the prohibition against any mention of our existence was more important than claiming the political scalp of a top Trump advisor. To the ADL and its allies, we constituted a fearsome Lord Voldemort, and merely mentioning our name might result in their destruction.

- Ideological Purges and the Lord Voldemort Effect
  Ron Unz • ***The Unz Review*** • July 14, 2020 • 3,900 Words

As the heavy blows suffered by Musk, West, and others have demonstrated, the media has enormous striking power, but creating an outlet that can effectively wield it is far from an easy undertaking, and the resources provided are merely one of the necessary factors.

I recently noted the interesting fact that Tech billionaire Pierre Omidyar had launched the *Intercept* almost simultaneously with our own publication. Lavishly funded and staffed by a crew of all-stars captained by renowned investigative reporter Glenn Greenwald, the *Intercept* seemed certain to transform journalism, but despite the $200 million it has absorbed since 2013, the results have been less than impressive. Indeed, these days our own webzine attracts roughly comparable monthly traffic along with almost twice as much readership time, despite our total deplatforming from Facebook and deranking by Google.

- Less Than $200 Million But Also More
  Ron Unz • ***The Unz Review*** • September 26, 2020 • 2,900 Words

The obvious reason for such a striking mismatch between inputs and outputs is that so much of the *Intercept*'s content during the Trump Era and afterwards became almost indistinguishable from what was found on so many other websites, a situation very different from the uniqueness of what we offer.

Over the years, visitors have regularly told me that they are aware of no other publication anywhere on the Internet that provides convenient access to such a wide range of ultra-controversial material across so many different subjects, nor many websites that allow such lightly-moderated discussions in its comment-threads. So perhaps this makes us the rightful heir to the mantle of "the free speech wing of the free speech party."

Obviously, such an approach has its pluses and minuses, and I personally find a great deal of the material we publish both distasteful and wrong-headed, a failing even more common in the regular flood of the often vituperative comments. But from the beginning, the Mission Statement of this alternative media publication had envisioned that situation, and our primary role has been to serve as a content-distribution channel and commenting platform.

Furthermore, a major reason for launching the publication had been to provide a convenient venue for my own future writings, and in that regard I've been very satisfied with the body of work I've now produced, mostly over the last four or five years.

Highly controversial material, no matter how persuasive or well-documented, almost inevitably requires considerable time to achieve any broader impact. Next week will mark the tenth anniversary of my own "Myth of American Meritocracy" article, and the legal challenges it inspired to discriminatory admissions practices at our elite universities have only just now finally reached the Supreme Court, which may soon strike down a half-century of Constitutional support for racial preferences, as I discussed in a recent review article:

Seen in this light, I'm hardly surprised that the far more recent contents of my American Pravda series have not yet produced much visible public impact, though given their exceptionally controversial nature, I suspect they have been quietly discussed in certain quarters, as suggested by the millions of total pageviews they have accumulated.

- American Pravda Series
  Ron Unz • ***The Unz Review*** • 445,000 Words

Taken as a whole, the series is intended to provide a comprehensive historical counter-narrative for the last 100 years, one vastly differing from that presented in our standard textbooks or mainstream media outlets, and it does so mostly in a series of self-contained, bite-size chunks that can easily be individually digested.

Over the last few years, these articles have attracted tens of thousands of comments, many of them substantial and fiercely critical, but after carefully considering the arguments made and the evidence presented, I still feel reasonably convinced that perhaps 99% of my published

analysis is correct, at least to within the limits of confidence that I had originally expressed. But even if only 10% of my conclusions were correct and 90% totally mistaken, the impact upon our established understanding of history would still be revolutionary. I'm much less certain when or if such unorthodox perspectives will become generally accepted, but it certainly might eventually happen.

I'm always extremely glad to discover that others may sometimes see things in the same way. Not long ago, I was contacted by a longtime reader of this website, someone with a strong academic background who later became quite financially successful. Although he'd previously read many of my articles when they had appeared over the last few years, once he sat down and read the total contents of my six American Pravda print collections, he found the combined impact extremely compelling, and he contacted me, wondering how he could assist the project. After a little discussion, he decided to become a financial sponsor of the website, providing an initial payment of $100,000, with his identity to be kept strictly confidential until he wanted it disclosed.

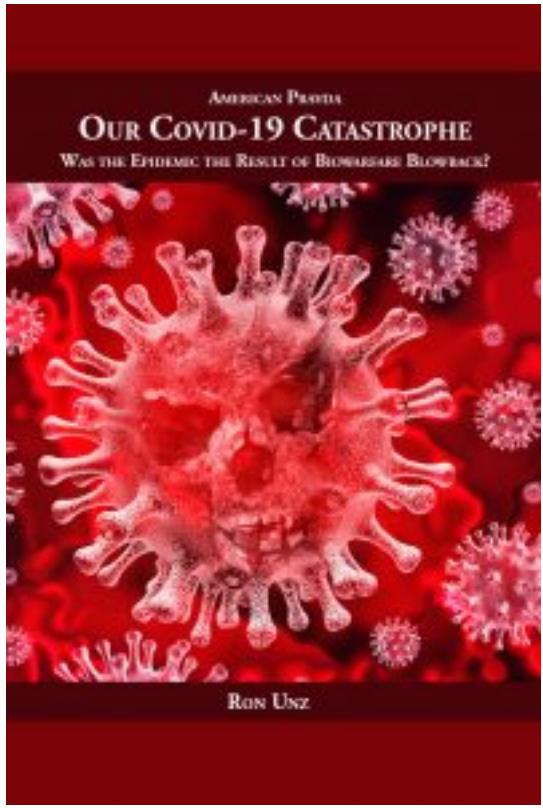
From its inception, I've funded the website almost entirely on my own, so his sponsorship was very welcome, especially since it provided hard evidence that others have a high regard for the material we have produced.

Additional financial sponsors would also be very much appreciated, and they should regard any assistance they provide as constituting media venture capital. Their confidential involvement would allow them to support a potentially crucial project with little if any downside risk if the certain topics remain controversial and forbidden, but which would provide them with enormous potential credit if the political and ideological winds change. Moreover, any such financial outlays would be merely a tiny sliver of the $200 million spent to fund the *Intercept*, let alone the tens of billions of dollars now invested in Twitter.

Anyone so interested in becoming a financial sponsor of our publication can contact me at Ron(at)unz(dot)com, while for the more paranoid individuals, I also now have a protonmail account RonUnz(at)protonmail(dot)com, though I seldom use it for anything.

As a perfect example of the upside potential of what I am describing, I still find it quite astonishing that for the last thirty months there has been strong even overwhelming evidence that the global Covid outbreak was the result of an American biowarfare attack against

China (and Iran), which has also cost the lives of well over a million Americans, but that virtually no one else anywhere on the Internet has been willing to point to that obvious scenario. Perhaps this climate of total avoidance will continue indefinitely, but if the story does eventually come out it would surely rival the two world wars as among the most significant occurrences in all of human history.



EPub Format • Mobi/Kindle

Meanwhile, my efforts on that score continue. My Covid/Biowarfare EBook has been downloaded over 13,000 times and my individual articles have accumulated more than 900,000 pageviews on the Internet, while three of my video podcast interviews from earlier this year have reached nearly 2.3 million views on Rumble, each probably more popular than 99.99% than the other videos on that platform.

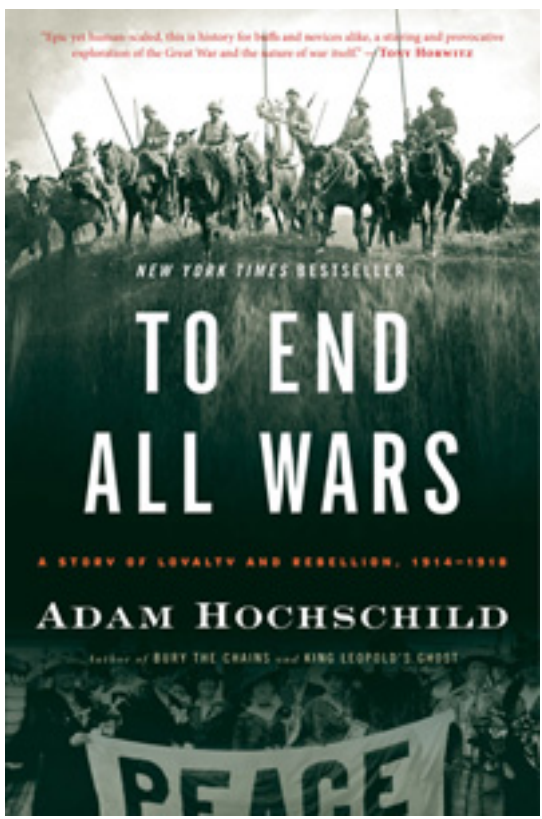
INTERVIEWS

# Lost Histories of the Great War

***The Unz Review*** • November 28, 2022 • 8,100 Words

Veterans Day came earlier this month, a public holiday that under the name of Armistice Day had originally celebrated the end of the First World War, itself then known as the Great War to those living during that era, over a century ago.

Friends of the Palo Alto Library runs a local monthly book sale, now reopened after nearly two years of Covid closures, and I usually attend, often buying for a pittance items that have caught my eye.  A few weeks ago I picked up for a quarter a copy of Adam Hochschild's widely praised 2011 volume *To End All Wars*, his account of the British anti-war movement during World War I, which I'd seen very favorably reviewed in the *Times* and elsewhere when it was originally released.  My own knowledge of that era was relatively meager and sparse, so I spent a couple of days reading the text.



Hochschild seems a fine writer and researcher, certainly earning the glowing blurbs by prominent scholars that stud his book, and he told a very interesting story of the men and women who organized and led Britain's powerful but heavily suppressed anti-war movement as it opposed the continuing slaughter in the trenches. Many of these individuals suffered harsh imprisonment for their dissent, including Keir Hardie, the founder of what became the Labour Party and Bertrand Russell, the brilliant mathematical philosopher and future Nobel Laureate.

Support for the war split the militant Suffragette movement straight down the middle, and important political families were also often deeply divided, with the beloved elder sister of Britain's own military commander-in-chief in France becoming a prominent peace campaigner. Just a few years earlier, E.D. Morel, the country's leading investigative journalist, had been celebrated as an international hero for exposing the horrors of the Belgian Congo, but he was now imprisoned for his anti-war writings, with the treatment so brutal that it permanently broke his health and he died at the age of 51, a few years after the war ended.

Just as I'd expected, I discovered a wealth of information about a period only known to me in outline, and I saw no reason to doubt any of its accuracy, including the brief but surprising references to supposedly widespread German war crimes in occupied Belgium. I was very glad to fill these large gaps in my existing knowledge.

But near the end of Hochschild's discussion of the year 1916, he emphasized that unlike Britain there was absolutely no corresponding anti-war movement in most other countries, including Germany. As he put it on p. 217:

> "Both sides were committed to fight to the bitter end, and by now, two years into the war, if someone in a prominent position on either side so much as advocated peace talks, it was considered close to treason."

On reading this, I did a double-take and almost questioned my sanity. Surely, Hochschild must be aware that exactly at that point in time, the government of Germany had publicly proposed international peace talks without preconditions aimed at ending the war, suggesting that the massive, pointless slaughter be halted, perhaps largely on a *status quo ante* basis.

The Germans had recently won several huge victories, inflicting

enormous losses on the Allies in the Battle of the Somme and also completely knocking Rumania out of the war. So riding high on their military success, they emphasized that they were seeking peace on the basis of their strength rather than from any weakness. Unfortunately, the Allies flatly rejected this peace overture, declaring that that the offer proved Germany was close to defeat, so they were determined to hold out for complete victory with major territorial gains.

As a result, many additional millions needlessly died over the next two years, while just a couple of months later in early 1917 Russia's Czarist government collapsed, eventually leading to the Bolshevik seizure of power, a turning-point with fateful, long-term consequences.

I don't recall having ever seen any discussion of that rejected German peace proposal in the cursory treatment of the First World War provided by my basic high school or college textbooks, so I hadn't originally heard of it. But around 2000, I'd begun a software project aimed at digitizing the near-complete archives of many of America's most influential opinion magazines of the past, and along the way I'd been surprised to notice all those late 1916 headlines describing the peace offer, then glanced at a few of the articles and discovered the important history that I'd previously missed. For example, the December 23, 1916 lead article in America's influential *Literary Digest* carried the headline "Germany's Peace-Proposals" and for several weeks around that date numerous other stories in that periodical, as well as in the *Nation*, the *New Republic*, and various other publications had covered the same topic.

But although my introductory textbooks had failed to mention those facts, Hochschild was an award-winning author and historian, someone who had obviously devoted years of diligent research to his book on WWI peace movements. I found it difficult to believe that he was unaware of those crucial events, and I assumed that he would discuss them in the next chapter, but I finished his entire 450 page book seeing absolutely no mention anywhere.

At that point, I decided to confirm my recollections by doing a few casual Google searches on the topic, and found surprisingly little on the Internet. I then consulted the Wikipedia entry on World War I, which ran almost 40,000 words including nearly 500 references, but it only featured a single sentence on the German peace proposal that might have ended the fighting and thereby saved many millions of lives. Fortunately, that brief mention did link to a short 2018 *Washington Post* piece by a couple of professional historians, whose

account fully matched my own understanding of the facts. The Great War ended on November 11, 1918, and their piece had appeared exactly one hundred years later to the day. So apparently it had required the centennial anniversary of the conclusion of that war to prompt our mainstream media to finally provide some coverage of that nearly forgotten story.

- Why the First World War Lasted So Long
  Alexander Lanoszka and Michael A. Hunzeker • ***The Washington Post*** • November 11, 2018 • 1,100 Words

If a negotiated peace had ended the wartime slaughter after just a couple of years, the impact upon the history of the world would obviously have been enormous, and not merely because more than half of the many millions of wartime deaths would have been avoided. All the European countries had originally marched off to battle in early August 1914 confident that the conflict would be a short one, probably ending in victory for one side or the other "before the leaves fell." Instead, the accumulated changes in military technology and the evenly-balanced strength of the two rival alliances soon produced a gridlock of trench-warfare, especially in the West, with millions dying while almost no ground was gained or lost. If the fighting had stopped in 1916 without a victory by either side, such heavy losses in a totally pointless conflict surely would have sobered the postwar political leadership of all the major European states, greatly discouraging the brinksmanship that had originally led to the calamity let alone allowing any repeat. Many have pointed to 1914 as the optimistic high-water mark of Western Civilization, and with the sobering impact of two disastrous years of warfare and millions of unnecessary deaths, that peak might have been sustained indefinitely.

Instead, the consequences of the continuing war were utterly disastrous for all of Europe and much of the world. Many millions more died, and the difficult wartime conditions probably fostered the spread of the deadly Spanish Flu epidemic of 1918, which then swept across the world, taking as many as 50 million lives. Russia's crippling defeats in 1917 brought the Bolsheviks to power, leading to a long civil war that killed many millions more, followed by three generations of global conflict over Soviet Communism, certainly accounting for tens of millions of additional civilian deaths. The extremely punitive terms that the Treaty of Versailles imposed upon defeated Imperial Germany in 1919 eventually led to the collapse of the Weimar Republic and a second, far worse round of global warfare

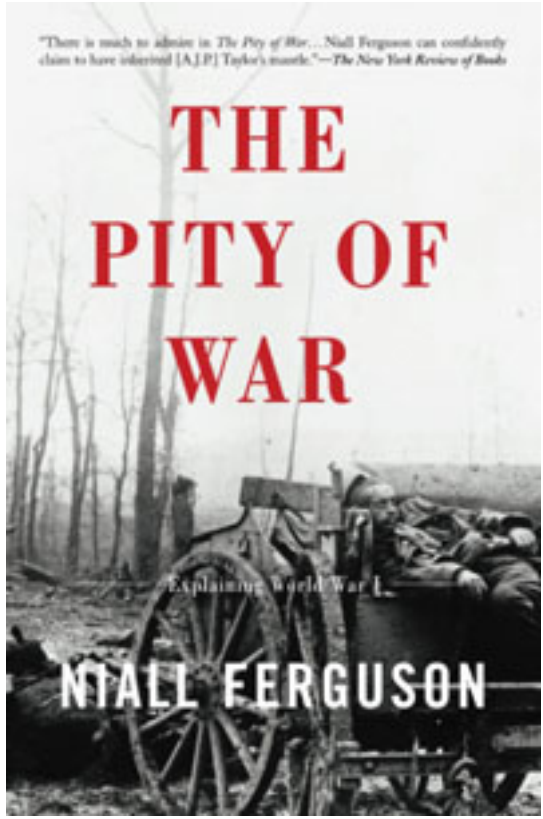
involving both Nazi Germany and Soviet Russia, a catastrophe that laid waste to much of Europe and claimed several times as many victims as the Great War itself.

Although the Allies at the time had bitterly denounced what they sometimes called the dangerous “German Peace Offensive” of late 1916, it seemed obvious to me that the world would have been a much better place if it hadn’t been rejected.

Just out of curiosity, I queried quite a number of knowledgeable, well-read individuals, asking what they knew of the abortive 1916 German peace proposal and their responses were quite interesting.  A mainstream scholar who had written several books on First World War topics was a little surprised at Hochschild’s lack of awareness, but noted that academic fashions since the 1960s had shifted in a direction sharply hostile to Imperial Germany, and as a result coverage of those elements of the historical record suggesting otherwise had been greatly minimized over the last half-century or more.

Meanwhile, nearly all of the lay individuals I contacted had never heard of the 1916 effort at peace and were mostly shocked by the story, the one notable exception being Kevin Barrett, whose long-running *Truth Jihad* podcast show had featured various conspiratorial guests over the years who had discussed it, sometimes with regard to broader, less plausible historical plots.

The extent to which the seemingly undeniable facts of the 1916 peace proposal have disappeared from public discussion is really quite remarkable, and I gradually discovered that Hochschild was far from alone in providing no hint of the story.



"There is much to admire in The Pity of War. . . Niall Ferguson can confidently claim to have inherited [A.J.P.] Taylor's mantle."—The New York Review of Books
THE PITY OF WAR
Explaining World War I
NIALL FERGUSON

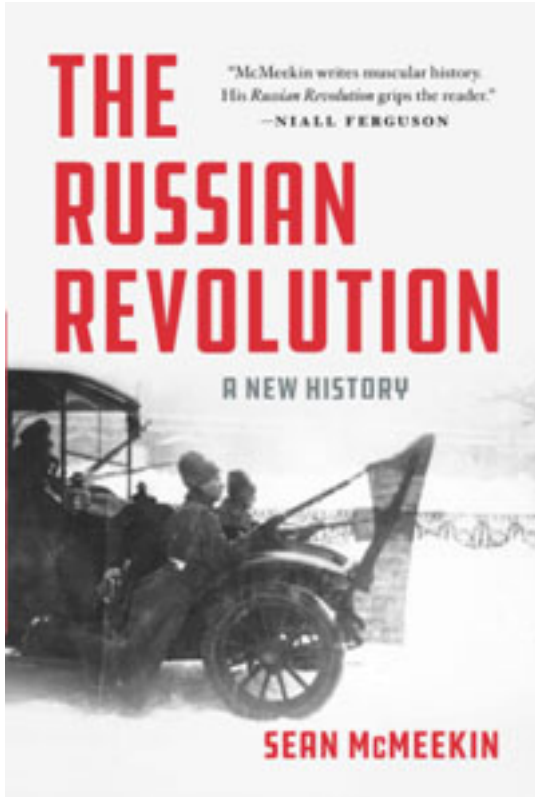
Consider high-profile British-born historian Niall Ferguson of Harvard and Stanford Universities, who had made his early name with his publication of *The Pity of War* in 1999, a highly heterodox reanalysis of World War I that came to numerous controversial conclusions. Among other positions, Ferguson boldly argued that the British should have stayed out of the conflict, which would then have resulted in a quick and sweeping German victory, leading Germany to establish political and economic hegemony over Continental Europe. But this would have simply resulted in the creation of the EU three generations earlier and avoided the many tens of millions of needless deaths in the two world wars, let alone the global consequences of the Bolshevik Revolution.

Although Ferguson was deliberately provocative in his account, I didn't remember seeing any specific mention of the 1916 peace proposal when I'd read the book a few years ago, and reexamining it now confirmed my recollection, even though his Introduction contains nearly a page of "What If?" scenarios, and he discussed numerous "alternative realities" later in his text. Indeed, just a couple of years earlier he had edited *Virtual History*, a collection of more than a dozen

lengthy essays by professional scholars examining the consequences of history taking a different turn at numerous key junctures, including a German victory in WWI, but once again it totally lacked any suggestion of a possible negotiated peace in 1916.

An even longer volume of a very similar type, appropriately titled *What If?* appeared in 2001, edited by historian Robert Cowley and it was just as silent. The book ran over 800 pages, of which more than 90 were devoted to seven different alternate scenarios involving World War I, but the possibility of a 1916 peace nowhere appeared, despite surely being one of the most obvious and important "What Ifs."

Comprehensive mainstream histories also seemed quite silent. In 1970 renowned British historian A.J.P. Taylor published *English History, 1914-45*, which ran almost 900 pages, with nearly a quarter of those were devoted to WWI; but no hint was given of the 1916 German peace proposal, with the very possibility of the Germans accepting a reasonable compromise peace at that point being dismissed in just a few sentences and a footnote. John Keegan's 1999 volume *The First World War* runs 475 pages and also appears to lack any mention. While I've hardly performed an exhaustive review of all the standard historical texts, I think these two examples seem fairly typical, probably thus explaining Hochschild's complete lack of awareness, with Ferguson and other distinguished authors likely having similar gaps in their knowledge.



The issue also seemed not to come up in more specialized studies, even when it might have played an important role. A couple of years ago I'd read Sean McMeekin's 2017 history *The Russian Revolution*, an outstanding, meticulous reconstruction of the complex and contingent circumstances that led to the 1917 fall of the Czarist Regime and the subsequent triumph of Lenin's Bolsheviks.

The prologue is devoted to the murder of Grigory Rasputin, the peasant faith-healer who exercised such enormous influence over the Czar and his family that although he held no official position, he probably ranked for many years as the third most powerful figure in the Russian Empire. Moreover, his December 1916 death at the hands of a conspiratorial group that included top members of Russia's elite seems to have been an important factor in destabilizing the regime, leading to its collapse in the February Revolution just a couple of months later.

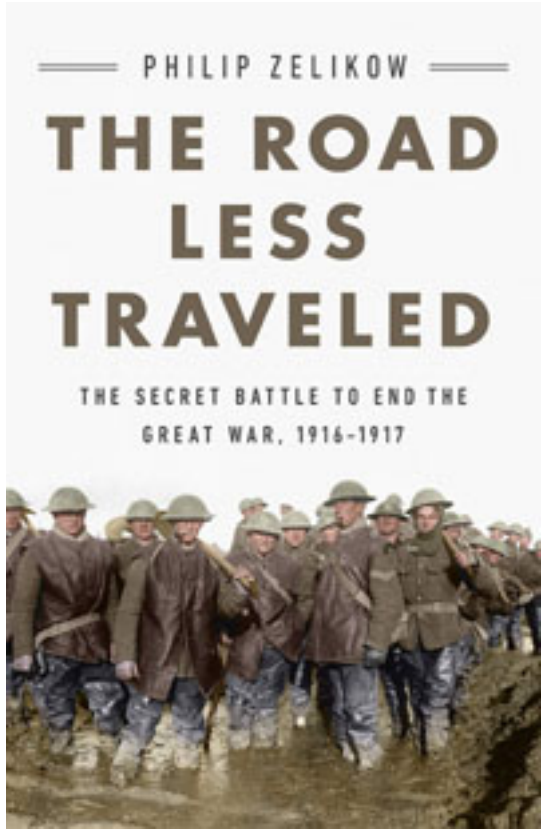
Rasputin had long had severe misgivings about continuing the costly war against Germany, and this was a crucial motive behind his killing; indeed, fears of the defection of their huge Russian ally led members of British Intelligence to assist the effort. Although plots against

Rasputin's life had been circulating for months, he was finally struck down on December 20th, exactly when Germany's very public "peace offensive" was gaining considerable international attention; and although the author doesn't directly connect the two developments, the timing hardly seems likely to have been purely coincidental. So the desperate Allied moves to block any support for the proposed German peace plan may have actually helped trigger the Russian Revolution.

Obviously an early end to the Great War would have been an event of tremendous importance and the 1916 German efforts to secure peace were certainly treated as such in the news reports of the day. But Germany ultimately lost the war and the resulting official narrative blamed Europe's catastrophe upon relentless German militarism, so that German peace proposal became a discordant element, raising troubling questions about the overall storyline. As a consequence, those facts were eventually flushed down the memory-hole for most of the next one hundred years, and if I hadn't glanced at those original 1916 headlines, I certainly never would have discovered them.

Indeed, once I casually mentioned this interesting history on my website, one or two of the other commenters sharply challenged my claims, regurgitating the orthodox narrative that the Germans had been opposed to any reasonable negotiated peace, without explaining why all the contemporaneous media accounts had said exactly the opposite. According to these critics, Germany's powerful military establishment would certainly have vetoed any such proposals, and I decided to see if I could find anything stronger to support my position than merely a thousand-word centennial op-ed in the *Post* written by a couple of obscure, junior academics.

To my considerable surprise, I discovered that just last year an entire book had been published on the lost chances for peace in 1916, apparently the first and only English-language work ever devoted to that seemingly important topic. Moreover, the author of *The Road Less Traveled* was Philip Zelikow, best known for having served as executive director of the 9/11 Commission, and therefore someone entirely in the good graces of the mainstream establishment. Near the end of his Introduction, he explained that he had been working on the project off and on for more than a dozen years.



Although the main text ran well under 300 pages, his account of events seemed thorough and persuasive in its coverage, drawing heavily upon archival records and private diaries to firmly establish the same remarkable story that I had originally glimpsed in those old publications. His exhaustive research had uncovered a great deal of additional material, piecing together an account radically different than what had been presented in many decades of highly misleading treatments. And despite such seemingly controversial "revisionism," his work received glowing endorsements from leading academic scholars and favorable reviews in such influential publications as *Foreign Affairs*, the *National Interest*, and *Foreign Policy*, though since it never caught the attention of my newspapers I'd remained unaware of it.

The story Zelikow tells is a really a fascinating one, especially since it had remained almost entirely hidden from public awareness for more than a century.

Although influential elements including his closest political advisor had wanted America to enter the war on the Allied side, President

Woodrow Wilson had been hoping all along that he could mediate an end to the conflict, much like his predecessor Theodore Roosevelt had done in the Russo-Japanese war, with the latter's success crowned by winning the 1906 Nobel Peace Prize.

During the first two years of the fighting, neither side had responded favorably to his peace feelers, but by August 1916 circumstances had changed, and although the conflicted British leadership finally decided to continue trying their luck on the battlefield, the similarly-conflicted German government secretly accepted Wilson's offer to preside as mediator at a peace conference. Given the horrific casualties that both sides had already suffered, it was widely believed that once public peace negotiations began, there was little chance that the fighting would ever resume. And with Wilson, most of the German leadership, and much of the British Cabinet ready for peace, the prospects certainly appeared excellent, especially since the Allies were so heavily dependent upon American supplies and financing for survival.

But although all the pieces seemed ready to fall into place, opportunities were repeatedly missed during the more than five months that followed. One important factor was the extreme difficulty of communications since the British had severed Germany's trans-Atlantic telegraph cable at the beginning of the war, meaning that German communications with Wilson or their own ambassador had to take a circuitous route through various neutral countries and Latin America, finally arriving at DC in encoded form days or even weeks later.

Another crucial factor was that Wilson lacked any strong staff that could translate his broad ideas into serious policy proposals. Unlike major European countries, America back then had little bureaucratic infrastructure, with Wilson mostly writing his own speeches and regarding his new Secretary of State, a lawyer who had no diplomatic experience, as merely an intelligent clerk. Instead, his only close advisor was Col. Edward House, a wealthy Texan dilettante who often had eccentric views, and so strongly favored the British that he sometimes seemed to deliberately sabotage the peace effort. As a lifelong academic, Wilson himself had only spent two years as Governor of New Jersey before unexpectedly reaching the White House in 1913, and therefore he had little direct experience in either politics or international diplomacy.

So although the German government responded favorably to his offer of a peace conference in August 1916, Wilson failed to grasp the

urgency of their request, and decided to take no action until after the November election. Meanwhile, within Germany, the military advocates of an unrestricted U-boat campaign against the American ships carrying Allied supplies were pressing very hard for their alternate strategy, which was sure to lead to a break in American relations.

After the British had suffered enormous casualties in their attack on the Somme, including losing nearly 20,000 dead on the first day of fighting, their own peace party was strengthened and the government became willing to consider Wilson's offer. A son of Prime Minister H.H. Asquith had died in the battle and another had been wounded, while the German offer to restore occupied Belgium satisfied the most important British condition.

But then at the end of September, War Minister David Lloyd George—who had been a leading advocate of the American peace option—suddenly switched sides, and declared that Britain would never accept a compromise peace and would instead be willing to fight for twenty years if necessary in order to achieve a total military victory, with anything less than a "knockout" being "unthinkable." Zelikow plausibly argues that Lloyd George believed he could use his reversal on peace to gain the support of British hardliners such as Lord Northcliffe's powerful newspaper group for replacing Asquith as Prime Minister, and indeed that was exactly what happened within a couple of months, with the advocates of peace being pushed out of the government.

Despite the shifting positions of the British, Wilson returned to his peace efforts after his November 7th reelection, only to encounter strong opposition from House, his key advisor. Although Britain was already locked in a desperate struggle with Germany and totally dependent upon American supplies, House somehow became convinced that if America pressed too hard for peace, the British would declare war against our own country. Incredible as it might sound to us, House repeatedly argued to Wilson and others that a British army could sweep down from Canada while the Royal Navy would land hundreds of thousands of troops from their Japanese ally on our coasts, together seeking to conquer the United States. Although these bizarre concerns were rejected, they assisted the overwhelmingly pro-British State Department officials in delaying Wilson's plans to launch his peace proposal.

Around this same time, the German ambassador began pleading with the Wilson Administration to act immediately lest the opportunity for

peace be lost, and Zelikow entitled this chapter “Peace Is on the Floor Waiting to Be Picked Up!” which was one of the impassioned phrases that envoy had used. Meanwhile, Germany’s hard-line military leadership was steadily increasing the pressure on their government to abandon its peace efforts and instead return to the unrestricted submarine warfare that they claimed could quickly win the war.

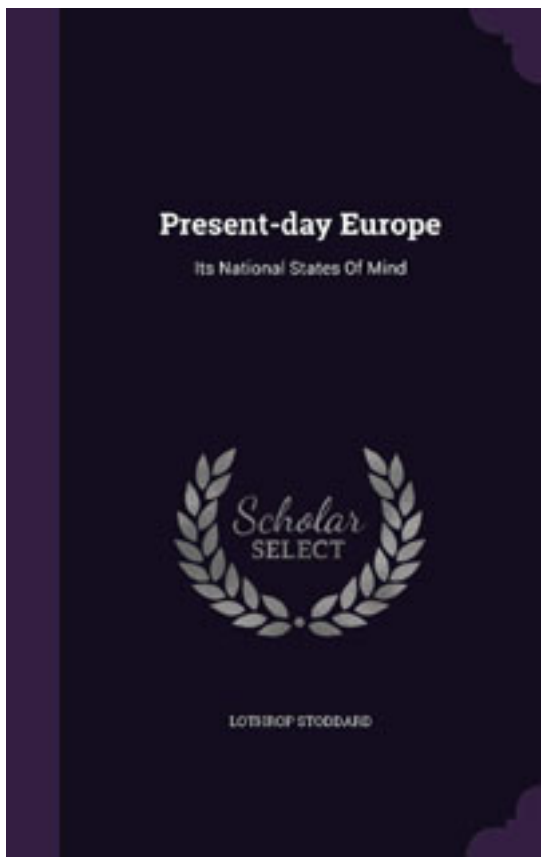
Growing desperate at the president’s endless delays, Germany and its allies eventually issued their own unconditional call for peace talks on December 12th, hoping that step would finally prompt Wilson to act by inviting participants to a peace conference at the Hague and offering himself up as the mediator. The German announcement captured the attention of the world and forced Wilson to respond lest he be eclipsed, and a week later he finally circulated his own peacemaking note, but as Zelikow explains, it constituted a “misfire,” lacking as it did any specifics let alone an invitation for the warring parties to attend an actual peace conference. So the Allies firmly rejected the German offer as a “trick” and were able to ignore Wilson’s statement since it required them to do nothing. Over the next few weeks, the opportunity for peace faded away, and in late January the Germans announced they would return to unrestrained submarine warfare, leading Wilson to break off relations and move towards war with Germany.

Although influential elements within the American government had sought this result from the beginning, Zelikow persuasively argues that the mistakes, errors, and misunderstandings by Wilson and the others also seeking a negotiated peace were probably more responsible for this outcome than the efforts by the individuals who actually intended it. His harsh historical verdict on the former hardly seems unfair:

> In the failure to make peace at the most opportune moment, no one failed, and failed the world, more than President Wilson. His was the most consequential diplomatic failure in the history of the United States.

Thus, one of the most important turning points of the twentieth century probably came in late 1916 with the tragic collapse of a peace effort that initially seemed so likely to succeed, and Zelikow’s gripping narrative tells the story of how and why that opportunity slipped away. By all rights, the Lost Peace of 1916 should have become the subject of countless novels, plays, and films, but instead it remains almost totally unknown today, even among the most highly educated.

My own encounter with some of the lost history of World War I came when I noticed the headlines and read the articles that had run in our leading publications while the story was still unfolding. Once important events have been finalized and the heroes and villains officially determined, there is a natural tendency to reinterpret the past in the light of what ultimately transpired, thereby establishing a simple narrative that follows straight lines. Put another way, the winners write most of the histories.



For that exact reason, I think that one of the least known but most absolutely valuable books about the Great War was completed in mid-March 1917, just weeks before our own involvement inevitably distorted all subsequent analysis. The author was Lothrop Stoddard, who had earned his Ph.D. in history at Harvard and was then just beginning a career that would soon establish him as one of America's most influential public intellectuals. His book was *Present-Day Europe*, a scrupulously even-handed survey of the wartime politics and recent history of each individual nation.

The work is not overly long, running less than 75,000 words, and can easily be read in just a day or two, but it provides an enormous wealth of detailed, contemporaneous information, much of which appears to have been left on the cutting-room floor of later historiography, written after the official narrative had already hardened. Moreover, as he explained in his Preface, Stoddard followed a rigid requirement of only quoting the natives of each country in their own chapter, Englishmen on England, Germans on Germany, and so forth, thereby providing an invaluable presentation of the elite and popular sentiments of each nation, something very useful to those of us seeking to reconstruct the situation more than a century later.

- Present-Day Europe
  *Its National States of Mind*
  Lothrop Stoddard • 1917 • 74,000 Words

Stoddard's book had gone to press just weeks after the final rejection of the German peace offer, and he hardly let a failed diplomatic project well-known to all of his readers dominate his narrative. But although the author was unaware of the extensive backstory, he gave the peace efforts reasonable treatment in the chapters on Britain and Germany, adding interesting details missed by both Zelikow and Hochschild. For example, as early as June 1916 several prominent British political figures of very mainstream views had publicly called for peace negotiations, including in the pages of the *Economist*, and their declaration had been emphatically endorsed by the editor of that influential publication. But this high-profile ideological rebellion in the elite media was swiftly crushed, with the editor losing his job as a consequence. Stoddard later explained that the uncompromising Allied rejection of all German peace offers had by early 1917 "spurred the entire German people to desperate wrath."

A perfect example of the tremendous value of Stoddard's material comes in his discussion of war aims, which obviously provided the necessary context for the differing national reactions to early peace negotiations, and there was a stark contrast between those of the two opposing camps. The goals of the Germans were relatively mild, with almost no demands for annexations of new territory. By contrast, the French were absolutely committed to the total destruction of Germany as their primary objective, with those sentiments being almost universally held across all political parties. They regarded the unified Germany created in 1870 as simply too powerful a European rival, which therefore had to be fragmented back into multiple, weak states. And not only would France reabsorb the lost provinces of Alsace-Lorraine, but it would also annex much of the

Rhineland, territory that had been German for a thousand years. The British were not quite that extreme, but most of their political leadership class strongly believed that Germany needed to be totally crippled as an economic and military competitor.

In the East, the primary war aim of the Russian Empire was the annexation of Constantinople, the capital city and largest metropolis of Germany's Ottoman Empire ally, which would give Russia strategic control of the Bosphorus Straits. Although Serbia had already been defeated and occupied by this date, elements of the Serbian government had originally provoked the war by arranging the assassination of Franz Ferdinand, the prospective Austro-Hungarian ruler, with their broader goal being the total destruction of that multi-ethnic state, several of whose major pieces would then become part of a Greater Serbia.

So to a considerable extent, Germany and its allies were actually the "status quo powers," reasonably satisfied with the existing arrangement of borders, a situation totally different from that of their Allied opponents. When one side in a conflict is determined to dismember and destroy the other, an early peace is difficult to arrange. Moreover, the German alliance faced an opposing coalition that was far superior in manpower, economic strength, and potential military resources, so it was fighting what it reasonably regarded as a purely defensive war. This clear situation at the time is exactly contrary to what has been implied or even explicitly stated in our basic History 101 textbooks for the last one hundred years.

Obviously, the complete picture was not entirely one-sided, and an important factor behind the outbreak of the war had been German concerns over the rapidly growing population and military power of its enormous Russian neighbor to the east. Indeed, although the very powerful Social Democratic political block in the German parliament was strongly anti-militarist, its members were also intensely hostile to the Czarist regime, which their influential Jewish elements demonized as fiercely anti-Semitic, so the Russian threat was an important factor behind the near-total domestic political unity once war broke out. Meanwhile, important elements of the German military establishment had long favored waging a preventive war aimed at breaking Russian power before it became too overwhelming.

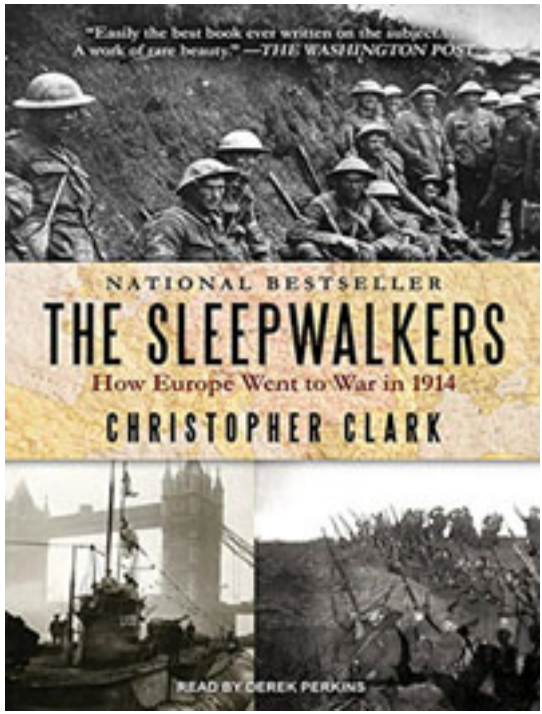
Major German victories during the first couple of years of fighting had led to the occupation of considerable Russian territory, and Jozef Pilsudski, Poland's George Washington figure, had organized an army of 20,000 Poles that fought side-by-side with the Germans. As a

consequence, the Germans decided to resurrect an independent Poland as a German client state more than a century after it had disappeared from the map, a geographical change that would greatly weaken Russia while providing a buffer against the latter's future westward expansion.

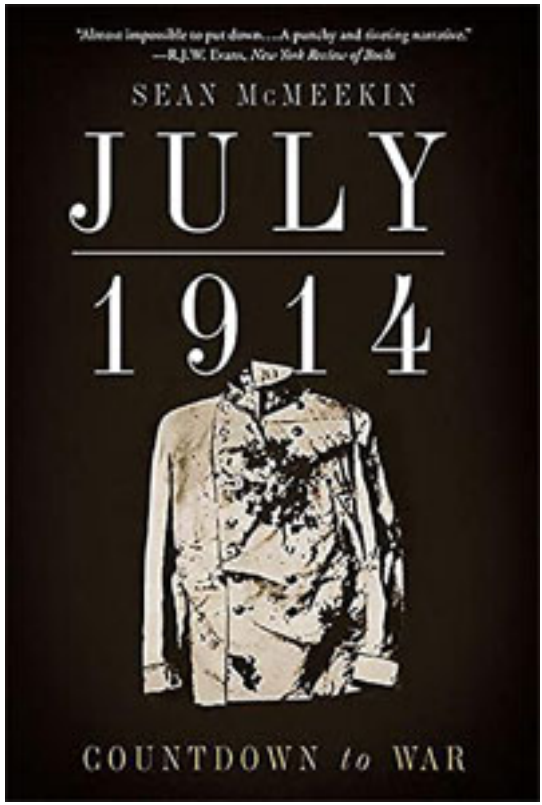
Although of relatively minor importance, one of Stoddard's most impressive sections is his discussion of the Balkans, home to several bitterly quarrelsome states, whose stories I had never previously seen treated, let alone analyzed in such intelligent detail. These countries had all fought wars against each other in 1912 and then again in 1913, and given the triggering 1914 events in Sarajevo, the Great War that followed might almost be regarded as merely a third consecutive Balkan round of fighting that unexpectedly brought in the rest of Europe.

As the author points out, prior to the Ottoman conquest and long occupation, each of the different Balkan peoples had at one time or another ruled a larger regional empire of their own, which they naturally sought to resurrect after Ottoman power receded. But all those previous Balkan empires had overlapped in territory, thus leading to bitter, conflicting claims, and the repeated rounds of new fighting between Bulgaria, Romania, Serbia, and Greece, all of which also coveted portions of the neighboring Austro-Hungarian and Ottoman empires, thereby contributing to the severe instability. Totally contrary to my assumptions, Stoddard explained that these individual countries actually had very different political and social profiles, with Bulgaria's characteristics being entirely different from those of neighboring Romania, for example, though they had always been lumped together in my mind.

Although Stoddard's book focused on the internal dynamics of the major European participants without directly addressing the exact causes of the conflict, his material generally supported the impression I'd always gotten from my textbooks that two heavily-armed and hostile alliances had blundered into a huge war, neither of them fully expecting or intending what eventually occurred. Just as Zelikow's detailed scholarship indicated that the US, Germany, and Britain had together fumbled away the possibility of peace in 1916, the European great powers had started the conflict a couple of years earlier in much the same fashion.



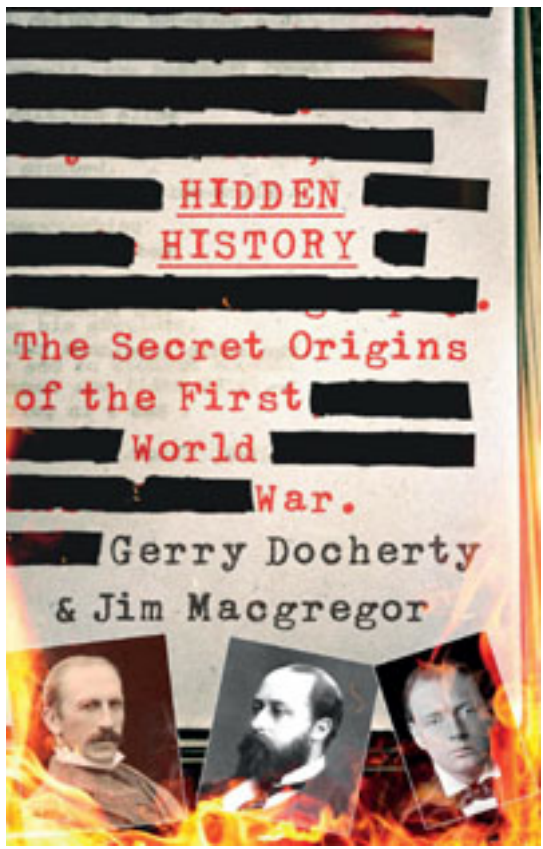
Two major historical volumes focusing on exactly that last topic had appeared about a decade ago, just before the hundredth-year anniversary, and they strongly reinforced that same conclusion with exhaustive scholarship. *The Sleepwalkers* by Christopher Clark and *July 1914: Countdown to War* by Sean McMeekin, together received a very lengthy and favorable front-page treatment in the *NYT Book Review* by Harold Evans, former editor of the *Times of London*. I'd read the first of these books a couple of years ago and the second just very recently, and found them both excellent, telling as they did a broadly similar story across their combined 1,100 pages.



McMeekin's very detailed narrative of the exact circumstances and decision-making process during July 1914 greatly emphasizes the extremely important role of unexpected, contingent factors that could so easily have diverted the history from its track. For example, just prior to the assassination in Sarajevo, Britain seemed on the very verge of violent civil war over Irish Home Rule, a conflict so bitter that it was weeks before the Cabinet even considered the developing situation in the Balkans, so if the events had occurred just a couple of months later, British military involvement might have been impossible. Similarly, by his strong initial stand against any attack on Serbia, the powerful Hungarian Prime Minister prevented the sort of immediate retaliatory strike that probably would have avoided bringing in other countries, unlike the eventual attack that came more than a month after the assassination; so the determined peace policy of a leading European statesman actually helped trigger the wider war. In all these countries, there were obviously powerful factions that had spent years pressing for war, but there were other powerful factions that felt otherwise, and the circumstances of the outbreak depended largely upon the particular decisions made.

Once the enormous conflict began, assigning the exact measure of

guilt for the calamity became a strategic objective during the years that followed, especially on the part of the Allies, with Clark even noting that both the French and the Russians created fraudulent documents that they then inserted into their own diplomatic archives. The scholarly dispute over relative war-guilt has continued unabated for more than a century now, and while neither of these books settles the matter, I do think that they provide a very solid factual basis, explaining exactly who did what and when, thereby allowing each of us to assign the appropriate quantity of guilt to those particular actions.



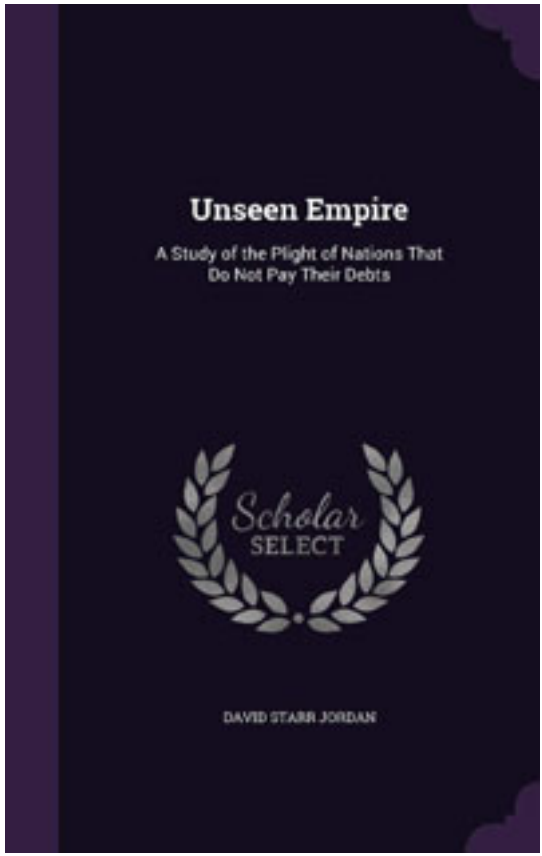
A very different sort of book on the same topic published almost simultaneously was *Hidden History* by amateur British historians Gerry Docherty and Jim Macgregor. Although totally ignored by the mainstream media, their extremely conspiratorial account of Britain's political leadership prior to the outbreak of the war has become wildly popular in many alternative circles, and I finally decided to read it a couple of years ago. Unfortunately, I was far from impressed by their analysis, and although they usefully described some of the machinations of the most aggressive British political faction, I think

they accorded it far more power than it probably possessed. I wrote my own appraisal in a comment after I'd only finished a chapter or two, but nothing in the remainder of the book would have altered my negative verdict:

> Well, I've seen numerous commenters give glowing endorsements of the Docherty/Macgregor book over the last year or more, so since I had it sitting around, I finally decided to take a look. So far, I haven't really been very impressed.
>
> As near as I can tell, their "revolutionary" hypothesis is that near the end of the 19th century a small group of individuals near the top of Britain formed a "secret society" with the central goal of greatly enhancing the power and wealth of the British Empire, sometimes using ruthless or dishonest means, and permanently dominate the world.
>
> Is that really so remarkable? Suppose the "secret society" had never been formed? Wouldn't we naturally assume that the normal, run-of-the-mill leaders of Britain would be doing their best to enhance the power and wealth of the British Empire? Wouldn't it be much more shocking if they weren't?
>
> Should someone write a book: "Top executives at Google are secretly trying to expand Google's wealth and power and gain dominance over the entire Internet." Or "Top executives at Goldman Sachs are secretly trying to expand Goldman's wealth and power and permanently dominate Wall Street."
>
> Neither Docherty nor Macgregor seem professional historians, and they're certainly correct in attempting to refute the "legend of German villainy," but I think that lots and lots of professional historians have already done that.
>
> Decades ago, my ordinary high school texts emphasized that one of the main factors behind WWI was Britain's fears of a rising Germany. And it's also true that another major factor was Germany's fears of a rising Russia. Historians have endlessly argued about the relative weighting of all these different factors, but everyone's certainly aware of them.

In sharp contrast, a different book published just over a century earlier might today be seen as a product of the conspiratorial fringe, but it was certainly not viewed that way at the time, given that the author was widely regarded as one of America's leading public

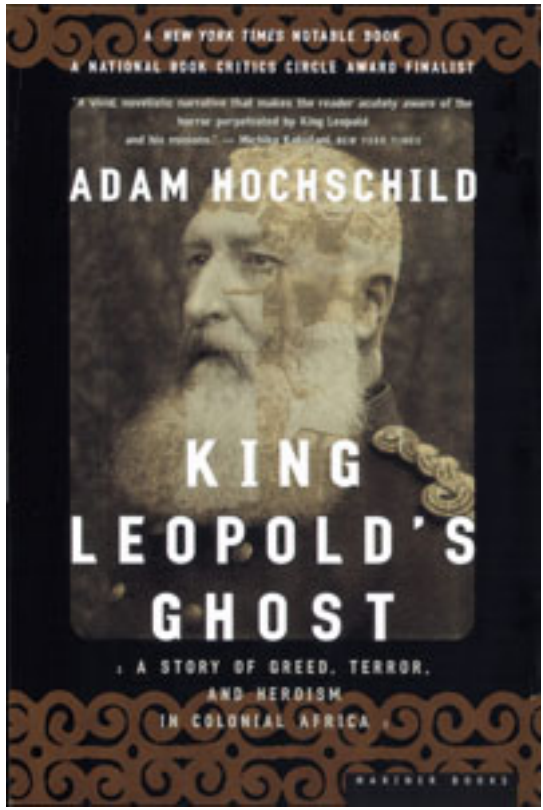
intellectuals and the work was favorably discussed in the influential *Literary Digest*. David Starr Jordan was the founding president of Stanford University, a biological scientist by training who had published at least ninety-odd books, mostly of a scientific nature but also including works of broader public policy.



*Unseen Empire*, which appeared in 1912, fell into that latter category and argued that although the United States and the major European powers remained nominally sovereign, their heavy, unproductive military spending had gradually bound them into tight coils of debt, leading most of them to quietly become political vassals of a network of powerful financiers, the "unseen empire" of the title. So instead of kings, parliaments, or kaisers, the true rulers of Europe were a set of interconnected and intermarried banking dynasties, almost all of them Jewish: the Sterns and Cassels of Britain, the Foulds and Pereires of France, the Bleichroders of Germany, the Gunzburgs of Russia, the Hirsches of Austria, the Goldschmids of Portugal, the Camondos of Turkey, the Sassoons of the Orient, and above all of them, the Rothschilds of London and Paris.

Although in today's world, such a description might seem insane or at least incendiary, Jordan presented it rather matter-of-factly without rancor, and indeed that particular claim didn't even constitute the main theme of his analysis. The Stanford University President firmly regarded modern warfare as disastrous for a society, but also argued that wars had become so ruinously expensive that they could not last for long. Moreover, since the true financial owners of Europe believed that they were bad for business, no major wars would be permitted to break out.

Obviously, Jordan's predictions were exploded just a couple of years later, but subsequent events did provide some hints that his analysis was not entirely mistaken. For example, according to Stoddard's account, much of Britain's wealthy Jewish elite, often having German roots like the Rothschilds, was widely regarded as being in the peace camp, so much so that in 1916 hard-line publications regularly denounced the country's German-Jewish financiers as undercutting Brtain's continuing military resolve. Similarly, Zelikow reports that Paul Warburg, the German-Jewish vice chairman of America's Federal Reserve, was an enthusiastic supporter of Wilson's efforts to pressure Britain into making peace, including discouraging American banks in late 1916 from making the additional loans that Britain required to purchase supplies. In private communications, the strongly pro-British head of the J.P. Morgan banking empire denounced that decision and argued for a public attack on the German-Jewish influence that he believed was behind this peace policy. Similarly, many of the wealthy Jewish interests in Germany were generally in the peace camp. So Jordan's main mistake was probably to overestimate the political power of Europe's dominant financial interests.



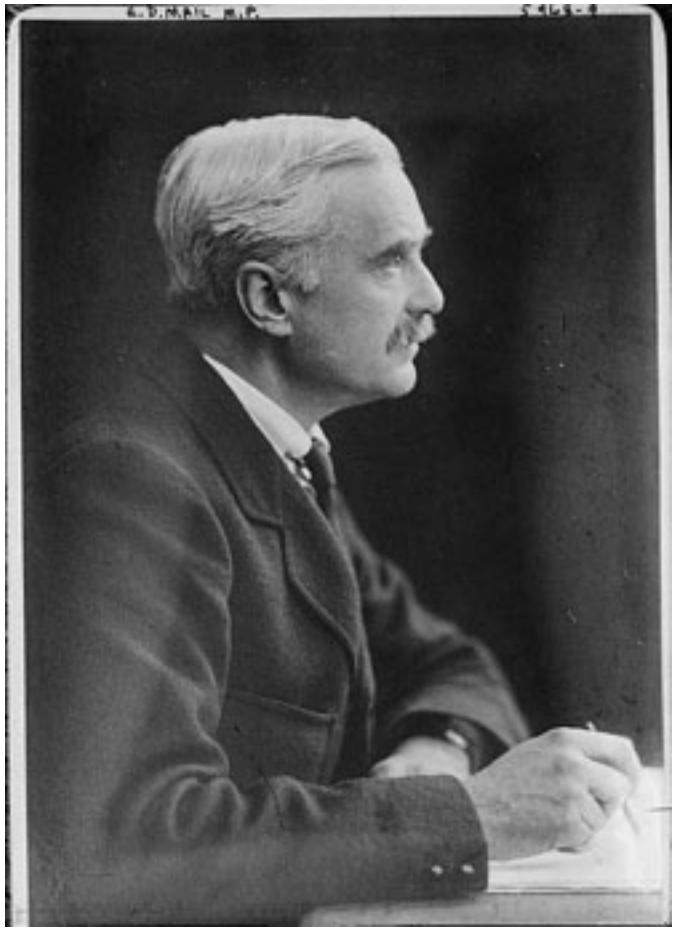
A NEW YORK TIMES NOTABLE BOOK
A NATIONAL BOOK CRITICS CIRCLE AWARD FINALIST
ADAM HOCHSCHILD
KING LEOPOLD'S GHOST
A STORY OF GREED, TERROR, AND HEROISM IN COLONIAL AFRICA

This extended discussion of the Great War was prompted after I read Hochschild's book on the British anti-war movement, and I'd decided to do so because I'd been very impressed with his previous, award-winning bestseller *King Leopold's Ghost*, which I'd read earlier this year. That latter work recounted the vivid history of the Belgian Congo and the horrific mistreatment of its inhabitants, which may have claimed the lives of up to ten million Africans, with Hochschild also telling the story of the British-led international moral crusade against those crimes, privately organized by E.D. Morel, a journalist, and Roger Casement, a civil servant. Their final victory came just a year before war broke out, and Hochschild's last two chapters constitute an extended epilogue, including a description of the sad wartime fates suffered by his pair of champions.

At the time of the Sarajevo assassination, both Morel and Casement were towering international heroes, with the latter having even been knighted for his humanitarian achievements. But both were firmly opposed to the war and generally sympathetic to Germany's position, and their public standing quickly collapsed, merely one of the many ironies that Hochschild describes.

One of the worst horrors that the colonial Belgians had inflicted upon the Congolese was chopping off the hands of those Africans who failed to meet their work-quotas or otherwise disobeyed, and photographs of the atrocity victims had triggered outrage across the globe. But in August 1914, the German army invaded Belgium, and the Belgians were suddenly transformed from monsters to martyrs, with British propagandists soon falsely claiming that the Germans were chopping off the hands of disobedient Belgians. For many years, the story of the millions of Africans who died in the horrors of the Belgian Congo had been the world's leading humanitarian issue, but Hochschild plausibly argues that the sudden wartime propaganda-elevation of Belgians to unrivaled global victimhood status probably explains why that earlier story so quickly faded from public awareness until being eventually revived a half-century later.

Casement himself was Irish and his efforts to free the Congolese had brought him public honors and acclaim; but when he began seeking German help to free his own country from British rule, he was hanged for treason, becoming the first holder of a British knighthood to suffer that fate in hundreds of years. Morel similarly fell from grace for his anti-war writings, and after he sent a copy of one of his pamphlets to his pacifist friend, Romain Rolland, a French Nobel Laureate in literature living in Switzerland, he received six months of brutal imprisonment, which permanently broke his health.



However, once the war ended, British sentiments changed, and the newly rising Labour Party considered Morel a wronged hero and nominated him as a candidate for Parliament. As a young Cabinet Minister, Winston Churchill had played a crucial role in leading Britain into the world war, and in a remarkable symbolic turnabout, Morel now defeated him for reelection in 1922, taking his seat in the House of Commons. Morel was one of Labour's leading spokesmen on foreign affairs and according to Hochschild, he was expected to be named Foreign Minister in Ramsay MacDonald's new Labour government of 1922, but MacDonald decided to keep the portfolio in his own hands, perhaps because he feared Morel might overshadow him as a political rival. However, Morel's political fairy tale had a less than happy ending, for although he was easily reelected in 1924, his harsh wartime imprisonment had destroyed his health and he died later that year at the unripe age of 51.

I had never previously heard of Morel and found his story a

fascinating one, but when I consulted his Wikipedia page I discovered that much of the long entry focused on aspects of Morel's postwar activism that the book had avoided mentioning, presumably for ideological reasons. In his epilogue chapters, Hochschild had rightly denounced the hypocrisy of the major European powers, which were willing to condemn the brutal treatment of Africans under Belgian colonial rule while ignoring the fact that they often behaved in a similar manner in their own African colonies. But he must have found Morel's extreme lack of any such hypocrisy troubling for other reasons, so the last major project of that remarkable man's career was excluded from his hagiography.

Morel heavily blamed France and Czarist Russia for the war and regularly condemned the extremely punitive terms of the Treaty of Versailles from the pages of Britain's *Foreign Affairs* journal, an influential Labour publication that he directed, condemning, for example, the mutilation of Hungary, which had lost two-thirds of its territory.

But according to Wikipedia, his most important postwar project was launching the international "Black Shame" campaign, denouncing the horrific atrocities committed by France's African colonial troops against the helpless German civilians of the occupied Rhineland, including widespread rape and murder. Wikipedia entries are usually heavily sanitized, so portions of this very surprising entry are worth quoting at length:

> In a front-page article in *The Daily Herald* on 9 April 1920 by Morel about the French occupation of the Rhineland, the headline read, ": "Frankfurt runs red with blood French Blood Troops Use Machine-guns on Civilians".[42] The following day, the same paper had another cover story by Morel, the title of which was "Black Scourge In Europe Sexual Horror Let Loose by France On Rhine Disappearance of Young German Girls". In it, Morel wrote that France is "thrusting her black savages into the heart of Germany" and that the "primitive African savages, the carriers of syphilis, have become a horror and a terror" to the Rhinelanders.[42] In his article, Morel claimed that the Senegalese soldiers serving in the French Army were "primitive African barbarians" who "stuffed their haversacks with eye-balls, ears and heads of the foe".[43] Morel declared in his article:
>
> > "There [the Rhineland] they [the Senegalese soldiers] have become a terror and a horror unimaginable to the countryside, raping girls and women – for well known

> physiological reasons, the raping of a white woman by a negro is nearly always accompanied by serious injuries and not infrequently has fatal results; spreading syphilis, murdering inoffensive civilians, often getting completely out of control; the terrible barbaric incarnation of a barbarous policy, embodied in a so-called peace treaty which puts the clock back 2,000 years".[43]

> Morel wrote that "black savages" have uncontrolled sexual impulses that "*must be satisfied upon the bodies of white women!*" (emphasis in the original).[44]

> The phrase that Morel coined to describe the alleged terror by Senegalese troops in the Rhineland was the "Black Horror on the Rhine", which became internationally famous, and the campaign against the "black horror" took much of his time for the last four years of his life.[45] Morel predicated the "black horror" would cause another world war, writing that the average German boy was thinking: "*Boys these men raped your mothers and sisters*" (emphasis in the original).[46] Morel used the "black horror" as a way of attacking France, which he claimed had caused a "sexual horror on the Rhine" and whose "reign of terror" was a "giant evil" that should inspire "shame into all four corners of the world" and ultimately should "a revision of the Versailles Treaty and the relief for Germany".[47]

The somewhat censorious Wikipedia article condemns Morel for his blatant racism and cites a German sociologist who argues that those same sentiments had actually governed his earlier Belgian Congo activism as well. But this new Rhineland campaign was soon followed by his rise within the British Labour Party and his electoral triumph over Churchill, so both British Socialists and British voters apparently gave a different verdict. Moreover, Adolf Hitler soon alluded to some of Morel's accusations in the pages of *Mein Kampf*, though in much less blood-curdling fashion, and those brief, mild passages have often been cited as proof of the German dictator's deep racism.

Hochschild is a committed racial liberal, whose lifelong support for blacks in the American South and under Apartheid dominated his early career, and this easily explains why he elevated Morel to heroic stature for his international campaign to end European atrocities against Africans in the Belgian Congo. But it equally well explains why he excluded any mention of his moral exemplar's final humanitarian crusade, this time focused on African atrocities against Europeans, which was contemporaneous with similar political projects

by the KKK in America and may have even played an important role in inspiring Adolf Hitler.

# An Authorized Political History of the 1960s and 1970s

*The Unz Review* • December 5, 2022 • 9,900 Words

## The Edward Gibbon of the Conservative Movement

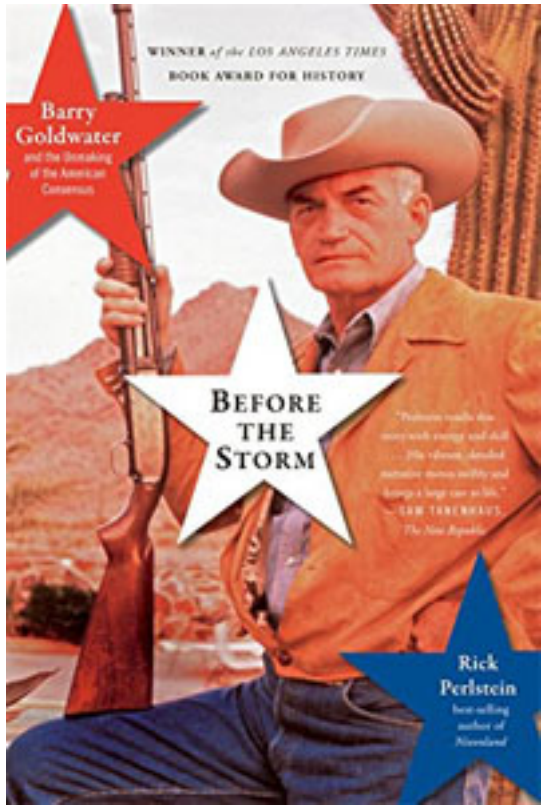
In my younger years, Edward Gibbon's *Decline and Fall of the Roman Empire* was the byword for massive histories.

I'd never read it myself nor even knew of anyone who had, but that famous six volume work from the 18th century was almost synonymous with exhaustive length, though its nearly 4,000 pages hardly seemed excessive given that it told the story of the greatest empire Europe had ever known. Indeed, consulting the Internet I've now discovered that well over half the length was actually devoted to events taking place long after the traditional Fall of Rome in 476 A.D., including the Islamic conquests, the rise of the Mongol Empire, and the histories of the Byzantines and the Turks extending to 1590. So perhaps only about 1,700 pages were devoted to the empire ruled by Rome.

In our own day and age, historian Rick Perlstein has labored to produce a tetralogy of similar weight, documenting the rise of the modern conservative movement to the election of Ronald Reagan in 1980. Each of his four volumes is of doorstop heft, and including notes the combined work runs well over 3,500 pages. In 2002 one of his early reviewers had hailed him as the Herodotus of the modern American Right, but perhaps calling him their Gibbon might have been more appropriate. Indeed, in many respects, Perlstein's research and writing puts the work of his illustrious British predecessor to shame when we consider that he devotes twice as many deeply-researched pages to two decades of a transient American ideological movement as the latter did to the five century lifespan of the fabled Empire of the Caesars.

Beginning in 2001 I'd regularly read the mostly glowing reviews of Perlstein's opus as each volume successively emerged and most of these had been sitting on my bookshelves for the last half-dozen years. Even leaving aside the story of American conservatives, the years from 1960 to 1980 were among the most tumultuous in our history, encompassing the Cuban Missile Crisis, the Kennedy

Assassination, the Vietnam War, the racial upheavals of the 1960s, and Watergate. So a few months ago I finally decided to tackle his tomes, hoping to fill the large gaps in my own knowledge of modern American political history, and the reading project absorbed around three weeks of my time.



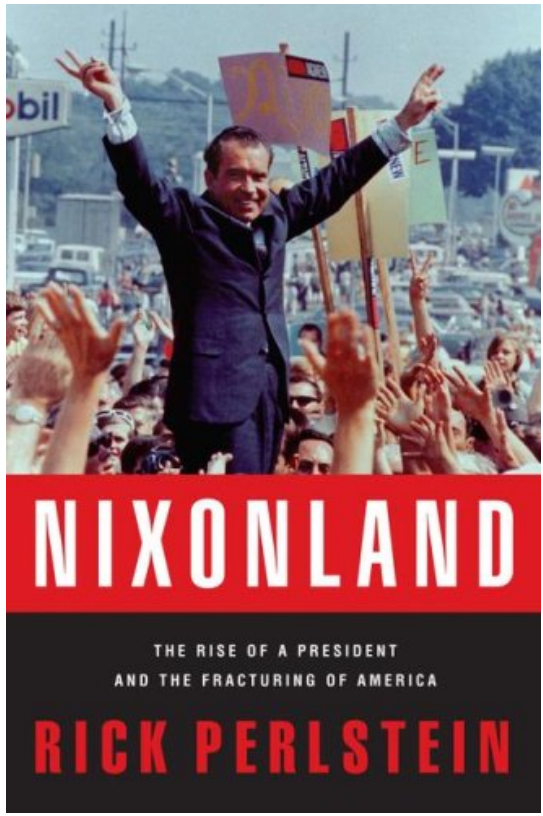
WINNER of the LOS ANGELES TIMES
BOOK AWARD FOR HISTORY
Barry Goldwater
and the Unmaking of the American Consensus
BEFORE THE STORM
Rick Perlstein
best-selling author of Nixonland

The first book in Perlstein's series recounted the rise of conservative icon Sen. Barry Goldwater from the late 1950s through his landslide defeat at the hands of President Lyndon Johnson in 1964, thereby also covering the very close 1960 Kennedy-Nixon election.
Although *Before the Storm* was by far his shortest volume, it still ran nearly 700 pages, including over 150 pages of notes and index, and it received exceptionally favorable reviews from both the Left and the Right, winning the *Los Angeles Times* Book Prize for History and making the author's reputation. Prominent conservatives expressed astonishment that a writer of self-proclaimed Democratic Socialist inclinations could treat their own movement with such scrupulous fairness and even uncover so many interesting historical details previously unknown to them. My own paperback edition had been released by *Nation* books and highlighted a glowing blurb by former *National Review* publisher William Rusher, with numerous other

accolades from across both sides of the ideological aisle.

*Nixonland* then appeared in 2008, covering the political revival and Presidency of that title figure through the end of the Vietnam War in 1973; *The Invisible Bridge* in 2014, recounting the fall of Nixon, the Ford Presidency, and the rise of Ronald Reagan, including his failed attempt to unseat a sitting President in the 1976 Republican Primaries; and *Reaganland* in 2020, describing the rise and Presidency of Jimmy Carter, and ending with his 1980 loss to Reagan. Each successive volume was longer than the last, while sometimes covering fewer years. And although the reactions became somewhat less uniformly glowing—many mainstream conservatives took angry exception to some of Perlstein's negative appraisals of the Reagan whom they idolized—the overview verdict in the couple of dozen reviews I read was still very strongly positive.

Although I already knew all of this history in basic outline and had personally been following American politics from about the later Ford years onward, I encountered a vast quantity of important material previously unknown to me. The two decades culminating in the 1980 election were a turbulent time in American political life, while the careers of Goldwater, Nixon, and Reagan had shaped the Republican Party and our nation as a whole, and the three weeks I invested greatly multiplied my knowledge of that era. Whether or not one agrees with all of Perlstein's interpretations, the wealth of information he provides across his thousands of pages seems an invaluable resource for anyone interested in American history, and I'd strongly recommend his books to others.



Some particular insights stand out. Since FDR's New Deal Era of the 1930s, white urban ethnics—Irish, Italians, and Slavs—had been a core constituency of the dominant Democratic Party coalition, but beginning in the late 1960s, the growing crime and social disorder of our urban centers began pushing them away, and this helped account for Nixon's huge 1972 landslide reelection and also Reagan's 1980 triumph. All of this was certainly known to me, but Perlstein's diligent research demonstrates that particularly during the period covered by *Reaganland*, the reigning Democratic Party elites could not quite believe what was happening, failing to recognize that their once-solid base of political power was permanently slipping away, while the Republicans themselves were often slow to take advantage of the opportunity. I read these passages during the latter stages of the 2022 midterm elections, and noted the eerie parallels to what currently seemed to be happening with America's Hispanic and Asian voters, as I recently discussed in an article.

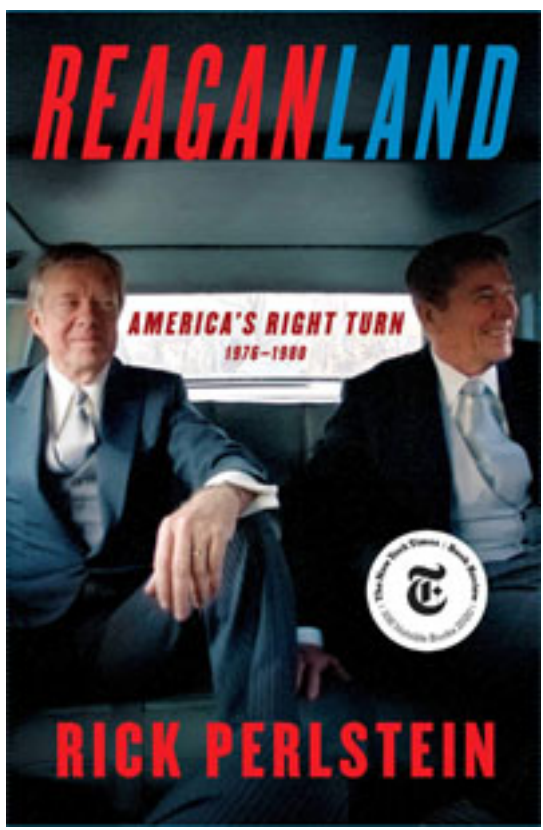
A good example of this situation came in Boston, home to the Kennedys and a long a Democratic Party stronghold, as the forced busing of public school students between the Irish and black neighborhoods sparked a political revolt of the former group, led by

School Board Member Louise Day Hicks. I'd always vaguely assumed that Hicks was a crude rabble-rouser, the George Wallace of Irish Boston, but according to Perlstein, she was "a genteel lady," who merely stood with her outraged constituents, and despite the harsh attacks of the national media, she soon came very close to unseating the incumbent Democratic mayor of her city by running on an anti-busing platform.

I encountered numerous fascinating political vignettes previously unknown to me but set forth in great detail by Perlstein's exhaustive research. For example, I'd never realized that Phyllis Schlafly—although well-educated and politically-engaged—had been an Illinois housewife raising five children and pregnant with her sixth when Goldwater's campaign had inspired her to self-publish her own short book; and without placing a single advertisement or contacting a book store, over 600,000 copies of *A Choice Not an Echo* were circulating by the time of the 1964 Republican Convention. With that powerful start, she soon became an influential figure on the Republican Right, going on to play a central role in the totally unexpected defeat of the feminist Equal Rights Amendment during the 1970s. Perlstein even argues that she had "become perhaps the most effective political

organizer that the right had ever known."

I'd vaguely been aware that singer Anita Bryant had led a campaign to repeal a local Gay Rights ordinance in Florida during the 1970s, but hadn't realized that she'd won by nearly a 70% landslide vote in liberal Dade County, despite overwhelming financial and political resources on the other side. Moreover, her 1977 victory soon inspired a string of copycat measures the following year in other strongly liberal cities such as St. Paul, Minnesota and Eugene, Oregon, which also racked up 2-to-1 victories against similar odds, while she was nearly elected vice president of the huge Southern Baptist Convention. This pattern of conservative wins was finally broken when her allies overplayed their hand and the far more intrusive Briggs Initiative was placed on the California ballot by a state senator hoping to ride the issue to the governorship; despite its strong early lead in the polls, former Gov. Reagan was persuaded to come out against it and many other prominent conservatives soon followed in his wake, so it lost by a wide margin.



I'd always remembered that President Jimmy Carter's July 1979 "Malaise" speech on the energy crisis had been a political disaster that

helped doom his reelection chances the following year. Not so according to Perlstein, who notes in *Reaganland* that his national address had actually produced an unprecedented rise in public support, with his approval rating jumping eleven points in poll and seventeen points in another, before his disastrous mistake of purging his Cabinet destroyed his standing.

That same volume ultimately closed with Ronald Reagan's triumph in the 1980 elections, and the author provided this striking passage describing the widely-perceived front-runner in the Republican primaries of the preceding year:

> The men rising to challenge Jimmy Carter did not generally resemble superheroes. Most were painfully bland. No surprise, then, that the first to emerge from the pack was the most charismatic of the bunch—who practically had leadership tattooed on his forehead.
>
> He was often photographed on his ranch, astride a horse. He grew up poor in the hinterlands, became a big man on campus in college, took a Hollywood screen test at the height of the Depression, and had served as a governor in the booming Sun Belt. He appeared the exact match for what a dejected nation desired in their president—not least in the way he held himself aloof from Washington, which he called a "jungle."
>
> Editors sent journalists to capture him for their readers in profile after profile after profile, which all turned out almost exactly the same. They talked about his "carriage," and how he was "always absolutely in control of himself." How he bore an "actor's control over his body," and was "never out of character." ("Even in an airplane or an automobile he sits so erect that he resembles one of those inflatable dummy passengers used in safety tests.") Producers of television commercials particularly admired him. In his memoir of the 1976 campaign, Gerald Ford's adman Mal MacDougall told of cutting a Ford commercial with this exemplary specimen under trying conditions at a state fair. The first take was virtually perfect—except that it ran four seconds too long. MacDougall offered to cut a few words from the script.
>
> "No," the performer answered. "I'll just shorten my drawl."
>
> The director called "Action!" The performer recited his lines precisely four seconds more expeditiously. MacDougall recorded his awe at how good he looked, "that tanned Texas face, the

> silver hair, the clean white shirt."
>
> The man was not Ronald Reagan. He was John Connolly of Texas.

Although I'd already been following politics at the time, I'd never realized that most shrewd political experts believed that Democrat-turned-Republican and Nixon protege John Connolly would be the GOP nominee in 1980, while they discounted Reagan's chances because he was too old, a Republican has-been. Partly for this reason, Connolly successfully raised a then-unprecedented $11 million in funding, but he ultimately captured only a single delegate, and Perlstein tells the vivid story of that epic political disaster.

## Conservative Paranoia and Communist Spies

Perlstein has devoted perhaps a quarter-century of his life to exhaustively researching and documenting a somewhat shorter period of American political history, and although his analysis of events can certainly be disputed, the massive narrative he provides will surely become the starting point for those in the future who wish to recapture the sense of that period.

Our media creates our popular reality, and in a later column Perlstein explained that in order to properly understand how the Americans of that era viewed the world and its politics, he had traveled thousands of miles visiting national video archive centers then spending hundreds of hours watching the television broadcasts that shaped popular perceptions, such as every national newscast mentioning Ronald Reagan between 1967 and 1975; he also read enormous numbers of the contemporaneous newspaper stories, now conveniently put online by Google. His project is unlikely to ever be matched in its thoroughness, and I noticed only the most trivial mistakes, such as when he repeatedly misidentified former LA Police Chief Ed Davis as the LA County Sheriff in his *Reaganland* volume. I have no reason to doubt that his factual content he provides is better than 99.9% accurate.

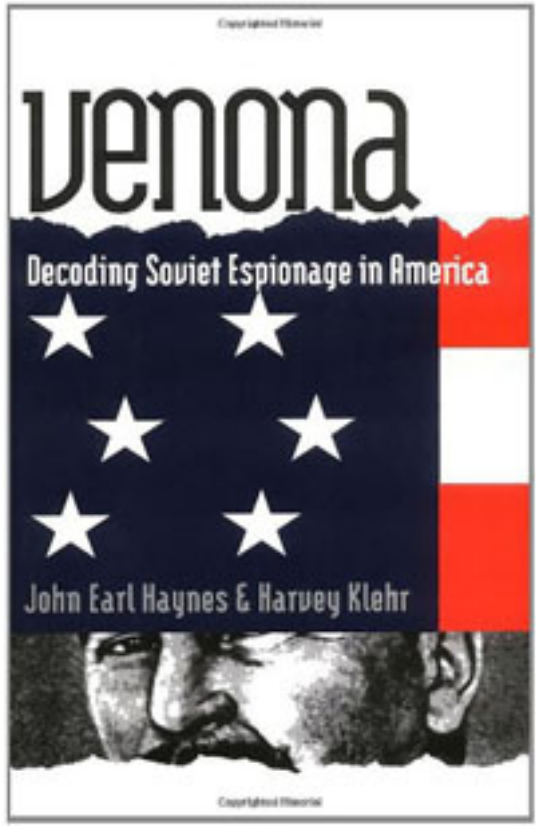
But history can just as easily be distorted by excluding or minimizing certain sufficiently important facts as by misrepresenting others, and here I noticed some serious problems in Perlstein's enormously detailed work when I first began examining it, problems that I also found across his other volumes. Perhaps partly because of his research techniques, the author has produced a "media consensus"

narrative of American political history, seeming to leave out those elements that the media of the time ignored unless they were eventually resurrected and elevated in the revised media consensus of the present day.

Such an approach may correctly explain what most ordinary Americans back then believed or what they believe about the past today, but sometimes the actual reality of what happened is different in startling ways. Interestingly enough, none of the dozens of major reviews I read reported any of these issues, presumably because all of the reviewers, whether Left and Right, favorable or critical, were bound by the limitations of the same media consensus as Perlstein himself.

These enormous, gaping holes became immediately apparent to me from the very early pages of his first, universally-praised volume on Goldwater. His story there was the early rise of the American conservative movement in the 1950s eventually leading to the Goldwater phenomenon, which had some of its crucial roots in the irrational paranoia of many of its leading figures, who had become alarmed by the actions of the earlier Roosevelt Administration and lived in mortal dread of phantom Communist conspiracies during the 1950s.

Yet right around the time that Perlstein was beginning his historical research, the declassification of the Venona Papers had unleashed a flurry of books by leading academic scholars that absolutely confirmed the conservative claims that Perlstein had so blithely dismissed. In 2018 I summarized some of these issues that I later discovered, including a sharp criticism of Perlstein's unwillingness to acknowledge these important realities:



I soon read three or four of the Venona books and was very impressed by their objective and meticulous scholarly analysis, which convinced me of their conclusions. And the implications were quite remarkable, actually far understated in most of the articles that I had read.

Consider, for example, the name Harry Dexter White, surely unknown to all but the thinnest sliver of present-day Americans, and proven by the Venona Papers to have been a Soviet agent. During the 1940s, his official position was merely one of several assistant secretaries of the Treasury, serving under Henry Morgenthau, Jr., an influential member of Franklin Roosevelt's cabinet. But Morgenthau was actually a gentleman-farmer, almost entirely ignorant of finance, who had gotten his position partly by being FDR's neighbor, and according to numerous sources, White actually ran the Treasury Department under his titular authority. Thus, in 1944 it was White who negotiated with John Maynard Keynes—Britain's most towering economist—to lay the basis for the the Bretton Woods Agreement, the IMF, and the rest of the West's post-war economic institutions.

Moreover, by the end of the war, White had managed to extend the power of the Treasury—and therefore his own area of control—deep into what would normally be handled by the Department of State, especially regarding policies pertaining to the defeated German foe.

The particular timing of events may sometimes exert an outsize influence on historical trajectories. Consider the figure of Henry Wallace, probably still dimly remembered as a leading leftwing Democrat of the 1930s and 1940s. Wallace had been something of a Midwestern wonder-boy in farming innovation and was brought into FDR's first Cabinet in 1933 as Secretary of Agriculture. By all accounts, Wallace was an absolutely 100% true-blue American patriot, with no hint of any nefarious activity appearing anywhere in the Venona Papers. But as is sometimes the case with technical experts, he seems to have been remarkably naive outside his main field of knowledge, notably in his extreme religious mysticism and more importantly in his politics, with many of those closest to him being proven Soviet agents, who presumably regarded him as the ideal front-man for their own political intrigues.

From George Washington onward, no American president had ever run for a third consecutive term, and when FDR suddenly decided to take this step during 1940, partly using the ongoing war in Europe as an excuse, many prominent figures in the Democratic Party launched a political rebellion, notably including his own two-time Vice President John Nance Garner, who had been a former Democratic Speaker of the House, and James Farley, the powerful party leader who had originally helped elevate Roosevelt to the presidency. FDR selected Wallace as his third-term Vice President, perhaps as a means of gaining support from the powerful pro-Soviet faction among the Democrats. But as a consequence, even as FDR's health steadily deteriorated during the four years that followed, an individual whose most trusted advisors were agents of Stalin remained just a heartbeat away from the American presidency.

Under the strong pressure of Democratic Party leaders, Wallace was replaced on the ticket at the July 1944 Democratic Convention, and Harry S. Truman succeeded to the presidency when FDR died in April of the following year. But if Wallace had not been replaced or if Roosevelt had died a year earlier, the consequences for the country would surely have been enormous. According to later statements, a Wallace Administration would have included Laurence Duggan as Secretary of State, Harry

Dexter White at the helm of the Treasury, and presumably various other outright Soviet agents occupying all the key nodes at the top of the American federal government. One might jokingly speculate whether the Rosenbergs—later executed for treason—would have been placed in charge of our nuclear weapons development program.

As it happens, Roosevelt lived until 1945, and instead of running the American government on behalf of Stalin, Duggan and White both died quite suddenly within a few months of each other after they came under suspicion in 1948. But the tendrils of Soviet control during the early 1940s ran remarkably deep.

As a striking example, Soviet agents became aware of the Venona decryption project in 1944, and soon afterward a directive came down from the White House ordering the project abandoned and the records of Soviet espionage destroyed. The only reason that Venona survived, allowing us to later reconstruct the fateful politics of that era, was that the military officer in charge risked a court-martial by simply ignoring that explicit Presidential order.

In the wake of the Venona Papers, publicly released a quarter century ago and today accepted by almost everyone, it seems undeniable that during the early 1940s America's national government came within a hairsbreadth—or rather a heartbeat—of falling under the control of a tight network of Soviet agents. Yet I have only very rarely seen this simple fact emphasized in any book or article, even though this surely helps explain the ideological roots of the "anti-Communist paranoia" that became such a powerful political force by the early 1950s.

Obviously, Communism had very shallow roots in American society, and any Soviet-dominated Wallace Administration established in 1943 or 1944 probably would sooner or later have been swept from power, perhaps by America's first military coup. But given FDR's fragile health, this momentous possibility should certainly be regularly mentioned in discussions of that era.

If important historical matters are excluded from the media, a younger generation of scholars may never encounter them, and the historiography they eventually produce with the best of intentions may contain enormous lacunae. Consider, for example, the prize-winning volumes of political history that Rick Perlstein has written since 2001, tracing the rise of American conservatism from the pre-Goldwater era up to the rise of Reagan in the 1970s.

> The series has justly earned widespread acclaim for its enormous attention to detail, but according to the indexes, the combined total of nearly 2,400 pages contains merely two glancing and totally dismissive mentions of Harry Dexter White at the very beginning of the first volume, and no entry whatsoever for Laurence Duggan, or even more shockingly, "Venona." I've sometimes joked that writing a history of post-war American conservatism without focusing on such crucial elements is like writing a history of America's involvement in World War II without mentioning Pearl Harbor.

So the undeniable reality is that just the decade before the beginning of Perlstein's narrative, control of America's federal government had very nearly been seized by a network of Stalinist agents. These facts went entirely unreported in the mainstream media of the time and are just as widely ignored today, so both Perlstein and most of his reviewers either seem blissfully unaware of them or at least try to pretend that they are. But they were widely believed or at least suspected by the conservative activists who are the early protagonists of Perlstein's narrative, and that probably helped to explain their apparent "paranoia."

As I mentioned in that same 2018 article, the history of the Roman Empire was replete with dramatic, conspiratorial events, and I'd always naively assumed that these had been lacking in our own recent history, which was why I'd found the subject so much less engrossing:

> However, I never had any interest in 20th century American history. For one thing, it seemed so apparent to me that all the basic political facts were already well known and conveniently provided in the pages of my introductory history textbooks, thereby leaving little room for any original research, except in the most obscure corners of the field.
>
> Also, the politics of ancient times was often colorful and exciting, with Hellenistic and Roman rulers so frequently deposed by palace coups, or falling victim to assassinations, poisonings, or other untimely deaths of a highly suspicious nature. By contrast, American political history was remarkably bland and boring, lacking any such extra constitutional events to give it spice. The most dramatic political upheaval of my own lifetime had been the forced resignation of President Richard Nixon under threat of impeachment, and the causes of his departure from office—some petty abuses of power and a subsequent cover-up—were so clearly inconsequential that they fully affirmed the strength of our

> American democracy and the scrupulous care with which our watchdog media policed the misdeeds of even the most powerful.
>
> In hindsight perhaps I should have asked myself whether the coups and poisonings of Roman Imperial times were accurately reported in their own day, or if most of the toga-wearing citizens of that era might have remained blissfully unaware of the nefarious events secretly determining the governance of their own society.

Gibbon's famous history would have been far less interesting and less accurate if all these dramatic developments had been struck from the text. And as I carefully read Perlstein's four volumes, I increasingly realized that if he were the Gibbon of our recent American past, his text might represent a heavily expurgated Gibbon, excluding so many of the elements that were likely to challenge or offend the mainstream media consensus. Celebrities often release "authorized" biographies, and perhaps Perlstein's volumes should be regarded as the authorized political history of an important two decade period.

## The Return of the American POWs from Vietnam

I'd only been a child at the end of the Vietnam War, and until the last dozen years or so, I'd never paid much attention to that conflict. That war and the growing war-weariness of the American public was a major element of Perlstein's second volume, *Nixonland*, greatly influencing the political collapse of the Johnson Administration and the election of Richard Nixon in 1968, who then inherited a conflict that seemingly could not be won but that he believed would be disastrous for our country if it ended in an outright American defeat.

The new President was facing a powerful anti-war movement that had already brought down his predecessor, and after years of fighting, few Americans had a clear idea of why we were there, with our original war aims having evaporated. So as Perlstein tells the story, Nixon's audacious strategy was to refocus public attention upon the sad fate of the many hundreds of American POWs being held by the Vietnamese, suggesting that the true aim of our continuing war effort was to gain the return of the servicemen previously captured because we were fighting it. Although our Vietnamese opponents said they were certainly willing to return these men as part of a peace agreement

once we left their country, Nixon regularly suggested otherwise, and in politics, emotion often trumps logic, especially when emotion is backed by control of the media megaphone.

This volume ended with Nixon's 1972 reelection landslide, and *The Invisible Bridge* released in 2014 began with the signing of the peace agreement and a chapter describing the triumphal return of the Vietnam POWs in "Operation Homecoming," with most of an additional chapter also given over to that same subject. It is obvious that Perlstein utterly despised Nixon and the cynical and deceptive strategy the latter had used in exploiting the issue of the POWs to outmaneuver his political opponents, thereby continuing a war that could have been ended on similar terms years sooner, probably saving many tens of thousands of lives; and the author clearly relished the shift of his narrative to Watergate and the President's subsequent downfall. But the true story of what happened was probably far darker and more cynical than what our "hypercaffineinated Herodotus" could willingly admit in the pages of his history.

As Perlstein emphasized, by the end of the war Nixon had successfully established the safe return of all our POWs as our overriding national objective, so the entire country basked in the triumph of their return once the planes began to touch down in 1973. But there is actually very strong evidence that only about half the POWs were ever returned, with the others living out the remainder of their lives in miserable Vietnamese captivity while Nixon and his accomplices suppressed this truth in order to desperately claim a victory as the growing Watergate Scandal threatened his political survival. Our media, both at the time and during the decades that followed, have been entirely complicit in concealing this outrage, one of the most shameful incidents in American history, and rather than setting the story straight, Perlstein clings to the standard narrative of this cover-up, never raising a word of doubt, even though it protects the reputation of a President whom he deeply loathes.

The remarkable facts had originally appeared during the course of the 2008 Presidential election, but received little attention at the time. However, in 2010 I republished that stunning expose as the centerpiece of a cover symposium in my own *American Conservative* magazine, introduced by a short essay of my own, from which the following passages are taken:

> In the closing days of the 2008 presidential campaign, I clicked an ambiguous link on an obscure website and stumbled into a parallel universe.

I read copious, detailed evidence that hundreds of American POWs had been condemned to death at enemy hands by top American leaders, apparently because their safe return home would have constituted a major political embarrassment. I found documentation that the cover-up of this betrayal had gone on for decades, eventually drawing in a certain Arizona senator. According to this remarkable reconstruction of events, the average teenage moviegoer of the 1980s watching mindless action films such as "Rambo," "Missing in Action," and "Uncommon Valor" was seeing reality portrayed on screen, while the policy expert reading sober articles in the pages of *The New Republic* and *The Atlantic* was absorbing lies and propaganda. Since I had been believing those very articles, this was a stunning revelation.

But was this alternate description of reality correct? Could this one article be true and all the countless contrary pieces I had read in America's most prestigious publications be false, merely the presentation of official propaganda endlessly repeated? I cannot say. I am not an expert on the history of the Vietnam War and its aftermath.

Yet consider the source. The author of that remarkable 8,000-word exposé—"McCain and the POW Cover-Up," published on The Nation Institute's website—was Sydney Schanberg, one of America's foremost Vietnam War journalists. His reporting won him a Pulitzer Prize, and his subsequent book on Cambodia was made into "The Killing Fields," an Oscar-winning movie. Schanberg later served as one of the highest-ranking editors at the *New York Times*, with a third of the reporters at our national newspaper of record working under him. A case can be made that no living American journalist can write with greater credibility on Vietnam War matters. And he had labored for years researching and exhaustively documenting the story of American POWs abandoned in Indochina—a story that if true might easily represent the single greatest act of national dishonor ever committed by our political leaders.

He presented a mass of evidence with names, dates, and documentary detail. Many of the individuals mentioned are still alive and could be interviewed or called to testify. Sealed government records could be ordered unsealed. If America wishes to determine the truth, it can do so.

Yet what I found most remarkable about Schanberg's essay were

not its explosive historical claims but the absolute silence with which they were received in the mainstream media. In 2008, John McCain's heroic war record and personal patriotism were central to his quest for supreme power—a goal he came very close to achieving. But when one of America's most eminent journalists published an exhaustive report that the candidate had instead served as one of the leading figures in a monumental act of national treachery, our media took no notice. McCain's public critics and the operatives of his Democratic opponent might eagerly seize upon every rumor that the senator had had a private lunch with a disreputable corporate lobbyist, but they ignored documented claims that he had covered up the killing of hundreds of American POWs. These allegations were serious enough and sufficiently documented to warrant national attention —yet they received none.

And if Schanberg's claims are indeed correct, they reveal the lethal consequences of America's overweening national pride. After all, his history is a simple one. Following the battle of Dien Bien Phu in 1954, the Vietnamese refused to return their French POWs unless Paris agreed to pay financial compensation for the war. The French leaders paid the money and got their men back. Similarly, the Vietnamese refused to return their American POWs unless the U.S. government agreed to pay reparations. Nixon signed a document promising to do exactly that, but the Vietnamese, being cautious, kept many of the POWs back until the money was delivered. Then Congress refused to authorize the funds because "America doesn't lose wars." Nixon and later U.S. leaders never acknowledged the fate of these captives lest the American people become outraged. And as the years and decades went by, and various schemes to ransom or rescue the POWs were considered and rejected, their continued existence became a major liability to numerous powerful political figures, whose reputations would have been destroyed if any of the prisoners ever returned and told his story to the American people. So none of them ever came home.

As far as I can tell, almost none of the material presented in Perlstein's thousands of pages strays very far from the consensus media narrative of the events described, though it fleshes it out with an enormous wealth of accumulated detail. And this is perhaps as it should be, since including highly unorthodox or shocking claims would require a great deal of supporting argumentation, which would disrupt the smooth flow of his storyline.

*Nixonland* had been released in 2008, and even in the unlikely event that Perlstein had been aware of the strong evidence for the abandoned POWs, he would have been risking his reputation to even suggest such a possibility, especially since it was tangential to his account. So instead he very correctly focused upon Nixon's successful efforts to make freedom for the POWs the central theme of his Vietnam peace plan.

But *The Invisible Bridge* appeared in 2014 and Schanberg's landmark journalism had been published years earlier, receiving considerable attention in alternative media circles, so Perlstein's total lack of any reference is much more troubling, perhaps explained by his unwillingness to completely abandon the factual assumptions of his previous book. I suspect that at least some readers subsequently brought the issue to his attention, since the following year he wrote a column for the *Washington Spectator* denouncing the claims of abandoned POWs as a racist conspiracy-hoax promoted by cynical political opportunists. Schanberg was one of our most eminent Vietnam War journalists and an individual of impeccable liberal sentiments, so neither his name nor his massive factual research was ever mentioned in that piece, which instead largely regurgitated the author's *Nixonland* analysis. Meanwhile, Perlstein drew upon the film criticism of a defrocked Maoist professor of cultural studies, hardly a figure of comparable credibility, while citing as "definitive" a newer book by a young academic whose debunking efforts had simply ignored all the strong evidence on the other side.

## The Kennedy Assassinations

The Vietnam POWs and the likely falsehoods surrounding their safe return under Nixon are discussed on nearly 100 pages of Perlstein's books and his treatment suggests that he is willing to whitewash the treacherous crimes of a President whom he deeply loathes in order to avoid challenging the established media narrative. This is hardly a fatal criticism of his work since virtually every other mainstream journalist and academic has also done the same, but it should alert us to the circumscribed nature of his project, which is enormously comprehensive in some respects, but rather limited in others.

And indeed, on other important subjects, Perlstein's relative silence indicates that he probably recognizes the existence of certain dangerous truths, but has decided to protect himself by avoiding almost any discussion of them.

Perhaps the most famous event of the twentieth century was the assassination of President John F. Kennedy in 1963. The killing came at the height of America's prosperity and global dominance, producing a national trauma that indelibly marked the memories of most of those alive at the time. The subsequent assassination of his younger brother Robert in 1968 also had a great impact upon our national life, and it cleared the way for the election of Richard Nixon the following year. The Kennedy assassinations cast a huge shadow over American politics during the period covered by Perlstein's volumes, yet they received minimal attention.

According to his indexes, the two killings are mentioned dozens of times across his four volumes, but nearly all of these are merely the barest of references, and the total substantive treatment amounts to just a few paragraphs across his 3,500 pages. Indeed, he allocates almost as much space to a detailed plot-summary of Warren Beatty's political assassination-thriller *The Parallax View* in 1974, or to President Gerald Ford's failed "Whip Inflation Now" (WIN) button campaign of that same year. Based upon Perlstein's coverage and tone, no naive reader would possibly suspect that there was anything deeply suspicious about the circumstances of the assassinations, and would instead probably accept the official claim that in each case a crazed lone gunman had been responsible, while dismissing any

skeptics as the conspiracy cranks and crackpots whom the author treats such disdain.

Once again, the author should not necessarily be condemned for taking this position, which merely reflects the unbroken establishment media consensus of the last six decades, a media consensus that has surmounted a tidal wave of factual evidence to the contrary. His mocking tone is exactly what I had always encountered in all my newspapers and other respectable publications, which was precisely the reason that until a decade or so ago, I had always regarded all JFK conspiracy theories as nonsense and their advocates as charlatans. Books that effectively present the congealed media narrative of the last sixty years have considerable value.

Playing Devil's Advocate, consider the single sentence that Perlstein devotes to summarizing the facts of the RFK assassination, which also wraps up another killing:

> Three days after that, with Kennedy's killer in custody—-his name was Sirhan Sirhan, and he acted out of some mysterious grievance involving Israel and Palestine—James Earl Ray was apprehended in London.

Now suppose that the author had instead included an additional sentence mentioning that the official autopsy report—confirmed by the LA Coroner—revealed that the fatal shot had been fired to the back of RFK's head at point-blank range, a distance of just an inch or two, while all witnesses agreed that Sirhan had been standing several feet in front of the slain candidate. Or that an audio tape recorded a dozen shots, while Sirhan's gun had only held eight rounds. Perlstein would surely have felt compelled to add many additional paragraphs and additional pages explicating and analyzing these bizarre factual inconsistencies, leading to a major digression that would completely deflect him from his intended narrative describing Richard Nixon's path to the White House in the election of 1968. So far better for him to just include a sentence encapsulating the conventional account of the mainstream media, while allowing those seeking a detailed discussion of assassination conspiracies to look elsewhere.

Similarly, his *Reaganland* volume ran over 1,100 pages but failed to mention anywhere the existence of the House Select Committee on Assassinations, whose official 1979 report concluded that the JFK assassination had probably been the result of a conspiracy. Since that finding so totally contradicted Perlstein's entire preceding narrative of that crucial event, his readers would have been left deeply confused.

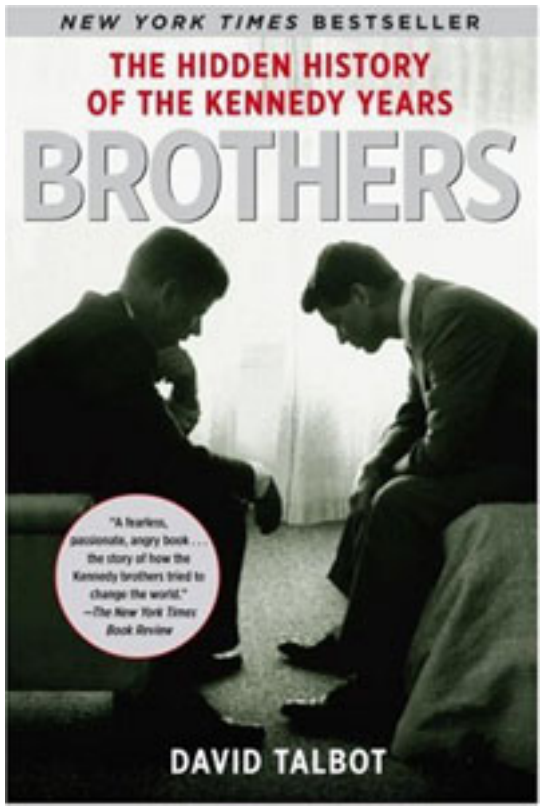
Better for him to avoid muddying the waters and simply omit that troublesome detail.

Rather than condemn Perlstein's thousands of pages of detailed political reconstruction, we should simply recognize it for what it is rather than what some might wish it to be. The volumes constitute the authorized narrative of two crucial decades of American political history, as reported in the mainstream media. The protective agents of Hollywood stars sometimes commission authorized biographies of their meal-tickets, with the writers guaranteeing that all controversial or doubtful elements will remained confined to the lurid pages of the *National Enquirer*, and a country as large and powerful as the United States surely warrants an authorized biography of its own, even one that devotes four very thick volumes to just a couple of important decades.

But for those who might wish to supplement that bowdlerized narrative with a few of the elements excluded, here is an extended extract from one of my own articles of a few years ago, an account that emphasized how I'd previously spent nearly my entire life kept in the dark by the similarly silent or skewed coverage I'd always absorbed from my mainstream media sources:

> Among other things, occasional references reminded me that I'd previously seen my newspapers discuss a couple of newly released JFK books in rather respectful terms, which had surprised me a bit at the time. One of them, still generating discussion, was *JFK and the Unspeakable* published in 2008 by James W. Douglass, whose name meant nothing to me. And the other, which I hadn't originally realized trafficked in any assassination conspiracies, was David Talbot's 2007 *Brothers: The Hidden History of the Kennedy Years*, focused on the relationship between John F. Kennedy and his younger brother Robert. Talbot's name was also somewhat familiar to me as the founder of *Salon.com* and a well-regarded if liberal-leaning journalist.
>
> None of us have expertise in all areas, so sensible people must regularly delegate their judgment to credible third-parties, relying upon others to distinguish sense from nonsense. Since my knowledge of the JFK assassination was nil, I decided that two recent books attracting newspaper coverage might be a good place to start. So perhaps a couple of years after watching that Oliver Stone film, I cleared some time in my schedule, and spent a few days carefully reading the combined thousand pages of text.

I was stunned at what I immediately discovered. Not only was the evidence of a "conspiracy" absolutely overwhelming, but whereas I'd always assumed that only kooks doubted the official story, I instead discovered that a long list of the most powerful people near the top of the American government and in the best position to know had been privately convinced of such a "conspiracy," in many cases from almost the very beginning.



NEW YORK TIMES BESTSELLER
THE HIDDEN HISTORY
OF THE KENNEDY YEARS
BROTHERS
"A fearless, passionate, angry book . . . the story of how the Kennedy brothers tried to change the world."
—The New York Times Book Review
DAVID TALBOT

The Talbot book especially impressed me, being based on over 150 personal interviews and released by *The Free Press*, a highly reputable publisher. Although he applied a considerable hagiographic gloss to the Kennedys, his narrative was compellingly written, with numerous gripping scenes. But while such packaging surely helped to explain some of the favorable treatment from reviewers and how he had managed to produce a national bestseller in a seemingly long-depleted field, for me the packaging was much less important than the product itself.

To the extent that notions of a JFK conspiracy had ever crossed my mind, I'd considered the argument from silence absolutely conclusive. Surely if there had been the slightest doubt of the

“lone gunman” conclusion endorsed by the Warren Commission, Attorney-General Robert Kennedy would have launched a full investigation to avenge his slain brother.

But as Talbot so effectively demonstrates, the reality of the political situation was entirely different. Robert Kennedy may have begun that fatal morning widely regarded as the second most powerful man in the country, but the moment his brother was dead and his bitter personal enemy Lyndon Johnson sworn in as the new president, his governmental authority almost immediately ebbed away. Longtime FBI Director J. Edgar Hoover, who had been his hostile subordinate, probably scheduled for removal in JFK’s second term, immediately became contemptuous and unresponsive to his requests. Having lost all his control over the levers of power, Robert Kennedy lacked any ability to conduct a serious investigation.

According to numerous personal interviews, he had almost immediately concluded that his brother had been struck down at the hands of an organized group, very likely including elements from within the U.S. government itself, but he could do nothing about the situation. As he regularly confided to close associates, his hope at the age of 38 was to reach the White House himself at some future date, and with the government in his hands then uncover his brother’s killers and bring them to justice. But until that day, he could do nothing, and any unsubstantiated accusations he made would be totally disastrous both for national unity and for his own personal credibility. So for years, he was forced to nod his head and publicly acquiesce to the official story of his brother’s inexplicable assassination at the hands of a lone nut, a fairy tale publicly endorsed by nearly the entire political establishment, and this situation deeply gnawed at him. Moreover, his own apparent acceptance of that story was often interpreted by others, not least in the media, as his wholehearted endorsement.

Although discovering Robert Kennedy’s true beliefs was a crucial revelation in the Talbot book, there were many others. At most three shots had allegedly come from Oswald’s rifle, but Roy Kellerman, the Secret Service agent in the passenger seat of JFK’s limousine, was sure there had been more than that, and to the end of his life always believed there had been additional shooters. Gov. Connolly, seated in front of JFK and severely wounded in the attack, had exactly the same opinion. CIA Director John McCone was equally convinced that there had been multiple

shooters. Across the pages of Talbot's book, I learned that dozens of prominent, well-connected individuals privately expressed extreme skepticism towards the official "lone gunman theory" of the Warren Commission, although such doubts were very rarely made in public or on the record.

For a variety of complex reasons, the leading national media organs—the commanding heights of "Our American Pravda"—almost immediately endorsed the "lone gunman theory" and with some exceptions generally maintained that stance throughout the next half-century. With few prominent critics willing to publicly dispute that idea and a strong media tendency to ignore or minimize those exceptions, casual observers such as myself had generally received a severely distorted view of the situation.

If the first two dozen pages of the Talbot book completely overturned my understanding of the JFK assassination, I found the closing section almost equally shocking. With the Vietnam War as a political millstone about his neck, President Johnson decided not to seek reelection in 1968, opening the door to a last minute entry into the Democratic race by Robert Kennedy, who overcame considerable odds to win some important primaries. Then on June 4, 1968, he carried gigantic winner-take-all California, placing him on an easy path to the nomination and the presidency itself, at which point he would finally be in a position to fully investigate his brother's assassination. But minutes after his victory speech, he was shot and fatally wounded, allegedly by another lone gunman, this time a disoriented Palestinian immigrant named Sirhan Sirhan, supposedly outraged over Kennedy's pro-Israel public positions, although these were no different than those expressed by most other political candidates in America.

All this was well known to me. However, I had not known that powder burns later proved that the fatal bullet had been fired directly behind Kennedy's head from a distance of three inches or less although Sirhan was standing several feet in front of him. Furthermore, eyewitness testimony and acoustic evidence indicated that at least twelve bullets were fired although Sirhan's revolver could hold only eight, and a combination of these factors led longtime LA Coroner Dr. Thomas Naguchi, who conducted the autopsy, to claim in his 1983 memoir that there was likely a second gunman. Meanwhile, eyewitnesses also reported seeing a security guard with his gun drawn standing immediately behind Kennedy during the attack, and that individual happened to have

a deep political hatred of the Kennedys. The police investigators seemed uninterested in these highly suspicious elements, none of which came to light during the trial. With two Kennedy brothers now dead, neither any surviving members of the family nor most of their allies and retainers had any desire to investigate the details of this latest assassination, and in a number of cases they soon moved overseas, abandoning the country entirely. JFK's widow Jackie confided in friends that she was terrified for the lives of her children, and quickly married Aristotle Onassis, a Greek billionaire, whom she felt would be able to protect them.

The chapter following Perlstein's one-sentence, cursory summary of the RFK assassination described the events of the 1968 Republican Convention in Miami, and the author mentioned that Richard Nixon's triumphal nomination had caused "an aged liberal" in New York to suffer a fatal stroke at his breakfast table. Out of curiosity I checked the endnotes only to the discover that the victim was Harry Elmer Barnes, a towering academic scholar and the dean of America's Revisionist historians, someone who had been purged from the mainstream media almost three decades earlier for his stubborn refusal to toe the establishment party line. Barnes had famously characterized as "court historians" those academics and journalists who trim the rough edges from their writing in order to avoid discomforting the powerful interests that dominate our political life or the publishing industry. So it seems that Perlstein was apparently well-acquainted with Barnes and his destroyed career, and may have decided to avoid risking the same fate. Who can really blame him?

## The Racial Killings of the 1970s

For more than two generations, the American establishment and its mainstream media allies have concealed the truth surrounding the assassination of President John F. Kennedy in 1963 and the same fate suffered by his younger brother a few years later. Accounts that stray from the official story are almost entirely excluded from respectable media outlets, and Perlstein's books merely conformed to this unwritten rule.

But candid discussions of racial issues are just as forbidden in those same venues. The overarching theme of Perlstein's four massive volumes is the revival and eventual political triumph of America's previously marginalized conservative movement, and the bitter racial conflicts of the 1960s and 1970s were probably the single largest factor driving that rising trajectory.

This underlying political dynamic was heavily featured in the media during that period and countless books, both scholarly and popular, have analyzed the story. Perlstein himself hardly avoids the topic, and the opening chapter of his *Nixonland* volume is entitled "Hell in the City of the Angels," describing the deadly Watts Riots of 1965. That violent outbreak shattered the expectations of racial comity that had followed passage of the landmark Civil Rights Act the previous year, and foreshadowed the waves of severe racial violence that soon engulfed our urban centers. According to the index, the text of that book contains dozens of references to Black Panther militants or Black Power, and additional coverage comes in the *The Invisible Bridge*, the next volume. But some important elements of that racial history are still too explosive to receive more than the briefest mention.

One of the chapters of his latter volume is entitled "Hank Aaron," and it discusses the black baseball slugger's success in breaking Babe Ruth's longtime home run record along with the racial animosity that his feat aroused from bigoted fans. But buried on the first page amidst a large potpourri of miscellaneous media stories is the following half-sentence:

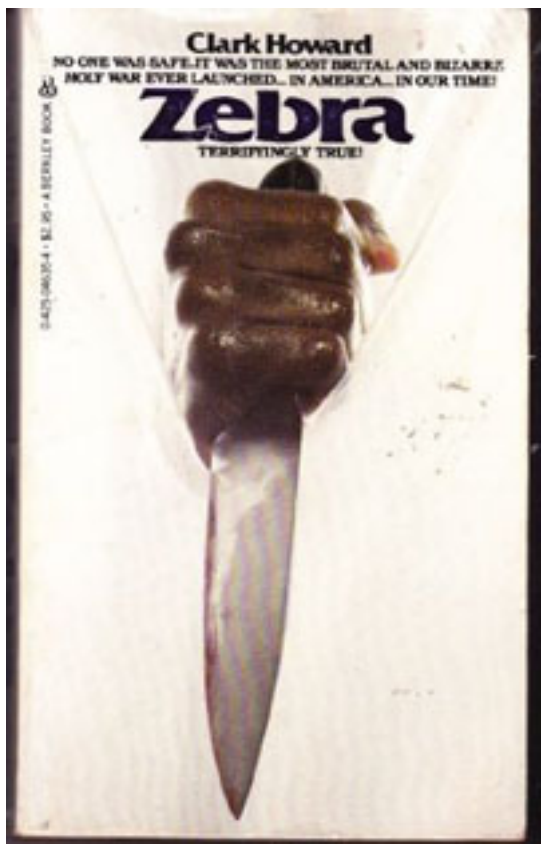
> …also in San Francisco, two hitchhiking teenagers became the tenth and eleventh victims of a spree of random murders of white citizens by black men in what police labeled the "Zebra" shootings.

Across Perlstein's 3,500 pages those words constitute the sole reference to what was almost certainly the worst spree of racially-motivated killings in the last one hundred years of American history. I think a paragraph from one of my articles is very relevant:

> We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the

> record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional. Our standard histories have always criticized the ludicrous Soviet propaganda during the height of Stalin's purges or the Ukrainian famine, but in its own way, our own media organs sometimes seem just as dishonest and absurd in their own reporting. And until the availability of the Internet, it was difficult for most of us to ever recognize the enormity of this problem.

That excerpt came from a 2016 article that extensively discussed the almost totally suppressed and forgotten history of that massive wave of racial killing from the early 1970s, and those facts are important enough to quote at length:



Clark Howard
NO ONE WAS SAFE..IT WAS THE MOST BRUTAL AND BIZARRE HOLY WAR EVER LAUNCHED... IN AMERICA... IN OUR TIME!
Zebra
TERRIFYINGLY TRUE!

> Indeed, one advantage of exploring the Zebra killings is there exists only one detailed, somewhat contemporaneous account, and a couple of years ago with my curiosity getting the better of me, I finally ordered the book from Amazon. Zebra was published

in 1979 by Clark Howard, an award-winning crime writer, who drew extensively on newspaper archives, court testimony, and personal interviews, with his text running over 400 pages.

The story of the Zebra killers almost sounds like something out of a movie, although no movie was ever made. For decades, the Nation of Islam—the so-called "Black Muslims"—had been preaching that whites were "devils," the product of a mad scientist's controlled-breeding experiment, and that killing such "devils" was a virtuous religious act. Then, some time in 1972, certain elements of the sect decided to transform religious dogma into actual practice, and began an organized campaign to randomly kill as many white men, women, and children as they could, with the attacks occurring throughout California but especially centered in the Bay Area and the city of San Francisco. One of the alleged motives was to terrorize the local whites into eventually fleeing that city, thereby allowing the establishment of a black-dominated metropolis.

The black attackers typically went out alone or in pairs to commit the killings, usually selecting any seemingly vulnerable victims on the streets at dusk or in the dark, with their weapons of choice being guns, hatchets, or machetes. Sometimes, victims were kidnapped and brought back to safe-houses to be tortured and killed by the entire group, with their bodies afterward dismembered and discarded.

According to the later court testimony, black participants each needed to kill a total of nine white men to be awarded the coveted title of "Death Angel," earning them the right to have their photos displayed in the Black Muslim meeting halls, while roughly double points were awarded for slaughtering white women or children, on the grounds that such killings were more psychologically difficult. Based on the number of such distinctive homicides—well-dressed black men randomly attacking whites on the street—police officials estimated that there were over 70 such killings throughout California, though based on his extensive research Howard himself believed that the true statewide total may have been close to 270 dead victims.

The period of the killings lasted for almost half a year, and once the newspapers and public grew aware of the situation, the city of San Francisco became gripped by a sense of terror, with public officials desperate to crack the case. Sometimes even politically-connected individuals fell victim, with future mayor Art Agnos

barely surviving a random gunshot attack. In desperation, Mayor Joseph Alioto, a staunch liberal, initiated stop-and-search patrols that targeted a majority of the local population of adult black males as possible killers. Eventually, eight of the suspects were arrested with the aid of an informant, with four of these being convicted and sentenced to life, at which point the attacks ceased. But it appears that the majority of the participants were never caught, let alone punished.

*Zebra* may be purchased for as little as $4 on Amazon, shipping included, and also found online both as a PDF and in various other formats at Archive.org. But for those too busy to read it, a much shorter summary of the story may be found in an article entitled "Remembering the Zebra Killing" published in 2001 by conservative writer James Lubinskas, with his presentation closely matching the book's facts, while the *San Francisco Chronicle* also ran a short retrospective around the time of the 2002 DC Sniper Attacks. There are also a handful of other small websites here and there, discussing the case and republishing some newspaper articles, including coverage of the Zebra killings in other cities.

Meanwhile, the events themselves have almost totally disappeared from public memory. When noted author David Talbot published his widely-praised 2012 book *Season of the Witch* covering that general era of San Francisco history, he included a discussion of the Zebra killings, and some knowledgeable San Francisco natives mentioned that it was the first time they had ever heard of the story. Indeed, the complete absence of any subsequent media coverage or investigation forced Talbot, a mainstream liberal, to cite an obscure white racialist blogsite devoted to the Zebra case as one of his only sources of documentary information on the wave of murders.

Not only did the Zebra killings represent the greatest instance of racially-motivated killings in modern American history, but the number of victims was quite possibly greater than the combined total for all other such examples over nearly the last 100 years of our history. Based on that reality, the near-absolute media blackout has been quite remarkably Orwellian and deeply disturbing. Prior to the development of the Internet, neither I nor almost anyone else would have ever encountered this important history, and I suspect that if anyone had presented us with the true facts back then, his claims might easily have been dismissed as the ravings of a lunatic.

## A Weighty Narrative History and Microwave Noodles

In early 2020 America's first Covid lockdowns began here in Silicon Valley, ordered by Dr. Sarah Cody and her fellow local public health officers of the SF Bay Area. With very little warning, we were told that stores and restaurants were about to be closed, perhaps for just a few weeks but possibly for much longer, and residents would mostly be confined to their homes for the duration. Nothing like this had ever previously happened in modern America, so everyone naturally stocked up on long-lasting food supplies.

I bought a few boxes of microwaveable instant noodles, a product I hadn't eaten for decades, and discovered that the technology had greatly improved. The dried noodles themselves were bland and tasteless, but each package came with one or more seasoning packets that provided the flavor and spices necessary to make the meal palatable before adding water and popping it into the microwave. These small packets constituted just a sliver of the overall contents and probably provided almost none of the calories or nutrition, but they added greatly to my taste for the overall meal, though perhaps others might find them too spicy for their palate.

Perlstein's massive four volumes of political history tell the important stories of what transpired across two decades of American public life, a comprehensive, sweeping narrative whose thousands of pages probably contain few if any significant errors and will constitute the standard starting point for students of that period. But for those readers who can tolerate the far spicier historical elements that the author was necessarily forced to exclude due to the constraints of our publishing industry, I would strongly suggest they also add one or more packets drawn from my own American Pravda series, unless of course the result might become too hot for their taste.

# Major Mysteries of the 1990s

***The Unz Review*** • December 12, 2022 • 8,800 Words

## Scandals of the Clinton Presidency

I spent most of the 1990s heavily involved in politics and political campaigns, often working closely with individuals quite active in conservative and Republican Party circles, and became friendly with many of them. Bill Clinton was President during those years, and I never had strong feelings about him one way or the other, agreeing with some of his policies and disagreeing with many others. But among the conservatives whom I knew, nearly all of them hated him with a passion, sometimes for reasons I endorsed and sometimes not.

Such passionate hatred naturally inspired dark theories of the evil doings of the President and his wife, Hillary Rodham Clinton, and these often merged into a broader current of anti-government sentiments common in conservative circles. Charges regarding such nefarious activities regularly boosted the circulation of leading conservative magazines while they also received much shriller treatment among activists farther to the fringe.

At the time, I never paid much attention to these accusations, except what I read of them in my morning newspapers, and while I never actually considered them debunked, I was still quite skeptical that any of them were likely to be true. Back then, I'd never done any serious reading in American history beyond the level of my introductory textbooks and I flatly doubted whether any of the more famous conspiracies from the JFK Assassination on down had any reality. So if the previous 200-plus years of American history were an open book, it hardly seemed likely that a former governor from tiny Arkansas had suddenly transformed DC into a snake-pit filled with intrigue worthy of Renaissance Italy.

But more recently, I've been persuaded by the opposite sort of argument. Over the last decade or so, my careful investigations have convinced me that many crucial elements of the most important events of the last hundred years of American history—from World War II to the JFK Assassination to the 9/11 Attacks—were totally different than the standard accounts presented in my mainstream media or introductory textbooks. And if the claims of supposedly

disreputable “conspiracy theorists” had often been correct in all those other cases, perhaps many of the far lesser events of the Clinton Administration were also quite different than what I’d casually absorbed from the pages of the *New York Times*.

The 9/11 Attacks of 2001 and the endless cycle of foreign wars they unleashed marked a watershed in American history, so that the stories of the Clinton 1990s probably feel far more distant than events that happened only a couple of years later.

Just consider the boldface names from that period: Randy Weaver and Ruby Ridge, Waco and the Branch Davidians, Vince Foster, Whitewater, Oklahoma City, Monica Lewinsky, Kenneth Starr. For many of us who were of age during that period, these bring back faded memories, while for younger readers, they are probably relegated to obscure trivia questions.

But earlier this year I decided to revisit that period, and see what I could decide about some of the events that I’d mostly disregarded at the time.

## The Story of TWA Flight 800

A half-dozen years ago I’d already dipped my toe in those waters and investigated one of the important but almost totally forgotten incidents of the 1990s, soon discovering that the government and media had been completely misleading and dishonest.

> When I used to recall the leading events of 1996, what came to mind was Bill Clinton’s triumphant reelection campaign in the wake of the Oklahoma City bombing and political overreach by Newt Gingrich’s Congressional Republicans. Perhaps there had also been some sort of plane crash on the East Coast, though none of the details were sharp or memorable in my mind. But in fact, the sudden mid-air explosion of TWA Flight 800 on a New York to Paris route was actually voted the top national news story of that year, ranking above the presidential campaign, while the 230 fatalities made it by far New York’s worst disaster of the twentieth century, and the second worst airline tragedy in American history to that date. Indeed, some journalists at the time suggested that the resulting media coverage had eclipsed that of any other transportation calamity since the sinking of the *Titanic* almost a century earlier.
>
> The outline of facts is hardly complicated. Soon after taking off

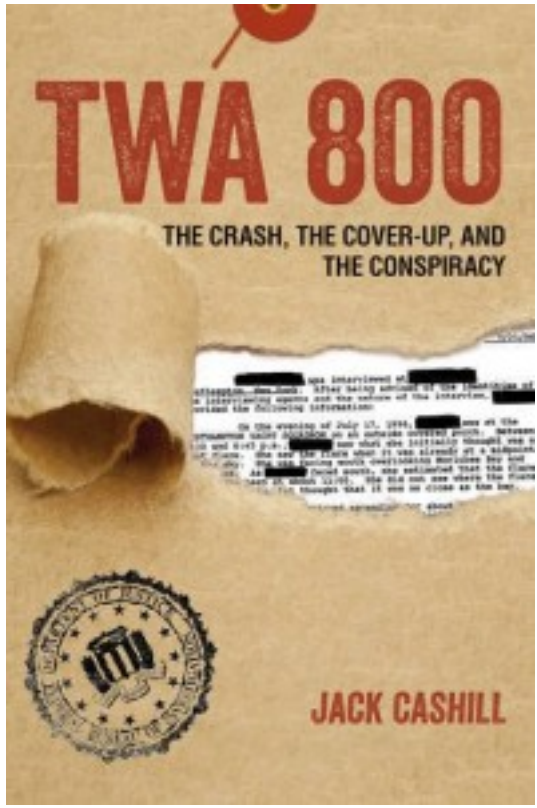
from New York's JFK Airport on July 17, 1996, TWA Flight 800 suddenly exploded in the air just off Long Island. So enormous a loss of life naturally produced an immediate scrambling of numerous federal agencies to investigate the cause, and with widespread fears of terrorism, the FBI launched the largest, most complex investigation in its entire history, deploying some 500 field agents to the area. The investigators soon gathered a copious quantity of seemingly consistent evidence.

Large numbers of local witnesses were immediately interviewed by the swarm of federal agents, with 278 of them reporting that they saw a streak of light, much like a missile, shoot up into the sky in the direction of the aircraft just before the huge explosion. Employees at the local FAA radar installation immediately reported to the government that they had seen what appeared to be a missile closing with the airliner just before it exploded, and other installations produced similar radar records. When tests were eventually performed on the plane wreckage, traces of explosive chemicals were found, exactly the sort used in the warhead of a missile, as well as some reddish-orange chemical residue that a laboratory later identified as likely missile exhaust propellant. An enormous effort was made to locate every possible piece of the wreckage, and for many of these, the contours of the damage indicated an initial explosion external to the plane. Almost immediately after the disaster, a bidding-war allegedly broke out between the national television networks for an amateur home-video showing a missile striking and destroying TWA 800, with the tape eventually being sold for more than $50,000 and briefly broadcast on the MSNBC cable news channel before reportedly being seized as evidence by FBI agents. In addition, a local resident provided a still photo taken at the time showing what seemed to be a missile rising toward the aircraft.

Based on all this initial evidence, many of the early news stories reported that the plane had probably been destroyed by a missile, with widespread speculation about whether the calamity was due to terrorist action or instead accidental "friendly fire" from one of the U.S. naval warships operating in the vicinity. Given the extreme sensitivity of the topic, government officials urged the media to keep an open mind until the full investigation was completed. However, the public debate sometimes turned rancorous, with some individuals soon alleging that a government cover-up was in the works. Eventually, the CIA was brought into the investigation, given its tremendous expertise in certain matters.

After more than a year of detailed research, the government investigation finally concluded that no missile could possibly have been involved, with all the eyewitnesses having been misled by what amounted to an optical illusion caused by the explosion of the aircraft. That explosion itself had been entirely spontaneous, probably caused by a random spark igniting one of the gas tanks. Given the controversy in the case, the CIA helpfully produced a computer animation showing the official reconstruction of the events, which was endlessly broadcast by our news media to explain the disaster to the public. The simulation showed the jetliner spontaneously exploding in mid-air, with no external cause, and just to further clarify matters, the CIA animators also inserted an explanatory message in large text: "There Was No Missile." The *New York Times*, and nearly all our other mainstream media repeatedly echoed this same simple conclusion in all their stories and headlines.

The vast majority of our sheep-like population absorbed the simple media message "No Missile" and went back to watching their football games and celebrity music videos, being greatly relieved to know that well-maintained 747 jumbo jets flown by leading national airlines can occasionally explode in mid-air without any external cause.



However, various disgruntled “conspiracy theorists” refused to accept these conclusions, and returned to their “crazy missile conspiracy theories,” thereby earning the hearty ridicule of the entire mainstream media, led by the *New York Times*. These conspiratorial suspicions even extended to the U.S. navy, which had apparently been staging military exercises in the near vicinity of the calamity, exercises that some claimed including the test-firing of anti-aircraft missiles. Indeed, a local resident later provided a home video clearly showing a missile being fired in that exact same area a few days earlier during previous naval exercises.

The entire remarkable history of this incident is persuasively set forth in a excellent twentieth-anniversary book *TWA 800* published earlier this year by investigative journalist Jack Cashill, who has been following the case since the late 1990s, having co-authored a previous book in 2003 and also produced an earlier 2001 television documentary *Silenced*, now available in its entirely on YouTube.

In addition, the 2013 television documentary by a former CBS producer, whose favorable review by the *New York Times* marked my first introduction to the topic, was discussed at length and substantially excerpted by Amy Goodman at *Democracy Now!*

http://www.democracynow.org/2013/6/20/did_us_govt_lie_about_twa

Cashill is strongly affiliated with conservative publications, while someone like Goodman clearly leans toward the left, but the question of whether an American jetliner was destroyed by a missile, and the facts then covered up by the government is a non-ideological matter, so their perspectives seem almost identical.

For anyone having less than absolute faith in the official pronouncements of our government and our media, the likely reality of what happened is hardly difficult to guess, and for those who currently maintain such naivete, I suspect it will quickly dissipate if they choose to watch the documentaries or read the books. But the loss of TWA Flight 800 is surely of no great importance to our country. Accidents do happen. A large and energetic military, eager to test its latest missile weapons, perhaps carelessly and fatally crossed paths with hundreds of unlucky travelers on their way to Paris. Some 30,000 Americans die each

year in fatal car crashes, and risks are inevitable in our modern industrial society.

However, from a broader perspective, I believe that the truly horrifying aspect of the incident is the tremendous ease with which our government and its lapdog media managed to so utterly suppress the reality of what had happened—an American jumbo jet shot down by a missile—and did so although this occurred not in some obscure, faraway foreign land, but within the very sight of Steven Spielberg's home in the exclusive Hamptons, on a flight that had just departed New York City, and despite such overwhelming physical evidence and hundreds of direct eye-witnesses. The successful cover-up is the important story, and constitutes a central subtext in all of the books and documentaries on the disaster.

Given the eyewitness testimony and other factors, it is hardly surprising that many of the initial media stories either directly referred to a missile strike or at least mentioned it as one of the main possibilities, and indeed there is some evidence that top government leaders initially assumed a terrorist attack. But President Bill Clinton was locked in the middle of his reelection campaign, and while the slaughter of Americans by terrorists might unify a nation, disasters brought about by careless military action would surely have had the opposite political impact. So it seems likely that once terrorism was ruled out and the American military believed responsible, a direct order quickly came down from the highest levels to make the missile and all evidence supporting it disappear, with all our supposedly independent federal agencies, especially the FBI, bowing to that primary directive.

As part of the standard investigation, all the debris were gathered and stored at a hangar for examination, but FBI agents were discovered spiriting away some of the most tell-tale pieces, or even caught in the wee hours of the morning hammering them into a shape that would suggest an internal rather than an external explosion. The amateur video showing the missile strike was only briefly broadcast by a cable news channel before being seized by government agents. When an investigative journalist acquired debris containing apparent missile residue and passed it along to a producer at CBS News, the evidence was quickly confiscated, with the journalist and his wife even being arrested, prosecuted, and convicted for violating an obscure law enacted to prohibit bystanders from removing souvenirs from the scene of a

disaster; the veteran CBS producer who accepted the material was vilified as a “conspiracy theorist” and soon forced out of her job, her career destroyed. The written FBI reports of 278 eyewitness statements describing the missile attack were completely ignored, and in a number of cases, later statements were actually fabricated, falsely suggesting that crucial witnesses had revised or recanted their earlier testimony.

These particular examples only scratch the surface of the massive amount of coordinated government fraud and deception that was marshalled to make a missile strike seen by hundreds of witnesses officially disappear from the historical record, and transform the destruction of TWA Flight 800 into a rather mysterious and spontaneous mid-air explosion. The *New York Times* in particular became the primary mouthpiece of the official “See No Missile” party-line, repeatedly denigrating and ridiculing all those who resisted this total rewriting of the facts and history.

When naive individuals suggest that maintaining a large government conspiracy in America is simply impossible because “somebody would have talked” perhaps they should consider the implications of this incident, which occurred so close to the media capital of the world. And if they ever decide to trust Wikipedia on any remotely controversial topic, they should consult the 10,000 word Wikipedia article on TWA Flight 800, comparing that exhaustive presentation with the simple facts provided in this article, or the wealth of additional information in the numerous books and documentaries upon which my treatment was based.

## The Bombing of the Chinese Embassy in Belgrade

Then in 2020 I used the publication of a much longer article to finally present the account I’d earlier pieced together of the true story of America’s bombing of the Chinese Embassy in Belgrade during the 1999 air war against Serbia.

Although our limited bombing campaign seemed quite successful and soon forced the Serbs to the bargaining table, the short war did include one very embarrassing mishap. The use of old maps had led to a targeting error that caused one of our smart bombs to

accidentally strike the Chinese Embassy in Belgrade, killing three members of its delegation and wounding dozens more. The Chinese were outraged by this incident, and their propaganda organs began claiming that the attack had been deliberate, a reckless accusation that obviously made no logical sense.

In those days I watched the *PBS Newshour* every night, and was shocked to see their U.S. Ambassador raise those absurd charges with host Jim Lehrer, whose disbelief matched my own. But when I considered that the Chinese government was still stubbornly denying the reality of its massacre of the protesting students in Tiananmen Square a decade earlier, I concluded that unreasonable behavior by PRC officials was only to be expected. Indeed, there was even some speculation that China was cynically milking the unfortunate accident for domestic reasons, hoping to stoke the sort of jingoist anti-Americanism among the Chinese people that would finally help bind the social wounds of that past 1989 outrage.

Even more remarkable were the discoveries I made regarding our supposedly accidental bombing of the Chinese Embassy in 1999. Not long after launching this website, I added former *Asia Times* contributor Peter Lee as a columnist, incorporating his *China Matters* blogsite archives that stretched back for a decade. He soon published a 7,000 word article on the Belgrade Embassy bombing, representing a compilation of material already contained in a half-dozen previous pieces he'd written on that subject from 2007 onward. To my considerable surprise, he provided a great deal of persuasive evidence that the American attack on the Chinese embassy had indeed been deliberate, just as China had always maintained.

According to Lee, Beijing had allowed its embassy to be used as a site for secure radio transmission facilities by the Serbian military, whose own communications network was a primary target of NATO airstrikes. Meanwhile, Serbian air defenses had shot down an advanced American F-117A fighter, whose top-secret stealth technology was a crucial U.S. military secret. Portions of that enormously valuable wreckage were carefully gathered by the grateful Serbs, who delivered the material to the Chinese for temporary storage at their embassy prior to transport back home. This vital technological acquisition later allowed China to deploy its own J20 stealth fighter in early 2011, many years sooner than American military analysts had believed possible.

Based upon this analysis, Lee argued that the Chinese embassy was attacked in order to destroy the Serbian retransmission facilities located there, while punishing the Chinese for allowing such use. There were also widespread rumors in China that another motive had been an unsuccessful attempt to destroy the stealth debris stored within. Later Congressional testimony revealed that the among all the hundreds of NATO airstrikes, the attack on the Chinese embassy was the only one directly ordered by the CIA, a highly-suspicious detail.

Although the American media dominates the English-language world, many British publications also possess a strong global reputation, and since they are often much less in thrall to our own national security state, they have sometimes covered important stories that were ignored here. And in this case, the *Sunday Observer* published a remarkable expose in October 1999, citing several NATO military and intelligence sources who fully confirmed the deliberate nature of the American bombing of the Chinese embassy, with a US colonel even reportedly boasting that their smartbomb had hit the exact room intended.

This important story was immediately summarized in the *Guardian*, a sister publication, and also covered by the rival *Times of London* and many of the world's other most prestigious publications, but encountered an absolute wall of silence in our own country. Such a bizarre divergence on a story of global strategic importance—a deliberate and deadly US attack against Chinese diplomatic territory—drew the attention of FAIR, a leading American media watchdog group, which published an initial critique and a subsequent follow-up. These two pieces totaled some 3,000 words, and effectively summarized both the overwhelming evidence of the facts and also the heavy international coverage, while reporting the weak excuses made by top American editors to explain their continuing silence. Based upon these articles, I consider the matter settled.

## The Strange Death of Vincent Foster

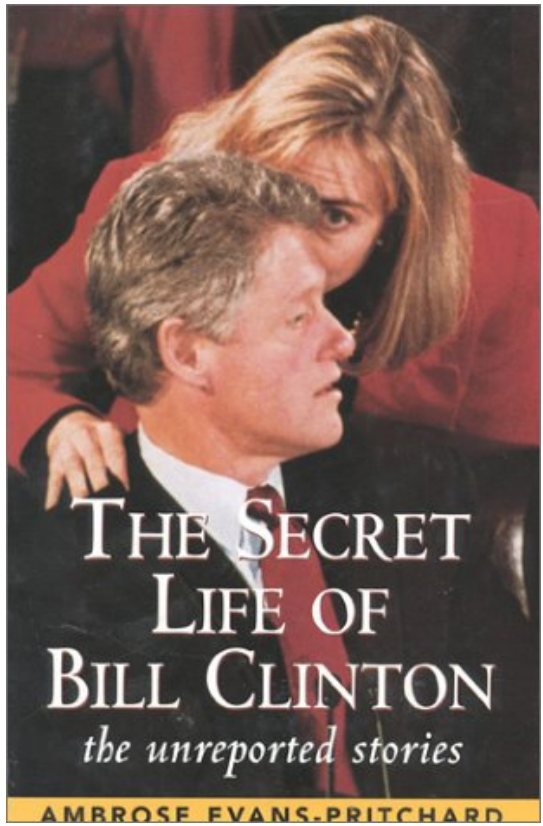
The two examples discussed above were considerable outliers among the important 1990s events whose reality was concealed or severely misreported by our media. The accidental NYC shootdown of TWA Flight 800 by an errant American missile and our deliberate bombing of the Chinese embassy in Belgrade were issues related to military affairs and national security. Thus, they were completely unconnected

with the domestic controversies that constituted the vast majority of the incidents, while their facts also seemed much more solidly established. But they do provide some important lessons that we should apply to our other analyses.

After the explosion of TWA Flight 800, the direct testimony of hundreds of eyewitnesses was completely disregarded, despite being backed by a great deal of hard photographic and physical evidence, while the official story widely promoted by the media seemed almost nonsensical, yet was overwhelmingly accepted. Meanwhile, in the Chinese embassy example, several leading British newspapers explicitly reported what had actually happened, directly quoting NATO officials, and those stories generated worldwide headlines everywhere outside the U.S., which enforced a tight information blockade. This demonstrated that media control may often end at the water's edge, with foreign editors and reporters, even those of our closest Western allies, sometimes remaining free of those constraints. Indeed, in the TWA 800 case, Pierre Salinger, a former top Kennedy aide and Paris Bureau Chief for *ABC News*, published a long expose in one of France's leading magazines setting out the facts, but ordinary Americans never heard the story and those veteran journalists who sought to inform them were purged from their jobs.

Perhaps for this reason, we shouldn't be surprised that some of the most important reporting on the "secret history" of the 1990s and the scandals of the Clinton Administration was produced by a journalist of the most impeccably establishmentarian credentials, but having British nationality. Ambrose Evans-Pritchard was an Oxford graduate whose father had been a longtime professor at that same institution, and after spending years working for the *London Spectator* and the *Economist*, he served as Washington Bureau Chief for the *Sunday Telegraph* during most of the 1990s, and is currently International Business Editor of the *Daily Telegraph*.

From what I vaguely recalled, Clinton's right-wing tormentors had bombarded him with numerous bizarre accusations ranging from drug-dealing to murder, none of which had any solid foundation and blew away like mist. By contrast, his seemingly endless string of girlfriends, most of whose names I forget, seemed very real, and finally got him impeached by outraged Republicans when he lied under oath about his sexual misbehavior with an intern named Monica Lewinsky in the White House.



Evans-Pritchard had been the author of one of the most popular anti-Clinton bestsellers of the era, *The Secret Life of Bill Clinton*, which I'd always assumed had covered those lurid personal scandals. It had been sitting on my shelves for several years, so although I was loath to revisit the story of the stained blue dress, I decided I might as well get that out of the way. The book had been published by the conservative Regnery Press, and the back cover carried glowing blurbs by all the leading conservative editors and pundits, with Michael Reagan hailing the author as the "Woodward and Bernstein of the current era," which seemed ridiculous praise for a lengthy account of sexual dalliances.

Yet the book turned out to be totally different from what I expected. It had been released in 1997, long before anyone had ever heard of Lewinsky, and although it ran more than 450 pages, with almost 100 of those being notes, appendices, and index, neither the name of Gennifer Flowers nor almost any of the other sexual scandals appeared anywhere in the text, the sole exception being a few pages about Paula Jones near the very end. Instead, the subject matter was far darker and more serious.

The text was divided into three main sections, of which the longest by far focused upon the extremely strange circumstances of the death of White House Counsel Vince Foster, one of the closest friends and advisors to the Clintons, who was found dead of an allegedly self-inflicted gunshot wound in nearby Fort Marcy Park, just six months into the new administration. The author began his discussion by emphasizing that Foster was the highest-ranking member of the executive branch to die under suspicious circumstances since the assassination of President Kennedy three decades earlier, a point I'd never previously considered.

As some may remember, Kenneth Starr was the special prosecutor appointed to run the Whitewater investigation, a very lengthy probe originally focused on a failed Arkansas real estate deal involving the Clintons. The investigation dragged on for years, soon digressing into all sorts of other issues, and Democratic partisans regularly denounced Starr to the media as an Inspector Javert or perhaps a Captain Ahab, endlessly pursuing his Presidential whale. But interestingly enough, the author's own appraisal was just as negative. He noted that Starr was an extremely well-paid establishment attorney, who continued devoting more time and effort to his important corporate clients than to his hot-potato of a political case, describing him as "a servant of power" who would never seriously challenge the FBI or the other institutions of the permanent DC establishment. Evans-Pritchard reasonably argued that corrupt or not, a failed 1979 real estate deal had no real national importance, while the unnatural demise of a top White House official certainly did.

Although Foster's death was officially ruled suicide—he'd supposedly become despondent over media criticism of a petty Clinton scandal and shot himself in despair—the facts presented by the author raised enormous doubts about that theory. Indeed, the young, apolitical prosecutor brought in from California and initially assigned to that investigation quickly found many gaping holes in the story along with indications of an FBI cover-up, but his effort was sabotaged and he was soon forced to resign. According to the author, deep skepticism of the official account was widespread among mainstream journalists, but almost none of them were willing to say a word:

> The Foster case is taboo for American journalists. In private, many concede that the official story is unbelievable, but they will not broach it in print. I have been involved in some contentious matters during my career as a journalist, but I have never seen anything like the irrational fright when the subject of Vincent Foster is raised. It has nothing to do with party affiliation. If

> anything, Republican journalists are even more susceptible to the spell…I do not entirely understand why this should be so.

In support of his claims, almost a decade ago a well-regarded former mainstream journalist who had covered the issue at the time once casually volunteered to me that the official Vince Foster story was obviously false, but since I'd never paid attention to the topic, I had mentally filed away his statement and never followed up on that matter. But just as in the JFK case, I think it likely that for every journalist or public figure who was willing to disclose his very risky opinion, there were probably numerous others who believed the same thing but kept silent.

The facts the author provided certainly seemed odd. According to the sworn testimony of the witness who first discovered Foster's body and reported it to two Park Service employees, there had been no blood and no gun, but he was shocked to later hear that both were described in the official report released to the media. Later crime scene photos and sworn testimony by one of the earliest police officers located the gun in different positions. Experienced homicide investigators claimed that the official crime scene was completely inconsistent with that of a suicide.

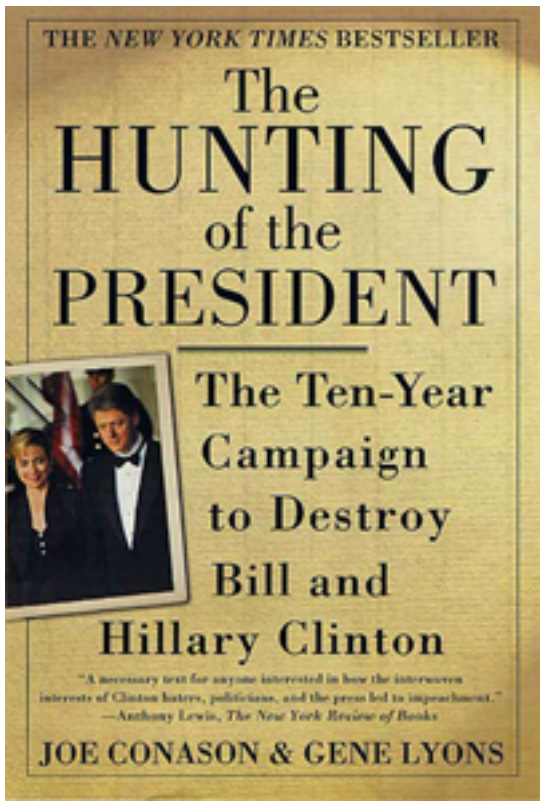
According to federal law, the FBI would have been required to investigate the death of a top government official if there had been any possibility of a homicide, but since the verdict was obvious suicide, the matter was left in the hands of the Park Police, who had negligible experience in such matters. Perhaps under normal circumstances, the FBI might have disputed this decision, but by a remarkable coincidence the FBI Director had been fired the previous day by President Clinton, the first time any such any FBI chief had been removed in the middle of his term, so the agency was in complete turmoil.

No member of Foster's family ever identified the gun found in Foster's hand as one he had previously owned, and it failed to show his fingerprints where he would have handled it. According to the official story, Foster had shot himself in the mouth, but there were no powder burns there, nor traces of gunpowder on his face. No blood was found on the gun, and no bullet was ever located in the park, despite weeks of diligent searching, while neither the nearby neighbors nor the other park visitors had heard any shot. Nearly all the polaroids taken at the scene later disappeared, but one of the very few surviving ones seemed to show a neck wound made by a much smaller caliber weapon than the one recovered, and paramedics on the scene later

testified to the same thing. Like most of the crime scene photos, the X-rays taken for the autopsy had all disappeared.

These particular facts appeared in the first thirty-odd pages of the section on Vince Foster's death, and there is a great deal of additional material in the hundred pages that follow, including the strange behavior of the victim in the period prior to his demise, behavior that hardly suggested severe depression but instead other types of concern.

Foster died nearly three decades ago, and I haven't made any effort to investigate the case in greater detail. If I had read those surprising factual claims in some dark corner of the Internet, I might not have taken them seriously, but Evans-Pritchard seems a very credible mainstream journalist, both then and now working for one of Britain's leading newspapers, and I doubt that he simply invented the important details in his national bestseller.



THE NEW YORK TIMES BESTSELLER
The HUNTING of the PRESIDENT
The Ten-Year Campaign to Destroy Bill and Hillary Clinton
"A necessary text for anyone interested in how the interwoven interests of Clinton haters, politicians, and the press led to impeachment."
—Anthony Lewis, The New York Review of Books
JOE CONASON & GENE LYONS

During that same era, liberal journalists Joe Conason and Gene Lyons had been among Clinton's strongest defenders, and in early 2000 they published a national bestseller of their own entitled *The Hunting of the President*, bearing the accusatory subtitle "The Ten-Year Campaign to

Destroy Bill and Hillary Clinton." So I decided to read it as well in order to get the other side of the story, and although many of their claims regarding the ideological motivation of the attacks on the Clintons seemed plausible, I found their arguments about the Vince Foster case much thinner and less persuasive. The authors were clearly aware of the earlier Evans-Pritchard book, which they repeatedly cited, but they only attempted to rebut a handful of the many strong factual claims it had made. Just as the contradictory physical evidence regarding Foster's death recalled that in the JFK assassination, this attempted debunking of the "conspiracy theories" reminded me of the same efforts that had been made in that earlier case.

So what really did happen to Foster and why? I personally venture no hypotheses, though a wide variety of conflicting ones, all rather speculative, have been advanced. Perhaps Foster did commit suicide, but in a different, more problematical location, so that his body was moved to the park to avoid difficulties. But it seems more likely that he was murdered, though by whom and for what reason is impossible to say. Probably the most outrageous suggestion was proposed by a former senior editor at *Forbes* a couple of years later, whose writings claimed that Foster and numerous other important government officials of both parties had been heavily immersed in a web of intelligence espionage and corruption; although the journalist lost his job as a consequence, some of his interviews and spiked articles can still be found on the Internet.

But a more mundane explanation seems likelier. Foster died just six months after Bill Clinton entered the White House, and if he had been murdered, Evans-Pritchard suggests that the cause had probably been somehow related to doings back home in Arkansas, a notoriously corrupt state. The last chapter of this section and the half dozen chapters that follow provide a very detailed account of the widespread organized criminality that seemed to be endemic to the region, including drug-dealing and more than a few contract-killings. When Foster's body was found, a former close Clinton associate in Little Rock told his family that he feared for his own life and began carrying a gun everywhere for protection; two months later, he was cut down by an assassin. A high-ranking local law enforcement officer even cautioned the inquisitive British journalist that he be careful lest he could end up at the bottom of a well somewhere.

Ironically enough, the author claims that some of these illegal activities were directly connected to the Nicaraguan Contra supply efforts organized by the Reagan and Bush administrations, for which

Gov. Clinton had apparently been a quiet ally. These swirling accusations of rampant criminal activity associated with Clinton's governorship had been widespread among the many Clinton-haters I'd known during the 1990s and I'd always discounted them, but after reading more than one hundred pages of the detailed reporting by Evans-Pritchard, I've reassessed my verdict. Even if only a fraction of these stories are accurate, Foster's demise becomes much less mysterious, though the precise motive remains unclear.

## The Oklahoma City Bombing

If the highly-suspicious circumstances surrounding Vince Foster's death evoked echoes of what had happened in Dallas three decades earlier, the first section of the Evans-Pritchard book focused upon a major incident that seemingly anticipated the 9/11 attacks a half-dozen years later. At the time it occurred, the 1995 bombing of the federal building in Oklahoma City was by far the largest terrorist attack in U.S. history, taking 168 lives, including 19 children in a day-care center located on the premises. The political impact was immediate and enormous, and it played a major role in reviving the scandal-ridden and politically-crippled Clinton Administration, allowing the incumbent to win an easy reelection victory the following year. The author actually entitled the first chapter "The Resurrection of President Clinton" and he reasonably described the event as the most traumatic in American history since the assassination of JFK.

The Wikipedia entry for the bombing runs more than 11,000 words, and according to the official story it presents, the destruction was inflicted by a large truck-bomb, consisting of a mixture of fertilizer and fuel-oil, with the perpetrator being an American Gulf War veteran named Timothy McVeigh. Caught by a chance police-stop 90 minutes after the attack, McVeigh stood trial, and was convicted and sentenced to death, finally dying by lethal injection in 2001. Meanwhile, one accomplice received life in prison and another who had played a very minor role and agreed to testify got twelve years. These non-abbreviated judicial proceedings were very different than what followed many other similarly dramatic events in our history, and this obviously tended to support the official story, but many other aspects of the case strongly suggested otherwise.

Prior to the attack, McVeigh had spent several years circulating on the fringes of right-wing, anti-government militia groups, which had become a growing force during that period, with his alleged motive

being retaliation for what he regarded as past government atrocities. The early 1990s had been a troubled time, and several deadly confrontations between government agents and right-wing whites had become notorious. In late August 1992, the household of a white separatist named Randy Weaver living in a rural cabin in Ruby Ridge, Idaho got into a fire-fight and siege with a large team of FBI agents seeking to arrest him, leaving his wife and teenage son dead along with a Deputy U.S. Marshall. The following year, a botched ATF raid on the Branch Davidians, an eccentric, heavily-armed religious sect living in a fortified compound in Waco, Texas left four government agents dead, leading to an eight-week siege ultimately ending in the fiery deaths of most of the Davidians, including 76 men, women, and children.

For many years afterward, mention of Ruby Ridge and Waco would inspire outrage among right-wingers and anti-government activists, regularly cited as proof that armed government agents were their deadly enemies, and these topics became a staple of the burgeoning empires of angry conservative talk-radio, led by Rush Limbaugh and his imitators. Sentiments towards the government became extremely bitter in such circles, and former FBI Agent and Watergate Burglar G. Gordon Liddy, who had reinvented himself as a popular right-wing talk-radio host, famously urged his gun-toting listeners to always aim at the faces of any attacking G-men, since those were unprotected by body-armor. The early 1990s saw the growth of various small right-wing militia groups, often heavily armed and based in rural parts of the Midwest or the South, who swore to resist what they believed was approaching government tyranny, and the widespread media coverage of their drills and conspiratorial world-views regularly terrified urban liberals. All of this popular, grassroots energy, especially propelled by the gun-control issue, had played an important role in powering the Republican Congressional landslide of 1994.

The previous year 1993 had also seen the first major incident of Islamic terrorism in our country as a group of Muslim radicals supposedly inspired by a blind sheikh had detonated a truck-bomb in the sub-basement of the World Trade Center, killing six and hoping to bring down the entire skyscraper. Fears of Muslim immigrants became commonplace, and although the flow of such newcomers was a tiny sliver of the total, these terrorism concerns vaguely permeated the overall immigration issue. Ironically enough, the exact same groups—and sometimes the same individuals—most agitated by the danger of immigrant terrorism were often themselves intensely hostile to the American government, whom they viewed as their dangerous enemy, sharing the perspective of the foreigners whom they feared

and despised.

This ironic situation became most apparent in the immediate aftermath of the Oklahoma City bombing. I remember watching the first C-Span show discussing the horrific event before most of the facts were in, and noticed that about half the agitated callers were claiming that the bombing must have been the work of fiendish Muslim terrorists while the other half said they were sure it had been carried out by heroic American patriots.

Once McVeigh was captured, the media soon reported that he had intended the attack as retaliation against the government for the deaths in Waco, staging it on the second anniversary of that incident. His truck-bomb weapon of choice had allegedly been inspired by a similar, fictional attack against the FBI building in DC described in *The Turner Diaries*, a wildly popular extremist novel of the 1970s, in which a small group of determined right-wing patriots successfully overthrew a tyrannical Jewish-dominated American government.

With the worst terrorist attack in American history blanketing the headlines, a heavy governmental crackdown on right-wing militia groups and their fellow-travelers soon followed, much like Muslim groups were later to be targeted in the aftermath of 9/11.

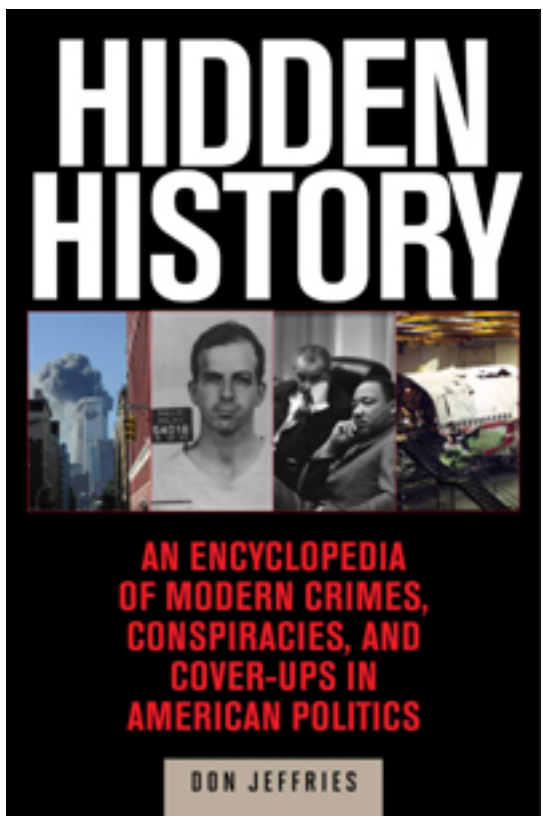
But according to the detailed account provided by Evans-Pritchard in his book, there were many extremely puzzling and suspicious aspects to the case, as he soon discovered once he began interviewing witnesses and relatives of victims a few months later.

For example, McVeigh's alleged target had been the ATF, which had been responsible for Waco and had an office on the ninth floor of the destroyed building. Yet oddly enough, not a single agent was reported on the casualty list, and there were stories circulating that none of them had come to work that day, with some public claims to the contrary later found to be false. Moreover, a bomb disposal squad and their large vehicle had very unusually been parked nearby that morning, with the denials eventually retracted. Most remarkably, seismographic equipment at the University of Oklahoma indicated that there had apparently been at least two large explosions rather than one, seemingly objective evidence directly contradicting the official story, while initial news reports had described additional, unexploded bombs being removed from the inside the remains of the severely damaged building.

Evans-Pritchard also provided several pages summarizing the

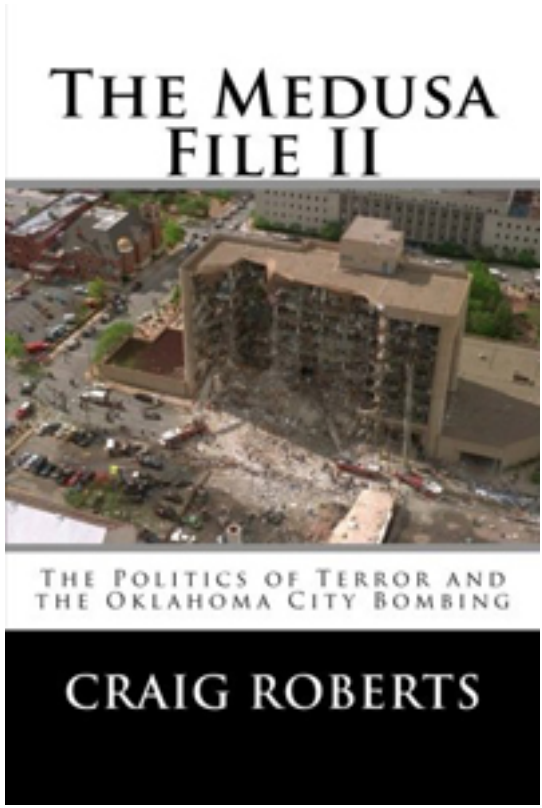
statements of more than a dozen eyewitnesses who had seen McVeigh accompanied by one or more other men during all his activities, as he rented, drove, and parked the truck, or who reported other facts at total odds with the official story that he had acted alone. A former ATF informant Carol Howe had infiltrated the white-separatist militants of Elohim City and she told the author that months earlier she had reported their plans to bomb federal buildings, with the one in Oklahoma City being one of their intended targets. Other federal agents or informants had apparently been involved in the plot as well.

Although this British journalist never attempted to formulate his own theory of what had actually happened, he provided a great deal of detailed evidence suggesting that official story was false or at least extremely incomplete, with both the government and the media apparently involved in the cover-up for unknown reasons.



Given the complexity of the case and the number of potentially significant facts and individuals totally excluded from the orthodox narrative, keeping them all straight is sometimes challenging. For that reason, I would strongly recommend the dozen pages summarizing these "conspiratorial" elements provided in *Hidden History*, a 2014

book that I read earlier this year. The author was Donald Jeffries, a longtime conspiracy-researcher who got his start as a student volunteer for Mark Lane, the JFK assassination trailblazer, and the 350 pages of his mini-encyclopedia usefully provide the core elements of dozens of major alleged conspiracies from the death of JFK up to the present day, also including TWA Flight 800 and the death of Vince Foster. Whether or not one agrees with him on all his analyses, he performs a very useful service in presenting the crucial information in a highly-condensed form, though seriously marred by its lack of crucial source references.

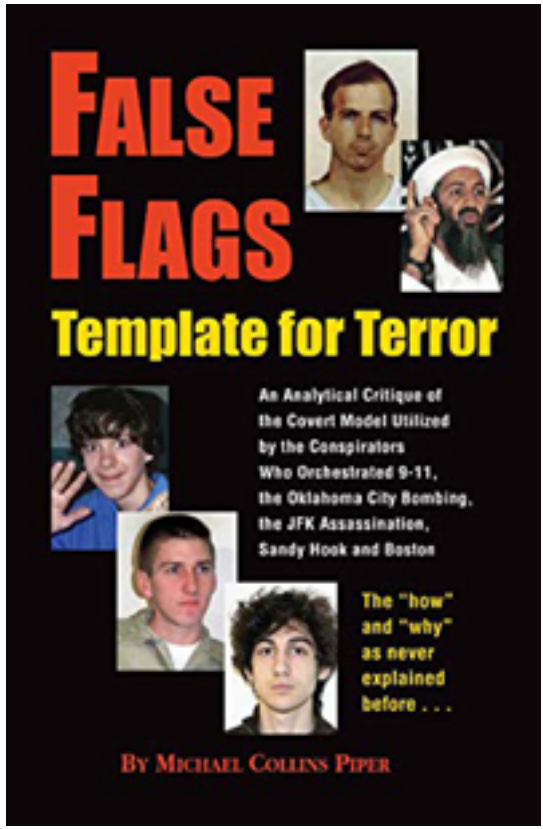


At the other end of the spectrum is *The Medusa Files II* by Craig Roberts, which runs more than 500 pages and is entirely devoted to the details of the Oklahoma City bombing. Roberts was a longtime Tulsa, Oklahoma police officer and bomb expert who had immediately been brought in by the local office of the FBI to assist their investigation, partly because of his technical expertise and partly because of his extensive personal contacts with right-wing groups, which were otherwise reluctant to speak with government representatives. He had already published numerous previous books, many of them on military matters or the JFK assassination, but he said

that he had waited twenty years to release his tell-all account of this particular case.

Although I'm quite skeptical of the various conspiratorial theories Roberts advances as to the motive and perpetrators of the attack, his factual, first-hand evidence and his technical expertise seem much more credible. According to the eyewitnesses he interviewed at the time, there definitely was a second, much larger explosion, confirmed by audio tapes and seismic records. He also notes all the initial news reports claiming that additional, unexploded bombs of a highly-sophisticated nature had been found in the building by the first rescue workers, with top government officials saying the same thing. In addition, the FBI had quickly seized all the surveillance videotapes from the vicinity, which could have revealed who parked the truck and also the pattern of explosions, and these have never been released. And as a bomb expert Roberts believed it was simply impossible that the massive destruction to the building could have been caused by a parked truck-bomb of the type claimed, and a top government explosives expert independently came to the same conclusion: explosions from within the building must have been responsible.

As is often the case, it's far easier to establish a negative than a positive, and demonstrating that the official story is very likely false is much easier than determining what really happened or why.



FALSE FLAGS
Template for Terror
An Analytical Critique of the Covert Model Utilized by the Conspirators Who Orchestrated 9-11, the Oklahoma City Bombing, the JFK Assassination, Sandy Hook and Boston
The "how" and "why" as never explained before . . .
By Michael Collins Piper

Despite this, I do think it's worth mentioning the scenario proposed by the late Michael Collins Piper, a renowned conspiracy-researcher. In 2013 he published *False Flags*, one of his last books, and although the bulk of the work was devoted to other issues, several short chapters, totaling 30-odd pages, covered the Oklahoma City bombing and provided his analysis of the case, which drew upon the original reporting of Evans-Pritchard.

Piper noted that there was strong evidence of ADL foreknowledge of the attack and that one of the key figures likely involved, a German national apparently working as a government informant, had considerable ties to Israel and its military. Meanwhile, immediately after the bombing, there was a major media effort to blame the devastating terrorist atrocity upon Arabs in general and Saddam Hussein's Iraq in particular, something I had certainly noticed at the time. Under Piper's speculative scenario, the Israeli Mossad and its American collaborators had orchestrated the false flag attack, intending to implicate their Middle Eastern rivals and thereby provoke America into large-scale military retaliation, much as actually happened in the aftermath of 9/11. However, Clinton or his advisors

quickly realized the game that was being played and not wanting to be dragged into an unnecessary Middle Eastern war, they ordered the FBI and other agencies to completely suppress all the evidence of an organized conspiracy that the plotters had previously been put into place, instead portraying McVeigh as a lone-nut, unconnected with any foreign power, while also concealing the Israeli fingerprints.

This scenario seems at least as plausible as any other, and since Piper's book is conveniently available on this website in HTML form, those so interested can read his dissection of the evidence and decide for themselves.

- False Flags
  *Yes, the Mossad Was Behind the Oklahoma City Bombing*
  Michael Collins Piper • 2013 • 136,000 Words

In order to balance out all of these accounts from sharply alternative sources, I also decided to read *A Force Upon the Plain*, published in 1996 by Kenneth S. Stern, which bears the subtitle "The American Militia Movement and the Politics of Hate." Stern is appropriately

enough described as the American Jewish Committee's chief expert on hate groups, and his short book, barely 250 pages of main text, mostly focuses upon the histories and ideologies of the right-wing groups that are his targets, while also sticking very closely to the standard narrative of events. Unfortunately, instead of effectively refuting the disturbing evidence presented by the other side, he mostly ignores it and his few attempted rebuttals seem rather weak, so I wasn't at all convinced by his arguments.

This handful of books hardly constitutes an exhaustive treatment of this complex topic, but it does provide an introduction to some of the important issues that interested individuals can use as a basis for further investigation.

## Keeping Silent or Speaking Out

Not long after the 9/11 Attacks, I was disturbed by the ease with which so much of the country was soon persuaded that Saddam Hussein's Iraq had somehow been responsible, and stampeded into a disastrous war as a consequence. The extremely suspicious aspects of the anthrax attacks had also led me to begin questioning the reported version of events presented in our mainstream media. And around that same time, I began work on my content-archiving project, digitizing the last 150 years of many of America's major periodicals and gradually noticing that the contemporaneous accounts they provided sometimes differed very sharply from what I'd always believed the history to be.

After a major crack in one's wall of skeptical disbelief occurs, it is natural to carefully reexamine much of the past, and a dozen years later I published my original American Pravda article, explaining the transformation in my understanding:

> The realization that the world is often quite different from what is presented in our leading newspapers and magazines is not an easy conclusion for most educated Americans to accept, or at least that was true in my own case. For decades, I have closely read the *New York Times*, the *Wall Street Journal*, and one or two other major newspapers every morning, supplemented by a wide variety of weekly or monthly opinion magazines. Their biases in certain areas had always been apparent to me. But I felt confident that by comparing and contrasting the claims of these different publications and applying some common sense, I could obtain a reasonably accurate version of reality. I was mistaken.

> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.

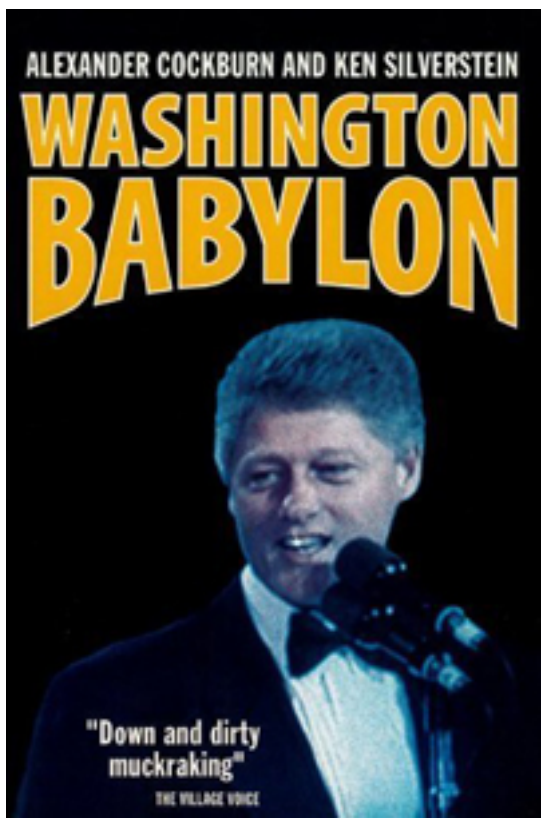
The ultimate result of this process has been the production of my American Pravda series, now approaching a half-million words and extending into the controversies of the 1990s that I had so casually dismissed at the time:

- The American Pravda Series
  Ron Unz • ***The Unz Review*** • 467,000 Words

Meanwhile, within a year or two after 9/11 I had discovered Alexander Cockburn's *Counterpunch*, a leading alternative media webzine, and became quite impressed by the coverage it provided of events ignored or misreported by my mainstream publications. I eventually became friendly with Alex himself, and he occasionally dropped by Palo Alto for lunch, so I mourned his passing in 2012, and in my tribute to his work explained what had attracted my admiration:

> Given my own scientific background in theoretical physics, I tend to follow a simple rule in attempting to discover the reality of the world. When people say things widely denounced by all established opinion but that turn out to be correct, I grant them an extra point. But when allegedly well-informed people backed by massive resources say things that seem absurd to me and these turn out to be totally false, they lose a point. By the time the massive hoax of the Saddam's WMD had exploded into international ridicule and national disaster, Alex's *Counterpunch* and the Sulzbergers' Gray Lady had largely switched their positions of credibility in my mind, at least across a broad range of issues. In the years that followed, there were many mornings when I would read endless amounts of absurd, dishonest nonsense in the news pages of the *New York Times* and the *Wall Street Journal*, only to discover a far more plausible and accurate discussion of world events on *Counterpunch*'s bright pages.

However, a few years later, I realized that Alex had operated under important constraints of his own, refusing to publish any of the controversial claims regarding the 9/11 attacks themselves that I later discovered and concluded were probably correct. One of his most experienced writers on intelligence matters was Bill Christison, who had spent decades at the CIA, rising to become a senior figure in its analysis division, but Christison's 2006 essay endorsing the 9/11 Truth Movement had to appear elsewhere, so I never encountered it until many years later. During the 1970s Alex had been a highly-influential journalist at the *Village Voice*, but he had been purged from his position in 1982, and I suspect he was concerned that being associated with conspiratorial beliefs might cost him his remaining foothold in mainstream media circles.



At one point, he'd sent me a copy of *Washington Babylon*, a 1996 muckraking book he'd co-authored on the dark side of American politics during the early Clinton Administration, and as I began to explore the hidden facts of the 1990s, I decided to finally read it. Although his former colleagues at the *Village Voice* praised it as "Down and dirty muckraking" and it extensively covered issues of campaign finance and corrupt lobbying, scarcely a skeptical word appeared

about Vince Foster's death or the Oklahoma City bombing or any of the other major events of that period I have discussed above, which disappointed me but was not a great surprise. I'd like to believe that if he had lived a few more years and been fortified by the dramatic shift of influence between the mainstream and alternative media, he would have become much bolder in his public positions.

Consider, for example, the recent trajectory of Prof. Jeffrey Sachs of Columbia University. For decades, he had ranked as a leading pillar of the elite academic establishment, with no indication that any of his views on historical events signficantly deviated from the official narrative. But a couple of years ago, he was named chairman of the *Lancet*'s Covid Commission, and in that role he gradually became aware that the facts surrounding the origin of the disease that has killed so many millions around the world were being concealed, with attempts to bring them to light being blocked by the concerted efforts of government and media. Then earlier this year, Russia's devastating war with Ukraine broke out, and once again, many of the crucial facts regarding the cause of the disaster were being kept from the general public. In a recent column, I praised him as a "righteous rogue elephant" and his interviews and other public statements have reached audiences numbering in the many millions.

As a consequence of these developments, he has also now apparently become far more suspicious of numerous historical matters he had previously accepted on faith, notably including the circumstances of the Kennedy assassination. In a remarkable recent podcast interview, he voiced sentiments strikingly similar to some of my own, saying that he had discovered that on many different issues of great importance, we are all living in "a sea of lies."

*The Unz Review* • December 19, 2022 • 6,900 Words

## Tucker Carlson and RFK Jr. on the JFK Assassination

Tucker Carlson hosts the most popular cable news show and last Thursday he aired an explosive segment in which he declared that that 1963 assassination of President John F. Kennedy had been the work of a conspiracy, with our own CIA heavily involved.

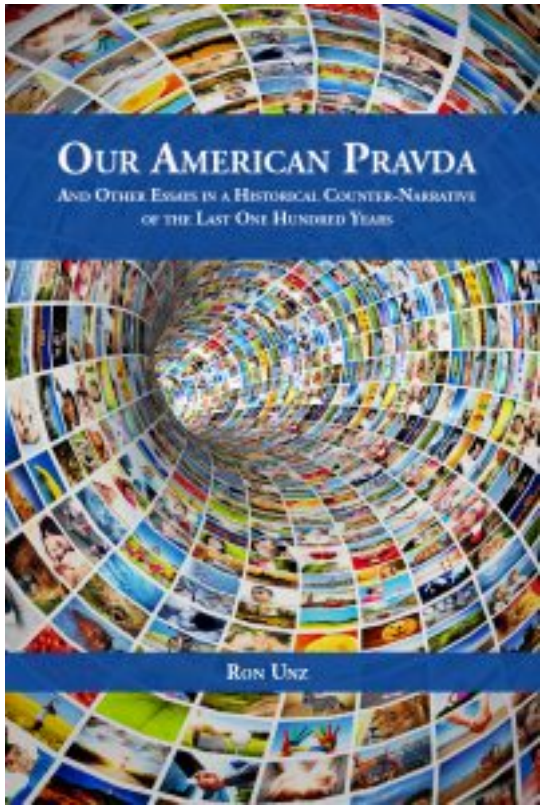
Carlson's regular nightly audience is over 3 million, and more than a million have already watched the Youtube video, so these bombshell accusations regarding the events in Dallas have probably now reached more ordinary Americans than anything else on the topic in the three decades since Oliver Stone's Oscar-winning film *JFK* was playing in the theaters.

Robert F. Kennedy, Jr., nephew of the slain President and son of his murdered brother praised Carlson's show as "the most courageous newscast in 60 years," and his remarks have been Retweeted more than 22,000 times.

> The most courageous newscast in 60 years. The CIA's murder of my uncle was a successful coup d'état from which our democracy has never recovered. @TuckerCarlson https://t.co/qJ1sUdhe4t

— Robert F. Kennedy Jr (@RobertKennedyJr) December 17, 2022

Kennedy is a prominent public figure and best-selling author, with the strongest possible personal standing on the murder of his uncle. But I suspect that if Elon Musk hadn't bought Twitter, that Tweet would have been immediately shadow-banned, disappearing with scarcely a trace.



In recent decades, such conspiratorial beliefs on the JFK assassination have been largely confined to the Left, with Stone himself being a prime example. But Carlson is one of America's most influential conservatives, so he may have successfully implanted these ideas among a portion of our citizenry previously unexposed to them. He also noted that widespread use of the insulting phrase "conspiracy theory" only began in the aftermath of the JFK assassination, with the CIA itself successfully marginalizing its critics by promoting that accusation in the compliant media.

Indeed, as a consequence of those decades of skewed and dishonest media coverage, I had spent most of my entire life assuming that such

"conspiracy theories" were total nonsense and had never taken them seriously. But about a dozen years ago, I stumbled across some surprising facts and later began a serious investigation, eventually leading me to publish several articles summarizing my remarkable conclusions:

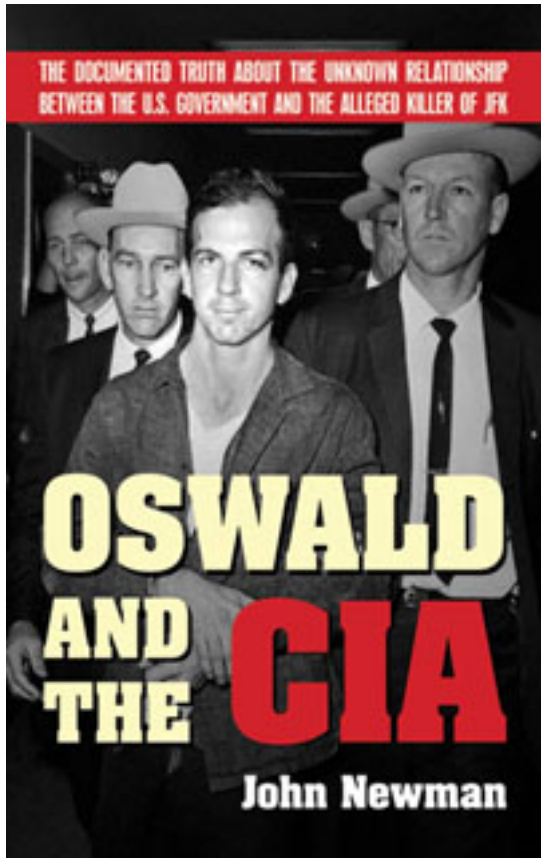
## Manipulating the JFK Assassination Cover-Up

By purest chance, Carlson's show had aired just a few days after I had finished reading an important book on the JFK assassination that someone had brought to my attention last year. Originally published almost thirty years ago, this work provided some crucial insights into how the political cover-up of the conspiracy had been arranged, a cover-up that has now successfully endured for nearly six decades. The most powerful man in the world had been killed at the very height of America's postwar success and prosperity, yet nearly all of America's political elites were successfully enlisted to suppress the truth of what had happened.



John Newman had spent twenty years in Military Intelligence and then became a professor of history at the University of Maryland. Since then, he had applied the technical skills that he had honed in his many years of government service to analyzing the bureaucratic minutia of declassified government files and using this material to produce a series of books on the hidden side of American government policies during the 1960s, including our growing involvement in Vietnam and especially the complex circumstances of the JFK Assassination. *Oswald and the CIA* originally appeared in 1993, but the 2008 edition included a new epilogue, summarizing some of his most important findings.

The book is a lengthy one, running over 650 pages with notes and appendices, and his exhaustively detailed analysis of the released intelligence files and their interpretation can be eye-glazingly dull at points, but his broader conclusions are not difficult to state. The profusion of internal CIA documents regarding Oswald and his movements seems completely inconsistent with any institutional plot at the Agency to kill Kennedy, but might fit very well with the

hypothesis of a "rogue faction" at the CIA having played a central role in the affair.

Newman argued that Oswald was exactly the "patsy" that he claimed to be, but more importantly he drew a very sharp distinction between the small group of plotters who had actually organized the JFK assassination itself and the much larger group who carried out the subsequent cover-up, with the motives of many of those latter individuals being entirely different. As he persuasively explained in his epilogue, the conspirators had created a false intelligence trail suggesting that Oswald might have been a Soviet agent, and then used that misinformation to force our fearful government leadership into become their unwitting accomplices after the fact, compelling them to suppress all evidence of any conspiracy in Dallas:

> It is now clear that most of the U.S. leaders and officials who participated in the national security cover-up had nothing to do with the plot that was hatched before the president's murder. Many of them—including leading legislators and Supreme Court Chief Justice Earl Warren—were motivated by the perceived threat of a nuclear exchange with the Soviet Union. Inside the executive branch of government, many others were motivated by the desire to protect their jobs and their institutions. Their collective actions, however, were not the result of an accident; rather, they were the forced checkmate in the endgame of an ingenious plan.
>
> The plan was designed to force official Washington to bury a radioactive story in Oswald's files in order for America to survive. The plan worked. No matter how sloppy the performance of the shooters in Dallas was, no matter how bungled the autopsy and the handling of the evidence was, all would be trumped by the threat of WWIII and 40 million dead Americans. From the beginning, the plot was based upon the assumption that, when presented with this horrific possibility, everyone would fall into line. This assumption was correct.
>
> …There was a darker purpose for Oswald's visit to Mexico City. He was sent there to seek visas from the Cuban Consulate and Soviet Embassy…the objective was simply incidental contact between Oswald and the man who issued Soviet visas in Mexico City: Valery Kostikov. The value of this contact derived from what only a handful of counterintelligence officers in Washington knew: Kostikov was an important operative of the KGB assassinations in the Americas…The handler's purpose in having

> both Oswald's and Kostikov's names mentioned was to place evidence into the CIA's records that, on 22 November, would link KGB assassinations to the murder of President Kennedy. The activities of this impersonator are what made it possible for President Johnson to tell Senator Russell on 29 November that those investigating the case were "testifying that Khrushchev and Castro did this." Johnson insisted that this must be prevented "from kicking us into a war that can kill forty million Americans in an hour."

So under Newman's convincing reconstruction, most of the powerful American officials who played such a pivotal role in concealing the conspiracy may have been acting under the best of intentions, seeking to protect our country from the risk of a devastating retaliatory war with the Soviets. And obviously these concerns would have been deliberately fanned by those among them who had been involved in the plot and created the false trail of evidence connecting Oswald with KGB assassination efforts.

The author therefore argued that creating that false trail had constituted an absolutely crucial element of the assassination plot, and by a very careful examination of the intelligence files, he concluded that longtime CIA Counter-Intelligence Chief James Angleton had been the likely culprit, thus identifying him as one of the key conspirators. This conclusion meshes perfectly with the entirely different arguments advanced by the late Michael Collins Piper in *Final Judgment*, his 1994 landmark work, which had also argued that Angleton was a central figure in the assassination.

Next year marks the 60th anniversary of the JFK assassination. Angleton, guilty or not, died in 1987, and all the other individuals involved have surely been dead for many years, even many decades. Newman's important book was published almost 30 years ago, and today the issue that he so effectively analyzed hardly seems of urgent importance.

But once we recognize that for nearly six decades our government and our media had successfully concealed the reality of JFK's assassination, we must necessarily turn a skeptical eye to more recent events. If the President of the United States—the most powerful man in the world—could be struck down in public by a conspiracy involving rogue elements of his own government, and that truth then kept hidden from the American people for generations, other important matters may have followed a similar pattern.

Over the last few years, I have carefully investigated quite a number of these, and my American Pravda series has been the result, now including many dozens of individual articles and totaling nearly a half-million words.

## Manipulating the Covid Origins Cover-Up

Of all these other events I have investigated, the one of greatest recent importance has been the Covid pandemic, the sudden appearance of a new coronavirus in late 2019 that soon spread around the world, killing perhaps 18 million people, including more than a million Americans. The global epidemic also produced major changes in the patterns of world trade, daily life, and government spending, and resulted in the widespread introduction of social controls that would have previously been unthinkable, while the new vaccines used to control the disease have provoked tremendous controversies of their own.

Although those latter issues have dominated the recent political debate, a fierce scientific dispute still rages over the origins of the virus, a controversy that has assumed much political importance. From the very beginning, there was considerable scientific evidence that the virus was artificial and had been produced in a lab, but that explosive possibility was quickly suppressed by influential members of the scientific community and the Western media, and their efforts amounted to a cover-up of why our society had been devastated, leaving more than a million Americans dead.

Aside from the huge historical importance of both the JFK assassination and the Covid epidemic, I think there is also a close analogy between how both those subsequent cover-ups came about. Newman argues that the vast majority of the individuals participating in the whitewash of JFK's assassination had been manipulating into doing so, persuaded by false information that they needed to take such actions for the good of their country and their institutions. And whether intentional or not, I believe that a very similar dynamic came into play during the early weeks of the global Covid epidemic, as numerous prominent individuals began proclaiming—despite all evidence to the contrary—that the virus was clearly natural, with most of them probably convincing themselves that they were taking that position for the best of intentions.

For example, leaked emails have demonstrated that Dr. Kristian Andersen of Scripps and other leading advocates of the natural origins hypothesis had initially believed that characteristics of the virus strongly suggested that it had come from a lab, but then surprisingly reversed themselves after an urgent conference call was arranged. As I described a year ago, others had originally had similar thoughts:

> Jeremy Farrar served as Director of Britain's Wellcome Trust, one of the world's largest funders of public health projects, and he played a crucial role in organizing the immediate measures taken to contain the Covid epidemic. *Spike*, co-authored by journalist Anjana Ahuja, is his short narrative account of those important events beginning in the last days of 2019, and it provides the useful perspective of a leading insider. I was also particularly interested to discover that Wellcome's chair was the former head of MI-5, Britain's domestic intelligence agency, who may have helped provide the author with some important insights on certain matters.
>
> In his account, Farrar repeatedly emphasized that the Covid outbreak had hit China at the absolute worst possible time, appearing on the eve of Chinese Lunar New Year, when 450 million Chinese might be traveling. This seemed likely to spread the disease to every corner of the huge country, and that gigantic, looming disaster was only averted by an immediate public health lockdown unprecedented in all of human history.
>
> Farrar is the most respectable of establishmentarian figures, and I was surprised to discover that in the early days of the epidemic he and his circle of leading scientific experts freely discussed whether the virus had been bioengineered, with some of them thinking that likely, and he even mentioned the speculation that it might have been a bioweapon, deliberately released. But as the practical needs of the terrible public health crisis facing Britain and the rest of the West began absorbing all of his concentration, these theoretical issues understandably faded from their discussions.

I think that the obvious reason for these sudden reversals on the origins of Covid was the massive propaganda barrage that America had quickly directed against China, leading many of these individuals to fear that this might lead to a disastrous global conflict. As I wrote last year:

> Although in recent decades America seems to have fallen behind

various other countries in industrial production, governing competence, and some important aspects of military technology, the effectiveness of our propaganda organs remains undiminished…

Using alternative media to immediately promote theories that the coronavirus outbreak was the result of a leak from a Chinese biowarfare lab was a natural means of preempting any later Chinese accusations along similar lines, thereby allowing America to win the international propaganda war before China had even begun to fight….I discovered that the fringes of the Internet were awash with claims that the disease was caused by a Chinese bioweapon accidentally released from that same Wuhan laboratory, with former Trump advisor Steve Bannon and *ZeroHedge*, a popular right-wing conspiracy-website, playing leading roles in advancing the theory. Indeed, the stories became so widespread in those ideological circles that Sen. Tom Cotton, a leading Republican Neocon, began promoting them on Twitter and *FoxNews*, thereby provoking an article in the *NYT* on those "fringe conspiracy theories."

As the *Times* article indicated, these early claims that Covid might be a leaked Chinese bioweapon were soon heavily amplified by Neocon-oriented international news outlets such as the *Washington Times* and Alex Jones's popular *InfoWars* network. Fearful of the possible international consequences of such explosive charges, well-intentioned scientists mobilized behind the defense that the virus was entirely natural, whether or not they actually believed the evidence was as strong as they claimed. Public statements to this effect appeared in a January 29th *Washington Post* article and a couple of weeks later the *New York Times* article debunking Sen. Cotton's charges.

This may also be the most likely explanation for the high-profile declaration published in the *Lancet* on February 19, 2020 by a group of 27 virologists and other noted scientists, condemning speculation about an artificial virus as an untenable "conspiracy theory," and the equally high-profile piece the following month in *Nature Medicine* arguing for a natural Covid origin. These early statements in prestigious journals completely framed the media discourse for more than a year, and as a consequence this supposed scientific consensus ensured that any Iranian accusations of a biowarfare attack were automatically dismissed as absurd and ridiculous.

I think that this reconstruction of events is supported by the remarkably contradictory public positions taken by Prof. Richard H. Ebright, a highly-reputable Rutgers molecular biologist and biosafety expert, who has recently established himself as one of the most widely cited scientific backers of the Wuhan lab-leak theory.

In January, Nicholson Baker had quoted Ebright as saying that for years he had been concerned about the Wuhan lab and the work being done there to create "chimeric" SARS-related bat coronaviruses "with enhanced human infectivity." In an email, the scientist further declared that "In this context, the news of a novel coronavirus in Wuhan ***screamed*** lab release."

Soon afterwards, Ebright became one of the prominent signatories of the March Open Letter sharply criticizing the WHO report and calling for a renewed international investigation of the Wuhan lab, outlining his views in a lengthy *Independent Science News* interview. According to the *Vanity Fair* article, when the earliest reports of the Covid outbreak appeared, his suspicions that an artificial virus had leaked from the Wuhan lab were immediate, emerging within "a nanosecond or a picosecond." Ebright's statements also constituted a centerpiece of Wade's seminal article:

> It is clear that the Wuhan Institute of Virology was systematically constructing novel chimeric coronaviruses and was assessing their ability to infect human cells and human-ACE2-expressing mice. It is also clear that, depending on the constant genomic contexts chosen for analysis, this work could have produced SARS-CoV-2 or a proximal progenitor of SARS-CoV-2…It is clear that some or all of this work was being performed using a biosafety standard … that would pose an unacceptably high risk of infection of laboratory staff. It also is clear that this work never should have been funded and never should have been performed.

Yet strangely enough, during the early months of the epidemic, Ebright had seemingly taken an entirely contrary public position. In his January 29, 2020 interview with the *Washington Post*, he had declared: "Based on the virus genome and properties there is no indication whatsoever that it was an engineered virus." And according to a *Post* story a couple of weeks later, he also added "The possibility that this was a deliberately released bioweapon can be firmly excluded."

Ebright's sweeping statements had been intended to rebut the widespread allegations that Covid was a *Chinese* bioweapon that had accidentally been leaked, but they soon proved extremely helpful to our own government-sponsored *RFE/RL*, which denounced the Iranian biowarfare accusation as "an unfounded claim" backed by "no evidence," and quoted Ebright's blanket assertion as an effective rebuttal. The apparent scientific consensus that the virus was natural ensured that any further Iranian accusations were summarily rejected as completely irrational by the international media, forcing Tehran to soon abandon the effort as counter-productive.

Whether or not my analysis of Ebright's motive is correct, there is the undeniable reality that the loudest early scientific voice favoring Covid as natural has become the loudest voice arguing that it came from a lab, a belief he now claims to have held from the very beginning. No one in the media seems to have commented upon or perhaps even noticed this radical reversal.

I cannot say if this political/media strategy was actually planned, but it proved very effective, and the fierce, early attacks on China for having released Covid achieved a double result. The accusations successfully demonized that country with much of the American and world public, so that according to a poll taken at the end of April, a remarkable 45% of Americans believed that the deadly virus had "probably" or "definitely" originated in a Chinese laboratory, with 74% of Republicans holding that opinion. But the charges also provoked a defensive response by reputable scientific authorities, who gravitated towards the doubtful natural virus theory as their best defense, and this proved extremely useful in defeating the Iranian accusations when they soon came. Moreover, the resulting natural virus consensus remained confined to the mainstream media, a source of information widely distrusted by populist conservatives, most of whom may have remained stubbornly convinced that Covid had indeed come from the Wuhan lab and had probably been a Chinese bioweapon.

## Evidence Against a Natural Virus and Against a Lab-Leak

The successful media suppression of the lab-leak theory came to an end last year with the publication of a lengthy article by Nicholas Wade, former Science Editor of the *New York Times*, who marshaled

the strong evidence that the virus was artificial, and since then the debate has see-sawed back and forth, propelled by both scientific and journalistic volleys from the two camps.

A few months ago, the skeptics of a natural virus gained a powerful advocate in Prof. Jeffrey Sachs, Chairman of the *Lancet*'s Covid Commission, whose academic writings and public interviews strongly argued that the virus had probably been produced in a lab, and he attracted considerable public attention when he denounced the governmental and media establishments for attempting to conceal this reality.

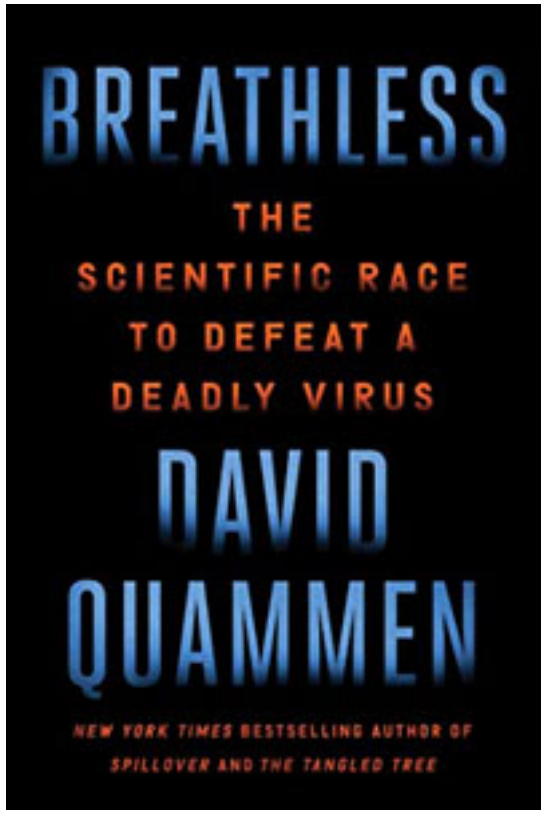
In mid-October further support for this position came in an important new scientific preprint by three researchers.

- Endonuclease fingerprint indicates a synthetic origin of SARS-CoV-2
  Valentin Bruttel, Alex Washburne, and Antonius VanDongen • ***bioRxiv*** • October 20, 2022 • 6,300 Words

The authors noted that when a virus is bioengineered, it is usually broken up into a half-dozen or so pieces for convenience, with most of those segments being of roughly similar size. The splitting is done by a selection of tools that use a number of possible genetic markers. Meanwhile, those same techniques would usually split natural viruses into pieces of much more irregular size.

They therefore tested how the Covid genome would be split under those various tools, and discovered that the largest piece was only a small fraction of the total length, then applied the same test to many dozens of the most closely-related natural viruses, finding that the pieces produced are much more irregular in size. So according to the statistical test they applied, the Covid virus is more regular in its decomposition than roughly 99.9% of natural viruses, strongly suggesting that it was bioengineered.

Although this analysis was taken very seriously by the *Economist*, the natural virus camp soon sharply challenged the strength of the case, arguing that it was far from conclusive, and the debate is still playing out.  But at the very least, this analysis certainly demonstrates the extremely unusual characteristics of Covid compared with nearly all natural viruses of a related type.



However, strangely enough, even as this evidence mounted against the Covid virus being natural, entirely conflicting evidence also appeared on the other side. A couple of weeks before the release of the important Bruttel preprint, award-winning science writer David Quammen published a book supporting the orthodox case that no lab-leak had occurred and that the Covid virus was probably natural. His work received strongly positive reviews in the *New York Times* and the *Guardian*, though it attracted a sharp dissent from Nicholas Wade.

Although little of Quammen's factual material was new to me, I still found it quite helpful that all the information was collected together in one place. But the author is an experienced journalist, long friendly with important individuals in both camps, and probably the greatest value of his book came in the nearly 100 personal interviews he conducted with key figures from both sides of the debate. These subjects included George Fu Gao, head of the China's CDC, and virologist Shi Zhengli of the Wuhan lab, as well as numerous other Chinese scientists and officials.

According to the lab-leak hypothesis the Covid virus had been created at the Wuhan lab, then accidentally leaked out during late 2019, with

the looming disaster concealed by the Chinese authorities; the Trump Administration even claimed that several members of the research staff had been infected with Covid at that time. However, as Quammen says, unless all of the Chinese figures whom he interviewed were remarkably good at deceiving him, absolutely none of these claims were true. The Covid virus had not been developed at the lab, nor had there been any known leak, while no one involved had had any suspicious of a viral outbreak until late December, just as presented in the standard timeline of the outbreak. Moreover, not a single staff member had tested positive for infection even after the circulation of the virus in Wuhan was detected.

Experienced Australian virologist Danielle Anderson had been working at the Wuhan lab during October and November 2019, exactly when the Covid outbreak probably began, and she repeated her strong doubts that the virus had been created there, nor that any lab-leak had occurred, let alone that some of the researchers had become infected.

Obviously, trained Intelligence operatives are experts at deceiving journalists, but the same is much less likely to be true of research scientists, so I consider Quammen's lengthy interviews fairly compelling evidence against the lab-leak hypothesis, as it has usually been presented.

Moreover, one of central figures in Quammen's narrative was Eddie Holmes, another leading Australian virologist who had been involved in the Covid outbreak from the very beginning, and the book's publication prompted a science podcaster to interview Holmes at length regarding the discovery of the Covid virus and the debate over its origins.

Holmes had been a key participant in all the crucial early Covid discussions, and he claimed that the redacted contents of the controversial emails involving Anthony Fauci, Francis Collins, and Peter Dauzek were entirely innocuous, while the widespread accusations against Dauzek seemed utterly ridiculous to him. He also made a seemingly strong case against the possibility that the Wuhan lab had developed Covid or had any connection to it. Although he also made a few glancing arguments against Covid having been bioengineered, these hardly seemed detailed or persuasive. For obvious epidemiological reasons he dismissed all those claims of Covid circulating in Italy and elsewhere during 2019 as false positives, feeling sure that the first appearance of the virus in the world had been in Wuhan during November, with his reasoning and conclusions being identical to my own. Others should watch the 90 minute interview and decide for themselves, but Holmes struck me as completely honest and very credible in his remarks. And if he is correct, much of the lab-leak case disintegrates.

I think that the combined testimony provided in Quammen's book and Holmes' interview greatly reduces the likelihood that the Covid virus was developed at the Wuhan lab or that any lab-leak occurred at that scientific facility. This evidence is hardly conclusive, but it considerably raises the presumptive burden against those who argue otherwise.

Furthermore, earlier this year, the highly-authoritative Pekar study had demonstrated that the geographical distribution of the earliest known Covid cases in Wuhan clustered in the vicinity of the Huanan Wildlife Market, many miles distant from the Wuhan lab, which seemed to have no association with the outbreak. Once again, these results are far from conclusive and reasonable arguments have been made to explain away this geographical discrepancy, but we would naturally expect a Covid lab-leak to produce many of its early cases in the approximate vicinity of that lab rather than on the other side of a huge metropolis larger than New York City.

While the issue is hardly settled, proponents of the lab-leak hypothesis should candidly admit that there is simply no solid evidence that Covid was developed at the Wuhan lab or that any lab-leak occurred there, while there is instead a great deal of direct evidence against both of these notions.

## Considering the Excluded Third Possibility

I think these exchanges demonstrate that to a considerable extent, the two main camps on the Covid origins debate have been talking past each other.

The testimonies provided by Quammen and Holmes strongly challenged the possibility of any lab-leak at Wuhan, suggesting that this proves the virus must have been natural, even though few arguments on that latter point were ever made; at most, they raised some doubts about the strength of the evidence for bioengineering.

Meanwhile, the articles and papers by Wade, Sachs, Bruttel, and others have provided strong evidence that the virus was artificial. All of this has usually been interpreted as support for the lab-leak hypothesis, even though very little evidence was ever presented that any lab-leak had occurred.

Yet the apparent vector-sum of these conflicting arguments is the conclusion that the Covid virus neither leaked from the Wuhan lab nor was natural, and this suggests that the public debate has been improperly restricted to just those two possibilities.

For more than 30 months I have emphasized that there are actually three perfectly plausible hypotheses for the Covid outbreak. The virus might have been natural, randomly appearing in Wuhan during late 2019; the virus might have been the artificial product of a scientific lab in Wuhan, which accidentally leaked out at that time; or the virus

might have been the bioengineered product of America's hundred-billion-dollar biowarfare program, the oldest and largest in the world, a bioweapon deployed against China and Iran by elements of the Trump Administration at the height of our hostile international confrontation with those countries.

The first two possibilities have been very widely discussed and debated across the Western mainstream and alternative media, while the third has been almost totally ignored, despite top Russian, Iranian, and Chinese government officials having publicly accused America of releasing Covid in a deliberate biowarfare attack.

Indeed, beginning in April 2020 I have published a long series of articles arguing that there is strong perhaps even overwhelming evidence in favor of that third, disregarded possibility.

Last December I had discussed and reviewed several important recent books on the origins of the Covid virus, all advocating the lab-leak hypothesis. I noted that none of the authors—Jasper Becker, Sharri Markson, Alina Chan and Matt Ridley—had dared to even consider the excluded third possibility, perhaps because the realities of the publishing industry required them to apply such Orwellian "crimestop" to their thinking.

- American Pravda: Confronting Covid Crimestop
  Ron Unz • ***The Unz Review*** • December 13, 2021 • 6,400 Words

Although the Quammen book and the Holmes interview present the absolutely mainstream position of the media and scientific establishments, I found myself agreeing with 90-95% of all their arguments, the sole exception being their skepticism that the virus was bioengineered, representing merely a small slice of their analysis. Yet my own conclusions were radically different.

This apparent paradox arises because Quammen, Holmes, and nearly all their colleagues and sources have been almost exclusively focused upon the scientific aspects of Covid, and seem largely unaware of the broader geopolitical or national security elements, notably those pieces of telling evidence that our Western media has been careful to avoid mentioning.

For example, Quammen naturally discusses the early spread of the virus out of China, noting that Northern Italy, home to 300,000 Chinese, was one of the first places hit very hard. But his index

contains no entry for Iran, which was actually hit even earlier than Italy; and that Covid outbreak was centered in the Holy City of Qom, which had a negligible Chinese population but was home to Iran's elderly religious and political elites, many of whom soon died from the disease. Moreover, that surprising Iranian outbreak began just three or four weeks after America had assassinated Iran's top military commander, the sort of implausible coincidence that quickly led the Iranian government and media to accuse America of having staged an illegal biowarfare attack and lodge a complaint with the United Nations; but since none of these facts were ever reported in the American media, a science journalist such as Quammen probably never encountered them.

Quammen seems similarly unaware that during the first eight months of 2019, Robert Kadlec, America's top biowarfare expert, had run the federal/state Crimson Contagion exercise, preparing to defend America against contagion if a dangerous respiratory virus were to suddenly appear in China, which is exactly what happened in Wuhan a few weeks after the conclusion of the drill. Nor does he realize that our Defense Intelligence Agency had prepared and distributed a secret report describing a potentially "cataclysmic" disease outbreak occurring in Wuhan, with that report having been produced in early November, after the Covid virus had probably appeared in that city but before any serious symptoms would have developed in the first handful of infected Chinese.

Scientists and science journalists are naturally focused on their personal areas of expertise, and they can hardly be faulted for failing to notice what virtually all members of the mainstream and alternative media have made such strong efforts to conceal. Even if they did become aware of those facts, they might conclude that mentioning them let alone drawing the obvious conclusions could easily prove fatal to their professional reputations.

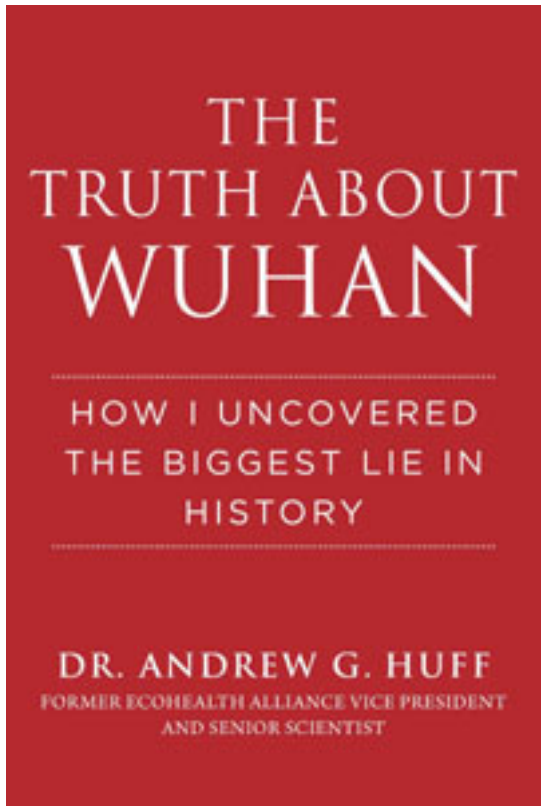
There is an ironic additional example of this political myopia among those analysts narrowly focused on scientific issues. Prof. Richard Muller of Berkeley has been a prominent advocate of the lab-leak hypothesis, arguing that Covid was developed as a Chinese bioweapon, but then accidentally leaked from the Wuhan lab. In his June 2021 presentation for the Neoconservative Hudson Institute, he explained that if the Chinese had wanted to deliberately deploy such a bioweapon, they surely would have released it in the vicinity of our own Ft. Detrick facility so that America would have been blamed for the resulting viral outbreak; and neither he nor either of the other two Covid discussants seemed to recognize that he was perfectly

describing the analogous mirror-image of what might have actually unfolded in Wuhan during late 2019.

Beginning in April 2020, my articles have presented all these facts and much additional evidence. Under my scenario, elements of the Trump Administration were responsible for the deliberate release of Covid, but those biowarfare attacks against China and Iran were launched without the knowledge or authorization of the President himself, a proposition that some have dismissed as totally implausible. However, three weeks after the appearance of the Quammen book, the *Wall Street Journal* published a 10,000 word article on the circumstances of a different American confrontation with China, which provided some fascinating details:

> Mr. Bolton, then-national security adviser in the Trump administration, knew Ms. Meng's arrest could disrupt the summit's marquee event that evening, a dinner between President Donald Trump and Chinese leader Xi Jinping. Yet Mr. Bolton, a longtime China hawk, felt it was worth the risk. The president didn't yet know about the plan. White House staffers later debated whether Mr. Bolton had told Mr. Trump or if it hadn't fully registered with the president …
>
> At the police station, Ms. Meng was fingerprinted, and allowed a phone call to the only Chinese-speaking lawyer Huawei could find on short notice, a patent attorney. As the attorney dashed to the station, Ms. Meng began to gasp for air, worrying officers who sped her to a hospital.
>
> Messrs. Trump and Xi were dining on Argentine sirloin, accompanied by a 2014 Malbec. The goal of the dinner was to reach a truce in an escalating U.S.-China trade war. Neither man appeared aware of Ms. Meng's arrest. Mr. Bolton, seated near Mr. Trump, didn't mention it.
>
> Mr. Xi learned shortly after, according to Chinese government officials, and it struck him as deceptive and an insult. He had just agreed to buy more U.S. food and energy.
>
> Mr. Trump questioned Mr. Bolton days later at a White House Christmas dinner, according to people familiar with the conversation. "Why did you arrest Meng?" the president said. "Don't you know she's the Ivanka Trump of China?"

Obviously, under normal circumstances the notion that an American biowarfare attack could be carried out by "rogue" elements of the Trump Administration without Presidential approval would be utterly outlandish and ridiculous; but recent circumstances in our government have been far from normal.



Most advocates of the lab-leak hypothesis have suggested that the Covid virus was developed in Wuhan under the direction of the Daszek's EcoHealth Alliance, which they often portray as a highly-nefarious organization. A disgruntled former EHA employee named Dr. Andrew G. Huff recently came forth as a whistleblower, and some of his claims have been cited in support of those accusations. Although Huff had only worked at EHA for about eighteen months and left in early 2016, years before the events in question, the *Daily Mail* and other British tabloids gave considerable coverage to his new book *The Truth About Wuhan*, which seemed to blame EHA and the Chinese for having unleashed the global pandemic.

Dr. Huff's book is fairly short and makes dismal reading, filled with

wild and outrageous accusations, while the extensive personal history he relates hardly strengthens his credibility. Despite his supposed doctorate in Environmental Health Studies, he seems to have had a rather mediocre academic record, dropping out of high school and serving as an infantryman in Central America and Iraq, where he attempted to beat to death one of his combat instructors and later required mental health counseling. More recently, he claims to have been massively persecuted by the government, with teams of 20-30 full-time agents constantly watching him, assisted by mechanical drones the size of small insects, all at an estimated cost of at least \ $45 million. In the two decades since the 9/11 attacks, our military-industrial complex with its myriad private contractors has received an unprecedented ocean of government funding, and I suspect a considerable fraction of our tax-dollars have gone to pay the salaries of very doubtful individuals such as Huff.

Still, some of the direct statements he makes about the activities of the EcoHealth Alliance are probably worth considering, even coming from such a questionable source. As the *Daily Mail* article summarized some of his most interesting claims:

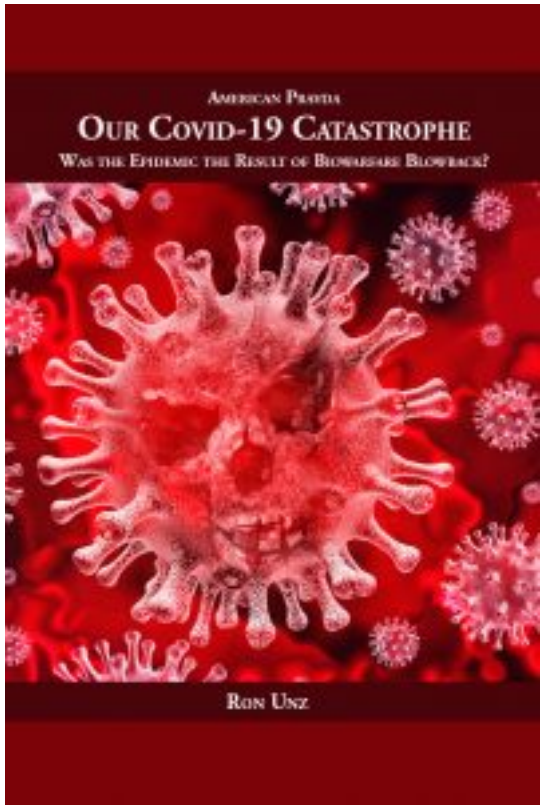
> …but believes the US-funded project was 'mostly a global fishing expedition for coronaviruses' to carry out GOF work or for intelligence collection – rather than preventing future pandemics.
>
> 'At the time, I felt like the project seemed more like intelligence collection than scientific research and development,' he said in his book.
>
> The scientist said the PREDICT program wasn't collecting the data it should have been and Huff told The Sun that it appeared to be a 'giant intelligence operation'.
>
> He alleges the US were using the project to assess the bioweapon capabilities of foreign labs – including the Wuhan Institute of Virology.

We know that EcoHealth Alliance was heavily funded by the Pentagon and according to Huff, it largely functioned as an intelligence-gathering operation, using the lure of its small financial grants to the Wuhan lab and other foreign biolabs to monitor them on behalf of our national security apparatus, which seems perfectly plausible. But if EHA was an espionage operation, it hardly seems likely that it would have heavily assisted the Chinese in developing dangerous viruses of their own. On the other hand, EHA might certainly have obtained

samples of the natural viruses collected by the Wuhan lab, and passed those along to its Pentagon paymasters, which then used one of them as the precursor to Covid, thus explaining the latter's close genetic similarity to some of the viruses in the Wuhan collection.

Huff also claims that in October 2019, three years after leaving EHA, he was suddenly and repeatedly offered "his former dream job" at the Pentagon's elite DARPA unit. After the Covid epidemic and the Wuhan lab reached the headlines, he immediately concluded that the intention had been to quickly bind him with secrecy agreements, thereby preventing him from revealing any of his past knowledge of EHA activities. Huff is convinced that this indicates that the American government was well aware of the Covid outbreak in Wuhan at that point, and if his testimony is accurate, such suspiciously coincidental timing does further strengthen the evidence that foreknowledge of the outbreak existed among some elements of the American national security apparatus.

For almost sixty years, nearly the entirety of the American mainstream media engaged in a conspiracy of silence to avoid discussing the obvious facts surrounding the death of President John F. Kennedy, an information embargo finally broken a few days ago by Tucker Carlson. So perhaps our country will finally begin to understand why that one man had died, a death that occurred before the overwhelming majority of today's Americans were even born.



EPub Format • Mobi/Kindle

But I think it is even more necessary that we break the same conspiracy of silence regarding the Covid deaths of well over a million Americans, deaths that were probably caused by the extremely reckless and illegal actions taken by elements of our own government.

For those who wish to inform themselves of these events and the very considerable evidence regarding what unfolded, I continue to recommend my Covid/Biowarfare series of articles, also conveniently available as a downloadable eBook, as well as several of my podcast interviews from earlier this year, which have already been viewed a couple of million times on Rumble:

## Covid and the Rise of the Anti-Vaxxing Movement

Until the last year or two, I'd never paid any attention to the anti-vaxxing movement, which very occasionally received some coverage in my newspapers. It seemed to mostly consist of a small slice of agitated women from affluent suburbs, morbidly fearful that the standard series of childhood vaccinations would injure their infants, perhaps producing autism or other serious disabilities. I regarded them almost as an eccentric cult that I mentally filed away with Scientologists or UFO adherents.

That all changed in 2020 as the massive Covid epidemic led the Trump Administration to propose an equally massive roll-out of mRNA vaccines, which were rushed into release without undergoing the usual years of careful clinical trials. Given the new technology employed—which effectively hijacked the body's own cellular machinery into producing portions of the Covid spike-protein—and the lack of testing, it's hardly surprising that many individuals were fearful of such injections. Indeed, there were plausible claims that the heavy media campaign against alternative Covid treatments relying upon HCQ and IVM had actually been orchestrated, intended to ensure that the lack of effective alternative drugs would allow the government to use its emergency powers to deploy the Covid vaccines without the lengthy normal testing process. This government-sponsored vaccination project had raised the market value of the large vaccine manufacturers by hundreds of billions of dollars, provoking the reasonable suspicions of cynical observers.

So by 2021 our website was flooded by waves of militant anti-vaxxers, while many of our existing writers and commenters also latched onto that same issue, sometimes to the near-exclusion of most others, a situation that greatly irritated me. Their wild outcries warned that the mRNA vaccines would kill millions—or even billions—perhaps as part of a diabolical globalist plot by Bill Gates to depopulate the earth. All of this seemed like stark, raving lunacy to me, and I regularly said so, incurring their ferocious outrage.

I felt that their basic concern about the widespread use of a relatively

untested medical technology might have possible merit. But on balance, the risks appeared smaller than the dangerous Covid epidemic it was intended to mitigate, at least according to an overwhelming large majority of medical professionals. Given my lack of personal expertise, that was the most I could say. So I got my shots, stopped paying any attention to the issue, and hoped for the best.

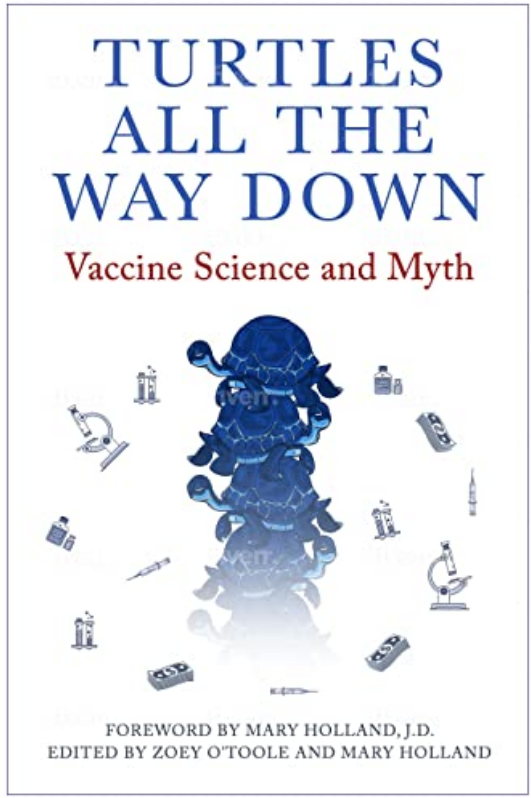
Fortunately, two years of statistical data now seems to indicate that the medical establishment had mostly been correct and its fervent critics mistaken, and in several recent articles I'd shown that across numerous countries, the number of non-elderly vaccine deaths seems almost invisibly low, too small to be noticeable in the mortality statistics. Anti-vaxxers frequently claim that the vaccines are responsible for a large wave of sudden deaths among youthful individuals and athletes; but the evidence suggests that these are much more likely due to the lingering consequences of Covid infections rather than the vaccines intended to combat the virus, as I've discussed in several recent articles:

- Vaxxing Deaths or Covid Deaths?
  Ron Unz • ***The Unz Review*** • January 2, 2023 • 3,300 Words
- Obesity and the End of the Vaxxing Debate?
  Ron Unz • ***The Unz Review*** • January 9, 2023 • 2,800 Words
- Vaxxing, Covid, and International Mortality Rates
  Ron Unz • ***The Unz Review*** • January 23, 2023 • 4,500 Words

It's certainly not impossible that the long-term consequences of mRNA injections might be harmful, but at least so far there doesn't seem to be much evidence of this, which is the most we can expect at this stage.

## The Surprising Flaws in Vaccine Safety Testing

To a huge extent, concerns about mRNA-based Covid vaccines have come to define today's anti-vaxxing movement, so much so that they seem to be the main focus of perhaps 95% or 98% of all the angry anti-vaxxers I've encountered over the last couple of years. Indeed, many of these activists have explicitly said that they'd feel fairly comfortable with the more traditional Covid vaccines released by Russia and various other countries. Although I'm sure that most of the original anti-vaxxers of 2019 are still around, they seem to have been reduced to a tiny minority in the movement that they once pioneered.



However, those earlier vaxxing concerns still have a presence here and there, and a few months ago I received a book on exactly that broader subject, published under the auspices of Robert F. Kennedy Jr.'s Children's Health Defense organization. It had originally been released in 2019, long before anyone had ever heard of Covid or Wuhan, so it had nothing to do with this current issues, but addressed the previous vaccine controversy. The authors were anonymous—supposedly a couple of Israeli medical doctors—and their work had originally been published in their own country, but had now been released in an English-language American edition. Except for a few simple charts, the contents consisted entirely of text, and the title was a puzzling one: *Turtles All the Way Down*. But the explanatory subtitle of "Vaccine Science and Myth" alerted me to the topic, and given my lack of interest in the vaxxing issue, I put it on the shelf, never intending to read it. After all, since I'd concluded that the radically new mRNA Covid vaccines probably seemed harmless, how likely was it that the traditional ones that had been used for so many decades were actually dangerous?

However, in early October I happened to listen to Kevin Barrett's interview with Zoey O'Toole, one of the editors of the American

edition of *Turtles*. To my considerable surprise, she came across as quite rational and persuasive, making all sorts of very reasonable points, and raising important issues that I'd never previously considered, so I dug out the book and decided to spend a couple of days reading it.

https://www.unz.com/CONTENTS/AUDIO/kbarrett/KB-TJ_2022-1003_o-toole_web.mp3

I was really quite impressed. Most of the Covid anti-vaxxers I'd encountered on the Internet were prone to making wild, very doubtful charges involving gigantic body-counts but I encountered very little of such grandiosity in this extremely sober 500 page discussion of the subject.

Yet although the tone and the factual claims were quite restrained, in many other respects this book constituted a far more radical critique of vaccines than anything I'd previously seen, amounting to a frontal assault against their traditional role in modern medicine. *Turtles* aimed at overthrowing what most of us had long assumed we knew about those established public health measures, so I was hardly surprised that the authors chose to conceal their names for fear of professional retribution. According to the foreword to the American edition, some months after its original publication the book had received a strongly favorable review in Israel's leading medical journal, but the senior academics who praised it were then harshly vilified by a medical establishment that was unwilling to directly challenge the substance of the text they had applauded. The front of the book is studded with lengthy endorsements by nearly a dozen medical professionals and other academics, certainly enough support for me to take the book seriously rather than merely dismissing it out of hand. Just over a year ago, I'd been stunned by the contents of Kennedy's own #1 Amazon best-seller, and since then I've grown much more cautious in accepting the conventional wisdom of the medical establishment.

*Turtles* provides some 1,200 references, which fill 273 pages of an online document, but just as in the case of the Kennedy book, I haven't attempted to check any of them, partly because I lack the technical expertise to properly do so. According to the editors, the claims of the authors have not been obviously refuted in the three years since publication. So without taking any position on the issues, I'll merely do my best to summarize some of their main arguments, encouraging those so interested to read the book and decide for themselves.

A central theme of anti-vaxxers has been that many of the vaccines they criticize actually have serious adverse side effects, sometimes doing more harm than good, and I'd always been quite skeptical of this claim. After all, I'd known that prior to their general release new vaccines must typically go through a long period of clinical trials, in which they are matched in randomized, blinded large-scale tests against placebos. But the very first chapter of *Turtles* claimed that this was mostly a myth and a deception.

According to the authors, such vaccine trials are not conducted against true placebos such as saline solutions, but only against previously approved vaccines. So a new treatment is considered safe if its rate of harmful side-effects is no worse than those of previously approved versions rather than no treatment at all, an illogical approach that seems to make little sense. Thus, the supposed safety and efficacy of current vaccines has only been established relative to a long series of their predecessors, often stretching back decades, and this constitutes the "Turtles All the Way Down" metaphor of the book's title. This sort of very simple factual claim seems unlikely to have been made unless it were actually true.

Surprisingly enough, the tested rate of adverse vaccine side-effects is sometimes quite significant. For example, during the clinical trials of the Prevnar vaccine, about 6% of the 17,000 infants tested needed emergency room visits and 3% required hospitalization. But because the previous vaccine used for comparison purposes had similarly high rates of negative side-effects, Prevnar was judged safe and effective, a shocking verdict.

There are also cases in which no previously approved version of the vaccine existed for use in such a comparison trial, and one might naturally assume that the only possible choice would be to use a true placebo such a saline solution. Yet as *Turtles* reveals, in that situation a deliberately crippled version of the vaccine itself is given to the other half of the trial population, a compound which could not provide any benefits but would still probably produce all the same adverse side-effects. The most plausible reason for this strange methodology would be to mask the existence of those adverse side-effects, thereby ensuring the vaccine's approval.

*Turtles* summarizes this outrageous situation by stating that each year tens of millions of vaccine doses are administered to infants and toddlers in America, and not a single one of them has ever been tested in clinical trials against an inert placebo. None of this proves that any of these vaccines are dangerous, but it certainly raises that serious

possibility. Pilots who fly blind may not necessarily crash, but they probably have a much greater chance of doing so.

Once a vaccine has passed its clinical trials and been approved for general use, any future problems that might appear are supposedly covered by VAERS, the "Vaccine Adverse Events Reporting System," whose name indicates its role of bringing any such problems to the attention of public health authorities. *Turtles* devotes a full chapter to this system, which the authors claim is very poorly designed and quite unreliable.

In particular, the reporting system is entirely voluntary, so that medical professionals are not obligated to file reports regarding harmful results they have encountered, even those involving the most severe reactions. This suggests that a large degree of under-reporting may be occurring, while at the same time false or misleading reports can also be filed by anyone, without any verification process.

As a result, the data collected by VAERS is statistically suspect and probably quite unreliable, and the authors are suspicious as to why those huge defects in such a seemingly vital system have been left uncorrected for decades. They suspect that these flaws may be deliberate, intended to mask the dangers of the vaccines the system is supposedly meant to monitor.

The authors recognize that skeptical readers may find it difficult to believe that ill-effects from so widespread a product as vaccines might have remained concealed for decades, so they take a short digression into the past history of disease epidemiology. They note that lung cancer was once extremely rare, but then suddenly began to appear in the early part of the twentieth century around the same time that cigarette smoking became widespread, and did so in many of the same populations. But although scientists began pointing to the possible connection and the supporting statistical evidence, that causal relationship was fiercely disputed for decades, partly because of the wealth and power of the industry responsible. *Turtles* suggests that this tragic history, which led to the premature deaths of millions of lung cancer victims, should be kept carefully in mind as we consider the issue of vaccine safety.

By the late 1990s, renewed questions regarding the safety of vaccines were beginning to appear in the scientific literature, notably the 1998 publication of a hugely controversial study concerning the safety of

the MMR vaccine by Dr. Andrew Wakefield and his colleagues in the *Lancet*, a leading medical journal. In addition, the appearance of the Internet for the first time allowed ordinary individuals to share their experiences and concerns, and organize themselves to investigate these issues.

But according to *Turtles*, the response of the vaccine establishment was to release a series of studies debunking these concerns, studies that the authors argue were severely flawed, biased, and possibly even corrupt, but which were heavily promoted by the medical establishment and its subservient media allies. They devote most of a long chapter to analyzing five of these major studies in considerable detail, noting that some of the most influential contained errors that seemed to severely damage their credibility. Remarkably enough, the raw data presented in one of the most important, the 2002 Madsen study of Danish children, actually seemed to support the opposite conclusion, suggesting that the vaccine indeed had dangerous side-effects, but various dubious statistical "adjustments" were then employed to produce the desired, reassuring result.

At this point the authors raised a very simple question. The easiest and most convincing means of demonstrating that vaccines are actually safe and beneficial with few serious side-effects, would obviously be to conduct a large randomized trial study comparing the total health consequences of vaccinated and unvaccinated individuals, what they call a "Vaccinated vs. Unvaccinated" (VU) study. Yet according to *Turtles*, no such study has ever been conducted: "It seems inexplicable that VU studies have not been initiated by the vaccine establishment for so many years."

Indeed, there already exist substantial populations such as the Amish which forego vaccinations and whose health outcomes could easily be compared with a matched control group of the general, fully-vaccinated public, and *Turtles* notes some disturbing indications in this regard. A journalistic investigation found that the rate of autism in the Amish was just a small fraction of that in the general population, and the same condition was non-existent in unvaccinated Ethiopian-born children in Israel, while their fully-vaccinated Israeli-born siblings showed normal levels. A similar pattern occurred with Somali immigrant families to both Minnesota and Sweden. Given that those autism-vaccine concerns have for years been such a flashpoint among anti-vaccine activists, it does seem quite suspicious that the public health authorities have been unwilling to respond with a large-scale

VU study to conclusively settle the issue.

There have been repeated demands for such VU studies but the regular response of the medical establishment has been to dismiss the proposal as unethical, claiming that it would require denying a large group of children access to beneficial vaccinations; but this is obvious nonsense. A non-randomized study could be based upon unvaccinated groups or a retrospective study could use the health history of large numbers of children who had been unvaccinated in the past. *Turtles* notes that 0.8% of all American children are today completely unvaccinated, thereby providing 30,000 potential subjects in each birth cohort, while in Australia the rate is 1.5%. These would obviously provide large enough numbers to conclusively determine the relative health benefits of vaccinations, so various other doubtful or entirely specious excuses are typically made.

So why has there been such strong opposition to conducting a comprehensive VU study? *Turtles* offers a simple answer.

> There can be only one explanation: **The results were markedly in favor of the unvaccinated.** [boldface in original]

The authors argue that such studies have indeed almost certainly been quietly conducted, probably many times, but the results have never been made public because they pointed in the wrong direction. After all, the data has been accessible to government authorities for many years and it seems inconceivable that no analysis was ever performed, only that the findings were never released. While I can't be certain that the authors are right, I do think that their deeply cynical suspicion is more likely correct than not.

## The Exaggerated Role of Vaccines in Public Health

The second half of the book shifts to a broader historical perspective, focusing on what the authors describe as the "founding myths" of public health, especially the supposedly crucial role that medical innovations such as vaccines had played in freeing us from the deadly diseases of the past. For nearly my entire life, I had always vaguely accepted these beliefs and had never seriously questioned them.

The authors tell a very different story. They explain that beginning in the early 1960s, Dr. Thomas McKeown, a leading British physician and academic researcher, and his colleagues had published a series of ground-breaking articles that successfully challenged these assumptions, noting that the huge reductions in infectious disease

mortality in Britain had actually long pre-dated the introduction of either vaccines or medical treatments such as antibiotics. Instead, the sharp reductions in disease mortality had overwhelmingly been due to major improvements in public sanitation and private hygiene, a surprising conclusion later confirmed in the US as well. They provide several very telling charts demonstrating these facts.

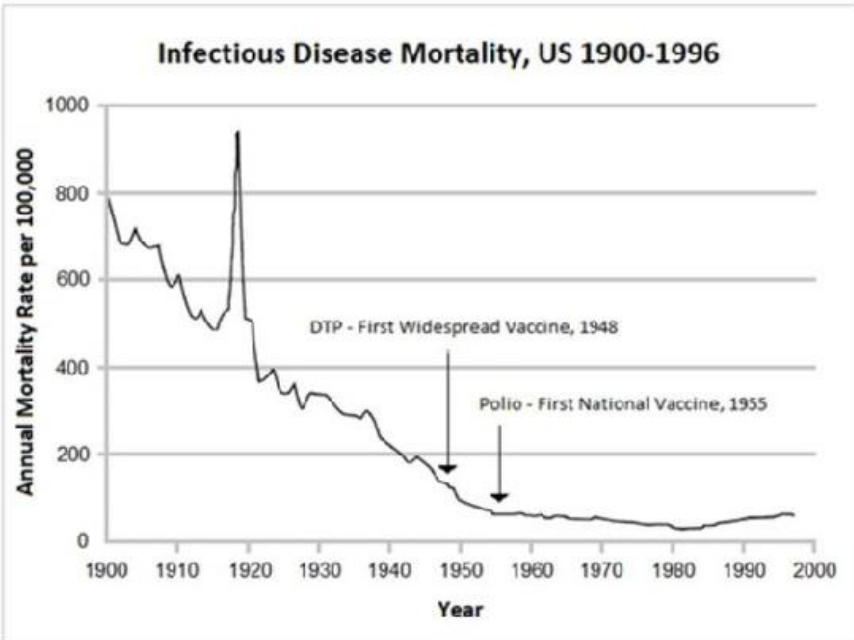


**Figure 8-1: Mortality from infectious disease in the United States (1900–1996)**

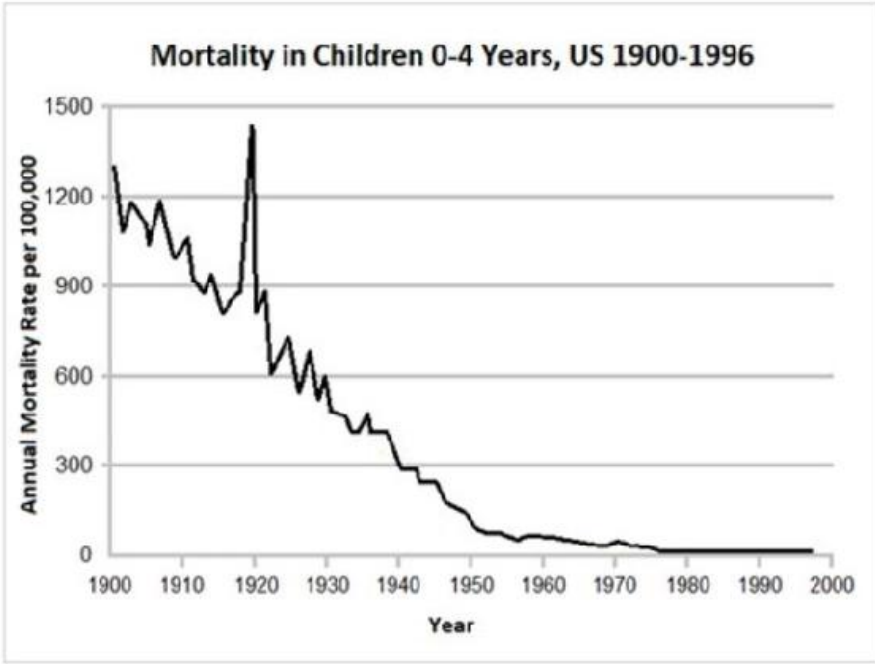

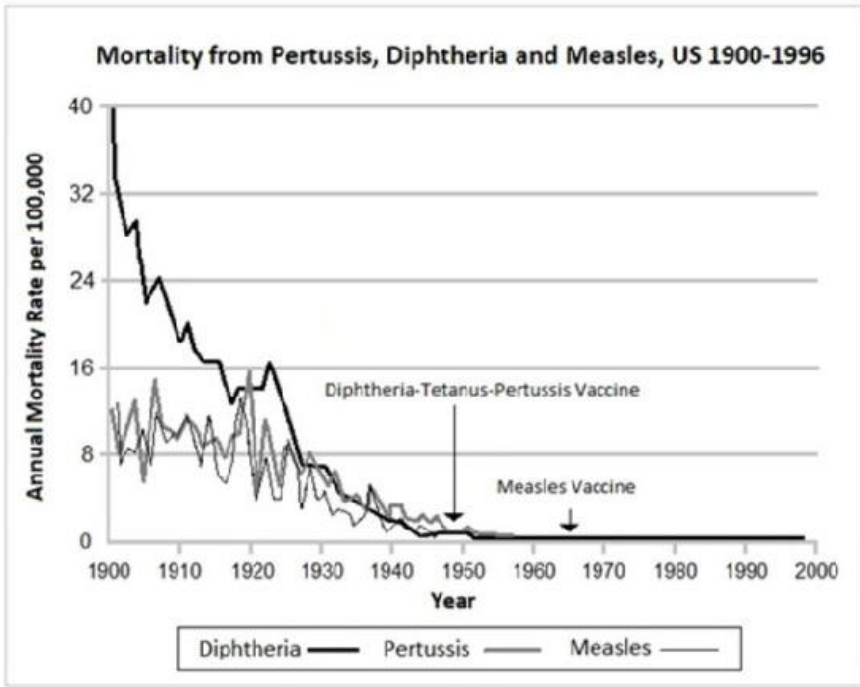

**Figure 8-3: Mortality rates of pertussis, diphtheria, and measles in the United States (1900–1996)**

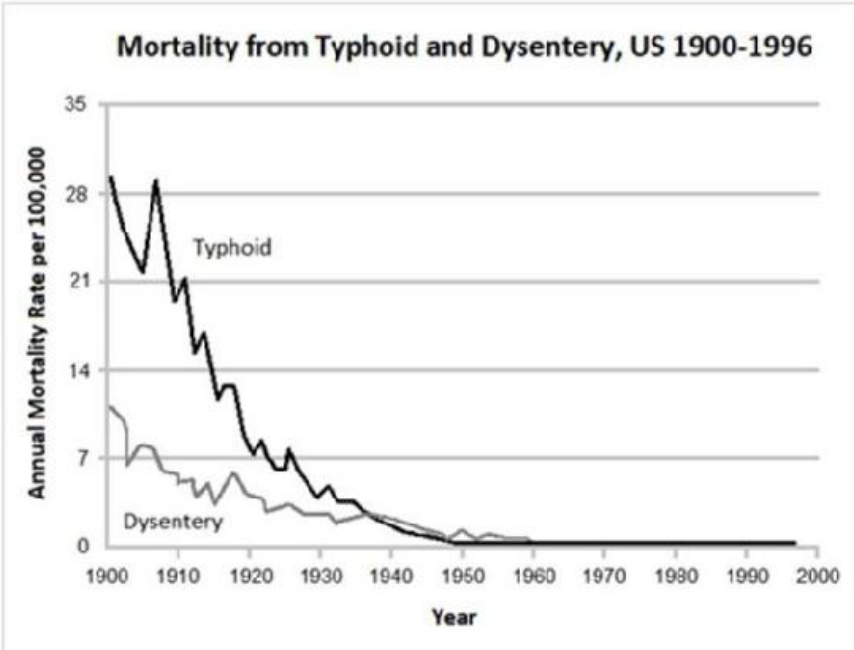

**Figure 8-4: Death rates from dysentery and typhoid in the United States (1900 – 1996)**

Among other factors, changes in urban transportation technology such as the replacement of horses by automobiles had had an enormous impact given that the former produced an average of 25 pounds of feces per day, much of it scattered on the city streets. The urban reliance on horses involved other major health hazards, with New York City having to remove some 15,000 horse carcasses from its streets during the year 1880. Meanwhile, refrigeration greatly reduced the consumption of spoiled or tainted food, and advances in nutritional understanding increased personal health.

The authors emphasize that forty years after McKeown and his allies produced this "conceptual revolution," leading health authorities have fully recognized the relative importance of these different factors. A report by the American Institute of Medicine states that

> the number of infections prevented by immunization is actually quite small compared with the total number of infections prevented by other hygenic interventions such as clean water, food, and living conditions.

But although the academic community has absorbed these facts, they have still not been widely disseminated or given proper attention. For example, most CDC publications still misleadingly emphasize the central role of vaccinations, leading to widespread public

misconceptions. According to *Turtles*

> the scientific consensus regarding the minor role vaccines played in reducing the burden of infectious diseases has become a kind of "open secret" in scientific and medical circles: Everyone knows the truth but nobody cares to share it with the public.

*Turtles* does freely admit that some major diseases were largely eliminated by vaccines, notably smallpox, and also that vaccines played an important role in reducing the morbidity—widespread illness—of others such as measles, even if not their mortality.

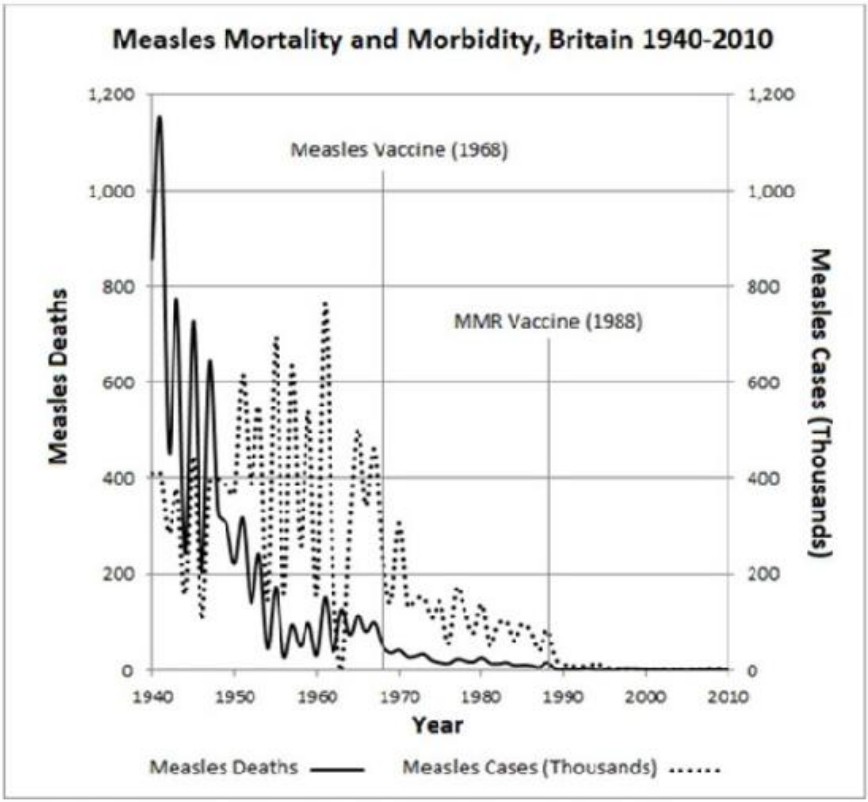

**Figure 8-5: Measles morbidity and mortality in Britain (1940–2010)** [47]

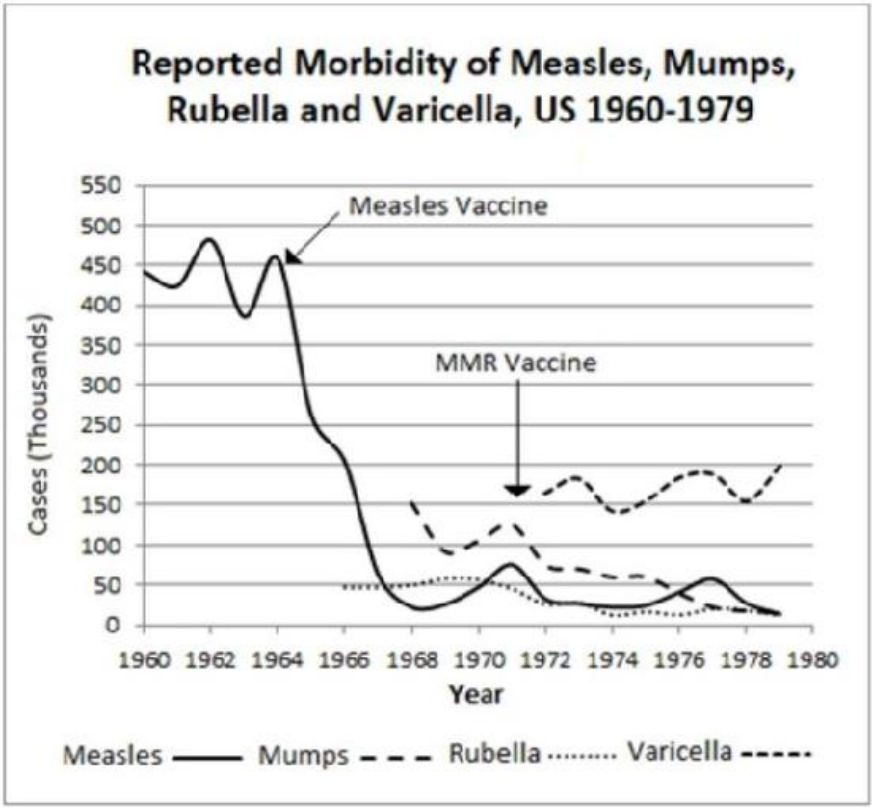

**Figure 8-6: Reported incidence of measles, mumps, rubella, and varicella (chickenpox) in the United States (1960-1979)**

But even these successful examples may raise complicated, hidden questions. Just as the widespread use of vaccines was successfully eliminating various contagious but non-fatal childhood illnesses, other important changes in public health occurred, sometimes quite negative ones. For example, chronic, incurable illnesses such as asthma, autism, and ADHD began appearing for the first time in significant numbers or rapidly growing, soon greatly surpassing the dwindling infectious diseases in their debilitating impact. Despite this, most such chronic diseases have received little attention from the CDC and other infectious-oriented health organizations that prefer to continue focusing upon the vanishing sliver of measles or mumps cases while the millions of children now suffering from chronic illnesses are given much less attention. *Turtles* raises the disturbing suspicion that these two divergent trends may be directly connected, suggesting once again that large-scale studies should explore the possible links of these new chronic illnesses to the vaccines that were introduced during roughly the same period.

Finally, one of the main justifications for widespread, mandatory vaccination campaigns has been the role of "herd immunity" in protecting the broader public from infection, but the authors argue that for most vaccines the case is actually far weaker than is widely assumed. Vaccines are often less effective in preventing infection or transmission than in greatly reducing the symptoms of the illness. But this allows vaccinated carriers to still pass the infection along to others as easily as the unvaccinated, thereby eliminating the social benefit that might justify the mandate. To the extent that this is true, vaccination requirements seem unwarranted, even in the case of strongly beneficial vaccines.

## The Mysteries of Polio

*Turtles* had presented all of these vaccine and public health issues in a relatively cautious manner, and although I found much of the information quite surprising, almost none of it provoked any sense of disbelief. However, the penultimate chapter of the book was by far the longest, amounting to nearly a quarter of the entire text and its contents were far more shocking. I suspect that the authors deliberately placed it near the end so that the earlier reading would have already softened the skepticism of readers, reducing the likelihood that this explosive material would simply be dismissed out of hand. The title of the chapter is "The Mysteries of Polio" and the first sentence describes the towering edifice they are boldly preparing to assault:

> The epic tale of science's victory over polio—more than any other account of a fight against disease, even the fable-like story of Edward Jenner and his smallpox vaccine—is the foundational myth of vaccination.

Just as the authors suggest, the successful use of the polio vaccine to eliminate that dread disease became the greatest public health triumph of the 1950s, one that saved countless children from crippling paralysis and lifted a reign of terror facing American families, while elevating Dr. Jonas Salk and his vaccine to secular sainthood. The history of that fearsome disease and the vaccine that eradicated it seems as solidly established as anything can be in medicine, with the Wikipedia page running well over 11,000 words and including nearly 150 references.

Yet remarkably enough, *Turtles* seeks to completely overturn this long-established narrative, claiming that the scientific facts are actually far

more complex and ambiguous than I or most other readers would have ever imagined. While this single long account can hardly overcome my enormous presumption in favor of so seemingly well-documented a medical history, it did raise numerous major issues that I'd never previously known, so I will merely present their arguments, urging those interested to read the book and then decide for themselves.

The authors begin by briefly summarizing the standard history of polio, explaining that the disease is caused by a viral infection that can produce a flu-like illness, but which in less than 1% of the cases may also damage the nerve cells thereby creating long-term paralysis. Polio has apparently been around for thousands of years, with the earliest evidence being an Egyptian stele from 1500 B.C. showing a young man with a withered leg supported by a crutch, and its first medical description came in a book by a physician published in 1789. But the illness was extremely rare with no recorded outbreaks so it received minimal attention until near the end of the 19th century, when such outbreaks suddenly began in Europe and the U.S. These soon multiplied in size, claiming 9,000 paralyzed victims in New York City in 1916, and polio epidemics then came and went without any clear pattern, increasing after World War II and reaching a peak in the early 1950s.

The mystery of the illness was solved in 1908 when the virus responsible was isolated, and with the later support of FDR, himself a paralyzed polio victim, huge sums were invested in studying the disease and seeking a cure. This finally culminated in the Salk and Sabin vaccines of the early 1950s, leading to the disappearance of the disease in the industrialized world in the 1960s and 1970s and its eventual near-eradication elsewhere by the end of the twentieth century.

Yet the authors note that this apparently simple story that I had casually absorbed over the years and never questioned, actually hides numerous strange anomalies, mysteries that have always been known in scientific circles but that were never brought before the public. There was no explanation of why polio outbreaks first began in the late 19th century, why they were entirely confined to industrialized countries, and why they were far more severe in summer and early fall. Polio spread and intensified exactly when most other infectious diseases were sharply declining, most victims had no identified contact with other infected individuals, and there was no explanation as to why the virus would only so very rarely attack the nervous system. It proved impossible to infect laboratory animals orally, as

humans themselves supposedly became infected.

And oddly enough, although the disease itself has supposedly been vanquished and almost eradicated by medical science, all these mysteries still remain unanswered today despite over a century of research, and some of them have become even more puzzling.

As the authors emphasize “Polio is one of a handful of diseases that have become a major threat to public health during modern times” and the well-documented record of its appearance followed a very strange pattern. The early outbreaks in Europe and North America were sufficiently conspicuous that they clearly represented a new phenomenon, yet there is no explanation for why they suddenly began.

These outbreaks were almost entirely confined to industrialized countries, and in those rare cases in which they spread to other parts of the world, the disease was almost always restricted to Westerners and only rarely affected local residents. American soldiers based in the Philippines contracted polio, but local Filipinos did not, and the same was true for such troops located in China and Japan. American soldiers stationed in the Middle East contracted polio at a rate ten times higher than their counterparts who remained in the U.S., but local residents seemed almost immune. During the early 1940s, polio cases were five times higher among British officers stationed in India than among British enlisted men and 120 times higher than for local Indian troops. Similarly, British officers based in North Africa and Italy were nearly an order-of-magnitude more likely to contract polio than the soldiers serving under their command. Numerous similar instances were recorded of this strange pattern of infection, disproportionately striking those of higher social status.

So during exactly the era when improved sanitation, hygiene, and diet had caused the dramatic decline of other infectious diseases in industrialized countries, polio began its frightening rise. By the late 1940s, the noted tendency of polio to strike Westerners rather than locals living elsewhere gave rise to the theory that “improved hygiene” was somehow an important contributing factor, a conclusion widely accepted by many top polio experts. Scientific hypotheses were formulated to explain this, but these were soon contradicted by empirical research.

However, as the authors point out, the earliest outbreaks of polio in the U.S. had actually followed the exact opposite pattern, being concentrated in the dirtiest, least hygienic urban slums, which had led

to the widespread belief that polio was a disease of poverty. But then after polio waned and eventually disappeared in the industrialized world during the 1960s and 1970s, it suddenly reemerged in impoverished Third World countries at rates similar to its 1950s peak in the West. So over the course of a couple of generations, a disease widely believed caused by poverty and lack of hygiene had been transformed into a disease associated with affluence and too much hygiene, but then afterwards returned to its roots as a disease of poverty and dirt. According to *Turtles*, these totally contradictory assumptions were sometimes simultaneously accepted by leading polio researchers. This very strange pattern of polio infection raises the obvious possibility that the true nature of the illness had been misunderstood in some very fundamental way.

A crucial point that *Turtles* raises is that contrary to public perceptions, the flaccid paralysis characteristic of polio may actually have a very large number of different causes, perhaps as many as 200 according to the medical literature, with most of these involving poisonings or toxic chemicals. But by the early decades of the 20th century the very high profile of the polio disease meant that the label "polio" was almost always immediately applied to any such physical illness. In some important cases, this was later found to have been a misdiagnosis, but the authors wonder whether this problem may have actually been much more widespread than was realized at the time.

As they emphasize, something very dramatic must have happened late in the 19th century producing the remarkable rise in the incidence of paralytic polio, and they note that this same period saw the widespread introduction of new dyes and pesticides based upon arsenic, lead, and other potentially toxic chemicals.

As a suspicious example, they explain that farmers in the northeastern U.S. began applying lead arsenate to their apple trees in 1892 and the following year there was a large rise in polio cases in the Boston area, which more than quadrupled in number. Moreover, these cases peaked in apple-picking season and most of the victims came from the rural areas surrounding Boston rather than from the city itself. Even decades later, medical experts emphasized that it was very difficult to distinguish polio paralysis from the nerve damage caused by lead poisoning, and misdiagnosis was common. The authors note that the rise of apparent polio cases from a few each year to hundreds or more seems to closely match the widespread use of lead arsenate, which was not only far more dangerous than previous pesticide chemicals but also remained on the fruit much longer.

As this point, *Turtles* employs highly restrained language to offer a remarkably explosive hypothesis:

> The supposition that polio is an infectious and contagious disease —that is, it is caused by a living organism (typically a bacterium or virus) and is transmitted from person to person—has not been in dispute in scientific circles for many decades. The institutional version of polio history has cast a thick layer of concrete around it, and any scientist daring enough to challenge it is likely to be ignored or mocked. The disease, as "everyone knows," is caused by the poliovirus—a highly contagious virus that enters the body through the mouth and is excreted in the feces. But is polio really an infectious and contagious disease? Delving into some of its early history suggests that the answer to this question is not nearly as straightforward or unequivocal as the official polio story would have us believe.

During the early years of polio's rise, the nature of the illness was often disputed, with critics of the infection theory emphasizing that they could find no examples of person-to-person transmission. Indeed, the cases were so geographically scattered that almost none of the victims had had any contact with each other. Among 1,400 cases reviewed, less than 3% involved more than a single patient in a family.

Meanwhile, there were many other large-scale instances of such paralysis produced by poisoned foods. In Manchester, England, a mysterious epidemic broke out in 1900, paralyzing thousands of people and killing several dozens, which was eventually traced to high arsenic concentrations in the sulfuric acid used to process sugar in local beer breweries. It was later determined that a similar problem at lower levels had been producing dozens of mysterious cases of paralysis each year in northwestern England during the late 19th century. In 1930, 50,000 Americans became paralyzed in the southern and central regions after they drank a patent medicine contaminated with a toxic chemical, and ten days had usually passed between time of consumption and first onset of the symptoms, completely masking the true cause.

The notion that the paralysis ascribed to polio might actually be due to a toxic chemical seems an astonishing one, not easy for me to accept, but it would help to explain the very strange pattern of the disease and its apparent lack of transmissibility.

Meanwhile, the authors carefully examine the historical studies said to

have established the contagious and infectious nature of polio, and find them very doubtful and inconclusive, pointing out that scientific critics had raised many of these same objections at the time. Although repeated experimental failures seemed to establish that polio infections were strictly unique to humans, they note that some of the earliest reports of the rural outbreaks had mentioned that similar forms of paralysis had also afflicted local farm animals such as horses, dogs, and fowls, suggesting that a toxic agent might have been responsible.

So the question naturally arises as to why the possible role of lead or arsenic poisoning had been ignored in those early studies, which instead concluded that a viral disease was responsible. The authors suggest that this was due to the powerful influence of the chemical industry, which marketed these dangerous compounds as pesticides for apple farmers. At the time, such chemicals were totally unregulated by the American government, and indeed several European countries banned American apples for exactly that reason.

The authors note that polio outbreaks in the northern hemisphere tended to peak in the summer and autumn months when fruits and vegetables were most heavily consumed and also intensively sprayed with chemicals to protect them from pests. By contrast, other infectious childhood diseases were much less likely to occur during those same months because schools were not in session.

Polio paralysis had become a notable illness in America by the late 1930s, but its incidence then grew very rapidly after the end of World War II, while outbreaks also began to afflict countries such as Germany, Japan, and the Netherlands, where it had previously been unknown. The first epidemics in France, Belgium, and the Soviet Union were only recorded during the 1950s. Medical historians have no explanation for this strange pattern, which elevated polio to a particularly fearsome disease even as so many others were finally being controlled and disappearing.

The authors note that a pesticide revolution was occurring at exactly this same time, with DDT becoming the global insecticide of choice, an inexpensive, powerful, and long-lasting compound that attacked the nervous system of common agricultural pests. Although the chemical was officially judged completely safe, early reports did show some examples of apparent toxicity to humans, even including paralysis as a symptom. According to some medical critics at the time, the pattern of surprising growth in polio infections both in America and other countries seemed to generally track the widening

use of DDT, but the Department of Agriculture and other federal agencies strongly denied any possible connection.

Any lingering doubts about the true nature of polio were seemingly swept away once the Salk vaccine was released in 1955, followed by the rapid disappearance of the illness, but the authors raise serious doubts about this seemingly conclusive cause-and-effect relationship. They note that polio cases had already been sharply declining nationwide for several years, and this trend merely continued, followed by a noticeable rise in polio incidence a few years later. The trajectory in Israel was even more contradictory, with a long decline in polio cases actually being reversed after vaccinations began, before dropping back down a few years later.

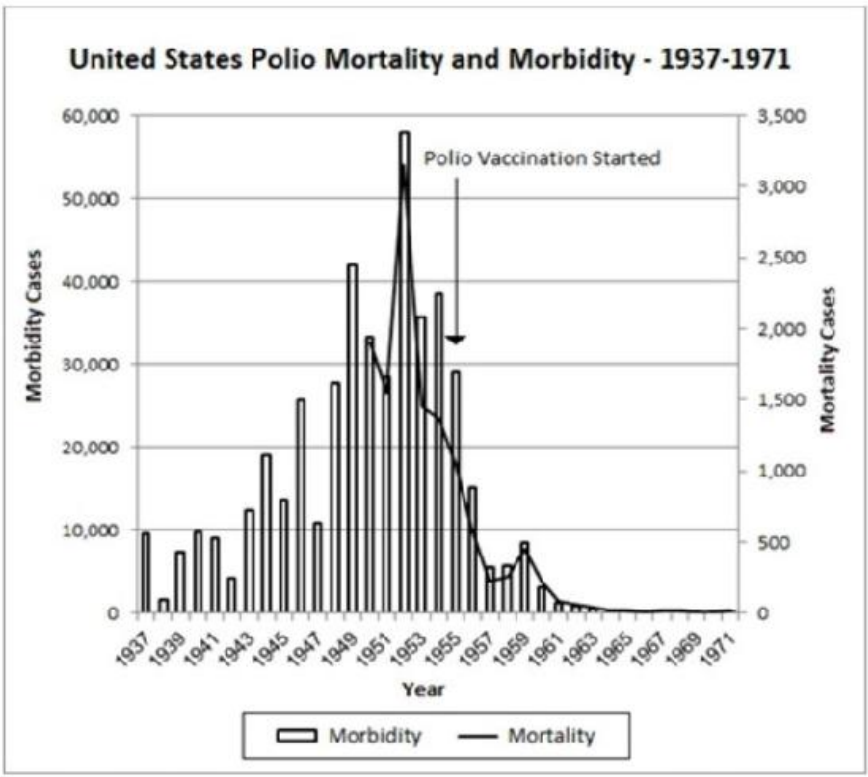

**Figure 10-1: Polio mortality and morbidity in the United States (1937–1971)**

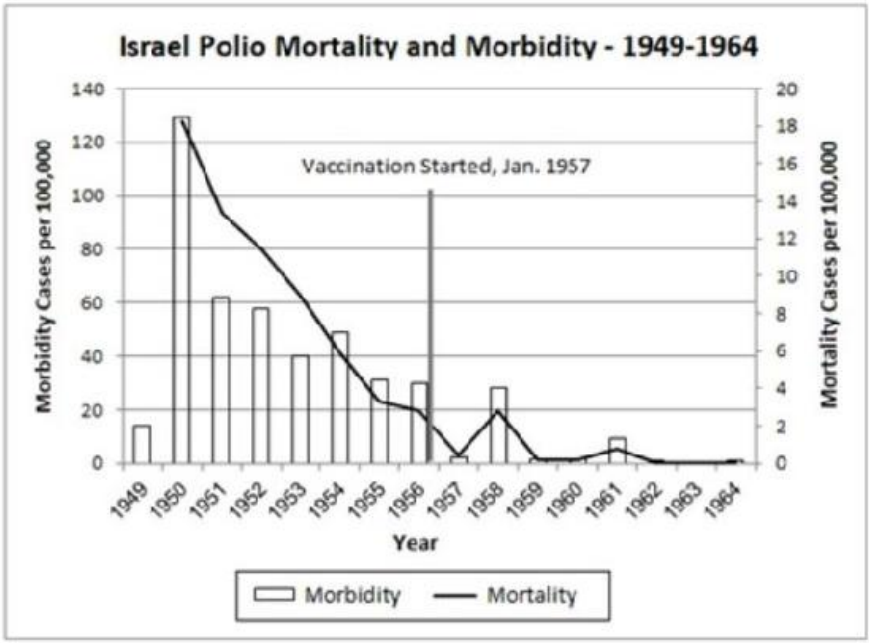

According to the authors, during the early 1950s American government agencies had become quietly concerned about the health effects of DDT and began discouraging its extensive use, especially in food preparation and within houses. They suggest that this might explain the sharp decline of apparent polio cases during the years prior to introduction of the Salk vaccine.

So for whatever combination of reasons, polio had largely disappeared from the US and the rest of the industrialized world by the 1970s. But meanwhile, the widespread use of DDT and other pesticides in many Third World countries was soon followed by a surprising rise in apparent polio outbreaks, which had previously been unknown in those regions, leading to the launch of a global vaccination campaign in 1988 to eradicate polio.

That massive effort has seemingly been very successful, and by 2013 reported cases of polio had dropped by 99.9%. However, the authors seriously question this triumphal narrative, noting the concurrent, even more rapid rise of “Accute Flaccid Paralysis” (AFP) syndrome, a physical ailment with similar characteristics but not ascribed to the polio virus. If the actual number of severely paralyzed individuals has remained constant or even sharply increased, perhaps the supposed success of the global polio vaccination campaign has been achieved merely by redefinition, a sleight of hand.

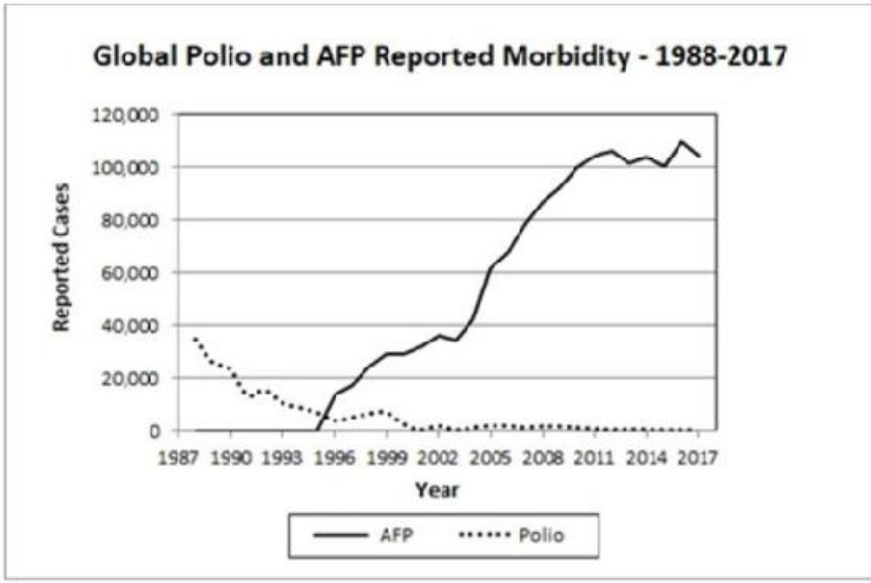

**Figure 10-3: Worldwide reported incidence of polio and AFP (1988–2017)**

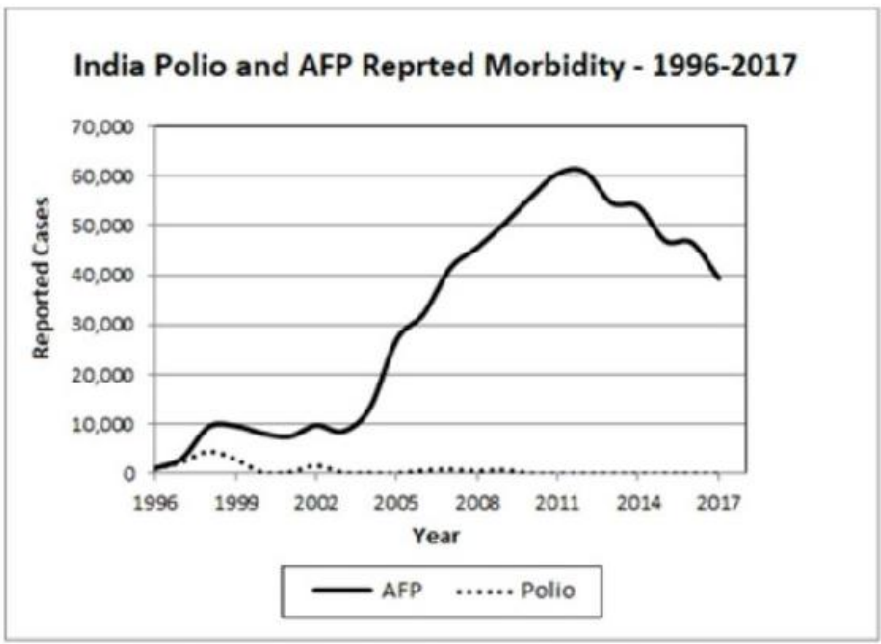

**Figure 10-4: Reported incidence of polio and AFP in India (1996–2017)**

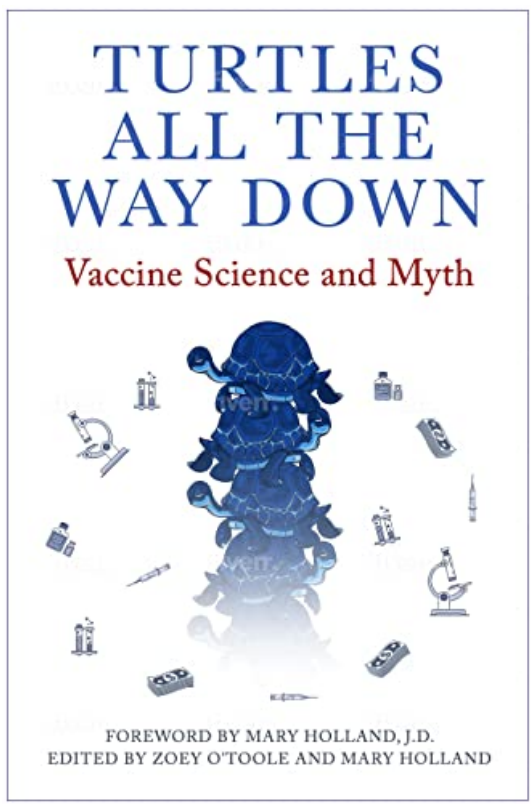
Although I'd found most of the previous sections of *Turtles* interesting and reasonably persuasive, these had hardly prepared me for the incendiary impact of this very long chapter on polio, which completely astonished me. The mere possibility that one of the most famous historical diseases of the twentieth century had largely a figment of medical misdiagnosis simply boggled the mind.

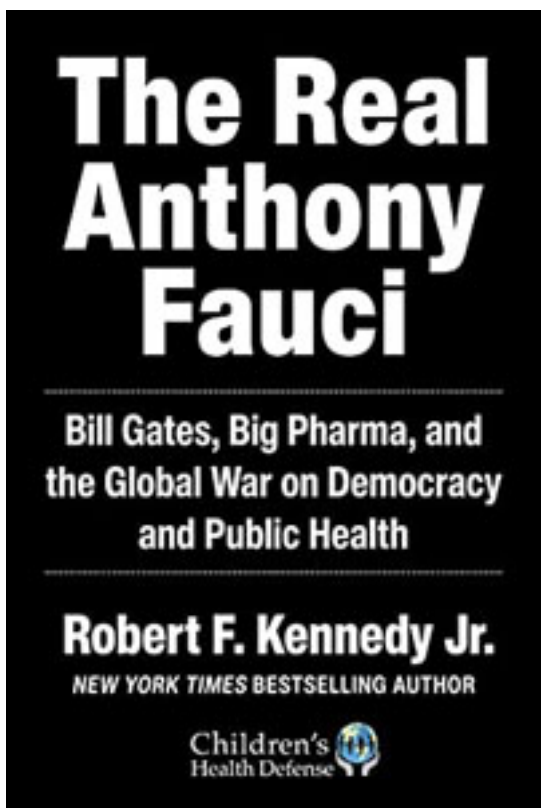
Polio's fatalities had been relatively few in number, but its legacy of permanently crippled children had established it as a particularly terrifying illness, finally conquered by the heroic medical breakthroughs of Dr. Jonas Salk and Dr. Albert Sabin, for which the former received a Nobel Prize. Just as the authors declare, the eradication of polio had been a crowning achievement of mass vaccination drives, permanently justifying that public health measure and leading to its widespread expansion. My view on all these matters had always been quite conventional and I'd never doubted what I'd read in my newspapers or textbooks. So I was stunned to encounter 125 pages—soberly written and carefully argued—that raised the serious suspicion that the contagious disease had never really existed, with most of the victims actually suffering from various types of toxic poisoning rather than any viral infection.

I'd similarly remembered the controversy surrounding the use of DDT as a pesticide and its ban a half-century ago because of the threat it posed to wildlife. But I'd accepted the arguments that it was almost entirely harmless to humans and had never heard of any possible connection to an illness, let alone anything as high-profile as the paralysis attributed to polio.



There is obviously an enormous difference between creating serious doubts about a landmark scientific issue and successfully overturning it. Even if I were willing to check the hundreds of scholarly references *Turtles* provides to support its revolutionary hypothesis, I probably wouldn't possess the technical expertise to properly evaluate them. The victory over polio ranks as one of the most famous triumphs of modern medicine, and surely its legion of defenders could produce lengthy rebuttals to the arguments made by these anonymous authors, rebuttals that would have to be carefully weighed by those with the expert knowledge to effectively do so. Reversing our settled understanding of polio is the sort of monumental feat that would require an equally monumental professional debate. But from my perspective, even merely raising significant doubts about such a seemingly central element of medical history entirely justifies reading the book of these courageous authors.

## The Possible Analogy with HIV/AIDS



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

Most of us tend to be much more respectful of official narratives in areas that we have never investigated. My lengthy American Pravda

series includes numerous historical revelations, but just a couple of years ago I would have been extremely reluctant to even consider the possibility that so seemingly established a scientific matter as the nature of polio might seriously be called into question.

However, in December 2021 I had read a stunning book by Robert F. Kennedy Jr. that included 200 pages presenting a somewhat similar analysis of HIV/AIDS, a disease that had spent nearly four decades as the world's highest-profile illness. According to his account, the deadly condition had actually been caused by toxic poisoning but was instead misdiagnosed as a infectious disease carried by a virus.

> Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis, for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.
>
> I found Kennedy's account as shocking as anything I have ever encountered.

Kennedy's claims had initially seemed utterly unbelievable to me, but after weeks of additional reading and investigation, I had finally concluded that he was probably correct. I also noted in my subsequent articles that although the mainstream media ferociously attacked him on so many other grounds, his critics maintained an absolute silence regarding his incendiary chapters on HIV/AIDS, and their surprising reticence seemed to confirm my verdict.

So while I have hardly devoted any similar research effort to the remarkable scientific claims provided in *Turtles*, I'm much more open to the possibility that they might be proven correct. If AIDS was indeed merely a phantom disease produced by medical misdiagnosis, perhaps the same might have earlier also been true for polio.

# The Leo Frank Case and the Origins of the ADL

***The Unz Review*** • March 27, 2023 • 5,300 Words

About a week ago both the *New York Times* and the *Wall Street Journal* devoted considerable space to the coverage of "Parade," the revival of a 1998 Broadway musical on the 1915 killing of Leo Frank, a Jewish factory manager in Atlanta, Georgia, arguably the most famous lynching in American history.

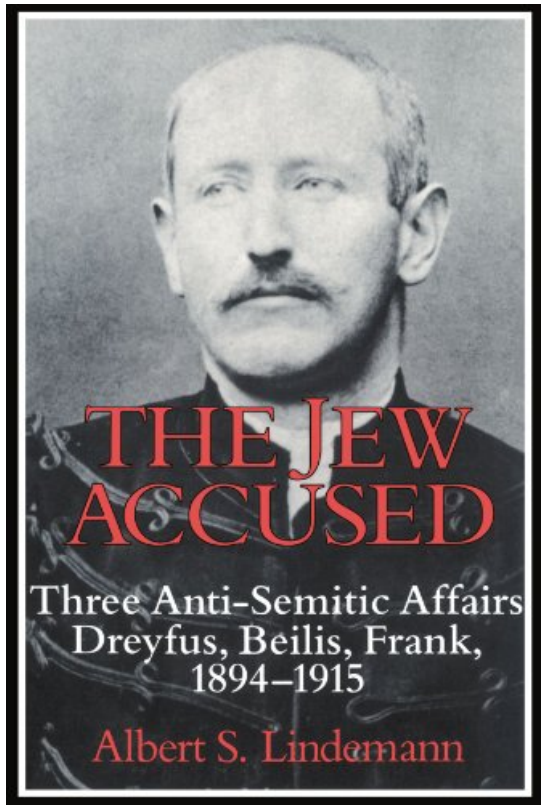
Frank had been convicted and sentenced to death for the rape and murder of a young girl in his employ and the Anti-Defamation League (ADL) was founded in an effort to save his life. After numerous legal appeals failed, the state's governor eventually commuted Frank's sentence and a group of outraged citizens responded by hanging Frank. The incident was portrayed in both the musical and the associated media coverage as a particularly horrifying example of American anti-Semitism.

Micaela Diamond and Ben Platt in "Parade" at the Bernard B. Jacobs Theater.

However, the actual facts of that case were quite different than that

and in 2018 I'd discussed them at considerable length as part of a longer article. Given the recently renewed spotlight on the issue and the fascinating implications of the true story, I've decided to extract and republish my analysis in hopes of bringing it to wider current attention.

> Although I had long recognized the power and influence of the ADL, a leading Jewish-activist organization whose officials were so regularly quoted in my newspapers, until rather recently I had only the vaguest notions of its origins. I'm sure I'd heard the story mentioned at some point, but the account had never stuck in my mind.
>
> Then perhaps a year or two ago, I happened to come across some discussion of the ADL's 2013 centenary celebration, in which the leadership reaffirmed the principles of its 1913 founding. The initial impetus had been the vain national effort to save the life of Leo Frank, a young Southern Jew unjustly accused of murder and eventually lynched. In the past, Frank's name and story would have been equally vague in my mind, only half-remembered from my introductory history textbooks as one of the most notable early KKK victims in the fiercely anti-Semitic Deep South of the early twentieth century. However, not long before seeing that piece on the ADL I'd read Albert Lindemann's highly-regarded study *The Jew Accused*, and his short chapter on the notorious Frank case had completely exploded all my preconceptions.



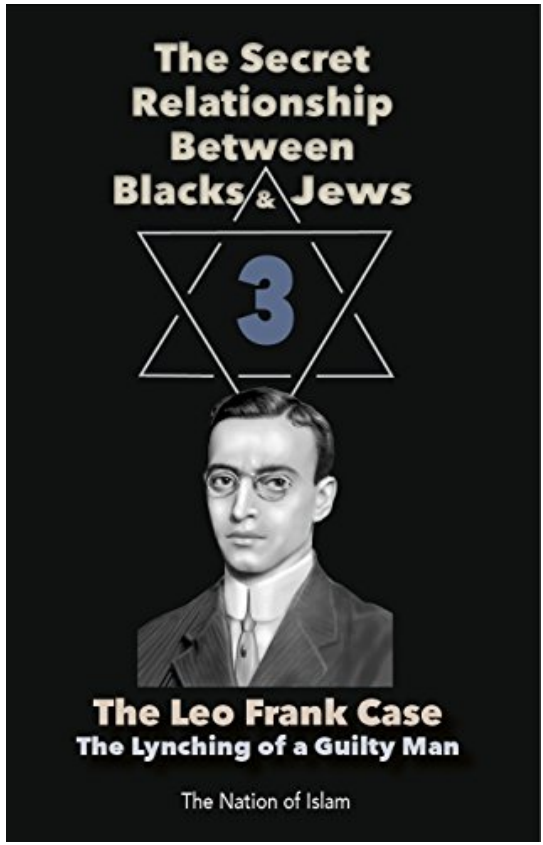
First, Lindemann demonstrated that there was no evidence of any anti-Semitism behind Frank's arrest and conviction, with Jews constituting a highly-valued element of the affluent Atlanta society of the day, and no references to Frank's Jewish background, negative or otherwise, appearing in the media prior to the trial. Indeed, five of the Grand Jurors who voted to indict Frank for murder were themselves Jewish, and none of them ever voiced regret over their decision. In general, support for Frank seems to have been strongest among Jews from New York and other distant parts of the country and weakest among the Atlanta Jews with best knowledge of the local situation.

Furthermore, although Lindemann followed the secondary sources he relied upon in declaring that Frank was clearly innocent of the charges of rape and murder, the facts he recounted led me to the opposite conclusion, seeming to suggest strong evidence of Frank's guilt. When I much more recently read Lindemann's longer and more comprehensive historical study of anti-Semitism, *Esau's Tears*, I noticed that his abbreviated treatment of the Frank case no longer made any such claim of innocence, perhaps indicating that the author himself might have also had second

thoughts about the weight of the evidence.

Based on this material, I voiced that opinion in my recent article on historical anti-Semitism, but my conclusions were necessarily quite tentative since they relied upon Lindermann's summary of the information provided in the secondary sources he had used, and I had the impression that virtually all those who had closely investigated the Frank case had concluded that Frank was innocent. But after my piece appeared, someone pointed me to a 2016 book from an unexpected source arguing for Frank's guilt. Now that I have ordered and read that volume, my understanding of the Frank case and its historical significance has been entirely transformed.

Mainstream publishers may often reject books that too sharply conflict with reigning dogma and sales of such works are unlikely to justify the extensive research required to produce the manuscript. Furthermore, both authors and publishers may face widespread vilification from a hostile media for taking such positions. For these reasons, those who publish such controversial material will often be acting from deep ideological motives rather than merely seeking professional advancement or monetary gain. As an example, it took a zealous Trotskyite leftist such as Lenni Brenner to brave the risk of ferocious attacks and invest the time and effort to produce his remarkable study of the crucial Nazi-Zionist partnership of the 1930s. And for similar reasons, we should not be totally surprised that the leading book arguing for the guilt of Leo Frank appeared as a volume in the series on the pernicious aspects of Jewish-Black historical relations produced by Louis Farrakhan's Nation of Islam (NOI), nor that the text lacked any identified author.



Anonymous works published by heavily-demonized religious-political movements naturally engender considerable caution, but once I began reading the 500 pages of *The Leo Frank Case: The Lynching of a Guilty Man* I was tremendously impressed by the quality of the historical analysis. I think I have only very rarely encountered a research monograph on a controversial historical event that provided such an enormous wealth of carefully-argued analysis backed by such copious evidence. The authors seemed to display complete mastery of the major secondary literature of the last one hundred years while drawing very heavily upon the various primary sources, including court records, personal correspondence, and contemporaneous publications, with the overwhelming majority of the 1200 footnotes referencing newspaper and magazine articles of that era. The case they made for Frank's guilt seemed absolutely overwhelming.

The basic outline of events is not disputed. In 1913 Georgia, a 13-year-old pencil company worker named Mary Phagan was last

seen alive visiting the office of factory manager Leo Frank on a Saturday morning to collect her weekly paycheck, while her raped and murdered body was found in the basement early the next morning and Frank eventually arrested for the crime. As the wealthy young president of the Atlanta chapter of B'nai B'rith, Frank ranked as one of the most prominent Jewish men in the South, and great resources were deployed in his legal defense, but after the longest and most expensive trial in state history, he was quickly convicted and sentenced to death.

The facts of the case against Frank eventually became a remarkable tangle of complex and often conflicting evidence and eyewitness testimony, with sworn statements regularly being retracted and then counter-retracted. But the crucial point that the NOI authors emphasize for properly deciphering this confusing situation is the enormous scale of the financial resources that were deployed on Frank's behalf, both prior to the trial and afterward, with virtually all of the funds coming from Jewish sources. Currency conversions are hardly precise, but relative to the American family incomes of the time, the total expenditures by Frank supporters may have been as high as \$25 million in present-day dollars, quite possibly more than any other homicide defense in American history before or after, and an almost unimaginable sum for the impoverished Deep South of that period. Years later, a leading donor privately admitted that much of this money was spent on perjury and similar falsifications, something which is very readily apparent to anyone who closely studies the case. When we consider this vast ocean of pro-Frank funding and the sordid means for which it was often deployed, the details of the case become far less mysterious. There exists a mountain of demonstrably fabricated evidence and false testimony in favor of Frank, and no sign of anything similar on the other side.

The police initially suspected the black night watchman who found the girl's body, and he was quickly arrested and harshly interrogated. Soon afterward, a bloody shirt was found at his home, and Frank made several statements that seemed to implicate his employee in the crime. At one point, this black suspect may have come close to being summarily lynched by a mob, which would have closed the case. But he stuck to his story of innocence with remarkable composure, in sharp contrast to Frank's extremely nervous and suspicious behavior, and the police soon shifted their scrutiny toward the latter, culminating in his arrest. All researchers now recognize that the night watchman

was entirely innocent, and the evidence against him planted.

The case against Frank steadily mounted. He was the last man known to have seen the young victim and he repeatedly changed important aspects of his story. Numerous former female employees reported his long history of sexually aggressive behavior toward them, especially directed towards the murdered girl herself. At the time of the murder, Frank claimed to have been working alone in his office, but a witness who went there reported he had been nowhere to be found. A vast amount of circumstantial evidence implicated Frank.

A black Frank family servant soon came forward with sworn testimony that Frank had confessed the murder to his wife on the morning after the killing, and this claim seemed supported by the latter's strange refusal to visit her husband in jail for the first two weeks after the day of his arrest.

Two separate firms of experienced private detectives were hired by Frank's lavishly-funded partisans, and the agents of both eventually came to the reluctant conclusion that Frank was guilty as charged.

As the investigation moved forward, a major break occurred as a certain Jim Conley, Frank's black janitor, came forward and confessed to having been Frank's accomplice in concealing the crime. At the trial he testified that Frank had regularly enlisted him as a lookout during his numerous sexual liaisons with his female employees, and after murdering Phagan, Frank had then offered him a huge sum of money to help remove and hide the body in the basement so that the crime could be pinned upon someone else. But with the legal noose tightening around Frank, Conley had begun to fear that he might be made the new scapegoat, and went to the authorities in order to save his own neck. Despite Conley's damning accusations, Frank repeatedly refused to confront him in the presence of the police, which was widely seen as further proof of Frank's guilt.

By the time of the trial itself, all sides were agreed that the murderer was either Frank, the wealthy Jewish businessman, or Conley, the semi-literate black janitor with a first-grade education and a long history of public drunkenness and petty crime. Frank's lawyers exploited this comparison to the fullest, emphasizing Frank's Jewish background as evidence for his innocence and indulging in the crudest sort of racial invective against his black

accuser, whom they claimed was obviously the true rapist and murderer due to his bestial nature.

Those attorneys were the best that money could buy and the lead counsel was known as the one of the most skilled courtroom interrogators in the South. But although he subjected Conley to a grueling sixteen hours of intense cross-examination over three days, the latter never wavered in the major details of his extremely vivid story, which deeply impressed the local media and the jury. Meanwhile, Frank refused to take the stand at his own trial, thereby avoiding any public cross-examination of his often changing account.

Two notes written in crude black English had been discovered alongside Phagan's body, and everyone soon agreed that these were written by the murderer in hopes of misdirecting suspicion. So they were either written by a semi-literate black such as Conley or by an educated white attempting to imitate that style, and to my mind, the spelling and choice of words strongly suggests the latter, thereby implicating Frank.

Taking a broader overview, the theory advanced by Frank's legion of posthumous advocates seems to defy rationality. These journalists and scholars uniformly argue that Conley, a semi-literate black menial, had brutally raped and murdered a young white girl, and the legal authorities soon became aware of this fact, but conspired to set him free by supporting a complex and risky scheme to instead frame an innocent white businessman. Can we really believe that the police officials and prosecutors of a city in the Old South would have violated their oath of office in order to knowingly protect a black rapist and killer from legal punishment and thereby turn him loose upon their city streets, presumably to prey on future young white girls? This implausible reconstruction is particularly bizarre in that nearly all its advocates across the decades have been the staunchest of Jewish liberals, who have endlessly condemned the horrific racism of the Southern authorities of that era, but then unaccountably chose to make a special exception in this one particular case.

In many respects, the more important part of the Frank case began after his conviction and death sentence when many of America's wealthiest and most influential Jewish leaders began mobilizing to save him from the hangman.  They soon established

the ADL as a new vehicle for that purpose and succeeded in making the Frank murder case one of the most famous in American history to that date.

Although his role was largely concealed at the time, the most important new backer whom Frank attracted was Albert Lasker of Chicago, the unchallenged monarch of American consumer advertising, which constituted the life's blood of all of our mainstream newspapers and magazines. Not only did he ultimately provide the lion's share of the funds for Frank's defense, but he focused his energies upon shaping the media coverage surrounding the case. Given his dominant business influence in that sector, we should not be surprised that a huge wave of unremitting pro-Frank propaganda soon began appearing across the country in both local and national publications, extending to most of America's most popular and highly-regarded media outlets, with scarcely a single word told on the other side of the story. This even included all of Atlanta's own leading newspapers, which suddenly reversed their previous positions and became convinced of Frank's innocence.

Lasker also enlisted other powerful Jewish figures in the Frank cause, including *New York Times* owner Adolph Ochs, *American Jewish Committee* president Louis Marshall, and leading Wall Street financier Jacob Schiff. The *Times*, in particular, began devoting enormous coverage to this previously-obscure Georgia murder case, and many of its articles were widely republished elsewhere. The NOI authors highlight this extraordinary national media attention: "The Black janitor whose testimony became central to Leo Frank's conviction became the most quoted Black person in American history up to that time. More of his words appeared in print in the *New York Times* than those of W.E.B. Du Bois, Marcus Garvey, and Booker T. Washington—*combined.*"

Back a century ago just as today, our media creates our reality, and with Frank's innocence being proclaimed nationwide in near-unanimous fashion, a long list of prominent public figures were soon persuaded to demand a new trial for the convicted murderer, including Thomas Edison, Henry Ford, and Jane Addams.

Ironically enough, Lasker himself plunged into this crusade despite apparently having very mixed personal feelings about the man whose cause he was championing. His later biography reveals that upon his first personal meeting with Frank, he

perceived him as “a pervert” and a “disgusting” individual, so much so that he even hoped that after he managed to free Frank, the latter would quickly perish in some accident. Furthermore, in his private correspondence he freely admitted that a large fraction of the massive funding that he and numerous other wealthy Jews from across the country were providing had been spent on perjured testimony and there are also strong hints that he explored bribing various judges. Given these facts, Lasker and Frank’s other major backers were clearly guilty of serious felonies, and could have received lengthy prison terms for their illegal conduct.

With the *New York Times* and the rest of the liberal Northern media now providing such heavy coverage of the case, Frank’s defense team was forced to abandon the racially-inflammatory rhetoric aimed at his black accuser which had previously been the centerpiece of their trial strategy. Instead, they began concocting a tale of rampant local anti-Semitism, previously unnoticed by all observers, and adopted it as a major grounds for their appeal of the verdict.

The unprincipled legal methods pursued by Frank’s backers is illustrated by a single example. Georgia law normally required that a defendant be present in court to hear the reading of the verdict, but given the popular emotions in the case, the judge suggested that this provision be waived, and the prosecution assented only if the defense lawyers promised not to use this small irregularity as grounds for appeal. But after Frank was convicted, AJC President Marshall and his other backers orchestrated numerous unsuccessful state and federal appeals on exactly this minor technicality, merely hiring other lawyers to file the motions.

For almost two years, the nearly limitless funds deployed by Frank’s supporters covered the costs of thirteen separate appeals on the state and federal levels, including to the U.S. Supreme Court, while the national media was used to endlessly vilify Georgia’s system of justice in the harshest possible terms. Naturally, this soon generated a local reaction, and during this period outraged Georgians began denouncing the wealthy Jews who were spending such enormous sums to subvert the local criminal justice system.

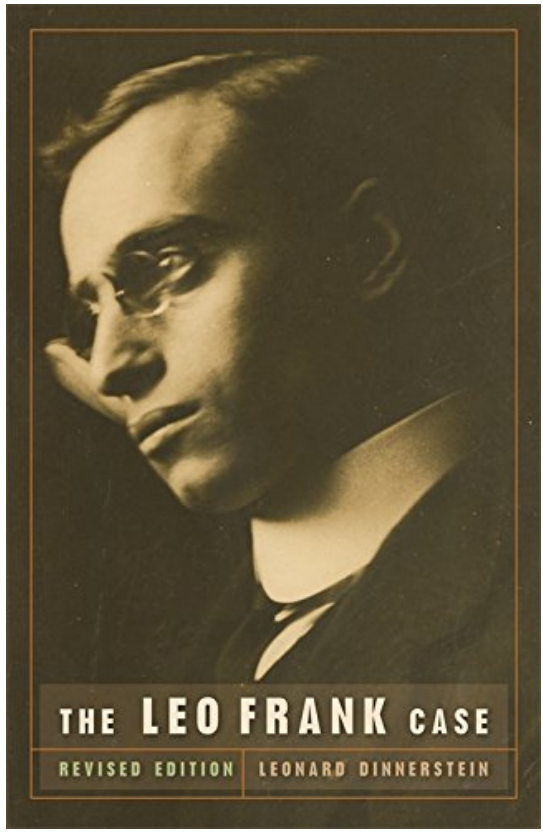
One of the very few journalists willing to oppose Frank’s position was Georgia publisher Tom Watson, a populist firebrand, and in

an editorial he reasonably declared “We cannot have…one law for the Jew, and another for the Gentile” while he also later lamented that “It is a bad state of affairs when the idea gets abroad that the law is too weak to punish a man who has plenty of money.” A former Georgia governor indignantly inquired “Are we to understand that anybody except a Jew can be punished for a crime.” The clear facts indicate that there was indeed a massive miscarriage of justice in Frank’s case, but virtually all of it occurred in Frank’s favor.

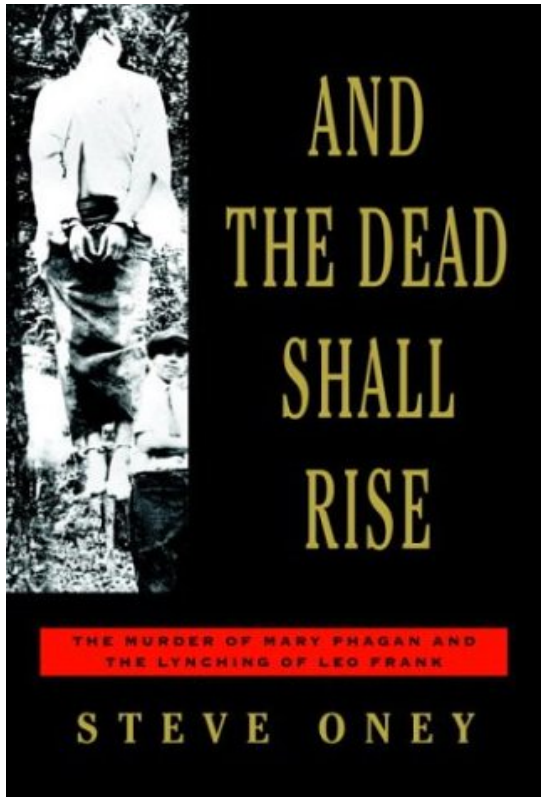
All appeals were ultimately rejected and Frank’s execution date for the rape and murder of the young girl finally drew near. But just days before he was scheduled to leave office, Georgia’s outgoing governor commuted Frank’s sentence, provoking an enormous storm of popular protest, especially since he was the business partner of Frank’s chief defense lawyer, an obvious conflict of interest. Given the enormous funds that Frank’s national supporters had been deploying on his behalf and the widespread past admissions of bribery in the case, there are obviously dark suspicions about what had prompted such a remarkably unpopular decision, which soon forced the former governor to exile himself from the state. A few weeks later, a group of Georgia citizens stormed Frank’s prison farm, abducting and hanging him, with Frank becoming the first and only Jew lynched in American history.

Naturally, Frank’s killing was roundly denounced in the national media that had long promoted his cause. But even in those quarters, there may have been a significant difference between public and private sentiments. No newspaper in the country had more strongly championed Frank’s innocence than the *New York Times* of Adolph Ochs. Yet according to the personal diary of one of the *Times* editors, Ochs privately despised Frank, and perhaps even greeted his lynching with a sense of relief. No effort was ever made by Frank’s wealthy supporters to bring any of the lynching party to justice.

Although I have now come to regard the NOI volume as the most persuasive and definitive text on the Frank case, I naturally considered conflicting works before reaching this conclusion.



For nearly a half-century, the leading scholarly account of the incident had probably been Leonard Dinnerstein's book *The Leo Frank Case*, first published in 1966, and Dinnerstein, a University of Arizona professor specializing in Jewish history, entirely supported Frank's innocence. But although the work won a national award, carries glowing blurbs from several prestigious publications, and has surely graced the reading lists of endless college courses, I was not at all impressed. Among other things, the book appears to be the original source of some of the most lurid examples of alleged anti-Semitic public outbursts that apparently have no basis in reality and seem to have been simply fabricated by the author given his lack of any citations; the NOI authors note these stories have been quietly abandoned by all recent researchers. Even leaving aside such likely falsifications, which were widely cited by later writers and heavily contaminated the historical record, I found the short Dinnerstein work rather paltry and even pitiful when compared to that of its NOI counterpart.



A far longer and more substantial recent work was Steve Oney's 2003 *And the Dead Shall Rise*, which runs nearly 750 pages and won the National Jewish Book Award, the Southern Book Critics Circle Prize, and the American Bar Association's Silver Gavel, probably establishing itself as today's canonical text on the historical incident. Oney had been a longtime Atlanta journalist and I was favorably impressed by his narrative skill, along with the numerous fascinating vignettes he provided to illustrate the Southern history of that general era. He also seemed a cautious researcher, drawing heavily upon the primary sources and avoiding much of the falsified history of the last century, while not entirely suppressing the massive evidence of bribery and perjury employed by the Frank forces.

But although Oney does mention much of this information, he strangely fails to connect the dots. For example, although he occasionally mentions some of the funds spent on Frank's behalf, he never attempts to convert them into present-day equivalents, leaving a naive reader to assume that such trivial amounts could not possibly have been used to pervert the course of justice. Furthermore, his entire book is written in chronological narrative

form, with no footnotes provided in the text, and a large portion of the content being entirely extraneous to any attempt to determine Frank's guilt or innocence, contrasting very sharply with the more scholarly style of the NOI authors.

To my mind, a central element of the Frank case was the massive financial temptations being offered by Frank's Jewish backers, and the huge number of Atlanta citizens, both high and low, who apparently shifted their positions on Frank's guilt in eager hopes of capturing some of that largess. But although this important theme was heavily emphasized in the NOI book, Oney seems to mostly avoid this obvious factor, perhaps even for personal reasons. Print publications have suffered massive cutbacks in recent years and I noticed on the book flap that although Oney is described as a longtime Atlanta journalist, he had subsequently relocated to Los Angeles. Once I checked, I immediately discovered that Oney's book had became the basis for an independent film entitled *The People v. Leo Frank*, and I wonder whether his hopes of capturing a sliver of Hollywood's vast lucre may not have encouraged him to so strongly suggest Frank's innocence. Would an account of Leo Frank as rapist and murderer ever be likely to reach the silver screen? The quiet influence of financial considerations is no different today than it was a century ago, and this factor must be taken into account when evaluating historical events.

The NOI authors devote nearly all of their lengthy book to a careful analysis of the Frank case provided in suitably dispassionate form, but a sense of their justifiable outrage does occasionally poke through. In the years prior to Frank's killing, many thousands of black men throughout the South had been lynched, often based on a slender thread of suspicion, with few of these incidents receiving more than a few sentences of coverage in a local newspaper, and large numbers of whites had also perished under similar circumstances. Meanwhile, Frank had received benefit of the longest trial in modern Southern history, backed by the finest trial lawyers that money could buy, and based on overwhelming evidence had been sentenced to death for the rape and murder of a young girl. But when Frank's legal verdict was carried out by extra-judicial means, he immediately became the most famous lynching victim in American history, perhaps even attracting more media attention than all those thousands of other cases combined. Jewish money and Jewish

media established him as a Jewish martyr who thereby effectively usurped the victimhood of the enormous number of innocent blacks who were killed both before and after him, none of whom were ever even recognized as individuals.

As Prof. Shahak has effectively demonstrated, traditional Talmudic Judaism regarded all non-Jews as being sub-human, with their lives possessing no value. Given that Frank's backers were followers of Reform Judaism, it seems quite unlikely that they accepted this doctrine or were even aware of its existence. But religious traditions of a thousand years standing can easily become embedded within a culture, and such unrecognized cultural sentiments may have easily shaped their reaction to Frank's legal predicament.

Influential historical accounts of the Frank case and its aftermath have contained lurid tales of the rampant public anti-Semitism visited upon Atlanta's Jewish community in the wake of the trial, even claiming that a substantial portion of the population was forced to flee as a consequence. However, a careful examination of the primary source evidence, including the contemporaneous newspaper coverage, provides absolutely no evidence of this, and it appears to be entirely fictional.

The NOI authors note that prior to Frank's trial American history had been virtually devoid of any evidence of significant anti-Semitism, with the previous most notable incident being the case of an extremely wealthy Jewish financier who was refused service at a fancy resort hotel. But by totally distorting the Frank case and focusing such massive national media coverage on his plight, Jewish leaders around the country succeeded in fabricating a powerful ideological narrative despite its lack of reality, perhaps intending the story to serve as a bonding experience to foster Jewish community cohesion.

As a further example of the widely promoted but apparently fraudulent history, the Jewish writers who have overwhelmingly dominated accounts of the Frank case have frequently claimed that it sparked the revival of the Ku Klux Klan soon afterward, with the group of citizens responsible for Frank's 1915 lynching supposedly serving as the inspiration for William Simmons' reestablishment of that organization a couple of years later. But there seems no evidence for this. Indeed, Simmons strongly emphasized the philo-Semitic nature of his new organization, which attracted considerable Jewish membership.

The primary factor behind the rebirth of the KKK was almost certainly the 1917 release of D.W. Griffith's overwhelmingly popular landmark film *Birth of a Nation*, which glorified the Klan of the Reconstruction Era. Given that the American film industry was so overwhelmingly Jewish at the time and the film's financial backers and leading Southern distributors came from that same background, it could be plausibly argued that the Jewish contribution to the creation of the 1920s Klan was a very crucial one, while the revenue from the film's distribution throughout the South actually financed Samuel Goldwyn's creation of MGM, Hollywood's leading studio.

In their introduction, the NOI authors make the fascinating point that the larger historical meaning of the Frank case in American racial history has been entirely lost. Prior to that trial, it was unprecedented for Southern courts to allow black testimony against a white man, let alone against a wealthy man being tried on serious charges; but the horrific nature of the crime and Conley's role as the sole witness required a break from that longstanding tradition. Thus, the authors not unreasonably argued that the Frank case may have been as important to the history of black progress in America as such landmark legal verdicts as *Plessy v. Ferguson* or *Brown v. Board*. But since almost the entire historical narrative has been produced by fervent Jewish advocates, these facts have been completely obscured and the case entirely misrepresented as an example of anti-Semitic persecution and public murder.

Let us summarize what seems to be the solidly established factual history of the Frank case, quite different than the traditional narrative. There is not the slightest evidence that Frank's Jewish background was a factor behind his arrest and conviction, nor the death sentence he received. The case set a remarkable precedent in Southern courtroom history with the testimony of a black man playing a central role in a white man's conviction. From the earliest stages of the murder investigation, Frank and his allies continually attempted to implicate a series of different innocent blacks by planting false evidence and using bribes to solicit perjured testimony, while the exceptionally harsh racial rhetoric that Frank and his attorneys directed towards those blacks was presumably intended to provoke their public lynching. Yet despite all these attempts by the Frank forces to play upon the notorious racial sentiments of the white Southerners of that era, the latter saw through these schemes and Frank was the one sentenced to hang for his rape and murder of that young girl.

> Now suppose that all the facts of this famous case were exactly unchanged except that Frank had been a white Gentile. Surely the trial would be ranked as one of the greatest racial turning points in American history, perhaps even overshadowing *Brown v. Board* because of the extent of popular sentiment, and it would have been given a central place in all our modern textbooks. Meanwhile, Frank, his lawyers, and his heavy financial backers would probably be cast as among the vilest racial villains in all of American history for their repeated attempts to foment the lynching of various innocent blacks so that a wealthy white rapist and murderer could walk free. But because Frank was Jewish rather than Christian, this remarkable history has been completely inverted for over one hundred years by our Jewish-dominated media and historiography.
>
> These are the important consequences that derive from control of the narrative and the flow of information, which allows murderers to be transmuted into martyrs and villains into heroes. The ADL was founded just over a century ago with the central goal of preventing a Jewish rapist and killer from being held legally accountable for his crimes, and over the decades, it eventually metastasized into a secret political police force not entirely dissimilar from the widely despised East German Stasi, but with its central goal seeming to be the maintenance of overwhelming Jewish control in a society that is 98% non-Jewish.
>
> We should ask ourselves whether it is appropriate for an organization with such origins and such recent history to be granted enormous influence over the distribution of information across our Internet.

The lengthy 2018 article I'd published attracted considerable readership and more than 750 comments. Perhaps partly as a consequence, a few months later Amazon purged the scholarly book on the Leo Frank case that had so impressed me, ironically doing so during Black History Month. However, it's still available for sale on the NOI website.

# The Limits of Media Corruption

***The Unz Review*** • May 22, 2023 • 3,400 Words

I published my original American Pravda article just over ten years ago, emphasizing that our reality was created by the media, which many of us eventually discovered was far from reliable.

> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.
>
> - Our American Pravda
> Ron Unz • ***The American Conservative*** • April 29, 2013 • 4,500 Words

Then five years ago this month I launched that series in earnest, eventually producing many dozens of articles that have totaled a half million words.

Although I've tried to be extremely careful in all this historical and media analysis, the surprising conclusions I've reached on so many past events have sometimes raised doubts in the back of my mind. Even if the evidence seems compelling and the sources quite credible, I wonder if it might really be possible for such explosive facts to be completely ignored by nearly all our media outlets. Surely the prospects of professional prizes would have tempted at least a few respectable journalists or academics into jumping on those same clues, setting off a cascade of their colleagues and resulting in a flood of media coverage. It seems almost inconceivable that nearly everyone could be ignoring such important matters.

But every now and then another example appears that confirms the reality of such seemingly implausible media silence.

Consider the case of Jonathan Turley, a leading establishmentarian figure who holds the Shapiro Chair of Public Interest Law at George Washington University. As his 5,000 word Wikipedia entry describes, he has spent decades as one of our most prolific and influential media commentators on legal matters, publishing numerous pieces in the *New York Times* and the *Washington Post* while being a regular guest on our broadcast networks. His long career has been entirely mainstream, and there is no sign he has ever explored any of the controversial topics that are the focus of my own research.

But just last week he published an outraged column in *The Hill*—a very respectable DC outlet—expressing his amazement at the total unwillingness of our media to report the massive evidence of financial corruption engulfing the family of President Joe Biden. His stunned reaction was so forceful that his remarks are worth excerpting at considerable length:

> This week, Rep. Byron Donalds (R-Fla.) tried to do the impossible. After he and his colleagues presented a labyrinth of LLC shell companies and accounts used to funnel as much as $10 million to Biden family members, Donalds tried to induce the press to show some interest in the massive corruption scandal. “For those in the press, this easy pickings & Pulitzer-level stuff right here,” he pleaded.
>
> The response was virtually immediate. Despite showing nine Biden family members allegedly receiving funds from corrupt figures in Romania, China and other countries, The New Republic quickly ran a story headlined “Republicans Finally Admit They Have No Incriminating Evidence on Joe Biden.”
>
> For many of us, it was otherworldly. A decade ago, when then-Vice President Joe Biden was denouncing corruption in Romania and Ukraine and promising action by the United States, massive payments were flowing to his son Hunter Biden and a variety of family members, including Biden grandchildren.
>
> The brilliance of the Biden team was that it invested the media in this scandal at the outset by burying the laptop story as “Russian disinformation” before the election. That was, of course, false, but it took two years for most major media outlets to admit that the laptop was authentic.
>
> But the media then ignored what was on that “authentic laptop.” Hundreds of emails detailed potentially criminal conduct and raw

influence peddling in foreign countries.

When media outlets such as the New York Post confirmed the emails, the media then insisted that there was no corroboration of the influence peddling payments and no clear proof of criminal conduct. It entirely ignored the obvious corruption itself.

Now that the House has released corroboration in actual money transfers linking many in the Biden family, the media is insisting that this is no scandal because there is no direct proof of payments to Joe Biden.

Putting aside that this is only the fourth month of an investigation, the media's demand of a direct payment to President Biden is laughably absurd. The payments were going to his family, but he was the object of the influence peddling.

The House has shown millions of dollars going to at least nine Bidens like dividends from a family business. As a long-time critic of influence peddling among both Republicans and Democrats, I have never seen the equal of the Bidens.

The whole purpose of influence peddling is to use family members as shields for corrupt officials. Instead of making a direct payment to a politician, which could be seen as a bribe, you can give millions to his or her spouse or children.

Moreover, these emails include references to Joe Biden getting a 10 percent cut of one Chinese deal. It also shows Biden associates warning not to use Joe Biden's name but to employ code names like "the Big Guy." At the same time, the president and the first lady are referenced as benefiting from offices and receiving payments from Hunter.

Indeed, Hunter complains that his father is taking half of everything that he is raking in.

None of that matters. The New York Times ran a piece headlined, "House Republican Report Finds No Evidence of Wrongdoing by President Biden." That is putting aside evidence against all the family members around Joe Biden. It also ignored that other evidence clearly shows Biden lied about his family not receiving Chinese funds or that he never had any knowledge of his son's business dealings.

In discussing modern Russian propaganda, researchers at the

> Rand Corporation described it as having "two distinctive features: high numbers of channels and messages and a shameless willingness to disseminate partial truths or outright fictions."
>
> Sound familiar?
>
> Today we are seeing a much more dangerous phenomenon. The coverage this week has all the markings of a state media. The consistent spin. The almost universal lack of details. The absurd distinctions.
>
> It is the blindside of our First Amendment, which addresses the classic use of state authority to coerce and control media. It does not address a circumstance in which most of the media will maintain an official line by consent rather than coercion.
>
> The media simply fails to see the story. Of course, it can always look to the president for enlightenment. Just before his son received a massive transfer of money from one of the most corrupt figures in Romania, Biden explained to that country why corruption must remain everyone's focus. "Corruption is a cancer, a cancer that eats away at a citizen's faith in democracy," he said. "Corruption is just another form of tyranny."
>
> It is just a shame that no one wants to cover it.

- America's state media: The blackout on Biden corruption is truly 'Pulitzer-level stuff'
  Jonathan Turley • ***The Hill*** • May 13, 2023 • 1,000 Words

If our journalists are unwilling to report the most blatant evidence of corruption surrounding our President, is there any chance they would be willing to consider the far more controversial topics I have covered in my series? And prior to the existence of the Internet, how many individuals would have even become aware of these facts or Turley's accusations?

His bitter complaints brought to mind one of my early American Pravda pieces, in which I'd described similar claims made by prominent journalist John T. Flynn in the 1940s. He had been outraged by the unwillingness of the media to report the enormous familial corruption surrounding President Franklin D. Roosevelt, involving sums vastly larger than those received by the Biden family.

> Take the case of John T. Flynn, probably unknown today to all but one American in a hundred, if even that…

So imagine my surprise at discovering that throughout the 1930s he had been one of the single most influential *liberal* voices in American society, a writer on economics and politics whose status may have roughly approximated that of Paul Krugman, though with a strong muck-raking tinge. His weekly column in *The New Republic* allowed him to serve as a lodestar for America's progressive elites, while his regular appearances in *Colliers*, an illustrated mass circulation weekly reaching many millions of Americans, provided him a platform comparable to that of an major television personality in the later heyday of network TV.

To some extent, Flynn's prominence may be objectively quantified. A few years ago, I happened to mention his name to a well-read and committed liberal born in the 1930s, and she unsurprisingly drew a complete blank, but wondered if he might have been a little like Walter Lippmann, the very famous columnist of that era. When I checked, I saw that across the hundreds of periodicals in my archiving system, there were just 23 articles by Lippmann from the 1930s but fully 489 by Flynn.

But Flynn's claims were extremely precise, detailed, and specific, including numerous names, dates, and references. Most surprisingly, he accused the Roosevelts of exhibiting an extraordinary degree of familial financial corruption, which he claimed may have been unprecedented in American history. Apparently, despite his wealthy and elite background FDR's eldest son Elliott never attended college and had essentially no professional qualifications in anything. But soon after FDR became president, he began soliciting large personal payments and "investments" from wealthy businessmen who needed favors from the massively growing federal government, and seemingly did so with FDR's full knowledge and approval. The situation sounded a little like Billy Carter's notorious activities during the late 1970s, but the money involved totaled as much as $50 million in present-day dollars relative to the household income of that era. I had never heard a word about this.

Even more shocking was the case of First Lady Eleanor Roosevelt, who also had never attended college and apparently had little formal education of any sort. Soon after FDR was inaugurated, she began a major round of very well-paid personal advertising for corporate consumer products such as soap and took all sorts of other large payments over the next few years from various businesses, especially those crucially dependent upon government regulatory decisions. Imagine if recent First Ladies such as

> Michelle Obama or Laura Bush were constantly seen in TV ads hawking cars and diapers and fast food. The payments Eleanor personally received over the course of the FDR's dozen years in office allegedly came to an astonishing $150 million, again relative to current family incomes. This, too, was something that I had never suspected. And all this was occurring during the very depths of the Great Depression, when a huge fraction of the country was desperately poor. Perhaps Juan and Eva Peron just didn't hire the right PR people or simply aimed too low.
>
> Obviously, the unprecedented growth in the spending and regulatory power of the federal government during the New Deal years increased opportunities for this sort of personal graft by an enormous amount. But Flynn notes how odd the situation seemed since FDR's inherited fortune meant that he had already come into office as one of the wealthiest presidents of modern times. And as far as I've heard, his successor Harry S. Truman left the White House about as poor as he had entered it.
>
> - American Pravda: Our Great Purge of the 1940s
> Ron Unz • ***The Unz Review*** • June 11, 2018 • 5,500 Words

According to Flynn, FDR's political victories were partly enabled by the total unwillingness of the partisan media of the day to report the facts of his personal corruption, and Prof. Turley says the same regarding Biden's 2020 victory over Donald Trump.

Days after the January 6th storming of the Capitol by outraged Trumpists, I had made a similar point, arguing that Trump's partisans had severely undercut their own case by focusing upon very dubious claims of Dominion voting machine fraud instead of the much more important factors of massive media bias and censorship.

> I haven't investigated the matter, but there does seem to be considerable circumstantial evidence of widespread ballot fraud by Democratic Party forces, hardly surprising given the apocalyptic manner in which so many of their leaders had characterized the threat of a Trump reelection. After all, if they sincerely believed that a Trump victory would be catastrophic for America why would they not use every possible means, fair and foul alike, to save our country from that dire fate?
>
> In particular, several of the major swing-states contain large cities

—Detroit, Milwaukee, Philadelphia, and Atlanta—that are both totally controlled by the Democratic Party and also notoriously corrupt, and various eye-witnesses have suggested that the huge anti-Trump margins they provided may have been heavily "padded" to ensure the candidate's defeat.

Even leaving aside some of these plausible claims, the case for a stolen election seems almost airtight. I don't know or care anything about Dominion voting machines, whether they are controlled by Venezuelan Marxists, Chinese Communists, or Martians. But the most blatant election-theft was accomplished in absolutely plain sight.

Not long before the election, the hard drive of an abandoned laptop owned by Joe Biden's son Hunter revealed a gigantic international corruption scheme, quite possibility involving the candidate himself. But the facts of this enormous political scandal were entirely ignored and boycotted by virtually every mainstream media outlet. And once the story was finally published in the pages of the *New York Post*, America's oldest newspaper, all links to the *Post* article and its website were suddenly banned by Twitter, Facebook, and other social media outlets to ensure that the voters remained ignorant until after they had cast their ballots.

Renowned international journalist Glenn Greenwald was hardly a Trump partisan, but he became outraged that the editors of the *Intercept*, the $100 million publication he himself had co-founded, refused to allow him to cover that massive media scandal, and he angrily resigned in protest. In effect, America's media and tech giants formed a united front to steal the election and somehow drag the crippled Biden/Harris ticket across the finish line.

Furthermore, as former longtime CIA Analyst Ray McGovern noted it has now come out that current Secretary of State Antony Blinken but then a top Biden aide had helped orchestrate the public declaration by 51 former Intelligence officers that the contents of the Hunter Biden laptop should be disregarded as likely Russian disinformation.

I had also pointed out that Trump's incompetent advocates had failed to emphasize the exceptionally close nature of the 2020 vote, which helped explain why his outraged supporters were driven to public protests:

> Although hardly suggested by our mainstream media, the officially-reported results demonstrated that our 2020 presidential election was extraordinarily close.
>
> All the regular pre-election polls had shown the Democratic candidate with a comfortable lead, but just as had been the case four years earlier, the actual votes tabulated revealed an entirely contrary outcome. According to the official vote-count, the Biden/Harris ticket ended up millions of votes ahead, having racked up huge leads in overwhelmingly Democratic states such as my own California, and also won by a very comfortable 306 to 232 margin in Electoral Votes. But control of the White House depends upon the state-by-state tallies, and these told a very different story.
>
> Incumbent Donald Trump lost Arizona, Georgia, and Wisconsin by such extremely narrow margins that a swing of less than 22,000 votes in those crucial states would have gotten him reelected. With a record 158 million votes cast, this amounted to a victory margin of around 0.01%. So if just one American voter

in 7,000 had changed his mind, Trump might have received another four years in office. ***One American voter in 7,000.***

Such an exceptionally narrow victory is extremely unusual in modern American history. For decades, the very tight Kennedy-Nixon race of 1960 had been a byword for close results, but Biden's margin of victory was much smaller. More recently, George W. Bush won a narrow reelection over Sen. John F. Kerry in 2004, but Kerry would have required a voter swing nearly five times greater than Trump's in order to claim victory. Indeed, with the sole exception of the notorious "dangling chads" Florida decision of the 2000 Bush-Gore election, no American presidential candidate in over 100 years had lost by so narrow a voter margin as Donald J. Trump.

If our incompetent or dishonest media had correctly reported these simple facts, perhaps Democratic partisans would have been somewhat more understanding of the outrage expressed by so many of their Republican counterparts, who believed they had been cheated of their election victory. Admittedly, Trump backers seem equally unaware of the historically slender margin of their candidate's defeat.

The Hunter Biden corruption scandal seemed about as serious as any in modern presidential election history and Biden's official victory margin was just 0.01%. So if the American voters had been allowed to learn the truth, Trump almost certainly would have won the election, quite possibly in an Electoral College landslide. Given these facts, anyone who continues to deny that the election was stolen from Trump is simply being ridiculous.

- American Pravda: Our Disputed Election
  Ron Unz • ***The Unz Review*** • January 14, 2021 • 2,000 Words

The total protection extended to Biden and his family despite the overwhelming evidence of criminality is matched by the huge efforts to railroad Trump on very doubtful grounds.

Columnist Kevin Barrett is a Muslim convert friendly towards Iran and he has long detested Trump, whom he considers an "odious" figure. Yet the totally unhinged campaign of vilification against the former President by our entire political and media establishment had led him to consider supporting Trump in the 2024 election:

Jimmy Dore makes a good case that Trump's civil trial for sexual assault and defamation was "A Pure Democratic Hit Job." Dore points out that New York's bizarre one-year repeal of the statute of limitations was specifically designed to grease the skids for Carroll-v-Trump. Since when did governments start temporarily repealing statutes of limitations so they can go after political figures they don't like? The move seems especially egregious because it involved an almost three-decade-old case in which the alleged victim can't even remember which *year* the alleged assault happened, and has no evidence whatsoever other than her word against his. If you're going to do something as extreme as suspending the statute of limitations so you can prosecute a specific case, shouldn't you at least have some evidence?

- Why I'm ALMOST Ready to Vote for Trump
  *Even if he runs from Death Row*
  Kevin Barrett • ***The Unz Review*** • May 14, 2023 • 800 Words

Progressive journalists such as Max Blumenthal and Aaron Mate have similarly ridiculed Trump's concurrent indictment on hush-money charges by an NYC prosecutor.

Thoughtful individuals naturally extrapolate from matters that they fully understand to those less familiar to them.  If Prof. Turley and other respectable figures have now concluded that our mainstream

media is far less reliable than they had ever believed possible, perhaps they should consider that this may have also been true in the past, including on important matters that they had never previously investigated.

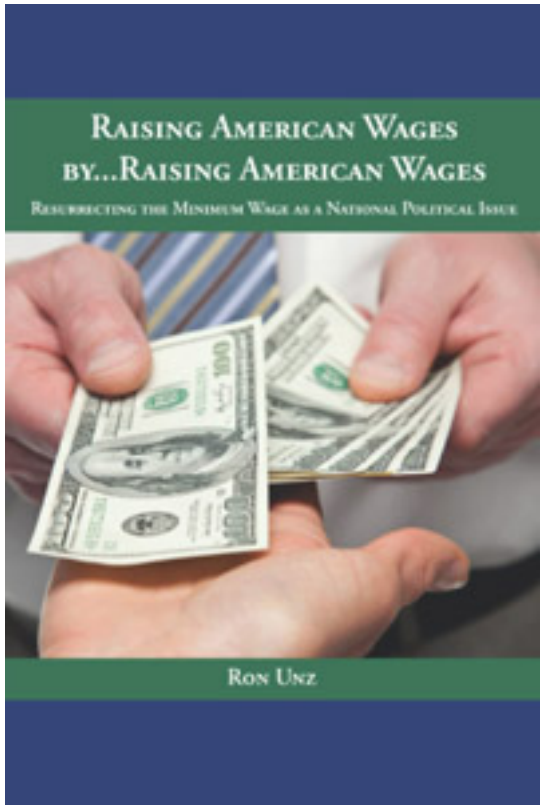
# Ten Years of American Pravda and *The Unz Review*

***The Unz Review*** • June 5, 2023 • 6,500 Words

My original American Pravda article was published just over ten years ago and that same mark is rapidly approaching for the website as a whole. With such a double anniversary now upon us, I think it's worth explaining the origins of those two interrelated projects and recapitulating how they unfolded.

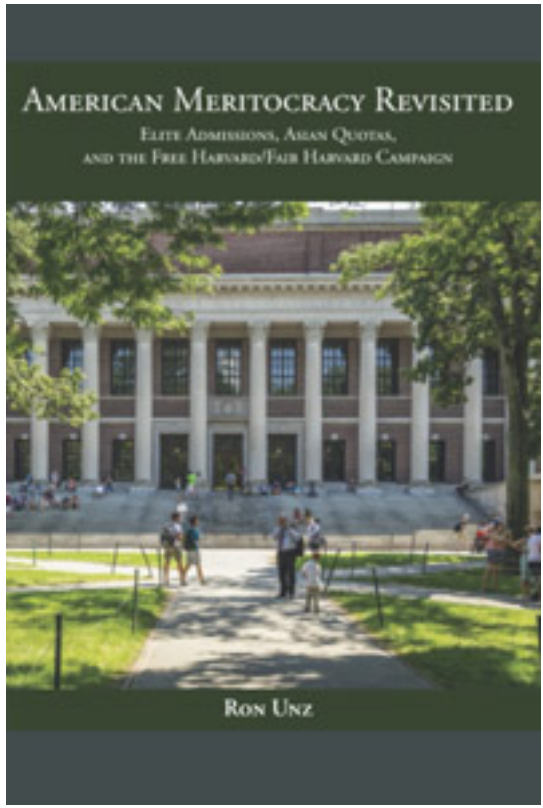
For nearly three decades I've been heavily involved in various political undertakings, and until the last few years I usually operated through the media, speaking with journalists and publishing my own pieces, especially targeting elite outlets such as the *New York Times* and the *Wall Street Journal*. This had been the basis of my highly successful campaign more than a quarter century ago to dismantle America's longstanding system of Spanish-almost-only so-called "bilingual education" and ensure that immigrant children were taught English from their first day of public school. Last year I summarized that history in a lengthy review-essay.

- The English Wars After Twenty-Five Years
  Ron Unz • ***The Unz Review*** • March 28, 2022 • 17,200 Words



My most recent success came about a dozen years ago when I'd resurrected the nearly-abandoned Minimum Wage issue, arguing for its powerful appeal both on political and policy grounds, then launched a 2014 national media campaign a couple of years later that managed to restore it to the center of the Democratic Party's agenda while also attracting the public support of a critical mass of influential conservative Republicans. As a result, big Minimum Wage hikes soon swept across most of our larger states, dramatically raising the economic prospects of our lowest paid workers.

- Resurrecting America's Minimum Wage
  Ron Unz • ***The Unz Review*** • April 18, 2022 • 25,200 Words



A couple of years later in 2016, I undertook an even bolder effort aimed at transforming American higher education. I recruited Ralph Nader to head a full slate of candidates for the Harvard Board of Overseers, with one of our main planks being the elimination of undergraduate tuition, a fiscal triviality given the gigantic size of the university's endowment and its annual income. The launch of our campaign was heralded by a front-page story in the *Times*, and if we'd won, America's other most elite universities probably would have followed Harvard's lead and also eliminated tuition, while the political ripple effects that would have drastically cut college costs all across the country. But we lost.

- American Meritocracy Revisited
  *Abolishing Tuition at Harvard University?*
  Ron Unz • ***The Unz Review*** • May 4, 2022 • 28,400 Words

The other half of our 2016 platform had demanded that Harvard increase the transparency of its extremely opaque and biased admissions system. Back in 2012, I'd provided strong evidence that Harvard and the rest of the Ivy League maintained what amounted to an Asian Quota; this prompted a *New York Times* symposium on that

subject and a year later a group of Asian American plaintiffs filed a lawsuit against the university. The discovery motions triggered by that lawsuit eventually revealed that an internal 2013 Harvard study had confirmed my accusations of apparent racial bias against Asian applicants, but the university administration had suppressed and ignored those findings. Now a decade later, the U.S. Supreme Court is poised to rule on that racial discrimination lawsuit within the next few weeks, a decision that many believe may severely restrict the use of Affirmative Action within higher education after a half-century of its seemingly inexorable growth.

- Challenging Racial Discrimination at Harvard
  Ron Unz • ***The Unz Review*** • October 31, 2022 • 5,900 Words

In late 2006 I'd become the publisher and primary financial backer of *The American Conservative (TAC)*, a small but well-regarded opinion magazine, and a few years later I'd begun writing major articles for that publication, notably including the ones that laid the intellectual basis for the Minimum Wage issue and the Asian Quota lawsuit against Harvard.

- Immigration, Republicans, and the End of White America
  Ron Unz • ***The American Conservative*** • September 19, 2011 • 12,200 Words

- How Social Darwinism Made Modern China
  Ron Unz • ***The American Conservative*** • March 11, 2013 • 8,300 Words

I'd been very pleased with all these articles, which had earned me a solid reputation as an influential analyst on important policy issues. However, by 2013 my research and writing efforts had also begun to take a very different turn. Much of my time over the previous dozen years had been devoted to a software project aimed at digitizing the archives of many of America's most influential publications of the previous 150 years, and as I'd explored those publications I'd gradually come to realize that the standard historical narrative that I'd always accepted without question was severely flawed, suffering from massive distortions and gaping omissions. As I later put it:

> I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other figures—Zinoviev, Kamenev,

> Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been such an idiot to have surrounded himself almost exclusively with traitors and spies?

My confidence in our mainstream media had already been shaken by the revelation of the non-existence of Saddam's WMDs in the wake of our disastrous Iraq War, and I had also been shocked to discover how much of the justification for the conflict had been based upon outright lies. A year or two after becoming *TAC* publisher, I'd summarized much of this criticism in a tribute I published to my old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan but had been banned from the media for his fierce opposition to that misbegotten war.

- The Life and Legacy of Lt. Gen. William Odom
  Ron Unz • ***The American Conservative*** • September 8, 2008 • 2,500 Words

Soon afterward, I was further shocked when I discovered Sydney Schanberg's remarkable expose of John McCain and the Vietnam War POWs. Despite Schanberg's stature as one of America's most respected journalists, a former top editor of the *New York Times*, the mountain of credible evidence he had compiled supporting that gigantic scandal was totally ignored by our entire mainstream media.

- Was Rambo Right?
  Ron Unz • ***The American Conservative*** • May 25, 2010 • 1,300 Words

The combination of all these factors—together with the alternatives sources of information increasingly available from the burgeoning Internet—led me to publish my original American Pravda article near the end of April 2013, just over ten years ago. I argued that our media might often be little better than the widely ridiculed propaganda organs of the late and unlamented Soviet Union.

- Our American Pravda
  Ron Unz • ***The American Conservative*** • April 29, 2013 • 4,500 Words

In that article, I emphasized that so much of our apparent reality was

constructed by the media, which was often far less reliable than many of us had once believed.

> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.

This article attracted more readership than all but a handful of *TAC's* previous pieces and it was also republished by the popular *ZeroHedge* website, while drawing favorable notice from writers in the *Atlantic*, *Forbes*, as well as a *New York Times* columnist.

But the deep and controversial issues I was raising were moving dangerously close to the "conspiracy theories" considered so poisonous in DC journalistic circles, and thus may have raised alarms in certain quarters. So a few weeks later on June 12, 2013 I was suddenly purged from my position at *TAC* and lost access to the outlet I had previously led. I later published my account of those unfortunate events.

- Why *The American Conservative* Purged Its Own Publisher
  Ron Unz • ***The Unz Review*** • May 29, 2018 • 5,800 Words • 380 Comments

At the time of my purge, I'd been doing a great deal of writing with many more pieces planned, but the main outlet for these pieces had been my own magazine, giving me an urgent need for a replacement. After considering my options, I launched *The Unz Review* webzine later that same year, though this required months of my time to design and build the customized software system, incorporating numerous features I'd thought might be useful. Since I typically wrote long articles at irregular intervals, I decided to make my new webzine a content distribution channel and commenting platform for alternative perspectives of all ideological types. This would allow it to draw readership on a daily basis, providing a built-in audience for the

articles of my own I intended to publish at much longer intervals.

The immediate trigger for my purge from *TAC* had been a long article I'd written providing an innovative statistical analysis of racial crime rates, which I'd made available on my small personal website. Once my new publication was released in late 2013, I immediately republished it there.

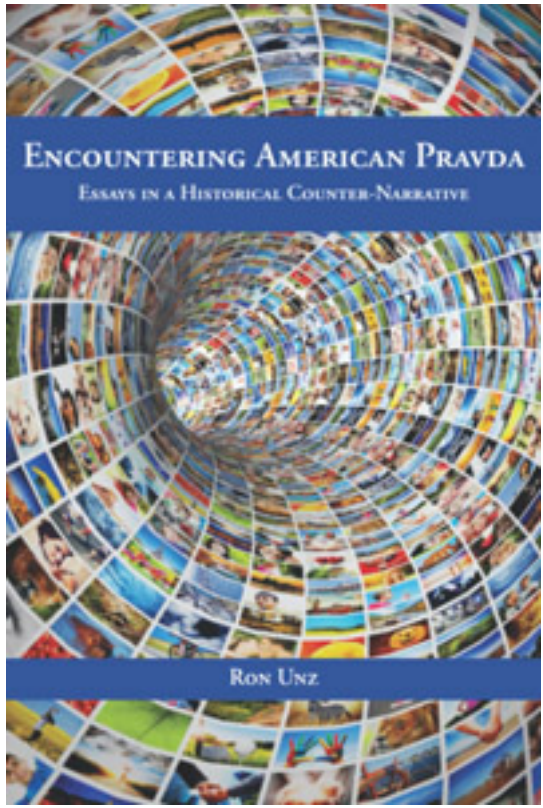
- Race and Crime in America
  Ron Unz • ***The Unz Review*** • July 20, 2013 • 7,300 Words • 434 Comments

I had originally planned to continue my writing, but instead I soon launched my Minimum Wage campaign, which occupied almost all my time. Afterwards I became preoccupied with other projects, and then began planning and preparing my Harvard Overseer campaign. As a result, my own writing on other topics was minimal for the first couple of years of the webzine's existence, though in early 2015 I did publish one important and well-received article on the hidden history of Sen. John McCain.

- John McCain: When "Tokyo Rose" Ran for President
  Ron Unz • ***The Unz Review*** • March 9, 2015 • 4,200 Words • 268 Comments

Our subsequent defeat in the Harvard Overseer campaign in 2016 left me somewhat adrift, but then a couple of months later on July 10th I was saddened to read Sydney Schanberg's obituary in the *New York Times*, and was struck that the long and glowing description of his illustrious career had totally avoided any mention of the journalistic project that had dominated the last quarter-century of his life. This prompted me to write a piece on the implications of that striking omission.

- American Pravda: The Legacy of Sydney Schanberg
  Ron Unz • ***The Unz Review*** • July 13, 2016 • 3,500 Words • 155 Comments



I followed this up with a couple of additional pieces on Schanberg's work and this began my American Pravda series. Over the next couple of months, I published nearly a dozen articles focusing on some of the important stories ignored or suppressed by the media, drawing from material that I'd come across in previous years.

I also produced an overview of the political/media strategy I had followed both in launching my series and creating the website itself, arguing that our mainstream media constituted a very powerful barrier to any political change and focused on the urgent need to break its hold on the American public.

  Ron Unz • ***The Unz Review*** • October 24, 2016 • 2,500 Words • 208 Comments

Traffic on this new alternative media website rose rapidly during 2016, spurred by the huge growth of on-line activism provoked by Donald Trump's unexpectedly strong Presidential campaign. Although I didn't think much of Trump myself and never wrote anything about him, many of our columnists and commenters were quite enthusiastic, establishing us one of the very few publications considered supportive of his effort, with an article in *The American Interest* characterizing us as "a Trump-friendly, highbrow online journal with a devoted following."

Unfortunately, the huge growth of readership and commenting we experienced put severe strains on the software system I'd built and this led to repeated crashes, forcing me to spend a month or two enhancing the system to handle the very heavy traffic. Having thus been diverted into software issues, I then decided to enhance the architecture of the system in various other ways. For example, I extended my software design so that it could easily handle full books in HTML format and added a library of these, making available older or especially controversial volumes that might not otherwise be conveniently available for reading. I also updated the design of the content-archiving system I had created a decade earlier and merged it into the same website.

Afterward I began doing some further reading and research on various historical topics that had long been of interest to me, laying the groundwork for the future articles I planned to write in my American Pravda series, while making arrangements to license the rights to republish some important books in the new, web-based system that I'd developed.

Due to the combined impact of this software work and my new background reading, my major writing went into abeyance for more than a year and a half, and I only was ready to finally resume it by mid-2018, almost exactly five years ago.

So on June 4th, 2018 I finally relaunched my American Pravda series by publishing two simultaneous pieces related to World War II. The first of them hailed the renowned historiography of David Irving while the second described the surprising Suvorov Hypothesis, arguing that Stalin's Soviet armies had been on the very verge of attacking and conquering Europe when Hitler unleashed his own 1941 Barbarossa offensive against the USSR. Both these highly controversial articles provoked a great deal of interest and a huge outpouring of discussion.

Controversial topics related to Jews or Israel have long been widely considered the lethal “Third Rail” for journalists and historians, and many of these issues I covered had actually seemed to have such connections, though they had been deeply suppressed.

I also published several articles directly describing some of my surprising even shocking discoveries in that explosive subject area.

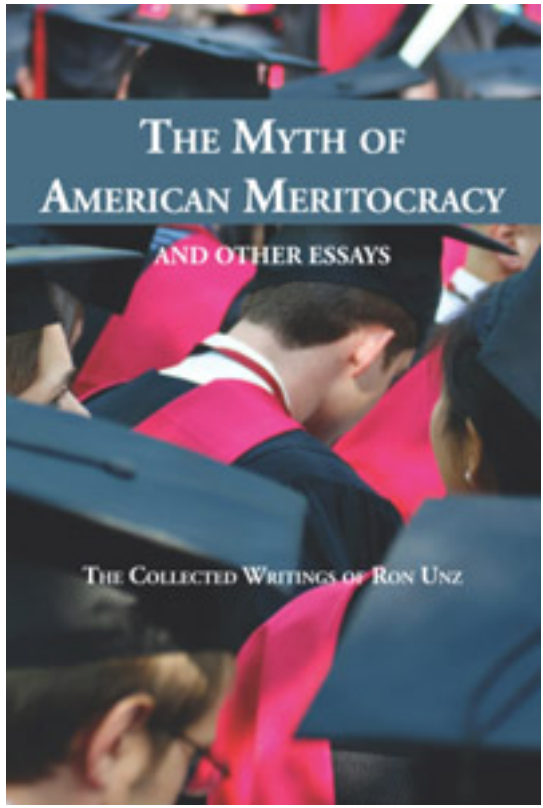
I fully recognized that the release of this new series of exceptionally controversial articles would completely transform my journalistic status and that of my website.



Three months earlier I had been regarded as the author of weighty, analytical articles that often dissected controversial racial issues in a thoughtful and restrained manner, probably best known for my highly-successful late 1990s "English" campaigns and my 2012 Meritocracy article that prompted the Asian lawsuit against Harvard's admissions policy.

In early 2016 I'd published a lengthy print collection of my essays in support of my Harvard Overseer campaign, and this volume had drawn glowing endorsements by top academic scholars and journalists.

The California Republican Party had long ago destroyed itself as a viable political force, this political vacuum lured me into making a strategic last-minute 2016 entry into the open U.S. Senate contest as a media ploy. In that high-profile statewide race I had been treated very respectfully, sharing a stage with then Attorney-General Kamala Harris at the televised debates, with the state's leading newspapers favorably reporting the points that I had made. After Trump's election victory, an elite media outlet had interviewed me for an hour regarding my views, and other important journalists had met with me

over lunch in Palo Alto.

But then in three short months I had burned all those many bridges to such mainstream respectability, publishing more than a dozen articles that together constituted some of the most controversial and incendiary collection of writings found anywhere on the Internet, a development that must surely have shocked and even horrified many of my readers. When I had lunch a few months later with a mainstream academic friend of mine, he only half-jokingly wondered

that I hadn't yet been arrested. I fully recognized that the extremely radioactive nature of my material would drastically alter my relationship with the mainstream media, which had hitherto always been a central pillar of my past political efforts.

Moreover, this burst of effort was among the most intense I'd ever undertaken. In less than 100 days, I'd produced more than a dozen major articles totaling nearly 100,000 words, an effort that had also required me to read or reread several dozen books and effectively analyze and summarize a vast quantity of complex and extremely controversial material.

There was a logical reason that I had followed such a difficult, rapid-fire publication schedule instead of releasing those same articles under a less punishing pace of a year or more. Obviously, the readership of each successive piece helped build the audience and momentum for the next in the series, allowing these to draw far more attention than if they'd been spaced out over time. But much more importantly, I believed that the very concentrated schedule greatly reduced the likelihood of any strong counter-attack in the media by such formidable activist groups as the ADL and its ideological allies.

As my controversial series of articles began appearing, various supportive individuals had expressed wonderment to me at the exceptionally bold positions I was taking. Given that I had long enjoyed a strongly positive public reputation and my website was quite popular, they felt sure that I would soon suffer a media assault of absolutely unprecedented ferocity, with the ADL and its allies totally demonizing me and the publication I had created. I thought otherwise and I was proven entirely correct.

I later explained my counter-intuitive thinking. If I'd only published a single item in my long series, those fierce ideological enforcers would probably have viciously attacked me in just the expected manner, hoping to severely damage my standing while believing that they would suffer no ill consequences if their effort failed. But by the time their leadership became fully aware of what I was doing and considered how to respond, I'd already raised so many different explosive issues on so many different fronts that they faced a difficult strategic predicament. Any attacks they made would certainly bring attention to my articles, and if these failed to destroy me, many of the issues their organization existed to protect might suffer severe damage as the information I presented became more widely known. So they decided that complete silence was the best approach.

Indeed, given that the ADL had decided to avoid battle, I began actively baiting them, ridiculing the fact that they had seemingly gone into hiding, and this finally prompted them to issue a rather milquetoast note, short and anonymous, rebuking me. But that mild slap then offered me an excuse to blast them back with a long and detailed account of the very sordid history of their own organization. I carefully explained that the ADL had originally been established to protect a notorious pedophile rapist and murderer, someone who had tried to orchestrate the lynching of completely innocent black men as a means of deflecting the just punishment for his own crimes.

- American Pravda: The ADL in American Society
  Ron Unz • ***The Unz Review*** • October 15, 2018 • 7,300 Words • 752 Comments

That powerful counter-blast immediately sent the ADL scurrying back into the shadows, and its leadership seems to have issued an edict declaring that no mention of my name or my publication might appear in any media outlet subject to their influence. A few telling media cases revealed this situation over the next year or two, and in a later column I dubbed this amusing situation "the Lord Voldemort Effect."

I noted an immediate example of this. During October 2018, legal arguments were presented in Boston federal court on the Asian lawsuit against Harvard and the high-profile case attracted a great deal of national media coverage, including numerous articles in the *New York Times*. One of the *Times* journalists called me for a lengthy interview that ran an hour or two, after she filed her story she'd dropped me a note apologizing that she'd only been able to include just a few of the many helpful quotes I'd given her. But when her article ran, all my quotes had been removed by her editors, a result that hardly surprised me.

A few months later the ADL probably played a central role in a new wave of Amazon book censorship, with the company suddenly eliminating a wide range of texts that the Jewish activist organization

considered noxious. Many of these were hortatory works of white racialism and the loss of Amazon availability probably had little consequence since such manifestos were so widespread all across the Internet. But the monopoly bookseller had also dropped the scholarly works produced by the Nation of Islam Research Group, including an outstanding academic monograph on the infamous Leo Frank case that I had heavily relied upon in my expose of the ADL's sordid origins. I found it strikingly ironic that Amazon chose Black History Month to purge a top-quality black history text published by one of America's highest-profile black activist organizations, and I tried to interest the leadership of the latter in organizing a public media protest, but after considering the possibility, they decided against it.

The fulminations of the Trump Administration on immigration and other racially-charged issues had returned these to the center-stage of

American politics.  Just before the November election, I gave a talk at a conference of the libertarian Mises Institute held near the Texas home of Ron Paul, with my topics including the Hispanic Crime and Asian Quota issues that I'd been best known for prior to my recent American Pravda articles.

This event and the subsequent election results prompted me to publish several long articles sharply challenging the racialist views of the Alt-Right movement that had been brought to national prominence by Trump's 2016 victory, provoking a vast outpouring of intensely hostile comments disputing my arguments.

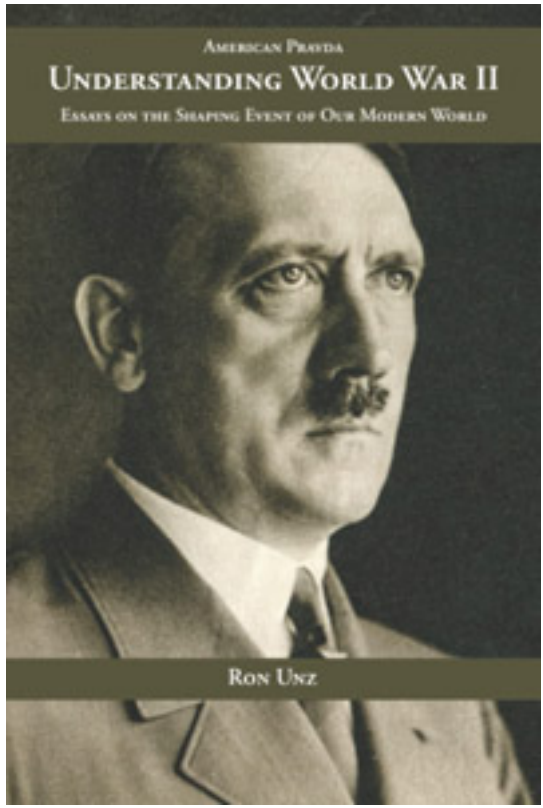
In early 2019 I had begun exploring possible topics for new articles, doing a great deal of background reading in various subjects in which I'd come to doubt the standard narrative I'd once accepted.



World War II had been the shaping event of our modern world, and I'd been pleased with several of my articles describing surprising aspects of that conflict. So I began further exploring that topic, digesting the important information contained in books I'd come across in previous references and eventually publishing a couple of lengthy new articles in May and June 2019. The first argued that for three generations the central turning point of that enormous conflict had been omitted from almost all Western history books while the second drew some very surprising conclusions from a major academic research study of pre-war anti-Semitism in the U.S. military. Then, with approach of the 80th anniversary of the start of the war, I published a very long and comprehensive analysis of what I believed were its true origins, drawing together the material from many of my previous articles and additional books that I now read or reread.

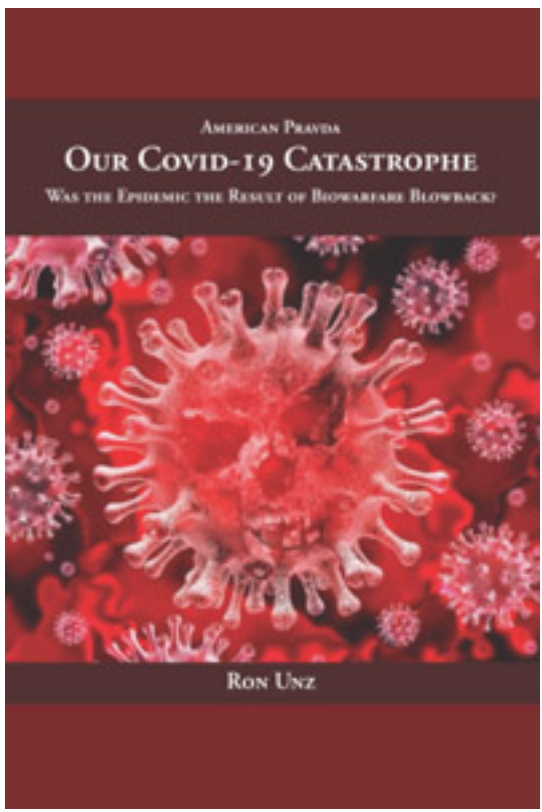
Then in January 2020 the entire world—and my own work—suddenly took a totally unexpected turn as our newspapers began reporting the appearance of a strange new illness in Wuhan, China.

The local public health authorities soon explained that a dangerous and highly-contagious new virus was responsible. The disease had appeared at the worst possible place and time for China, in a key transit hub just before the annual Lunar New Year holiday travels, so it seemed likely to spread everywhere, devastating the huge country. As a desperate measure, the Chinese government took the astonishing step of locking-down and confining to their homes all 11 million residents of Wuhan, soon extending the unprecedented lockdown to the entire province and imposing country-wide restrictions.

America's bitter global confrontation with China had previously been dominating the headlines and before the first Chinese death was even reported, our Internet was already awash with wild claims that the

Covid virus was a Chinese bioweapon that had leaked from a Wuhan lab. I became very suspicious of this immediate wave of intensely anti-China propaganda and soon arranged publication of early pieces by journalist Whitney Webb, a retired longtime American biodefense expert, conspiratorial ex-pats, and others that provided very different evidence, even suggesting sinister possibilities.

By February, China's heroic measures had begun turning the tide and controlling the Covid outbreak, but the virus was now beginning to spread worldwide, with Iran strangely becoming the second global epicenter despite its lack of any substantial Chinese population. Iran's ruling elites were hit particularly hard, with all of this taking place just a few weeks after America had assassinated Iran's top military commander, greatly multiplying my suspicions.



By March, the viral epidemic was devastating Northern Italy and other parts of Europe and beginning to spread uncontrollably in our own country, with the controversial lockdowns beginning in California and copied in various other states.

By April, I had finally accumulated enough evidence to publish my

first long article arguing that tens of thousands of Americans were now sickening and dying from the blowback of a botched American biowarfare attack against China (and Iran). My article initially attracted very strong readership, but within days our entire website had been banned by Facebook with all our pages deranked by Google, severely restricting our ability to disseminate our ideas.

Despite that setback, over the next couple of years I published a long list of additional articles in this series, greatly strengthening the case I was making, but being shocked that virtually no one else anywhere on the Internet was willing to highlight the same compelling evidence, easily drawn from our leading mainstream media outlets. Over a million Americans eventually died from Covid, along with twenty million people worldwide, making this an event of world-historic magnitude if this hypothesis were true. Yet scarcely a single alternative media writer was willing to broach this explosive subject.

For decades, the credibility of the our government, media, and other establishment sources had sunk lower and lower, and this led tens of millions of our citizens to severely question the safety and efficacy of the new Covid vaccines. As a result, the once obscure and marginal anti-vaxxing movement suddenly grew to enormous size and moved to the center of the political stage, with Robert F. Kennedy, Jr. being one of its most prominent leaders. Enormous numbers of Americans began to believe that the Covid vaccine was a deadly threat to their lives and health, fiercely boycotting the government-sponsored drive. The resulting censorship by social media gatekeepers merely stoked the paranoia of these activists, some of whom began loudly proclaiming that the vaccines were part of an elite plot to exterminate much of the human race.

I dismissed all these fears as groundless and was very irritated when these agitated activists swarmed the comment-threads of my website, with all my subsequent investigations confirming my verdict that the vaxxing fears were almost entirely mistaken. However, a commenter whose opinion I greatly respected on other matters strongly

recommended RFK Jr.'s new book and I ordered and read it, being very surprised to discover that nearly half the pages focused on AIDS. Kennedy made a strongly persuasive case that almost everything I'd thought I'd known about that high-profile disease had been wrong, a conclusion that astonished me.

Then in mid-2020, the death of George Floyd in Minneapolis suddenly sparked an enormous wave of racial activism across the country, producing the worst urban rioting and looting in a half-century and deeply impacting our political and intellectual life. For many years, these sorts of issues had been my primary focus and I soon published a controversial article analyzing these developments and coming to some surprising conclusions, then followed it a few months later with a very long and comprehensive review of the intellectual history of white racialism in America over the last century. All of these political developments greatly impacted the bitter 2020 Presidential election, leading to a disputed election and the storming of the Capitol by outraged Trumpists.

In late February 2022 the international landscape was once again suddenly transformed by the Russian invasion of Ukraine, a geopolitical development of enormous importance. Almost immediately, foreign policy and military matters moved back to the center of the political stage, as America and its NATO allies closed ranks against Russia, imposing a huge package of harsh economic sanctions and demonizing President Putin to an unprecedented extent. Russia's foreign exchange reserves were seized and the entire dollar-based global banking system was suddenly weaponized with the aim of destroying the Russian economy. Meanwhile, America and its allies soon began providing heavy military support to the Ukrainians, whose resistance was much more effective than had originally been expected.

NATO was soon locked into a bitter proxy war against Russia, but although the Russians failed to win the quick sweeping military victory that many had expected, the Russian economy held up very

well, while the loss of cheap Russian energy caused severe economic problems for Europe and America. The economic and political alliance between China and Russia was greatly strengthened, and other major countries such as Iran, Saudi Arabia, India, and Brazil gravitated towards that new non-Western axis, while America was widely suspected of having been behind the destruction of Europe's vital Nord Stream pipelines. There are now indications that the most important global realignment since the collapse of the Soviet Union thirty years ago is taking place, with the emergence of a new multipolar world underway.

Taken together, this body of work approaches a million words of text, with the bulk of it produced during the last five years. I've tried to be very judicious in my claims and careful in my analysis, emphasizing my conviction on some issues and my uncertainty on others. But overall, I think the material covers a range of topics as ultra-controversial as anything found anywhere on the Internet, and I'd stand by virtually everything I've written, still believing that 99% of it has been accurate, at least to the claimed tolerances I'd originally expressed.

# Why Everything You Know About World War II Is Wrong

*Mike Whitney Interview with Ron Unz*

***The Unz Review*** • June 12, 2023 • 12,600 Words

> **"Much of the current political legitimacy of today's American government and its various European vassal-states is founded upon a particular narrative history of World War II, and challenging that account might have dire political consequences."—**Ron Unz

## Question 1: Hitler

*Let's start with Hitler. In the West it is universally accepted that:*

1. *Hitler started WW2*
2. *Hitler's invasion of Poland was the first step in a broader campaign aimed at world domination*

*Is this interpretation of WW2 true or false? And, if it is false, then—in your opinion—what was Hitler trying to achieve in Poland and could WW2 have been avoided?*

**Ron Unz**—Until the last dozen years or so, my views on historical events had always been fairly conventional, formed from the classes I'd taken in college and the uniform media narrative I'd absorbed over the decades. This included my understanding of World War II, the greatest military conflict in human history, whose outcome had shaped our modern world.

But in the years after the 9/11 Attacks and the Iraq War, I'd grown more and more suspicious of the honesty of our mainstream media, and begun to recognize that history books often merely represent a congealed version of such past media distortions. The growth of the Internet has unleashed a vast quantity of unorthodox ideas of all possible flavors and since 2000 I'd been working on a project to digitize the archives of our leading publications of the last 150 years, which gave me convenient access to information not easily available to anyone else. So as I later wrote:

> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.

As a consequence of all these developments, I published my original American Pravda article a decade ago, which contained that passage. In that article I emphasized that what our history books and media told us about the world and its past might often be just as dishonest and distorted as the notorious *Pravda* of the vanished USSR.

- Our American Pravda
  Ron Unz • ***The American Conservative*** • April 29, 2013 • 4,500 Words

At first, my focus had been on more recent historical events, but I soon began doing a great deal of reading and investigation into the history of World War II as well, gradually realizing that a large fraction of everything I'd always accepted about that war was completely incorrect.

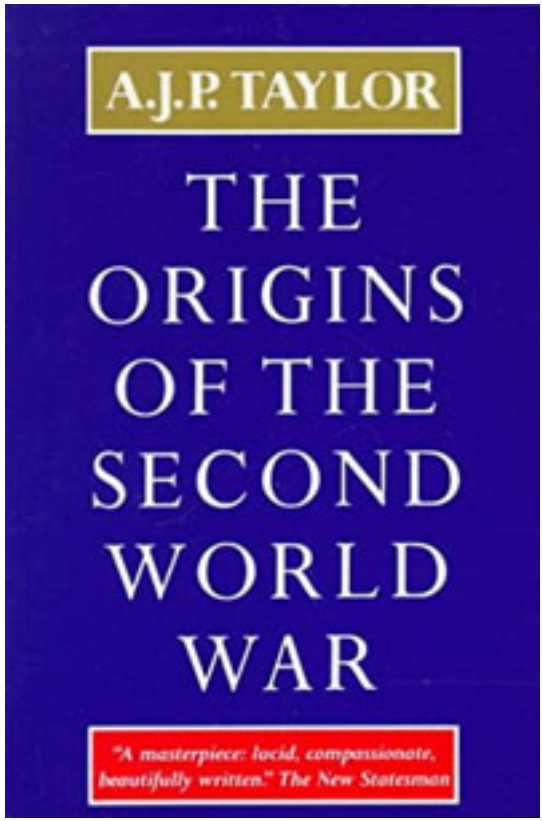
Perhaps I shouldn't have been too surprised to discover this. After all, if our media could lie so blatantly about events in the here and now, why should we trust it on matters that had happened long ago and far away?

I eventually concluded that the true history of World War II was not only quite different from what most of us had always believed, but was largely inverted. Our mainstream history books had been telling the story upside-down and backwards.

With regard to Hitler and the outbreak of the war, I think an excellent starting point would be *Origins of the Second World War*, a classic work published in 1961 by renowned Oxford historian A.J.P. Taylor. As I described his conclusions in 2019:

> **Hitler's final demand, that 95% German Danzig be returned to Germany just as its inhabitants desired, was an absolutely**

**reasonable one, and only a dreadful diplomatic blunder by the British had led the Poles to refuse the request, thereby provoking the war. The widespread later claim that Hitler sought to conquer the world was totally absurd, and the German leader had actually made every effort to avoid war with Britain or France.** Indeed, he was generally quite friendly towards the Poles and had been hoping to enlist Poland as a German ally against the menace of Stalin's Soviet Union.



A.J.P. TAYLOR
THE ORIGINS OF THE SECOND WORLD WAR
"A masterpiece: lucid, compassionate, beautifully written." The New Statesman

The recent 70th anniversary of the outbreak of the conflict that consumed so many tens of millions of lives naturally provoked numerous historical articles, and the resulting discussion led me to dig out my old copy of Taylor's short volume, which I reread for the first time in nearly forty years. I found it just as masterful and persuasive as I had back in my college dorm room days, and the glowing cover-blurbs suggested some of the immediate acclaim the work had received. *The Washington Post* lauded the author as "Britain's most prominent living historian," *World Politics* called it "Powerfully argued, brilliantly written, and always persuasive," *The New Statesman*, Britain leading leftist

magazine, described it as “A masterpiece: lucid, compassionate, beautifully written,” and the august *Times Literary Supplement* characterized it as “simple, devastating, superlatively readable, and deeply disturbing.” As an international best-seller, it surely ranks as Taylor’s most famous work, and I can easily understand why it was still on my college required reading list nearly two decades after its original publication.

Yet in revisiting Taylor’s ground-breaking study, I made a remarkable discovery. Despite all the international sales and critical acclaim, the book’s findings soon aroused tremendous hostility in certain quarters. Taylor’s lectures at Oxford had been enormously popular for a quarter century, but as a direct result of the controversy “Britain’s most prominent living historian” was summarily purged from the faculty not long afterwards. At the beginning of his first chapter, **Taylor had noted how strange he found it that more than twenty years after the start of the world’s most cataclysmic war no serious history had been produced carefully analyzing the outbreak.** Perhaps the retaliation that he encountered led him to better understand part of that puzzle.

Numerous other leading scholars and journalists, both contemporaneous and more recent, have come to very similar conclusions, but they too often suffered severe retaliation for their honest historical assessments. For decades William Henry Chamberlin had been one of America’s most highly-regarded foreign policy journalists, but after he published *America’s Second Crusade* in 1950, he vanished from most mainstream publications. David Irving quite possibly ranks as the most internationally successful British historian of the last 100 years, with his seminal books on World War II receiving enormous critical praise and selling in the millions; but he was driven into personal bankruptcy and narrowly avoided spending the rest of his life in an Austrian prison.

Hitler Returning in Triumph to Berlin After Reunification with Austria

**By the late 1930s Hitler had resurrected Germany, which had become newly prosperous under his rule, and he had also managed to reunite it with several separated German populations. As a result, he was widely recognized as one of the most successful and popular leaders in the world, and he hoped to finally settle the Polish border dispute, offering concessions far more generous than any of his democratically-elected Weimar predecessors had ever considered. But Poland's dictatorship instead spent months rejecting his attempts at negotiations and also began brutal mistreatment of its German minority, finally forcing Hitler into declaring war.** And as I discussed in 2019, provoking that war may have been the deliberate goal of certain powerful figures.

> Perhaps the most obvious of these is the question of the true origins of the war, which laid waste to much of Europe, killed perhaps fifty or sixty million, and gave rise to the subsequent Cold War era in which Communist regimes controlled half of the entire Eurasian world-continent. **Taylor, Irving, and numerous others have thoroughly debunked the ridiculous mythology that the cause lay in Hitler's mad desire for world conquest**, but if the German dictator clearly bore only minor responsibility, was there indeed any true culprit? Or did this massively-destructive world war come about in somewhat similar fashion to

its predecessor, which our conventional histories treat as mostly due to a collection of blunders, misunderstandings, and thoughtless escalations?

During the 1930s, John T. Flynn was one of America's most influential progressive journalists, and although he had begun as a strong supporter of Roosevelt and his New Deal, he gradually became a sharp critic, concluding that FDR's various governmental schemes had failed to revive the American economy. Then in 1937 a new economic collapse spiked unemployment back to the same levels as when the president had first entered office, confirming Flynn in his harsh verdict. And as I wrote last year:

Indeed, **Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box**, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after **a top Roosevelt adviser had privately boasted to him that a large bout of "military Keynesianism" and a major war would cure the country's seemingly insurmountable economic problems.** At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but **developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.**

The last point is an important one since the confidential opinions of those closest to important historical events should be accorded considerable evidentiary weight. In a recent article John Wear mustered the **numerous contemporaneous assessments that implicated FDR as a pivotal figure in orchestrating the world war by his constant pressure upon the British political leadership**, a policy that he privately even admitted could mean his impeachment if revealed. Among other testimony, we have

the statements of the Polish and British ambassadors to Washington and the American ambassador to London, who also passed along the concurring opinion of Prime Minister Chamberlain himself. Indeed, the German capture and publication of secret Polish diplomatic documents in 1939 had already revealed much of this information, and William Henry Chamberlin confirmed their authenticity in his 1950 book. But since the mainstream media never reported any of this information, these facts remain little known even today.

I discussed these historical events at great length in my 2019 article:

- American Pravda: Understanding World War II
  Ron Unz • ***The Unz Review*** • September 23, 2019 • 20,500 Words

## Question 2: The London "Blitz"

*Germany launched the "Blitz" on England in order to terrorize the British people into submission. Do you agree with this or were there other factors involved which have been omitted in western history textbooks? (Like Churchill's bombing of Berlin?)*

**Ron Unz—Once again, this standard account of World War II is largely the opposite of the truth.** In that era, the aerial bombardment of urban centers far behind military lines was illegal and considered a war crime, with **Hitler having absolutely no intention of attacking Britain's cities in that way.**

**Indeed, the German leader had always had favorable views toward Britain and also believed that the preservation of the British Empire was in Germany's strategic interest since its collapse would create a geopolitical vacuum that might be filled by a rival power.**

After Germany attacked Poland, Britain and France declared war. The Polish army was defeated in just a few weeks, and Hitler then offered to withdraw his forces from the Polish territories they had occupied and make peace, but the two Western powers vowed to continue the war until Germany was crushed. Little fighting occurred until spring of 1940 when the Germans finally attacked and defeated the huge French army, seizing Paris and knocking France out of the war.

**The British forces were evacuated at Dunkirk and there's quite a lot of evidence that Hitler deliberately allowed them to escape as a face-saving gesture rather than ordering them captured. He followed his victory in France by offering extremely generous terms to the British government, making no demands against them and instead proposing a German alliance, including military support for protecting the security of their worldwide empire. Hitler naturally believed that they would accept such an attractive offer and end the war, which he assumed was essentially over.**

Several of the top British leaders seemed eager to make peace on Hitler's generous terms, and according to the evidence found by renowned British historian David Irving, Prime Minister Winston Churchill himself seemed willing to do so before changing his mind and pulling back. Churchill had spent decades seeking to become Prime Minister, and Irving plausibly argues he realized that losing a disastrous war within weeks of finally achieving that position would have rendered him a laughingstock in the history books.

But given Britain's military defeat on the Continent and the very generous terms Hitler was offering, **Churchill faced a huge problem in persuading his country to continue a war that was widely**

**regarded as lost. Therefore, he began ordering a series of bombing raids against the German capital, an illegal war crime, hoping to provoke a German response.** This led Hitler to repeatedly warn that if they continued bombing his cities, he would be forced to retaliate in kind, and he finally did so. Since the British public was unaware that their own government had initiated the campaign of urban bombing, they regarded those retaliatory German aerial attacks as monstrous, unprovoked war crimes, and just as Churchill had hoped, they became fully committed to continuing the war against Germany.

Irving and others explain all these important facts in their books, and a riveting Irving lecture summarizing his information is still available on Bitchute after having been purged from Youtube.

Irving is a crucial source for much important information on the war and in 2018 I explained why the results of a high-profile lawsuit against Deborah Lipstadt had demonstrated that his historical research was extremely reliable:

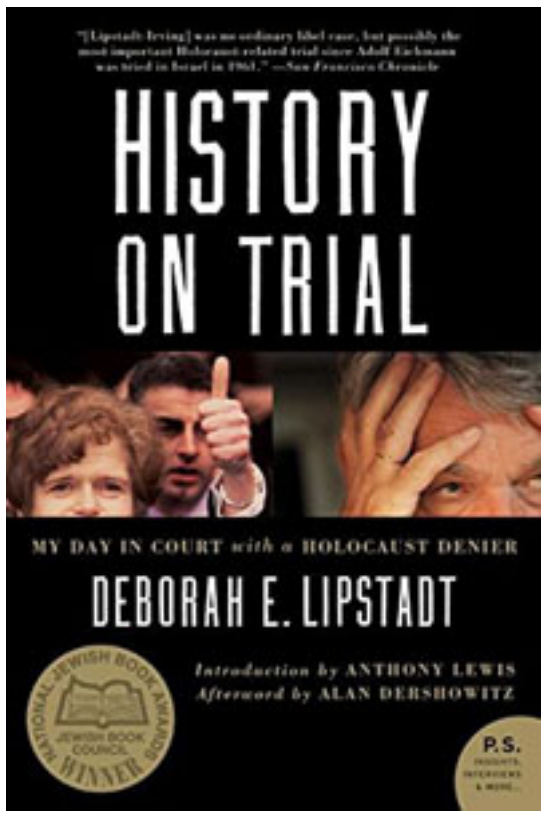
> These zealous ethnic-activists began a coordinated campaign to pressure Irving's prestigious publishers into dropping his books, while also disrupting his frequent international speaking tours and even lobbying countries to bar him from entry. They maintained a drumbeat of media vilification, continually blackening his name and his research skills, even going so far as to denounce him as a "Nazi" and a "Hitler-lover," just as had similarly been done in the case of Prof. Wilson.
>
> That legal battle was certainly a David-and-Goliath affair, with

wealthy Jewish movie producers and corporate executives providing a huge war-chest of \$13 million to Lipstadt's side, allowing her to fund a veritable army of 40 researchers and legal experts, captained by one of Britain's most successful Jewish divorce lawyers. By contrast, Irving, being an impecunious historian, was forced to defend himself without benefit of legal counsel.

In real life unlike in fable, the Goliaths of this world are almost invariably triumphant, and this case was no exception, with Irving being driven into personal bankruptcy, resulting in the loss of his fine central London home. But seen from the longer perspective of history, I think the victory of his tormentors was a remarkably Pyrrhic one.

Although the target of their unleashed hatred was Irving's alleged "Holocaust denial," as near as I can tell, that particular topic was almost entirely absent from all of Irving's dozens of books, and exactly that very silence was what had provoked their spittle-flecked outrage. Therefore, lacking such a clear target, their lavishly-funded corps of researchers and fact-checkers instead spent a year or more apparently performing a line-by-line and

footnote-by-footnote review of everything Irving had ever published, seeking to locate every single historical error that could possibly cast him in a bad professional light. With almost limitless money and manpower, they even utilized the process of legal discovery to subpoena and read the thousands of pages in his bound personal diaries and correspondence, thereby hoping to find some evidence of his "wicked thoughts." *Denial*, a 2016 Hollywood film co-written by Lipstadt, may provide a reasonable outline of the sequence of events as seen from her perspective.



"[Lipstadt-Irving] was no ordinary libel case, but possibly the most important Holocaust-related trial since Adolf Eichmann was tried in Israel in 1961." —San Francisco Chronicle
HISTORY ON TRIAL
MY DAY IN COURT with a HOLOCAUST DENIER
DEBORAH E. LIPSTADT
Introduction by ANTHONY LEWIS
Afterword by ALAN DERSHOWITZ
NATIONAL JEWISH BOOK AWARDS
JEWISH BOOK COUNCIL
WINNER
P.S.

Yet despite such massive financial and human resources, they apparently came up almost entirely empty, at least if Lipstadt's triumphalist 2005 book *History on Trial* may be credited. Across four decades of research and writing, which had produced numerous controversial historical claims of the most astonishing nature, they only managed to find a couple of dozen rather minor alleged errors of fact or interpretation, most of these ambiguous or disputed. And the worst they discovered after reading every page of the many linear meters of Irving's personal diaries was that he had once composed a short "racially insensitive" ditty for his infant daughter, a trivial item which they naturally then

trumpeted as proof that he was a "racist." Thus, they seemingly admitted that Irving's enormous corpus of historical texts was perhaps 99.9% accurate.

I think this silence of "the dog that didn't bark" echoes with thunderclap volume. I'm not aware of any other academic scholar in the entire history of the world who has had all his decades of lifetime work subjected to such painstakingly exhaustive hostile scrutiny. And since Irving apparently passed that test with such flying colors, I think we can regard almost every astonishing claim in all of his books—as recapitulated in his videos—as absolutely accurate.

## Question 3: The Purge of Antiwar Intellectuals

*In the 1940s, there was a purge of antiwar intellectuals and pundits similar to the purge of critics of US policy in social media today. Can you briefly explain what happened, who was targeted, and whether the first amendment should apply in times of national crisis?*

**Ron Unz**—Around 2000, I began a project to digitize the archives of **many of our leading publications of the last 150 years and I was astonished to discover that some of our most influential figures from the years prior to World War II had been "disappeared"** so completely that I'd never heard of them. This played a major role in **my growing suspicions that the standard narrative I'd always accepted was false**, and I later described the situation using the analogy of the notorious historical lies of the old Soviet Union:

I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other figures—Zinoviev, Kamenev, Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had

barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been such an idiot to have surrounded himself almost exclusively with traitors and spies?

But unlike their Stalinist analogs from a couple of years earlier, the American victims who disappeared around 1940 were neither shot nor Gulaged, but merely excluded from the mainstream media that defines our reality, thereby being blotted out from our memory so that future generations gradually forgot that they had ever lived.

A leading example of such a "disappeared" American was journalist **John T. Flynn**, probably almost unknown today but whose stature had once been enormous. As **I wrote** last year:

So imagine my surprise at discovering that throughout the 1930s he had been one of the single most influential *liberal* voices in American society, a writer on economics and politics whose status may have roughly approximated that of Paul Krugman, though with a strong muck-raking tinge. His weekly column in *The New Republic* allowed him to serve as a lodestar for America's progressive elites, while his regular appearances in *Colliers*, an illustrated mass circulation weekly reaching many millions of Americans, provided him a platform comparable to that of an major television personality in the later heyday of network TV.

To some extent, Flynn's prominence may be objectively quantified. A few years ago, I happened to mention his name to a well-read and committed liberal born in the 1930s, and she

unsurprisingly drew a complete blank, but wondered if he might have been a little like **Walter Lippmann**, the very famous columnist of that era. When I checked, I saw that across the hundreds of periodicals in my archiving system, there were just 23 articles by Lippmann from the 1930s but fully 489 by Flynn.

An even stronger American parallel to Taylor was that of historian Harry Elmer Barnes, a figure almost unknown to me, but in his day an academic of great influence and stature:

Imagine my shock at later discovering that **Barnes** had actually been one of the most frequent early contributors to *Foreign Affairs*, serving as a primary book reviewer for that venerable publication from its 1922 founding onward, while his stature as one of America's premier liberal academics was indicated by his scores of appearances in *The Nation* and *The New Republic* throughout that decade. Indeed, he is credited with having played a central role in "revising" the history of the First World War so as to remove the cartoonish picture of unspeakable German wickedness left behind as a legacy of the dishonest wartime propaganda produced by the opposing British and American governments. And his professional stature was demonstrated by his thirty-five or more books, many of them influential academic volumes, along with his numerous articles in *The American Historical Review*, *Political Science Quarterly*, and other leading journals.

A few years ago I happened to mention Barnes to an eminent American academic scholar whose general focus in political science and foreign policy was quite similar, and yet the name meant nothing. By the end of the 1930s, Barnes had become a leading critic of America's proposed involvement in World War II, and was permanently "disappeared" as a consequence, barred from all mainstream media outlets, while a major newspaper chain was heavily pressured into abruptly terminating his long-running syndicated national column in May 1940.

Many of Barnes' friends and allies fell in the same ideological purge, which he described in his own writings and which continued after the end of the war:

Over a dozen years after his disappearance from our national media, Barnes managed to publish ***Perpetual War for Perpetual Peace***, a lengthy collection of essays by scholars and other experts discussing the circumstances surrounding America's entrance into World War II, and have it produced and distributed by a small printer in Idaho. His own contribution was a 30,000 word essay entitled **"Revisionism and the Historical Blackout"** and discussed the tremendous obstacles faced by the dissident thinkers of that period.

The book itself was dedicated to the memory of his friend, historian **Charles A. Beard**. Since the early years of the 20th century, Beard had ranked as an intellectual figure of the greatest stature and influence, co-founder of The New School in New York and serving terms as president of both The American Historical Association and The American Political Science Association. As a leading supporter of the New Deal economic policies, he was overwhelmingly lauded for his views.

Yet once he turned against Roosevelt's bellicose foreign policy, publishers shut their doors to him, and only his personal friendship with the head of the Yale University Press allowed his critical 1948 volume *President Roosevelt and the Coming of the War, 1941* to even appear in print. Beard's stellar reputation seems to have begun a rapid decline from that point onward, so that by 1968 historian Richard Hofstadter **could write**: "Today Beard's reputation stands like an imposing ruin in the landscape of American historiography. What was once the grandest house in the province is now a ravaged survival". Indeed, Beard's once-dominant "economic interpretation of history" might these days almost be dismissed as promoting "dangerous conspiracy

theories," and I suspect few non-historians have even heard of him.

Another major contributor to the Barnes volume was **William Henry Chamberlin**, who for decades had been ranked among America's leading foreign policy journalists, with more than 15 books to his credit, most of them widely and favorably reviewed. Yet ***America's Second Crusade***, his critical 1950 analysis of America's entry into World War II, failed to find a mainstream publisher, and when it did appear was widely ignored by reviewers. Prior to its publication, his byline had regularly run in our most influential national magazines such as *The Atlantic Monthly* and *Harpers*. But afterward, his writing was almost entirely confined to small circulation newsletters and periodicals, appealing to narrow conservative or libertarian audiences.

In these days of the Internet, anyone can easily establish a website to publish his views, thus making them immediately available to everyone in the world. Social media outlets such as Facebook and Twitter can bring interesting or controversial material to the attention of millions with just a couple of mouse-clicks, completely bypassing the need for the support of establishmentarian intermediaries. It is easy for us to forget just how extremely challenging the dissemination of dissenting ideas remained back in the days of print, paper, and ink, and recognize that an individual purged from his regular outlet might require many years to regain any significant foothold for the distribution of his work.

I'd written those last words in June 2018 and ironically enough, sweeping social media purges and shadow-banning soon engulfed many present-day dissenters, greatly reducing their ability to distribute their ideas.

## Question 4: Postwar Germany

*Most Americans believe that the German people were treated humanely following the end of hostilities and that the Marshall Plan helped to rebuild Europe. Is that an accurate account of what actually took place? (Freda Utley)*

**Ron Unz**—Although long forgotten today, **Freda Utley** was a mid-century journalist of some prominence. Born an Englishwoman, she had married a Jewish Communist and moved to Soviet Russia, then fled to America after her husband fell in one of Stalin's purges. Although hardly sympathetic to the defeated Nazis, she **strongly shared Beaty's view of the monstrous perversion of justice at Nuremberg and her first-hand account of the months spent in Occupied Germany is eye-opening in its description of the horrific suffering imposed upon the prostrate civilian population even years after the end of the war.**

> In 1948 she spent several months traveling around Occupied Germany, and the following year published her experiences in *The High Cost of Vengeance*, which I found eye-opening. Unlike the vast majority of other American journalists, who generally took brief, heavily-chaperoned visits, Utley actually spoke German and was quite familiar with the country, having frequently visited it during the Weimar Era. Whereas Grenfell's discussion was highly restrained and almost academic in its tone, her own writing was considerably more strident and emotional, hardly surprising given her direct encounter with extremely distressing subject matter. Her eyewitness testimony seemed quite credible, and the factual

information she provided, buttressed by numerous interviews and anecdotal observations, was gripping.

**More than three years after the end of hostilities, Utley encountered a land still almost totally ruined, with large portions of the population forced to seek shelter in damaged basements or share tiny rooms in broken buildings. The population regarded itself as being "without rights,"** often subject to arbitrary treatment by occupation troops or other privileged elements, who stood completely outside the legal jurisdiction of the regular local police. Germans in large numbers were regularly removed from their homes, which were used to billet American troops or others who found favor with them, a situation that had been noted with some outrage in Gen. George Patton's posthumously published diaries. Even at this point, a foreign soldier might still sometimes seize anything he wanted from German civilians, with potentially dangerous consequences if they protested the theft. **Utley tellingly quotes a former German soldier who had served occupation duties in France and remarked that he and his comrades had operated under strictest discipline and could never have imagined behaving toward French civilians in the manner that current Allied troops now treated German ones.**

Some of Utley's quoted claims are quite astonishing, but seem solidly based on reputable sources and fully confirmed elsewhere. Throughout the first three years of peacetime, the daily food ration allocated to Germany's entire civilian population was roughly 1550 calories, approximately the same as that provided to the inmates of German concentration camps during the war recently ended, and it sometimes dropped far, far lower. **During the difficult winter of 1946-47, the entire population of the Ruhr, Germany's industrial heartland, had only received starvation rations of 700-800 calories per day, and even lower levels were sometimes reached.**

Influenced by hostile official propaganda, the widespread attitude of Allied personnel towards ordinary Germans was certainly as bad as anything faced by the natives living under a European colonial regime. Time and again, Utley notes the remarkable parallels with the treatment and attitude she had previously seen Westerners take towards the native Chinese during most of the 1930s, or that the British had expressed to their Indian colonial subjects. Small German boys, shoeless, destitute, and hungry, eagerly retrieved balls at American sporting-clubs for a tiny

pittance. Today it is sometimes disputed whether American cities during the late 19th century actually contained signs reading “No Irish Need Apply,” but Utley certainly saw signs reading “No Dogs or Germans Allowed” outside numerous establishments frequented by Allied personnel.

Based on my standard history textbooks, I had always believed that there existed a total night-and-day difference in the behavior toward local civilians between the German troops who occupied France from 1940-44 and the Allied troops who occupied Germany from 1945 onward. After reading the detailed accounts of Utley and other contemporaneous sources, I think my opinion was absolutely correct, but with the direction reversed.

Utley believed part of the reason for this utterly disastrous situation was deliberate American government policy. Although the Morgenthau Plan—aimed at eliminating half or so of Germany’s population—had been officially abandoned and replaced with the Marshall Plan promoting German revival, she found that many aspects of the former actually still held sway in practice. Even as late as 1948, **huge portions of the German industrial base continued to be dismantled and shipped off to other countries while very tight restrictions on German production and exports remained in place. Indeed, the level of poverty, misery, and oppression she saw everywhere almost seemed deliberately calculated to turn ordinary Germans against America and its Western allies**, perhaps opening the door to Communist sympathies. Such suspicions are certainly strengthened when we consider that this system had been devised by Harry Dexter White, later revealed to be a Soviet agent.

She was especially scathing about the total perversion of any basic notions of human justice during **the Nuremberg Tribunal** and various other war crime trials, a subject to which she devoted two full chapters. These judicial proceedings exhibited the worst sort of legal double-standards, with leading Allied judges explicitly stating that their own countries were not at all bound by the same international legal conventions which they claimed to be enforcing against German defendants. Even more shocking were some of the measures used, with outraged American jurists and journalists revealing that **horrific torture, threats, blackmail, and other entirely illegitimate means were**

**regularly employed to obtain confessions or denunciations of others, a situation that strongly suggested a very considerable number of those condemned and hanged were entirely innocent.**

Her book also gave substantial coverage to **the organized expulsions of ethnic Germans from Silesia, the Sudatenland, East Prussia, and various other parts of Central and Eastern Europe where they had peacefully lived for many centuries, with the total number of such expellees generally estimated at 13 to 15 million.** Families were sometimes given as little as ten minutes to leave the homes in which they had resided for a century or more, then forced to march off on foot, sometimes for hundreds of miles, towards a distant land they had never seen, with their only possessions being what they could carry in their own hands. In some cases, any surviving menfolk were separated out and shipped off to slave-labor camps, thereby producing an exodus consisting solely of women, children, and the very elderly. **All estimates were that at least a couple million perished along the way, from hunger, illness, or exposure.**

**These days we endlessly read painful discussions of the notorious "Trail of Tears" suffered by the Cherokees in the distant past of the early 19th century, but this rather similar 20th Century event was nearly a thousand-fold larger in size.** Despite this huge discrepancy in magnitude and far greater distance in time, I would guess that the former event may command a thousand times the public awareness among ordinary Americans. If so, this would demonstrate that overwhelming media control can easily shift perceived reality by a factor of a million or more.

The population movement certainly seems to have represented **the largest ethnic-cleansing in the history of the world**, and if the Germany had ever done anything even remotely similar during its years of European victories and conquests, the visually-gripping scenes of such an enormous flood of desperate, trudging refugees would surely have become a centerpiece of numerous World War II movies of the last seventy years. But since nothing like that ever happened, Hollywood screenwriters lost a tremendous opportunity.

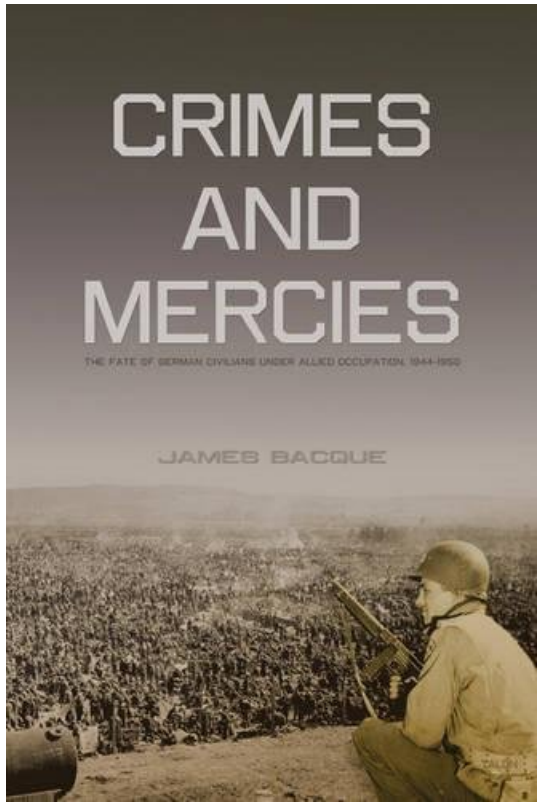
- The High Cost of Vengeance
  Freda Utley • 1949 • 125,000 Words

Utley's extremely grim portrayal is strongly corroborated by numerous other sources. In 1946, Victor Gollanz, a prominent British publisher from a Socialistic Jewish background, took an extended visit to Germany, and published *In Darkest Germany* the following year, recounting his enormous horror at the conditions he discovered there. His claims of **the appalling malnutrition, illness, and total destitution were supported by over a hundred chilling photographs**, and the introduction to the American edition was written by University of Chicago President Robert M. Hutchins, one of our most reputable public intellectuals of that era. But his slim volume seems to have attracted relatively little attention in the American mainstream media, although his somewhat similar book *Our Threatened Values*, published the previous year and based upon information from official sources had received a little more. *Gruesome Harvest* by Ralph Franklin Keeling, also published in 1947, helpfully gathers together a large number of official statements and reports from major media outlets, which generally support exactly this same picture of the first few years of Germany under Allied occupation.

During the 1970s and 1980s this distressing topic was taken up by Alfred M. de Zayas, who held a Harvard Law degree and doctorate in history, and served a long and illustrious career as a leading international human rights lawyer long affiliated with the United Nations. **His books such as *Nemesis at Potsdam*, *A Terrible Revenge*, and *The Wehrmacht War Crimes Bureau, 1939-1945* especially focused on the massive ethnic cleansing of the German minorities**, and were based on great quantities of archival research. They received considerable scholarly praise and notice in major academic journals and sold hundreds of thousands of copies in Germany and other parts of Europe, but hardly seem to have penetrated the consciousness of America or the rest of the English-speaking world.

In the late 1980s this smoldering historical debate took a remarkable new turn. While visiting France during 1986 in preparation for an unrelated book, **a Canadian writer named James Bacque** stumbled upon clues suggesting that one of the most terrible secrets of post-war Germany had long remained completely hidden, and he soon embarked upon extensive research into the subject, finally publishing *Other Losses* in 1989. Based upon very considerable evidence, including government records, personal interviews, and recorded eyewitness testimony,

**he argued that after the end of the war, the Americans had starved to death as many as a million German POWs, seemingly as a deliberate act of policy, a war crime that would surely rank among the greatest in history.**



Bacque's discussion of the new evidence of the Kremlin archives constitutes a relatively small portion of his 1997 sequel, *Crimes and Mercies*, which centered around an even more explosive analysis, and also became an international best-seller.

As described above, first-hand observers of post-war Germany in 1947 and 1948 such as Gollanz and Utley, had directly reported on the horrific conditions they discovered, and **stated that for years official food rations for the entire population had been comparable to that of the inmates of Nazi concentration camps and sometimes far lower, leading to the widespread malnutrition and illness they witnessed all around them.** They also noted the destruction of most of Germany's pre-war housing stock and the severe overcrowding produced by the influx of so many millions of pitiful ethnic German refugees expelled from other parts of Central and Eastern Europe. But

these visitors lacked any access to solid population statistics, and could only speculate upon the enormous human death toll that hunger and illness had already inflicted, and which would surely continue if policies were not quickly changed.

Years of archival research by Bacque attempt to answer this question, and the conclusion he provides is certainly not a pleasant one. Both the Allied military government and the later German civilian authorities seem to have made a concerted effort to hide or obscure the true scale of the calamity visited upon German civilians during the years 1945-1950, and the official mortality statistics found in government reports are simply too fantastical to possibly be correct, although they became the basis for the subsequent histories of that period. Bacque notes that these figures suggest that the death rate during the terrible conditions of 1947, long remembered as the "Hunger Year" (*Hungerjahr*) and vividly described in Gollancz's account, was actually lower than that of the prosperous Germany of the late 1960s. Furthermore, private reports by American officials, mortality rates from individual localities, and other strong evidence demonstrate that these long-accepted aggregate numbers were essentially fictional.

Instead, Bacque attempts to provide more realistic estimates based upon an examination of the population totals of the various German censuses together with the recorded influx of the huge number of German refugees. **Applying this simple analysis, he makes a reasonably strong case that the excess German deaths during that period amounted to at least around 10 million, and possibly many millions more. Furthermore, he provides substantial evidence that the starvation was either deliberate or at least enormously worsened by American government resistance to overseas food relief efforts.** Perhaps these numbers should not be so totally surprising given that the official Morgenthau Plan had envisioned the elimination of around 20 million Germans, and as Bacque demonstrates, top American leaders quietly agreed to continue that policy in practice even while they renounced it in theory.

Assuming these numbers are even remotely correct, the implications are quite remarkable. **The toll of the human catastrophe experienced in post-war Germany would certainly rank among the greatest in modern peacetime history, far exceeding the deaths that occurred during the Ukrainian Famine of the early 1930s and possibly even**

**approaching the wholly unintentional losses during Mao's Great Leap Forward of 1959-61.** Furthermore, the post-war German losses would vastly outrank either of these other unfortunate events in percentage terms and this would remain true even if the Bacque's estimates are considerably reduced. Yet I doubt if even a small fraction of one percent of Americans are today aware of this enormous human calamity. Presumably memories are much stronger in Germany itself, but given the growing legal crackdown on discordant views in that unfortunate country, I suspect that anyone who discusses the topic too energetically risks immediate imprisonment.

To a considerable extent, this historical ignorance has been heavily fostered by our governments, often using underhanded or even nefarious means. Just like in the old decaying USSR, **much of the current political legitimacy of today's American government and its various European vassal-states is founded upon a particular narrative history of World War II, and challenging that account might have dire political consequences.** Bacque credibly relates some of the apparent efforts to dissuade any major newspaper or magazine from running articles discussing the startling findings of his first book, thereby imposing a "blackout" aimed at absolutely minimizing any media coverage. Such measures seem to have been quite effective, since until eight or nine years ago, I'm not sure I had ever heard a word of these shocking ideas, and I have certainly never seen them seriously discussed in any of the numerous newspapers or magazines that I have carefully read over the last three decades.

In assessing the political factors that apparently produced such an enormous and seemingly deliberate death toll among German civilians long after the fighting had ended, an important point should be made. Historians seeking to demonstrate Hitler's tremendous wickedness or to suggest his knowledge of various crimes committed during the course of the Second World War are regularly forced to sift tens of thousands of his printed words for a suggestive phrase here and there, and then interpret these vague allusions as absolutely conclusive declarative statements. Those who fail to stretch the words to fit, such as renowned British historian David Irving, will sometimes see their careers destroyed as a consequence.

But as early as 1940, an American Jew named **Theodore Kaufman became so enraged at what he regarded as Hitler's**

**mistreatment of German Jewry that he published a short book evocatively entitled *Germany Must Perish!*, in which he explicitly proposed the total extermination of the German people.** And that book apparently received favorable if perhaps not entirely serious discussion in many of our most prestigious media outlets, including the *New York Times*, the *Washington Post*, and *Time Magazine*. If such sentiments were being freely expressed in certain quarters even before America's actual entrance into the military conflict, then perhaps the long-hidden policies that Bacque seems to have uncovered should not be so totally shocking to us.

## Question 5: The Pearl Harbor Attack

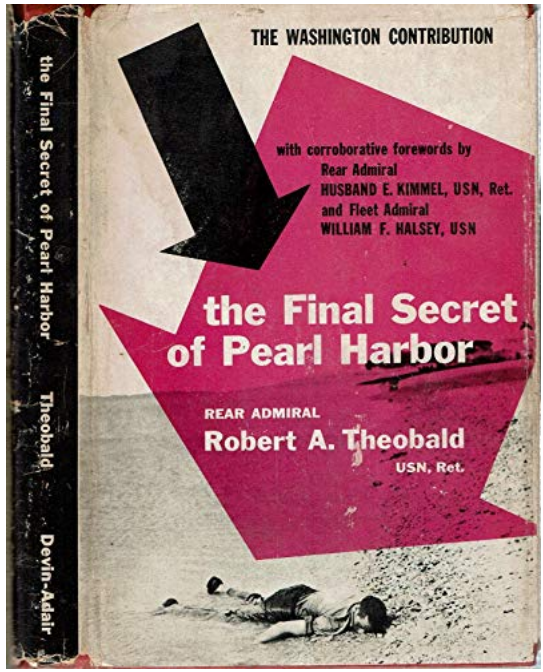
*Was Japan's attack on Pearl Harbor unexpected or was it preceded by numerous US provocations that compelled Japan to respond militarily?*

**Ron Unz**—On December 7, 1941, Japan's military forces launched a surprise attack against our Pacific Fleet based at Pearl Harbor, sinking

many of our largest warships and killing more than 2,400 Americans. As a result, America was suddenly propelled into World War II and that date "lived in infamy" as one of the most famous in our national history.

At the time, **nearly all ordinary Americans regarded the Japanese attack as a shocking, unprovoked bolt-from-the-blue, and for more than 80 years, our mainstream history books and media coverage have reinforced that strong impression.** But as I explained in 2019, the actual facts are entirely different:

> **From 1940 onward, FDR had been making a great political effort to directly involve America in the war against Germany, but public opinion was overwhelmingly on the other side, with polls showing that up to 80% of the population were opposed.** All of this immediately changed once the Japanese bombs dropped on Hawaii, and suddenly the country was at war.
>
> Given these facts, there were natural suspicions that **Roosevelt had deliberately provoked the attack by his executive decisions to freeze Japanese assets, embargo all shipments of vital fuel oil supplies, and rebuff the repeated requests by Tokyo leaders for negotiations.** In the 1953 volume edited by Barnes, noted diplomatic historian Charles Tansill summarized his very strong case that **FDR sought to use a Japanese attack as his best "back door to war" against Germany**, an argument he had made the previous year in a book of that same name. Over the decades, the information contained in private diaries and government documents seems to have almost conclusively established this interpretation, with Secretary of War Henry Stimson indicating that **the plan was to "maneuver [Japan] into firing the first shot"…**



By 1941 the U.S. had broken all the Japanese diplomatic codes and was freely reading their secret communications. Therefore, there has also long existed **the widespread if disputed belief that the president was well aware of the planned Japanese attack on our fleet and deliberately failed to warn his local commanders, thereby ensuring that the resulting heavy American losses would produce a vengeful nation united for war.** Tansill and a former chief researcher for the Congressional investigating committee made this case in the same 1953 Barnes volume, and the following year a former US admiral published *The Final Secret of Pearl Harbor*, providing similar arguments at greater length. This book also included an introduction by one of America's highest-ranking World War II naval commanders, who fully endorsed the controversial theory.

In 2000, journalist Robert M. Stinnett published a wealth of additional supporting evidence, based upon his eight years of archival research, which was discussed in a recent article. A telling point made by Stinnett is that **if Washington had warned the Pearl Harbor commanders, their resulting defensive preparations would have been noticed by the local Japanese spies and relayed to the approaching task force; and with the element of surprise lost, the attack probably would have been aborted**, thus frustrating all of FDR's long-standing plans for war. Although various details may be disputed, I find the

evidence for Roosevelt's foreknowledge quite compelling.

Last year I further extended these arguments:

> This historical reconstruction is strongly supported by much additional material. During this period, Prof. Revilo P. Oliver had held a senior position in Military Intelligence, and when he published his memoirs four decades later, he claimed that FDR had deliberately tricked the Japanese into attacking Pearl Harbor. Knowing that Japan had broken Portugal's diplomatic codes, FDR informed the latter country's ambassador of his plans to wait until the Japanese had over-extended themselves, then order the Pacific Fleet to launch a devastating surprise attack against their home islands. According to Oliver, **Japan's subsequent diplomatic cables revealed they had successfully been convinced that FDR planned to suddenly attack them.**

> Indeed, just a couple of months before Pearl Harbor, *Argosy Weekly*, one of America's most popular magazines, carried a fictional cover story describing exactly such a devastating surprise attack on Tokyo in retaliation for a naval incident, with the powerful bombers of our Pacific Fleet inflicting huge damage upon the unprepared Japanese capital. I wonder whether the

Roosevelt Administration didn't have a hand in getting that story published.

As early as May 1940, FDR had ordered the Pacific Fleet relocated from its San Diego home port to Pearl Harbor in Hawaii, a decision strongly opposed as unnecessarily provocative and dangerous by James Richardson, its commanding admiral, who was fired as a result. Moreover:

There was also a very strange domestic incident that immediately followed the Pearl Harbor attack, one which seems to have attracted far too little interest. In that era, films were the most powerful popular media, and although Gentiles constituted 97% of the population, they controlled only one of the major studios; perhaps coincidentally, Walt Disney was also the only high-ranking Hollywood figure perched squarely within the anti-war camp. And the day after the surprise Japanese attack, hundreds of U.S. troops seized control of Disney Studios, allegedly in order to help defend California from Japanese forces located thousands of miles away, with the military occupation continuing for the next eight months. Consider what suspicious minds might have thought if on September 12, 2001, President Bush had immediately ordered his military to seize the CBS network offices, claiming that such a step was necessary to help protect New York City against further Islamicist attacks.

Pearl Harbor was bombed on a Sunday and unless FDR and his top aides were fully aware of the pending Japanese assault, they surely would have been totally preoccupied with the aftermath of the disaster. It seems highly unlikely that the U.S. military would have been ready to seize control of Disney studios early Monday morning following an actual "surprise" attack.

## Question 6: Operation Pike

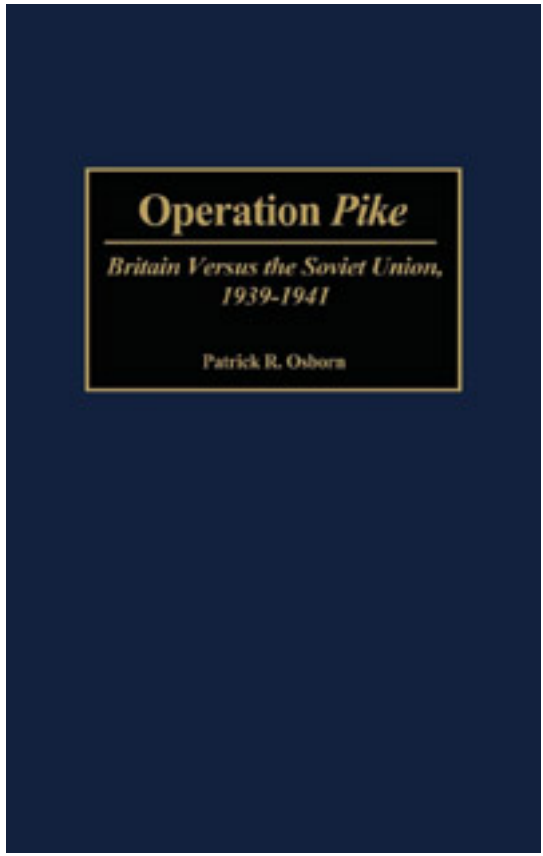
*Did England and France plan to attack Russia prior to Hitler's invasion of that country?*

**Ron Unz**—For more than eighty years, one of the single most crucial turning points of World War II has been omitted from nearly every Western history written about that conflict and as a result, virtually no educated Americans are even aware of it.

**It is an undeniable, documented fact that just a few months after the war began, the Western Allies—Britain and France—decided to attack the neutral Soviet Union, which they regarded as militarily weak** and a crucial supplier of natural resources for Hitler's war machine. Based upon their experience in World War I, the Allied leadership believed that there was little chance of any military breakthrough on the Western front, so they felt that their best chance of overcoming Germany was by defeating Germany's Soviet quasi-ally.

However, the reality was entirely different. The USSR was vastly stronger than they realized at the time and it was ultimately responsible for destroying 80% of Germany's military formations, with America and the other Allies only accounting for the remaining 20%. Therefore, **a 1940 Allied attack on the Soviets would have brought them directly into the war as Hitler's full military ally, and the combination of Germany's industrial strength and Russia's natural resources would have been nearly invincible, almost certainly reversing the outcome of the war.**

From the earliest days of the Bolshevik Revolution, the Allies had been intensely hostile to the Soviet Union and became even more so after Stalin attacked Finland in late 1939. That Winter War went badly as the heavily outnumbered Finns very effectively resisted the Soviet forces leading to an Allied plan to send several divisions to fight alongside the Finns. According to Sean McMeekin's ground-breaking 2021 book *Stalin's War*, the Soviet dictator became aware of this dangerous military threat, and his concerns over looming Allied intervention persuaded him to quickly settle the war with Finland on relatively generous terms.



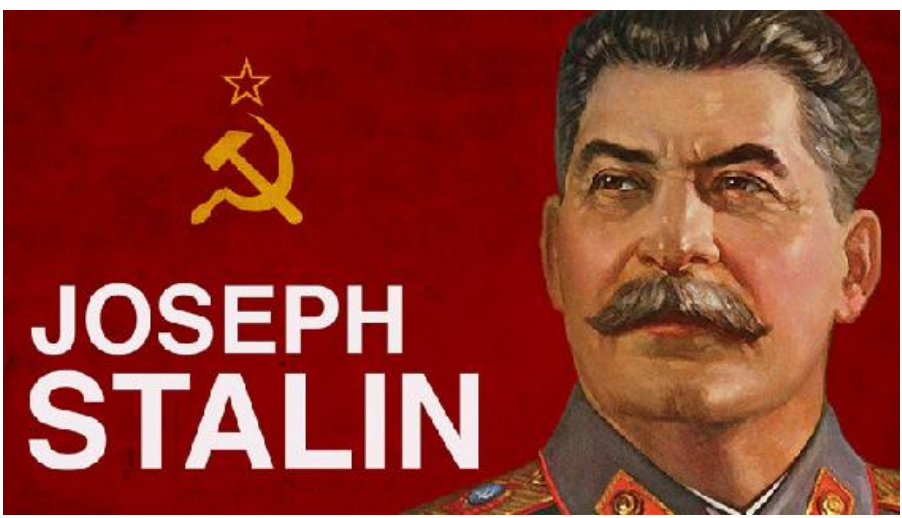
Despite this, **the Allied plans to attack the USSR continued, now shifting to Operation Pike, the idea of using their bomber squadrons based in Syria and Iraq to destroy the Baku oilfields in the Soviet Caucasus, while also trying to enlist Turkey and Iran into their planned attack against Stalin.** By this date, Soviet agriculture had become heavily mechanized and dependent upon oil, and Allied strategists believed that the successful destruction of the Soviet oilfields would eliminate much of that country's fuel supply, thereby possibly producing a famine that might bring down the distasteful Communist regime.

Yet virtually all of these Allied assumptions were completely incorrect. Only a small fraction of Germany's oil came from the Soviets, so its elimination would have little impact upon the German war effort. As subsequent events soon proved, the USSR was enormously strong in military terms rather than weak. The Allies believed that just a few weeks of attacks by dozens of existing bombers would totally devastate the oil fields, but later in the war vastly larger aerial attacks had only limited impact upon oil

production elsewhere.

Successful or not, **the planned Allied attack against the USSR would have represented the largest strategic bombing offensive in world history to that date, and it had been scheduled and rescheduled during the early months of 1940, only finally abandoned after Germany's armies crossed the French border**, surrounded and defeated the Allied ground forces, and knocked France out of the war.

The victorious Germans were fortunate enough to capture all the secret documents regarding Operation Pike, and they achieved a major propaganda coup by publishing them in facsimile and translation, so that all knowledgeable individuals soon knew that the Allies had been on the verge of attacking the Soviets. This missing fact helps to explain why Stalin remained so distrustful of Churchill's diplomatic efforts prior to the Hitler's Barbarossa attack a year later.



However, for more than three generations the remarkable story of how the Allies came so close to losing the war by attacking the USSR has been totally excluded from virtually all Western histories. Therefore, when I discovered these facts in the 1952 memoirs of Sisley Huddleston, a leading Anglo-French journalist, I initially assumed he must have been delusional:

> The notion that the Allies were preparing to launch a major bombing offensive against the Soviet Union just a few months after the outbreak of World War II was obviously absurd, so ridiculous a notion that not a hint of that long-debunked rumor had ever gotten into the standard history texts I had read on the

European conflict. But for Huddleston to have still clung to such nonsensical beliefs even several years after the end of the war raised large questions about his gullibility or even his sanity. I wondered whether I could trust even a single word he said about anything else.

However, not long afterward I encountered quite a surprise in a 2017 article published in *The National Interest*, an eminently respectable periodical. The short piece carried the descriptive headline "In the Early Days of World War II, Britain and France Planned to Bomb Russia." The contents absolutely flabbergasted me, and with Huddleston's credibility now fully established—and the credibility of my standard history textbooks equally demolished—I went ahead and substantially drew upon his account for my long article "American Pravda: Post-War France and Post-War Germany."

If all our World War II history books can exclude a fully-documented story of such enormous importance, they obviously cannot be trusted about anything else.

## Question 7: The Holocaust

*What is the truth about the Holocaust? You have apparently done a fair amount of research on the topic and may have an opinion about what actually took place. Can we say with certainty how many Jews were killed or verify the manner in which they were killed? In your opinion, do the historical facts about the Holocaust align the narrative that is backed by powerful Jewish organizations or are there major discrepancies?*

**Ron Unz**—For most Americans and other Westerners, the Jewish Holocaust ranks as one of the most important and monumental events of the twentieth century, probably today greater in its visibility than any other aspect of World War II, during which it occurred.

**The mere mention of the iconic number of "Six Million" is immediately understood, and in recent decades many Western countries have legally protected the status of that particular historical event by mandating stiff fines or prison sentences for anyone who disputes or minimizes it, the modern equivalent of**

**old-fashioned blasphemy laws.**

As someone who was educated in the American school system and then spent a lifetime absorbing information from our media and popular culture, I'd certainly always been aware of the Holocaust, though I'd never had much explored its details. With the growth of the Internet over the last couple of decades, I'd occasionally come across individuals who challenged that narrative, but the world is filled with all sorts of cranks and crackpots, and I usually didn't pay much attention to their arguments.

Then eight or nine years ago, a major controversy erupted regarding *Reason* magazine, the flagship publication of the libertarian movement. Apparently during the mid-1970s, *Reason* had actively published and promoted the work of America's leading Holocaust Deniers, a rather shocking revelation. During the 1990s I'd become a little friendly with the *Reason* people and although they could sometimes be dogmatic on certain ideological issues, they otherwise seemed rather sensible. I couldn't understand why they would have denied the reality of the Holocaust, especially since so many of them were themselves Jewish. So later when I had some time, I decided to investigate the controversy more carefully.

Most of the articles by Holocaust Deniers that *Reason* published had actually dealt with other historical controversies, but all these pieces seemed extremely solid and well-done. So I decided to read the books by Deborah Lipstadt, one of the world's foremost critics of Holocaust Denial, who had been heavily quoted in the articles attacking *Reason*. Lipstadt's name was already slightly familiar to me from her rancorous late 1990s legal battle against British historian David Irving.

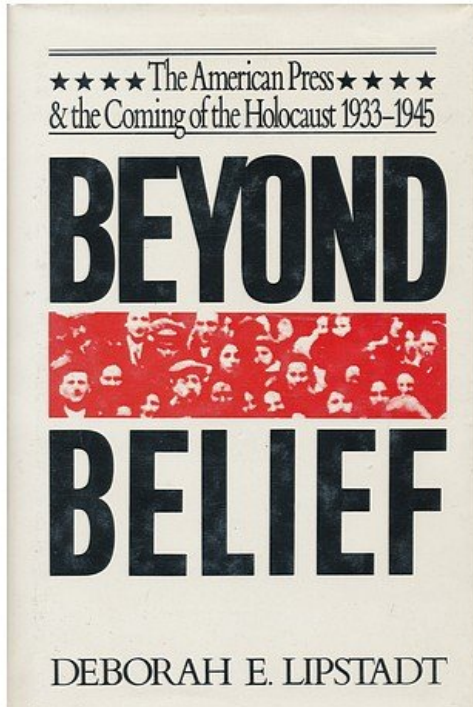
In reading Lipstadt's books, **I was very surprised to discover that during the Second World War itself, few mainstream individuals in the political or media worlds had apparently believed in the reality of the ongoing Holocaust, mostly regarding the widespread stories being promoted by Jewish activists and Allied governments as merely dishonest wartime propaganda**, much like the ridiculous World War I atrocity stories of Germans raping Belgian nuns or eating Belgian children. And indeed, many of the Holocaust stories Lipstadt condemns the media for ignoring were totally ridiculous, such as the Germans killing over a million Jews by individually injecting them in the heart with a poison compound. As I wrote:



Lipstadt entitled her first book “Beyond Belief,” and I think that all of us can agree that the historical event she and so many others in academia and Hollywood have made the centerpiece of their lives and careers is certainly one of the most extremely remarkable occurrences in all of human history. Indeed, perhaps only a Martian Invasion would have been more worthy of historical study, but Orson Welles’s famous War of the Worlds radio-play which terrified so many millions of Americans in 1938 turned out to be a hoax rather than real.

The six million Jews who died in the Holocaust certainly constituted a very substantial fraction of all the wartime casualties in the European Theater, outnumbering by a factor of 100 all the British who died during the Blitz, and being dozens of times more numerous than all the Americans who fell there in battle. Furthermore, the sheer monstrosity of the crime against innocent civilians would surely have provided the best possible justification for the Allied war effort. Yet for many, many years after the war, a very strange sort of amnesia seems to have gripped most of the leading political protagonists in that regard.

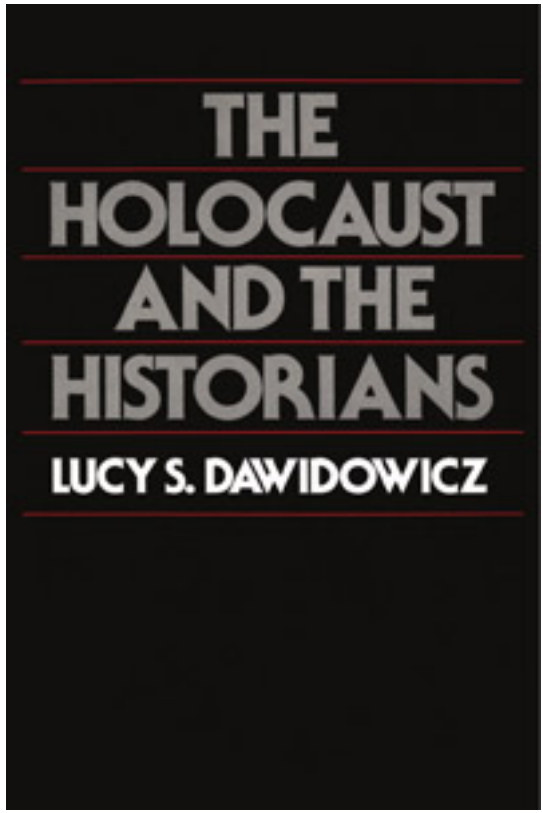
Robert Faurisson, a French academic who became a prominent

Holocaust Denier in the 1970s, once made an extremely interesting observation regarding the memoirs of Eisenhower, Churchill, and De Gaulle:

***Three of the best known works on the Second World War are General Eisenhower's* Crusade in Europe *(New York: Doubleday [Country Life Press], 1948), Winston Churchill's* The Second World War *(London: Cassell, 6 vols., 1948-1954), and the* Mémoires de guerre *of General de Gaulle (Paris: Plon, 3 vols., 1954-1959). In these three works not the least mention of Nazi gas chambers is to be found.***

*Eisenhower's* Crusade in Europe *is a book of 559 pages; the six volumes of Churchill's* Second World War *total 4,448 pages; and de Gaulle's three-volume* Mémoires de guerre *is 2,054 pages. In this mass of writing, which altogether totals 7,061 pages (not including the introductory parts), published from 1948 to 1959, one will find no mention either of Nazi "gas chambers," a "genocide" of the Jews, or of "six million" Jewish victims of the war.*

Given that the Holocaust would reasonably rank as the single most remarkable episode of the Second World War, such striking omissions must almost force us to place Eisenhower, Churchill, and De Gaulle among the ranks of "implicit Holocaust Deniers."



The books by Lipstadt and other prominent Holocaust historians such as Lucy Dawidowicz had fiercely condemned a long list of America's leading historians and other academic scholars as implicit or explicit Holocaust Deniers, claiming that they continued to ignore or dispute the reality of the Holocaust even years after the war had ended.

Even more remarkable was the fact that influential Jewish groups such as the ADL seemed unwilling to challenge or criticize even the most explicit Holocaust Denial during the years after World War II. In my research, I discovered a particularly striking example of this:

> Some years ago, I came across a totally obscure 1951 book entitled *Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.
>
> As a zealous anti-Communist, he regarded much of America's

Jewish population as deeply implicated in subversive activity, therefore constituting a serious threat to traditional American freedoms. In particular, the growing Jewish stranglehold over publishing and the media was making it increasingly difficult for discordant views to reach the American people, with this regime of censorship constituting the "Iron Curtain" described in his title. He blamed Jewish interests for the totally unnecessary war with Hitler's Germany, which had long sought good relations with America, but instead had suffered total destruction for its strong opposition to Europe's Jewish-backed Communist menace.

Beaty also sharply denounced American support for the new state of Israel, which was potentially costing us the goodwill of so many millions of Muslims and Arabs. And as a very minor aside, he also criticized the Israelis for continuing to claim that Hitler had killed six million Jews, a highly implausible accusation that had no apparent basis in reality and seemed to be just a fraud concocted by Jews and Communists, aimed at poisoning our relations with postwar Germany and extracting money for the Jewish State from the long-suffering German people.

Furthermore, he was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty's book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk's iconic classic, *The Conservative Mind*.

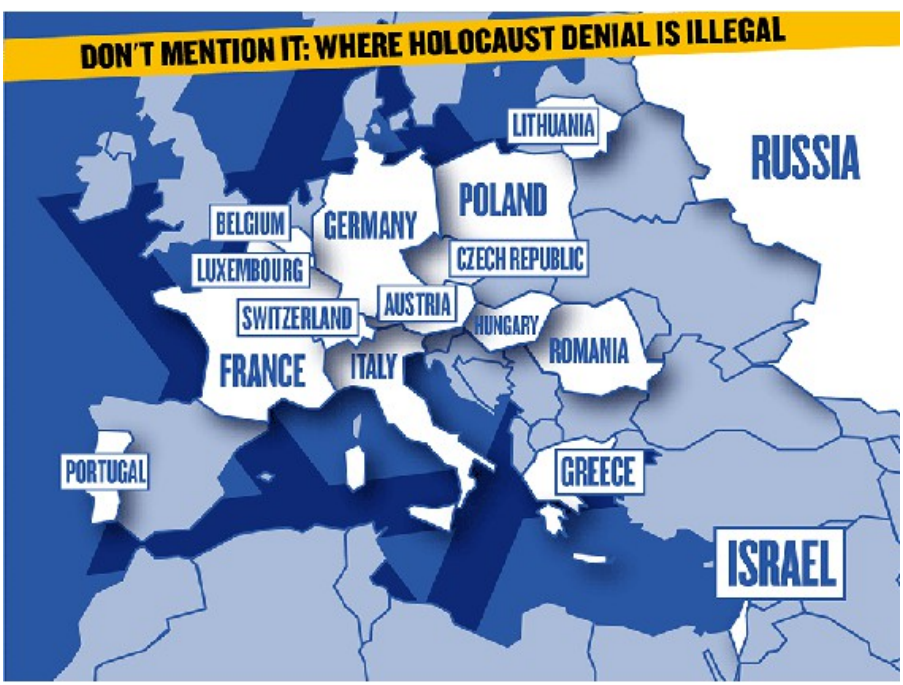
Moreover, although Jewish groups including the ADL harshly condemned the book, especially in their private lobbying, those efforts provoked a backlash, and numerous top American generals, both serving and retired, wholeheartedly endorsed Beaty's work, denouncing the ADL efforts at censorship and urging all Americans to read the volume. Although Beaty's quite explicit Holocaust Denial might shock tender modern sensibilities, at the time it seems to have caused barely a ripple of concern and was almost totally ignored even by the vocal Jewish critics of the work.

Beaty's huge national bestseller attracted enormous attention as well as massive criticism from Jews and liberals, yet although they energetically attacked him on every other issue, none of them challenged him when he dismissed the Holocaust as merely a notorious wartime propaganda-hoax that few still believed. Furthermore, a long list of our top World War II military commanders strongly endorsed Beaty's book making that claim.

**Our modern understanding of the Holocaust can almost entirely be traced back to a seminal 1961 book by historian Raul Hilberg. He had been a child when his family of Jewish refugees arrived**

**in America at the beginning of the war and became outraged that the entire American media was ignoring the extermination of the European Jews** as claimed by Jewish activists. Years later, when he attended college, he was further outraged that his history professor—a fellow German-Jewish refugee—seemed not to accept the reality of the Holocaust, so Hilberg decided to make that topic the focus of his doctoral research.

Ironically enough, **leading Jewish scholars urged him to avoid that subject lest he wreck his academic career and for years major publishing houses repeatedly rejected his book. However, once he finally got it into print, it proved tremendously popular among Jewish activists, and over the next decade or two had sparked an entire genre of literature, including numerous Holocaust memoirs, though some of the most prominent turned out to be fraudulent.** Heavily Jewish Hollywood soon began producing an unending stream of Holocaust-themed films and television programs, eventually enshrining the Holocaust as a central event of the twentieth century. And **once historians or other researchers began disputing these claimed facts, energetic groups of Jewish activists successfully passed laws in Europe and elsewhere outlawing such "Holocaust Denial," while purging or even physically attacking any such dissidents.**



Despite this considerable repression, **a large body of scholarly**

**literature has been produced over the decades that raises enormous doubts about the officially-established Holocaust narrative**, which seems largely to have been created by Hollywood. Indeed, the first such comprehensive analysis, by a seemingly apolitical professor of Electrical Engineering named Arthur R. Butz, had appeared nearly a half-century ago, probably prompting the interest of *Reason* magazine that same year, and although banned a few years ago by Amazon, Butz's work still remains a very effective summation of the basic case.

- The Hoax of the Twentieth Century
  *The Case Against the Presumed Extermination of European Jewry*
  Arthur R. Butz • 1976/2015 • 225,000 Words

After reading it and nearly a dozen other books on both sides of the contentious issue, I closed my long article with the following verdict:

> Any conclusions I have drawn are obviously preliminary ones, and the weight others should attach to these must absolutely reflect my strictly amateur status. However, as an outsider exploring this contentious topic **I think it far more likely than not that the standard Holocaust narrative is at least substantially false, and quite possibly, almost entirely so.**
>
> Despite this situation, the powerful media focus in support of the Holocaust over the last few decades has elevated it to a central position in Western culture. I wouldn't be surprised if it currently occupies a larger place in the minds of most ordinary folk than does the Second World War that encompassed it, and therefore possesses greater apparent reality.
>
> However, some forms of shared beliefs may be a mile wide but an inch deep, and the casual assumptions of individuals who have never actually investigated a given subject may rapidly change. Also, the popular strength of doctrines that have long been maintained in place by severe social and economic sanctions, often backed by criminal penalties, may possibly be much weaker than anyone realizes.
>
> Until thirty years ago, Communist rule over the USSR and its Warsaw Pact allies seemed absolutely permanent and unshakeable, but the roots of that belief had totally rotted away, leaving behind nothing more than a hollow facade. Then one day, a gust of wind came along, and the entire gigantic structure collapsed. I wouldn't be surprised if our current Holocaust

narrative eventually suffers that same fate, perhaps with unfortunate consequences for those too closely associated with having maintained it.

## Question 8: Our Understanding of the War

*On page 202, you made the following statement which helps to underscore the grave importance of historical accuracy:*

> *"We must also recognize that many of the fundamental ideas that dominate our present-day world were founded upon a particular understanding of that wartime history, and if there seems good reason to believe that narrative is substantially false, perhaps we should begin questioning the framework of beliefs erected upon it."*

*This is a thought-provoking statement that makes me wonder whether the last 80 years of bloody US interventions can all be attributed to our "particular understanding" of WW2. It seems to me that our leaders have used this idealized myth of the '"Good War" in which the "exceptional" American people fight the evil of fascism', to promote their warlike agenda and to justify their relentless pursuit of global hegemony.*

*In your opinion, what is the greatest danger of erecting a "framework of beliefs" on a false understanding of history?*

**Ron Unz—The Hollywood-constructed image of our great global triumph in the heroic war against Hitler and Nazi Germany has inspired a legacy of colossal American arrogance, now leading us towards an enormously reckless confrontation with Russia over Ukraine and with China over Taiwan**, the sort of geopolitical *hubris* that often leads to *nemesis*, perhaps even *nemesis* of an extreme form given the nuclear arsenals of those rival states. As I wrote soon after the outbreak of the Ukraine War:

> For years the eminent Russia scholar Stephen Cohen had ranked President Vladimir Putin of the Russian Republic as the most consequential world leader of the early twenty-first century. He praised the man's enormous success in reviving his country after the chaos and destitution of the Yeltsin years and emphasized his desire for friendly relations with America, but increasingly feared

that we were entering into a new Cold War, even more dangerous than the last.

As far back as 2017, the late Prof. Cohen argued that no foreign leader had been as greatly vilified in recent American history as Putin, and Russia's invasion of Ukraine two weeks ago has exponentially raised the intensity of such media denunciations, almost matching the hysteria our country experienced two decades ago after the 9/11 attack on New York City. Larry Romanoff has provided a useful catalog of some examples.

Until recently, this extreme demonization of Putin was largely confined to Democrats and centrists, whose bizarre Russiagate narrative had accused him of installing Donald Trump in the White House. But the reaction has now become entirely bipartisan, with enthusiastic Trump-backer Sean Hannity recently using his prime-time *FoxNews* show to call for Putin's death, a cry soon joined by Sen. Lindsey Graham, the ranking Republican on the Senate Judiciary Committee. These are astonishing threats to make against a man whose nuclear arsenal could quickly annihilate the bulk of the American population, and the rhetoric seems unprecedented in our postwar history. Even in the darkest days of the Cold War, I don't recall such public sentiments ever being directed towards the USSR or its top Communist leadership.

In many respects the Western reaction to Russia's attack has been closer to a declaration of war than merely a return to Cold War confrontation. Russia's massive foreign reserves held abroad have been seized and frozen, its civilian airlines excluded from Western skies, and its leading banks disconnected from global financial networks. Wealthy Russian private citizens have had their properties confiscated, the national soccer team has been banned from the World Cup, and the longtime Russian conductor of the Munich Philharmonic was fired for refusing to denounce his own country…

Indeed, the closest parallel that comes to mind would be the American hostility directed against Adolf Hitler and Nazi Germany after the outbreak of World War II, as indicated by the widespread comparisons between Putin's invasion of Ukraine and Hitler's 1939 attack on Poland. A simple Google search for "Putin and Hitler" returns tens of millions of webpages, with the top results ranging from the headline of a *Washington Post* article to the Tweets of pop music star Stevie Nicks. As far back as 2014, Andrew Anglin of the *Daily Stormer* had documented the

emerging meme “Putin is the new Hitler.”

I went on to discuss the extremely dangerous implications of our hysterical anti-Russia policy.

- American Pravda: Putin as Hitler?

- Assassinating Vladimir Putin?
  Ron Unz • ***The Unz Review*** • May 15, 2023 • 3,700 Words

And as I wrote in 2019, my own assessment of the actual history is considerably different:

> In the wake of the 9/11 Attacks, the Jewish Neocons stampeded America towards the disastrous Iraq War and the resulting destruction of the Middle East, with the talking heads on our television sets endlessly claiming that “Saddam Hussein is another Hitler.” Since then, we have regularly heard the same tag-line repeated in various modified versions, being told that “Muammar Gaddafi is another Hitler” or “Mahmoud Ahmadinejad is another Hitler” or “Vladimir Putin is another Hitler” or even “Hugo Chavez is another Hitler.” For the last couple of years, our American media has been relentlessly filled with the claim that “Donald Trump is another Hitler.”

During the early 2000s, I obviously recognized that Iraq's ruler was a harsh tyrant, but snickered at the absurd media propaganda, knowing perfectly well that Saddam Hussein was no Adolf Hitler. But **with the steady growth of the Internet and the availability of the millions of pages of periodicals provided by my digitization project, I've been quite surprised to gradually also discover that Adolf Hitler was no Adolf Hitler.**

It might not be entirely correct to claim that the story of World War II was that Franklin Roosevelt sought to escape his domestic difficulties by orchestrating a major European war against the prosperous, peace-loving Nazi Germany of Adolf Hitler. But I do think that picture is probably somewhat closer to the actual historical reality than the inverted image more commonly found in our textbooks.

# More Falsehoods of World War II

*The Unz Review* • June 19, 2023 • 7,500 Words

## The Many Falsehoods of the Second World War

World War II ranks as the greatest military conflict in human history and became the shaping event of our modern world, with the account told in many tens of thousands of books.  But over the last five years I've published a long series of articles providing elements of the story that are sharply—sometimes even shockingly—at odds with the standard narrative.

About a year ago, I'd produced print collections of my writings and made them available on Amazon, with one of those volumes including most of my World War II essays.

Even if someone had previously looked at a few of my articles when they'd originally appeared four or five years ago, the impact of

reading them together in a physical book was far greater. Mike Whitney told me that he'd found the historical material in my World War II collection so astonishing that he'd read the entire volume three separate times, so he suggested that he interview me on some of the major topics.

He sent me eight open-ended questions, and prompted by these I distilled and summarized the material I'd previously published. The resulting text ran over 12,000 words but was merely a tenth of the total original length.

Although the Second World War ended more than three generations ago, I had argued that it still retained enormous present-day relevance and he appropriately selected one of my sentences as a framing quote for the entire interview:

> Much of the current political legitimacy of today's American government and its various European vassal-states is founded upon a particular narrative history of World War II, and challenging that account might have dire political consequences.

My reconstruction of the true wartime history was exceptionally provocative and controversial, as indicated by my closing paragraphs:

> In the wake of the 9/11 Attacks, the Jewish Neocons stampeded America towards the disastrous Iraq War and the resulting destruction of the Middle East, with the talking heads on our television sets endlessly claiming that "Saddam Hussein is another Hitler." Since then, we have regularly heard the same tag-line repeated in various modified versions, being told that "Muammar Gaddafi is another Hitler" or "Mahmoud Ahmadinejad is another Hitler" or "Vladimir Putin is another Hitler" or even "Hugo Chavez is another Hitler." For the last couple of years, our American media has been relentlessly filled with the claim that "Donald Trump is another Hitler."
>
> During the early 2000s, I obviously recognized that Iraq's ruler was a harsh tyrant, but snickered at the absurd media propaganda, knowing perfectly well that Saddam Hussein was no Adolf Hitler. But with the steady growth of the Internet and the availability of the millions of pages of periodicals provided by my digitization project, I've been quite surprised to gradually also discover that Adolf Hitler was no Adolf Hitler.
>
> It might not be entirely correct to claim that the story of World

> War II was that Franklin Roosevelt sought to escape his domestic difficulties by orchestrating a major European war against the prosperous, peace-loving Nazi Germany of Adolf Hitler. But I do think that picture is probably somewhat closer to the actual historical reality than the inverted image more commonly found in our textbooks.

I had thought that this long piece would do well, but it easily exceeded all my expectations, with the early traffic being far greater than anything I'd published in many years. Within the first six days, the interview had attracted more readership than any other article on our website had accumulated over the previous six months. And although my long piece seemed to boldly cross every forbidden red line in mainstream history, the reaction was also surprisingly favorable, including far less angry criticism than I had expected to encounter.

Indeed, some of the responses were remarkably heartening. For example, I received a plaintive and sympathetic note from an eminent international academic scholar, an elderly, fully mainstream figure who had specialized in human rights issues and was the author of many excellent books, several of which I had read.

He explained that during 1972-1975 he had done extensive archival research on the war and had also interviewed dozens of the key surviving figures on both sides, including many of the highest rank, discovering that the official story we had all been taught was merely a pack of lies. But

> "…never published my research, because it is useless in a world that wants to be lied to. Mainstream history is a disgrace — contrary to the testimony of eye witnesses, contrary to the documents in the archives…"

> "I feel like you do there is not only fake news but fake history fake law fake diplomacy and fake democracy…the level of falsification of history is appalling"

My presentation of the true history of World War II was organized by the eight separate interview questions and can be explored in that way:

- Question 1: Hitler
- Question 2: The London "Blitz"
- Question 3: The Purge of Antiwar Intellectuals

- Question 4: Postwar Germany
- Question 5: The Pearl Harbor Attack
- Question 6: Operation Pike
- Question 7: The Holocaust
- Question 8: Our Understanding of the War

Or the entire article can be read as a whole:

  *Mike Whitney Interview with Ron Unz*
  Ron Unz and Mike Whitney • ***The Unz Review*** • June 12, 2023 • 12,600 Words

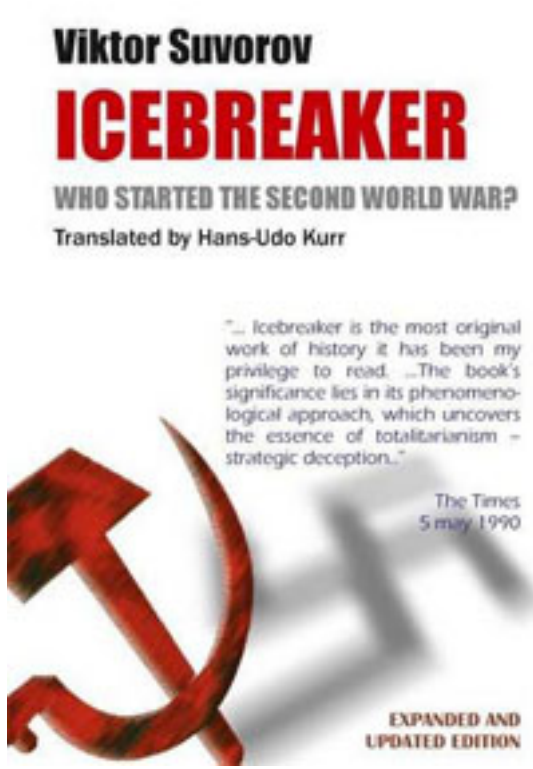
But although my responses ran a very long 12,000 words, even that was insufficient to include several of the most important "hidden histories" of the Second World War.  Therefore, I'm now providing these in this follow-up piece.

## The Suvorov Hypothesis

In 1990 the prestigious *Times Literary Supplement* had carried a long review of *Icebreaker*, a newly published book boldly seeking to overturn our entire settled history of the Second World War:

> [Suvorov] is arguing with every book, every article, every film, every NATO directive, every Downing Street assumption, every Pentagon clerk, every academic, every Communist and anti-Communist, every neoconservative intellectual, every Soviet song, poem, novel and piece of music ever heard, written, made, sung, issued, produced, or born during the last 50 years. For this reason, Icebreaker is the most original work of history it has been my privilege to read.

As I explained in my 2018 article:



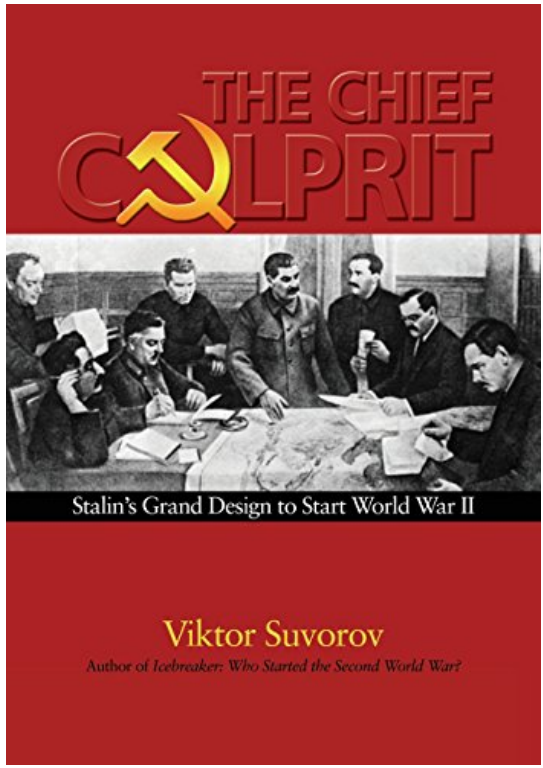
Viktor Suvorov
ICEBREAKER
WHO STARTED THE SECOND WORLD WAR?
Translated by Hans-Udo Kurr
"... Icebreaker is the most original work of history it has been my privilege to read. ...The book's significance lies in its phenomenological approach, which uncovers the essence of totalitarianism – strategic deception.."
The Times
5 may 1990
EXPANDED AND
UPDATED EDITION

*Icebreaker*'s author, writing under the pen-name Viktor Suvorov, was a veteran Soviet military intelligence officer who had defected to the West in 1978 and subsequently published a number of well-regarded books on the Soviet military and intelligence services. But here he advanced a far more radical thesis.

The "Suvorov Hypothesis" claimed that during the summer of 1941 Stalin was on the very verge of mounting a massive invasion and conquest of Europe, while Hitler's sudden attack on June 22nd of that year was intended to forestall that looming blow.

Since 1990, Suvorov's works have been translated into at least 18 languages and an international storm of scholarly controversy has swirled around the Suvorov Hypothesis in Russia, Germany, Israel, and elsewhere. Numerous other authors have published books in support or more often strong opposition, and even international academic conferences have been held to debate the theory. But our own English-language media has almost entirely blacklisted and ignored this ongoing international debate, to such an extent that the name of the most widely-read military historian

who ever lived had remained totally unknown to me.



THE CHIEF
CULPRIT
Stalin's Grand Design to Start World War II
Viktor Suvorov
Author of Icebreaker: Who Started the Second World War?

Finally in 2008, the prestigious Naval Academy Press of Annapolis decided to break this 18 year intellectual embargo and published an updated English edition of Suvorov's work. But once again, our media outlets almost entirely averted their eyes, and only a single review appeared in an obscure ideological publication, where I chanced to encounter it. This conclusively demonstrates that throughout most of the twentieth century a united front of English-language publishers and media organs could easily maintain a boycott of any important topic, ensuring that almost no one in America or the rest of the Anglosphere would ever hear of it. Only with the recent rise of the Internet has this disheartening situation begun to change.

The Eastern Front was the decisive theater of World War II, involving military forces vastly larger than those deployed in the West or the Pacific, and the standard narrative always emphasizes the ineptitude and weakness of the Soviets. On June 22, 1941, Hitler launched Operation Barbarossa, a sudden, massive surprise attack on the USSR, which caught the Red Army completely unaware. Stalin has been regularly ridiculed for his total lack of

preparedness, with Hitler often described as the only man the paranoid dictator had ever fully trusted. Although the defending Soviet forces were enormous in size, they were poorly led, with their officer corps still not recovered from the crippling purges of the late 1930s, and their obsolete equipment and poor tactics were absolutely no match for the modern panzer divisions of Germany's hitherto undefeated *Wehrmacht*. The Russians initially suffered gigantic losses, and only the onset of winter and the vast spaces of their territory saved them from a quick defeat. After this, the war seesawed back-and-forth for four more years, until superior numbers and improved tactics finally carried the Soviets to the streets of a destroyed Berlin in 1945.

Such is the traditional understanding of the titanic Russo-German struggle that we see endlessly echoed in every newspaper, book, television documentary, and film around us.

But Suvorov's seminal research argued that the reality was entirely different.

First, although there has been a widespread belief in the superiority of Germany's military technology, its tanks and its planes, this is almost entirely mythological. In actual fact, Soviet tanks were far superior in main armament, armor, and maneuverability to their German counterparts, so much so that the overwhelming majority of panzers were almost obsolescent by comparison. And the Soviet superiority in numbers was even more extreme, with Stalin deploying many times more tanks than the combined total of those held by Germany and every other nation in the world: 27,000 against just 4,000 in Hitler's forces. Even during peacetime, a single Soviet factory in Kharkov produced more tanks in every six month period than the entire Third Reich had built prior to 1940. The Soviets held a similar superiority, though somewhat less extreme, in their ground-attack bombers. The totally closed nature of the USSR meant that such vast military forces remained entirely hidden from outside observers.

There is also little evidence that the quality of Soviet officers or military doctrine fell short. Indeed, we often forget that history's first successful example of a "blitzkrieg" in modern warfare was the crushing August 1939 defeat that Stalin inflicted upon the Japanese 6th Army in Outer Mongolia, relying upon a massive surprise attack of tanks, bombers, and mobile infantry.

> Certainly, many aspects of the Soviet military machine were primitive, but exactly the same was true of their Nazi opponents. Perhaps the most surprising detail about the technology of the invading Wehrmacht in 1941 was that its transportation system was still almost entirely pre-modern, relying upon wagons and carts drawn by 750,000 horses to maintain the vital flow of ammunition and replacements to its advancing armies.

During Spring 1941 the Soviets had assembled a gigantic armored force on Germany's border, one that even contained enormous numbers of specialized tanks whose unusual characteristics clearly demonstrated Stalin's purely offensive aims. For example, the Soviet juggernaut included 6,500 high-speed *autobahn* tanks, almost useless within Soviet territory but ideally suited for deployment on Germany's network of highways and 4,000 amphibious tanks, able to navigate the English Channel and conquer Britain.

> The Soviets also fielded many thousands of heavy tanks, intended to engage and defeat enemy armor, while the Germans had none at all. In direct combat, a Soviet KV-1 or KV-2 could easily destroy four or five of the best German tanks, while remaining almost invulnerable to enemy shells. Suvorov recounts the example of a KV which took 43 direct hits before finally becoming incapacitated, surrounded by the hulks of the ten German tanks it had first managed to destroy.
>
> Suvorov's reconstruction of the weeks directly preceding the outbreak of combat is a fascinating one, emphasizing the mirror-image actions taken by both the Soviet and German armies. Each side moved its best striking units, airfields, and ammunition dumps close to the border, ideal for an attack but very vulnerable in defense. Each side carefully deactivated any residual minefields and ripped out any barbed wire obstacles, lest these hinder the forthcoming attack. Each side did its best to camouflage their preparations, talking loudly about peace while preparing for imminent war. The Soviet deployment had begun much earlier, but since their forces were so much larger and had far greater distances to cross, they were not yet quite ready for their attack when the Germans struck, and thereby shattered Stalin's planned conquest of Europe.
>
> All of the above examples of Soviet weapons systems and strategic decisions seem very difficult to explain under the conventional defensive narrative, but make perfect sense if Stalin's orientation from 1939 onward had always been an offensive one, and he had

decided that summer 1941 was the time to strike and enlarge his Soviet Union to include all the European states, just as Lenin had originally intended. And Suvorov provides many dozens of additional examples, building brick by brick a very compelling case for this theory.

Given the long years of trench warfare on the Western front during the First World War, almost all outside observers expected the new round of the conflict to follow a very similar static pattern, gradually exhausting all sides, and the world was shocked when Germany's innovative tactics allowed it to achieve a lightening defeat of the allied armies in France during 1940. At that point, Hitler regarded the war as essentially over, and was confident that the extremely generous peace terms he immediately offered the British would soon lead to a final settlement. As a consequence, he returned Germany to a regular peacetime economy, choosing butter over guns in order to maintain his high domestic popularity

Stalin, however, was under no such political constraints, and from the moment he had signed his long-term peace agreement with Hitler in 1939 and divided Poland, he ramped up his total-war economy to an even higher notch. Embarking upon an unprecedented military buildup, he focused his production almost entirely upon purely offensive weapons systems, while even discontinuing those armaments better suited for defense and dismantling his previous lines of fortifications. By 1941, his production cycle was complete, and he made his plans accordingly.

And so, just as in our traditional narrative, we see that in the weeks and months leading up to Barbarossa, the most powerful offensive military force in the history of the world was quietly assembled in secret along the German-Russian border, preparing for the order that would unleash its surprise attack. The enemy's unprepared airforce was to be destroyed on the ground in the first days of the battle, and enormous tank columns would begin deep penetration thrusts, surrounding and trapping the opposing forces, achieving a classic *blitzkrieg* victory, and ensuring the rapid occupation of vast territories. But the forces preparing this unprecedented war of conquest were Stalin's, and his military juggernaut would surely have seized all of Europe, probably soon followed by the remainder of the Eurasian landmass.

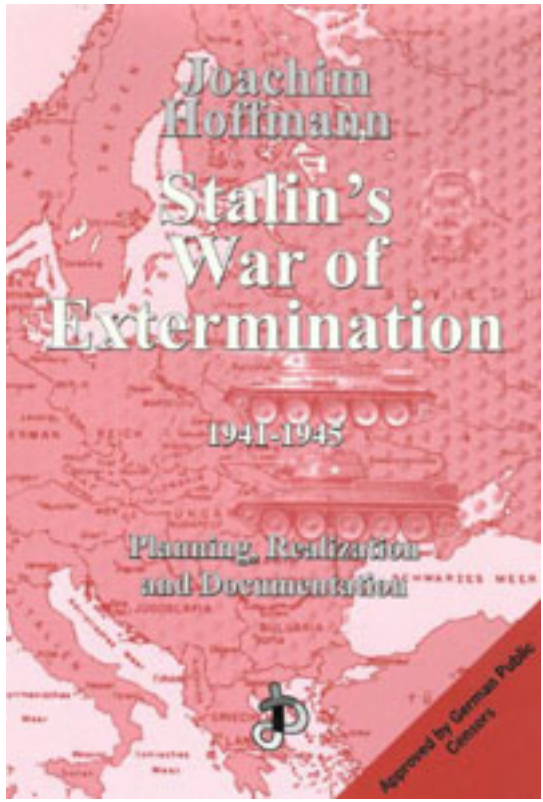
Then at almost the last moment, Hitler suddenly realized the

> strategic trap into which he had fallen, and ordered his heavily outnumbered and outgunned troops into a desperate surprise attack of their own on the assembling Soviets, fortuitously catching them at the very point at which their own final preparations for sudden attack had left them most vulnerable, and thereby snatching a major initial victory from the jaws of certain defeat. Huge stockpiles of Soviet ammunition and weaponry had been positioned close to the border to supply the army of invasion into Germany, and these quickly fell into German hands, providing an important addition to their own woefully inadequate resources.

For those who prefer to absorb Suvorov's information in a different format, his October 2009 public lecture at the U.S. Naval Academy is available on Youtube:

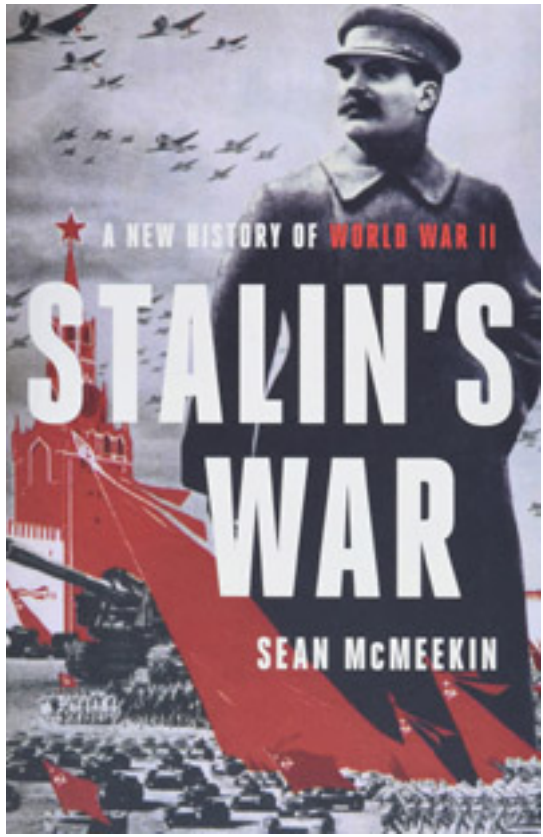
Earlier that same year his lecture at the Woodrow Wilson Center had been broadcast on C-SPAN Book TV.

I naturally read some of the books purportedly claiming to refute Suvorov's thesis, such as those by historians David M. Glantz and Gabriel Gorodetsky, but found them rather unpersuasive.



A far superior book, generally supportive of Suvorov's framework, was *Stalin's War of Annihilation*, by prize-winning German military historian Joachim Hoffmann, originally commissioned by the German Armed Forces and published in 1995 with an English revised edition appearing in 2001. The cover carries a notice that the text was cleared by German government censors, and the author's introduction recounts the repeated threats of prosecution he endured from elected officials and the other legal obstacles he faced, while elsewhere he directly addresses himself to the unseen government authorities whom he knows are reading over his shoulder. When stepping too far outside the bounds of accepted history carries the serious risk that a book's entire print-run will be burned and the author imprisoned, a reader must necessarily be cautious at evaluating the text since important sections have been skewed or preemptively excised in the interests of self-preservation. Scholarly debates on historical issues become difficult when one side faces incarceration if their arguments are too bold.

- American Pravda: When Stalin Almost Conquered Europe
  Ron Unz • ***The Unz Review*** • June 4, 2018 • 4,200 Words



Most recently, Sean McMeekin's outstanding 2021 history *Stalin's War* has provided a wealth of additional evidence strongly supporting the theory that the Soviet dictator had massed his enormous offensive forces on the German border and was probably preparing to invade and conquer Europe when Hitler struck first.

The original 1990 *Times of London* review of *Icebreaker* had been written by Andrei Navrozov, a Soviet emigre long resident in Britain. As a Russian Slav, he was hardly favorable to the German dictator, but he accepted Suvorov's remarkable theory that only Hitler's Barbarossa attack had forestalled Stalin's conquest of all Europe and he closed his twentieth anniversary discussion with a powerful declaration:

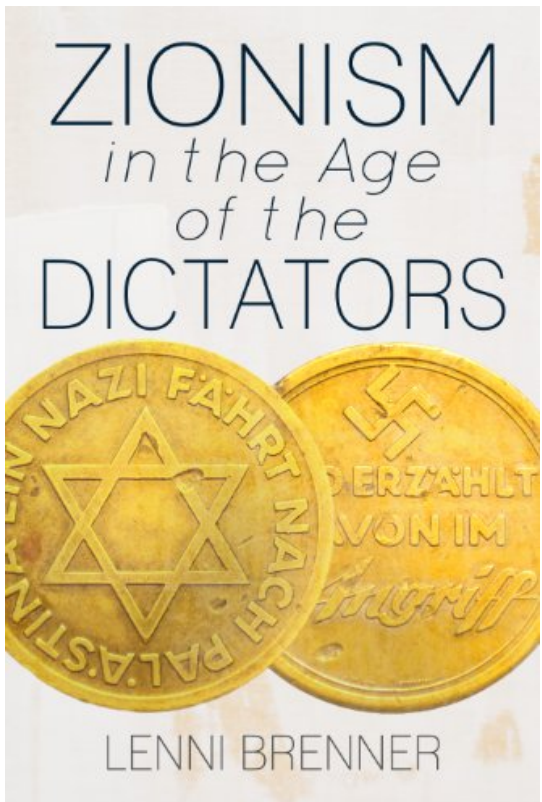
> Therefore, if any of us is free to write, publish, and read this today, it follows that in some not inconsequential part our gratitude for this must go to Hitler. And if someone wants to arrest me for saying what I have just said, I make no secret of where I live.

## The Nazi-Zionist Economic Partnership of the

## 1930s

Forty years ago the *New York Times* and other mainstream newspapers published some astonishing revelations regarding the wartime activities of Yitzhak Shamir, who was then serving as Israel's Prime Minister. I discussed these in a 2018 article:

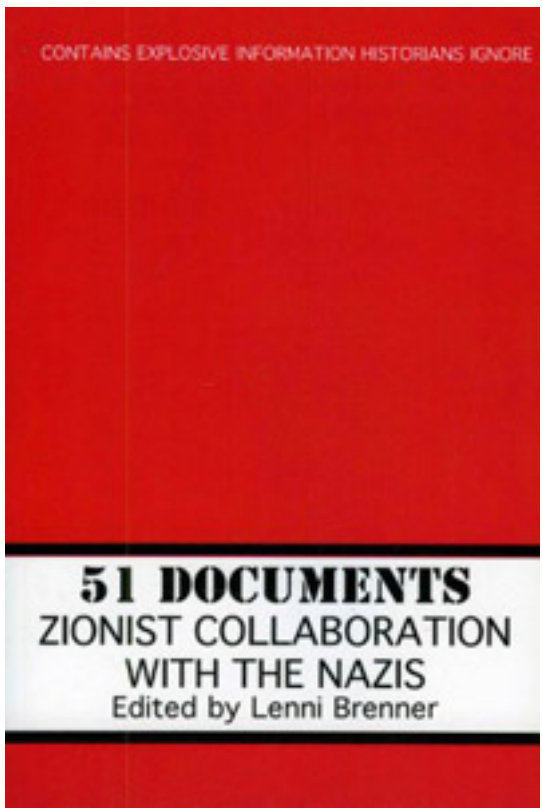
> Apparently, during the late 1930s, Shamir and his small Zionist faction had become great admirers of the Italian Fascists and German Nazis, and after World War II broke out, they had made repeated attempts to contact Mussolini and the German leadership in 1940 and 1941, hoping to enlist in the Axis Powers as their Palestine affiliate, and undertake a campaign of attacks and espionage against the local British forces, then share in the political booty after Hitler's inevitable triumph.



> Among other things, there were long excerpts from the official letters sent to Mussolini ferociously denouncing the "decadent" democratic systems of Britain and France that he was opposing, and assuring *Il Duce* that such ridiculous political notions would

have no future place in the totalitarian Jewish client state they hoped to establish under his auspices in Palestine.

As it happens, both Germany and Italy were preoccupied with larger geopolitical issues at the time, and given the small size of Shamir's Zionist faction, not much seems to have ever come of those efforts. But the idea of the sitting Prime Minister of the Jewish State having spent his early wartime years as an unrequited Nazi ally was certainly something that sticks in one's mind, not quite conforming to the traditional narrative of that era which I had always accepted.



Most remarkably, the revelation of Shamir's pro-Axis past seems to have had only a relatively minor impact upon his political standing within Israeli society. I would think that any American political figure found to have supported a military alliance with Nazi Germany during the Second World War would have had a very difficult time surviving the resulting political scandal, and the same would surely be true for politicians in Britain, France, or most other western nations. But although there was certainly some embarrassment in the Israeli press, especially after the

shocking story reached the international headlines, apparently most Israelis took the whole matter in stride, and Shamir stayed in office for another year, then later served a second, much longer term as Prime Minister during 1986-1992. The Jews of Israel apparently regarded Nazi Germany quite differently than did most Americans, let alone most American Jews.

These remarkable historical disclosures were the product of extensive research by Lenni Brenner, an anti-Zionist of the Trotskyite persuasion and Jewish origins, which he had published in his 1983 book *Zionism in the Age of the Dictators*, as well as his later companion volume, *51 Documents: Zionist Collaboration with the Nazis*.

The cover of the 2014 paperback edition of Brenner's book displays the commemorative medal struck by Nazi Germany to mark its Zionist alliance, with a Star-of-David on the front face and a Swastika on the obverse. But oddly enough, this symbolic medallion actually had absolutely no connection with the unsuccessful attempts by Shamir's small faction to arrange a Nazi military alliance during World War II.

Although the Germans paid little attention to the entreaties of that minor organization, the far larger and more influential mainstream Zionist movement of Chaim Weizmann and David Ben-Gurion was something else entirely. And during most of the 1930s, these other Zionists had formed an important economic partnership with Nazi Germany, based upon an obvious commonality of interests. After all, Hitler regarded Germany's one percent Jewish population as a disruptive and potentially dangerous element which he wanted gone, and the Middle East seemed as good a destination for them as any other. Meanwhile,

the Zionists had very similar objectives, and the creation of their new national homeland in Palestine obviously required both Jewish immigrants and Jewish financial investment.

LATE NEWS

After Hitler had been named Chancellor in 1933, outraged Jews worldwide had quickly launched an economic boycott, hoping to bring Germany to its knees, with London's *Daily Express* famously running the banner headline "Judea Declares War on Germany." Jewish political and economic influence, then just like now, was very considerable, and in the depths of the Great Depression, impoverished Germany needed to export or die, so a large scale boycott in major German markets posed a potentially serious threat. But this exact situation provided Zionist groups with an excellent opportunity to offer the Germans a means of breaking that trade embargo, and they demanded favorable terms for the export of high-quality German manufactured goods to Palestine, together with accompanying German Jews. Once word of this major *Ha'avara* or "Transfer Agreement" with the Nazis came out at a 1933 Zionist Convention, many Jews and Zionists were outraged, and it led to various splits and controversies. But the economic deal was too good to resist, and it went forward and quickly grew.

The importance of the Nazi-Zionist pact for Israel's establishment is difficult to overstate. According to a 1974 analysis in *Jewish Frontier* cited by Brenner, between 1933 and 1939 over 60% of all the investment in Jewish Palestine came from Nazi Germany. The worldwide impoverishment of the Great Depression had drastically reduced ongoing Jewish financial support from all other sources, and Brenner reasonably suggests that without Hitler's financial backing, the nascent Jewish colony, so tiny and fragile, might easily have shriveled up and died during that difficult period.

Such a conclusion leads to fascinating hypotheticals. When I first

stumbled across references to the *Ha'avara* Agreement on websites here and there, one of the commenters mentioning the issue half-jokingly suggested that if Hitler had won the war, statues would surely have been built to him throughout Israel and he would today be recognized by Jews everywhere as the heroic Gentile leader who had played the central role in reestablishing a national homeland for the Jewish people in Palestine after almost 2000 years of bitter exile.

This sort of astonishing counter-factual possibility is not nearly as totally absurd as it might sound to our present-day ears. We must recognize that our historical understanding of reality is shaped by the media, and media organs are controlled by the winners of major wars and their allies, with inconvenient details often excluded to avoid confusing the public. It is undeniably true that in his 1924 book *Mein Kampf*, Hitler had written all sorts of hostile and nasty things about Jews, especially those who were recent immigrants from Eastern Europe, but when I read the book back in high school, I was a little surprised to discover that these anti-Jewish sentiments hardly seemed central to his text. Furthermore, just a couple of years earlier, a vastly more prominent public figure such as British Minister Winston Churchill had published sentiments nearly as hostile and nasty, focusing on the monstrous crimes being committed by Bolshevik Jews. In Albert Lindemann's *Esau's Tears*, I was surprised to discover that the author of the famous Balfour Declaration, the foundation of the Zionist project, was apparently also quite hostile to Jews, with an element of his motivation probably being his desire to exclude them from Britain.

Once Hitler consolidated power in Germany, he quickly outlawed all other political organizations for the German people, with only the Nazi Party and Nazi political symbols being legally permitted. But a special exception was made for German Jews, and Germany's local Zionist Party was accorded complete legal status, with Zionist marches, Zionist uniforms, and Zionist flags all fully permitted. Under Hitler, there was strict censorship of all German publications, but the weekly Zionist newspaper was freely sold at all newsstands and street corners. The clear notion seemed to be that a German National Socialist Party was the proper political home for the country's 99% German majority, while Zionist National Socialism would fill the same role for the tiny Jewish minority.

In 1934, Zionist leaders invited an important SS official to spend

six months visiting the Jewish settlement in Palestine, and upon his return, his very favorable impressions of the growing Zionist enterprise were published as a massive 12-part series in Joseph Goebbel's *Der Angriff*, the flagship media organ of the Nazi Party, bearing the descriptive title "A Nazi Goes to Palestine." In his very angry 1920 critique of Jewish Bolshevik activity, Churchill had argued that Zionism was locked in a fierce battle with Bolshevism for the soul of European Jewry, and only its victory might ensure amicable future relations between Jew and Gentile. Based on available evidence, Hitler and many of the other Nazi leaders seemed to have reached a somewhat similar conclusion by the mid-1930s.

The very uncomfortable truth is that the harsh characterizations of Diaspora Jewry found in the pages of *Mein Kampf* were not all that different from what was voiced by Zionism's founding fathers and its subsequent leaders, so the cooperation of those two ideological movements was not really so totally surprising.

Also quite ironic was the role of Adolf Eichmann, whose name today probably ranks as one of the most famous half-dozen Nazis in history, due to his postwar 1960 kidnapping by Israeli agents, followed by his public show-trial and execution as a war-criminal. As it happens, Eichmann had been a central Nazi figure in the Zionist alliance, even studying Hebrew and apparently becoming something of a philo-Semite during the years of his close collaboration with top Zionist leaders.

Brenner is a captive of his ideology and his beliefs, accepting without question the historical narrative with which he was raised. He seems to find nothing so strange about Eichmann being a philo-Semitic partner of the Jewish Zionists during the late 1930s and then suddenly being transformed into a mass-murderer of the European Jews in the early 1940s, willingly committing the monstrous crimes for which the Israelis later justly put him to death.

This is certainly possible, but I really wonder. A more cynical observer might find it a very odd coincidence that the first prominent Nazi the Israelis made such an effort to track down and kill had been their closest former political ally and collaborator. After Germany's defeat, Eichmann had fled to Argentina and lived there quietly for a number of years until his name resurfaced in a celebrated mid-1950s controversy surrounding one of his leading Zionist partners, then living in

Israel as a respected government official, who was denounced as a Nazi collaborator, eventually ruled innocent after a celebrated trial, but later assassinated by former members of Shamir's faction.

Following that controversy in Israel, Eichmann supposedly gave a long personal interview to a Dutch Nazi journalist, and although it wasn't published at the time, perhaps word of its existence may have gotten into circulation. The new state of Israel was just a few years old at that time, and very politically and economically fragile, desperately dependent upon the goodwill and support of America and Jewish donors worldwide. Their remarkable former Nazi alliance was a deeply-suppressed secret, whose public release might have had absolutely disastrous consequences.

According to the version of the interview later published as a two-part story in *Life Magazine*, Eichmann's statements seemingly did not touch upon the deadly topic of the 1930s Nazi-Zionist partnership. But surely Israeli leaders must have been terrified that they might not be so lucky the next time, so we may speculate that Eichmann's elimination suddenly became a top national priority, and he was tracked down and captured in 1960. Presumably, harsh means were employed to persuade him not to reveal any of these dangerous pre-war secrets at his Jerusalem trial, and one might wonder if the reason he was famously kept in an enclosed glass booth was to ensure that the sound could quickly be cut off if he started to stray from the agreed upon script. All of this analysis is purely speculative, but Eichmann's role as a central figure in the 1930s Nazi-Zionist partnership is undeniable historical fact.

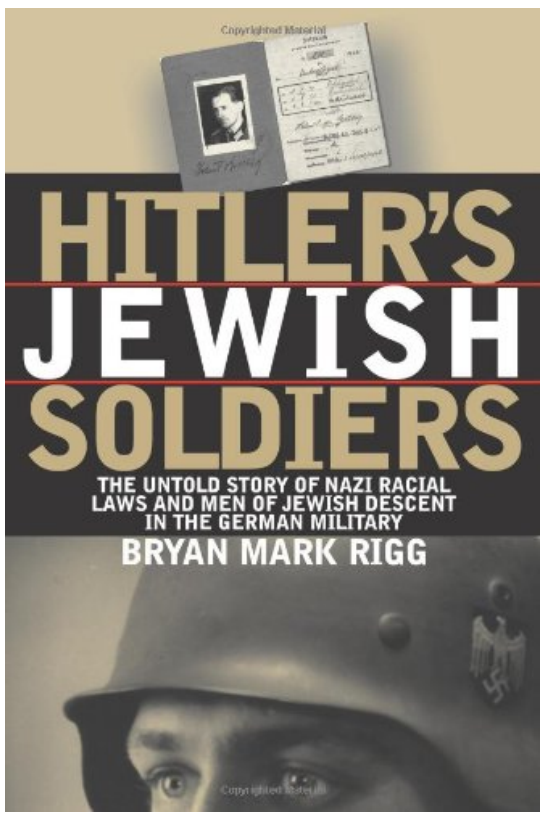
## Hitler's Jewish Soldiers

Once World War II began, this Nazi-Zionist partnership quickly lapsed for obvious reasons. Germany was now at war with the British Empire, and financial transfers to British-run Palestine were no longer possible. Furthermore, the Arab Palestinians had grown quite hostile to the Jewish immigrants whom they rightfully feared might eventually displace them, and once the Germans were forced to choose between maintaining their relationship with a relatively small Zionist movement or winning

the political sympathy of a vast sea of Middle Eastern Arabs and Muslims, their decision was a natural one. The Zionists faced a similar choice, and especially once wartime propaganda began so heavily blackening the German and Italian governments, their long previous partnership was not something they wanted widely known.

However, at exactly this same moment a somewhat different and equally long-forgotten connection between Jews and Nazi Germany suddenly moved to the fore.

Like most people everywhere, the average German, whether Jewish or Gentile, was probably not all that political, and although Zionism had for years been accorded a privileged place in German society, it is not entirely clear how many ordinary German Jews paid much attention to it. The tens of thousands who emigrated to Palestine during that period were probably motivated as much by economic pressures as by ideological commitment. But wartime changed matters in other ways.



Copyrighted Material
HITLER'S
JEWISH
SOLDIERS
THE UNTOLD STORY OF NAZI RACIAL LAWS AND MEN OF JEWISH DESCENT IN THE GERMAN MILITARY
BRYAN MARK RIGG

This was even more true for the German government. The

outbreak of a world war against a powerful coalition of the British and French empires, later augmented by both Soviet Russia and the United States, imposed the sorts of enormous pressures that could often overcome ideological scruples. A few years ago, I discovered a fascinating 2002 book by Bryan Mark Rigg, *Hitler's Jewish Soldiers*, a scholarly treatment of exactly what the title implies. The quality of this controversial historical analysis is indicated by the glowing jacket-blurbs from numerous academic experts and an extremely favorable treatment by an eminent scholar in *The American Historical Review*.

Obviously, Nazi ideology was overwhelmingly centered upon race and considered racial purity a crucial factor in national cohesion. Individuals possessing substantial non-German ancestry were regarded with considerable suspicion, and this concern was greatly amplified if that admixture was Jewish. But in a military struggle against an opposing coalition possessing many times Germany's population and industrial resources, such ideological factors might be overcome by practical considerations, and Rigg persuasively argues that some 150,000 half-Jews or quarter-Jews served in the armed forces of the Third Reich, a percentage probably not much different than their share of the general military-age population.

Germany's long-integrated and assimilated Jewish population had always been disproportionately urban, affluent, and well-educated. As a consequence it is not entirely surprising that a large proportion of these part-Jewish soldiers who served Hitler were actually combat officers rather than merely rank-and-file conscripts, and they included at least 15 half-Jewish generals and admirals, and another dozen quarter-Jews holding those same high ranks. The most notable example was Field Marshal Erhard Milch, Hermann Goering's powerful second-in-command, who played such an important operational role in creating the Luftwaffe. Milch certainly had a Jewish father, and according to some much less substantiated claims, perhaps even a Jewish mother as well, while his sister was married to an SS general.

Admittedly, the racially-elite SS itself generally had far stricter ancestry standards, with even a trace of non-Aryan parentage normally seen as disqualifying an individual from membership. But even here, the situation was sometimes complicated, since there were widespread rumors that Reinhard Heydrich, the second-ranking figure in that very powerful organization, actually had considerable Jewish ancestry. Rigg investigates that claim

without coming to any clear conclusions, though he does seem to think that the circumstantial evidence involved may have been used by other high-ranking Nazi figures as a point of leverage or blackmail against Heydrich, who stood as one of the most important figures in the Third Reich.

As a further irony, most of these individuals traced their Jewish ancestry through their father rather than their mother, so although they were not Jewish according to rabbinical law, their family names often reflected their partly Semitic origins, though in many cases Nazi authorities attempted to studiously overlook this glaringly obvious situation. As an extreme example noted by an academic reviewer of the book, a half-Jew bearing the distinctly non-Aryan name of Werner Goldberg actually had his photograph prominently featured in a 1939 Nazi propaganda newspaper, with the caption describing him as the "The Ideal German Soldier."

The author conducted more than 400 personal interviews of the surviving part-Jews and their relatives, and these painted a very mixed picture of the difficulties they had encountered under the Nazi regime, which varied enormously depending upon particular circumstances and the personalities of those in authority over them. One important source of complaint was that because of their status, part-Jews were often denied the military honors or promotions they had rightfully earned. However, under especially favorable conditions, they might also be legally reclassified as being of "German Blood," which officially eliminated any taint on their status.

Even official policy seems to have been quite contradictory and vacillating. For example, when the civilian humiliations sometimes inflicted upon the fully Jewish parents of serving half-Jews were brought to Hitler's attention, he regarded that situation as intolerable, declaring that either such parents must be fully protected against those indignities or all the half-Jews must be discharged, and eventually in April 1940 he issued a decree requiring the latter. However, this order was largely ignored by many commanders, or implemented through a honor-system that almost amounted to "Don't Ask, Don't Tell," so a considerable fraction of half-Jews remained in the military if they so wished. And then in July 1941, Hitler somewhat reversed himself, issuing a new decree that allowed "worthy" half-Jews who had been discharged to return to the military as officers, while also announcing that after the war, all quarter-Jews would be

reclassified as fully “German Blood” Aryan citizens.

It has been said that after questions were raised about the Jewish ancestry of some of his subordinates, Goering once angrily responded “I will decide who is a Jew!” and that attitude seems to reasonably capture some of the complexity and subjective nature of the social situation.

Interestingly enough, many of part-Jews interviewed by Rigg recalled that prior to Hitler’s rise to power, the intermarriage of their parents had often provoked much greater hostility from the Jewish rather than the Gentile side of their families, suggesting that even in heavily-assimilated Germany, the traditional Jewish tendency toward ethnic exclusivity had still remained a powerful factor in that community.

Although the part-Jews in German military service were certainly subject to various forms of mistreatment and discrimination, perhaps we should compare this against the analogous situation in our own military in those same years with regard to America’s Japanese or black minorities. During that era, racial intermarriage was legally prohibited across a large portion of the US, so the mixed-race population of those groups was either almost non-existent or very different in origin. And when Japanese-Americans were allowed to leave their wartime concentration camps and enlist in the military, they were entirely restricted to segregated all-Japanese units, but with the officers generally being white. Meanwhile, blacks were almost entirely barred from combat service, though they sometimes served in strictly-segregated support roles. The notion that an American with any appreciable trace of African, Japanese, or for that matter Chinese ancestry might serve as a general or even an officer in the U.S. military and thereby exercise command authority over white American troops would have been almost unthinkable. The contrast with the practice in Hitler’s own military is quite different than what Americans might naively believe.

This paradox is not nearly as surprising as one might assume. The non-economic divisions in European societies had almost always been along lines of religion, language, and culture rather than racial ancestry, and the social tradition of more than a millennium could not easily be swept away by merely a half-dozen years of National Socialist ideology. During all those earlier

centuries, a sincerely-baptized Jew, whether in Germany or elsewhere, was usually considered just as good a Christian as any other. For example, Tomas de Torquemada, the most fearsome figure of the dreaded Spanish Inquisition, actually came from a family of Jewish converts.

Even wider racial differences were hardly considered of crucial importance. Some of the greatest heroes of particular national cultures, such as Russia's Alexander Pushkin and France's Alexandre Dumas, had been individuals with significant black African ancestry, and this was certainly not considered any sort of disqualifying characteristic.

By contrast, American society from its inception had always been sharply divided by race, with other differences generally constituting far smaller impediments to intermarriage and amalgamation. I've seen widespread claims that when the Third Reich devised its 1935 Nuremberg Laws restricting marriage and other social arrangements between Aryans, non-Aryans, and part-Aryans, its experts drew upon some of America's long legal experience in similar matters, and this seems quite plausible. Under that new Nazi statute, pre-existing mixed-marriages received some legal protection, but henceforth Jews and half-Jews could only marry each other, while quarter-Jews could only marry regular Aryans. The obvious intent was to absorb that latter group into mainstream German society, while isolating the more heavily-Jewish population.

Over the last few years, many outside observers have noted a seemingly very odd political situation in Ukraine. That unfortunate country possesses powerful militant groups, whose public symbols, stated ideology, and political ancestry all unmistakably mark them as Neo-Nazis. Yet those violent Neo-Nazi elements are all being bankrolled and controlled by a Jewish Oligarch who holds dual Israeli citizenship. Furthermore, that peculiar alliance had been mid-wifed and blessed by some of America's leading Jewish Neocon figures, such as Victoria Nuland, who have successfully used their media influence to keep such explosive facts away from the American public.

At first glance, a close relationship between Jewish Israelis and European Neo-Nazis seems as grotesque and bizarre a misalliance as one could imagine, but after recently reading Brenner's fascinating book, my perspective substantially shifted. Indeed, the main difference between then and now is that during the 1930s,

Zionist factions represented a very insignificant junior partner to a powerful Third Reich, while these days it is the Nazis who occupy the role of eager suppliants to the formidable power of International Zionism, which now so heavily dominates the American political system and through it, much of the world.

- American Pravda: Jews and Nazis
  Ron Unz • ***The Unz Review*** • August 6, 2018 • 6,800 Words

A couple of years ago I encountered another strikingly ironic vignette, almost totally excluded from our mainstream histories.

In reading wartime accounts of Britain's government I came across Leo Amery, a prominent British political figure and one of Churchill's closest lifelong friends, who eventually served as a member of the British Cabinet. He was also secretly of Jewish ancestry and according to some accounts was the individual who had actually drafted the Balfour Declaration, which was the basis for the creation of the State of Israel.

But oddly enough, in my other readings I had also discovered that during World War II, Amery's eldest son John had become a great supporter of Adolf Hitler. As a result, he defected to Nazi Germany and served as a leading wartime propaganda broadcaster for the Third Reich, afterwards hanged as a traitor by the British.

All our standard history books always mention the postwar execution of British Nazi broadcaster "Lord Haw-Haw," a total obscure individual, but strangely omit the similar fate of John Amery, the son of Churchill's closest friend, a Jewish member of Britain's Cabinet, whose wartime efforts on behalf of Nazi Germany seem far more noteworthy.

## The Continuing Importance of World War II

The Second World War ended nearly eighty years ago and despite the enormous role it played in shaping our modern world, many might argue that revisiting the factual details of that conflict would merely be an intellectual exercise, devoid of relevance to our present-day situation. But I think otherwise.

Our relentlessly aggressive foreign policy towards Russia and China today constitutes an enormous threat to world peace, and as I

suggested last year, uncovering the true history of World War II might have an important impact upon our current debate.

> Consider our Secretary of State Antony Blinken, one of the key figures formulating our current policies. Prior to his appointment, I'd never heard of him, but I soon discovered that he'd attended the same college that I did, graduating one year later. We may have even shared some classes, though since my major was Theoretical Physics and his was Social Studies, probably not. But I do think that I have a very good understanding of his view of the world and the history of the twentieth century since until the last decade or so mine was probably not too different. Most of the other senior figures in the Biden Administration seem to fall into that same category.
>
> These individuals have a fixed set of particular beliefs regarding America's role in the world, beliefs shared by their entire ideological circle, and I'm sure that they would immediately reject any challenges to that framework with regard to Russia or China. Such challenges are probably not uncommon, but are regularly dismissed and ignored.
>
> However, I suspect that none of them have ever imagined that the deepest foundations of their belief-system—their assumed history of World War II—is actually false and rotten to the core. They have probably never encountered such ideas in their entire lives, and as a consequence, their psychological defenses might be much weaker. And if any of them begins to even consider the slightest possibility that every source of information they have absorbed since elementary school has been based upon the same underlying set of falsehoods, that realization might shake their confidence in contemporary matters, including the circumstances surrounding the current war in Ukraine.
>
> Mules are stubborn animals. But there's a classic joke that they can be persuaded to follow directions if you first get their attention by hitting them on the head with a two-by-four. For most American policy-experts discovering that their entire accepted history of World War II is upside-down and backwards amounts to being hit on the head with a two-by-four

# Harvard, Racial Discrimination, and Holocaust Denial

***The Unz Review*** • June 26, 2023 • 5,500 Words

Later this week the U.S. Supreme Court will release its verdict on the landmark case *Students for Fair Admissions v. Harvard College*, widely expected to severely curtail or possibly even ban the use of race in college admissions, perhaps one of the most momentous court rulings of recent decades. After a half-century of continual growth and expansion, America's system of racial Affirmative Action may be facing a major legal threat to its survival.

Given the huge potential importance of that ruling, the media coverage over the last decade—and especially the last year—has been intense, ranging from numerous front-page stories in the *New York Times* to endless heated exchanges on Twitter and other social media venues.

Yet until earlier this month, an extremely important aspect of the story had been utterly ignored by virtually all our media outlets despite the potential impact it might have had on the court decision. I think this silence of "the dog that didn't bark" demonstrates the true forces that govern our American media, determining what is revealed and what is concealed about important events.

Consider the notorious right-wing political activist David Duke. His last substantive political achievement was holding a seat in the Louisiana State Legislature during the 1989-1991 sessions and by his unsuccessful runs for U.S. Senate in 1990 and governor in 1991; he's been almost entirely out of politics for most of the 31 years since then, reportedly living abroad during much of that time. Yet the media has maintained his public profile to such an extent that his name is still widely recognized, probably more so than other individuals who have enjoyed a hundred times his political success in recent decades. Our media creates our reality, and Duke is almost entirely a media creation.

Duke has always been a strong opponent of Affirmative Action, and let us suppose that his original research had been a crucial factor behind the current Harvard lawsuit now poised to strike it down. Our mainstream media and its huge corps of liberal, left-liberal, and leftist

journalists fervently support the continued use of race in admissions decisions, and they surely would have highlighted Duke's role from the very beginning, using his involvement as a brutally effective means of smearing and tainting the plaintiffs in the lawsuit.

Under such a media barrage, the case would quickly have become known as the "David Duke lawsuit" against Harvard, while giving massive attention to all his other controversial and outrageous ideological positions, ranging from racism to antisemitism to Holocaust Denial, thereby dramatically reshaping the atmospherics surrounding the lawsuit. Over the last five years, lower federal courts have repeatedly ruled in Harvard's favor, upholding the long-standing legality of race-based Affirmative Action. Would the justices of the U.S. Supreme Court have been willing to even take up a case that had become so heavily identified with Duke, a case that might have required them to overturn five decades of their own past decisions? I strongly suspect that such a David Duke case would have followed a legal trajectory very different from the one whose decision will be announced within the next few days.

Yet the true circumstances of the current lawsuit—as opposed to our media portrayal of it—are actually not so very different from that seemingly far-fetched scenario I have just outlined, as was finally revealed earlier this month by the *Guardian*, a leading British media outlet. Then on Friday, those explosively provocative headlines were repeated in an even longer article that ran in the *Harvard Crimson*:

- Harvard affirmative action challenge partly based on Holocaust denier's work
  *Complaint draws heavily from 2012 article by Ron Unz, who publishes antisemitic, anti-LGBTQ+ and neo-Nazi screeds*
  Ed Pilkington • ***The Guardian*** • June 6, 2023 • 1,500 Words
- Deep Within the Anti-Affirmative Action Lawsuit, a Holocaust Denier
  Michelle N. Amponsah • ***The Harvard Crimson*** • June 23, 2023 • 2,200 Words

Although I might take issue with a few points here and there in those two articles, the overwhelming majority of the facts they present are absolutely correct, as were their dramatic headlines. Yet my crucial role in the Harvard lawsuit and the exceptionally controversial nature of my stated positions on numerous other issues had previously remained obscure due to the deliberate omissions of the media and nearly all of its American journalists.

Indeed, I would even argue that the full range of my controversial views considerably exceeds those held by Duke, and if our reporters had chosen to cover and emphasize these over the last few years, our high court might have been very reluctant to hear the case, thereby preserving Affirmative Action. The story of why virtually every journalist in America chose to spend these years hiding such facts seems an enormously important one, well worth investigating, and I have my own suspicions.

The absurdity of this total lack of media coverage is easily demonstrated if we consider two of my own articles, one of them on the Harvard lawsuit and my role in the case and the other recounting and summarizing some of my exceptionally controversial views on other topics. Although they were both published on the same website just seven days apart in October 2018 and each attracted a great deal of readership and many hundreds of comments, not a single journalist in America was ever willing to report and connect them.

On October 22, 2018, I had discussed the start of the Harvard lawsuit and its origins:

> This last week trial began in Boston federal court for the current lawsuit in which a collection of Asian-American organizations are charging Harvard University with racial discrimination in its college admissions policies. *The New York Times*, our national newspaper of record, has been providing almost daily coverage to developments in the case, with the stories sometimes reaching the front page.
>
> Last Sunday, just before the legal proceedings began, the *Times* ran a major article explaining the general background of the controversy, and I was very pleased to see that my own past research was cited as an important factor sparking the lawsuit, with the reporter even including a direct link to my 26,000 word 2012 cover-story "The Myth of American Meritocracy," which had provided strong quantitative evidence of anti-Asian racial quotas. Economic historian Niall Ferguson, long one of Harvard's most prominent professors but recently decamped to Stanford, similarly noted the role of my research in his column for the *London Sunday Times*.
>
> Two decades ago, I had published a widely-discussed op-ed in *The Wall Street Journal* on somewhat similar issues of racial

discrimination in elite admissions. But my more recent article was far longer and more comprehensive, and certainly drew more attention than anything else I have ever published, before or since. After it appeared in *The American Conservative*, its hundreds of thousands of pageviews broke all records for that publication and it attracted considerable notice in the media. *Times* columnist David Brooks soon ranked it as perhaps the best American magazine article of the year, a verdict seconded by a top editor at *The Economist*, and the *Times* itself quickly organized a symposium on the topic of Asian Quotas, in which I eagerly participated. *Forbes*, *The Atlantic*, *The Washington Monthly*, *Business Insider*, and other publications all discussed my striking results.

Conservative circles took considerable interest, with Charles Murray highlighting my findings, and *National Review* later published an article in which I explained the important implications of my findings for the legal validity of the 1978 *Bakke* decision by the U.S. Supreme Court.

There was also a considerable reaction from the academic community itself. I quickly received speaking invitations from the Yale Political Union, Yale Law, and the University of Chicago Law School, while Prof. Ferguson discussed my distressing analysis in a lengthy *Newsweek/Daily Beast* column entitled "The End of the American Dream."

Moreover, I had also published an associated critique suggesting that over the years my beloved Harvard *alma mater* had transformed itself into one of the world's largest hedge-funds with a vestigial school attached for tax-exempt purposes. This also generated enormous discussion in media circles, with liberal journalist Chris Hayes Tweeting it out and generously saying he was "very jealous" he hadn't written the piece himself. Many of his colleagues promoted the piece with similarly favorable remarks, while the university quickly provided a weak public response to these serious financial charges.

Meanwhile, unbeknownst to myself or other outside observers, Harvard itself launched an internal investigation of the anti-Asian bias that I had alleged. Apparently, the university's own initial results generally confirmed my accusations, indicating that if students were admitted solely based upon objective academic merit, far more Asians would receive thick envelopes. But Harvard's top administrators buried the study and did nothing, with these important facts only coming out years later during the

discovery process of the current Asian Quotas lawsuit.

Only the first part of my very long article dealt with the question of anti-Asian racial discrimination in elite college admissions, but it attracted vastly more attention than any other element.

For many years, there had been a widespread belief within the Asian-American community that such discriminatory practices existed, a sentiment backed by considerable anecdotal evidence. But the university administrations had always flatly denied those claims, and the media had shown little interest in investigating them. However, my powerful new quantitative evidence proved very difficult to ignore.

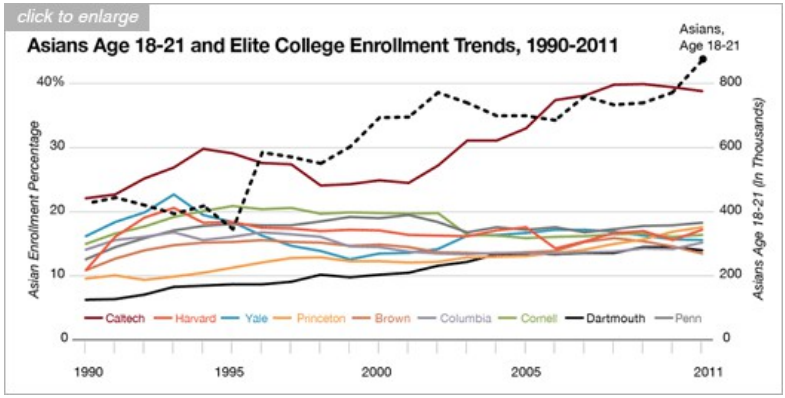
Among other things, I focused upon the publicly available statewide lists of National Merit Semifinalists (NMS), a group that constituted the highest-performing one-half percent of American high school seniors. By a fortunate coincidence, this fraction of the American student body was reasonably close in size to the total enrollment of students at the Ivy League schools together with similarly elite schools such as Stanford, Caltech, and MIT. The NMS dataset had previously been almost entirely ignored by researchers, but I found it provided a treasure-trove of useful empirical information.

Since Asian last names are extremely distinctive, I was able to estimate that Asians nationally constituted roughly 25-30% of this top academic group, a figure considerably larger than their enrollment at Harvard and other elite schools. This conclusion was supported by the even greater Asian dominance in more highly selective academic competitions such as the Math Olympiad and the Intel Science Talent Search, though the far smaller numbers involved reduced the statistical validity of these analyses.

But my most dramatic finding relied upon an even simpler analysis of public data, which had previously remained unnoticed. As I wrote in my *New York Times* column…

This statistical finding was illustrated in a simple graph, demonstrating that over the last two decades enrollment of Asian-Americans had gradually converged across the entire Ivy League, while sharply diverging from the rapidly increasing Asian-

American population, with only strictly meritocratic Caltech continuing to track the latter.



It would be difficult to imagine more obvious visual evidence of an Asian Quota implemented across the Ivy League, and this chart was very widely circulated among Asian-American organizations and activists, who launched their lawsuit the following year. If they do succeed in winning their current case in federal court, the history books may eventually record that the wealthiest and most powerful university in the world was brought low by a single striking graph.

  Ron Unz • ***The Unz Review*** • October 22, 2018 • 10,300 Words • 578 Comments

Just one week before that October 2018 article in which I had recapitulated the history of the Harvard lawsuit, I had also published an article responding to a critique by the ADL, a leading Jewish activist organization, taking the opportunity to enumerate my extremely controversial writings.

Given the fearsome reputation of the ADL and its notorious hair-trigger activists, there was a widespread belief that my small webzine would be completely annihilated when I first launched my recent series of controversial articles in early June by praising the works of historian David Irving, a figure long demonized by the ADL. Yet absolutely nothing happened.

During the next three months my subsequent articles directly challenged nearly every hot-button issue normally so fiercely

defended by the ADL and its lackeys, so much so that a friendly journalist soon described me as the "Kamikaze from California." Yet despite my 90,000 words of text and the 13,000 comments I had attracted, the continuing silence of the ADL was absolutely deafening. Meanwhile, my articles were read more than half a million times, with the following being a list of the most provocative pieces:

- The Remarkable Historiography of David Irving
  June 4, 2018 • 1,700 Words • 570 Comments
- American Pravda: The JFK Assassination, Part II – Who Did It?
  June 25, 2018 • 8,000 Words • 985 Comments
- American Pravda: Oddities of the Jewish Religion
  July 16, 2018 • 7,800 Words • 1,637 Comments
- American Pravda: The Bolshevik Revolution and Its Aftermath
  July 23, 2018 • 6,900 Words • 913 Comments
- American Pravda: The Nature of Anti-Semitism
  July 30, 2018 • 5,500 Words • 666 Comments
- American Pravda: Jews and Nazis
  August 6, 2018 • 6,800 Words • 554 Comments
- American Pravda: Holocaust Denial
  August 27, 2018 • 17,600 Words • 2,323 Comments
- American Pravda: 9/11 Conspiracy Theories
  September 10, 2018 • 11,000 Words • 2,355 Comments

When divine wrath fails to smite the heretic and terrifying enforcers of official dogma seem to have suddenly lost their taste for battle, others gradually begin to take notice and may grow emboldened. Eventually leading pro-Russian and Libertarian websites such as *Russia Insider* and *LewRockwell* began republishing some of my most controversial American Pravda articles, thus bringing my factual claims to the attention of broader audiences. After the conclusion of my series, I began directly ridiculing my strangely timorous ADL opponents, publishing a short column entitled "Has the ADL Gone Into Hiding?" which led the redoubtable Paul Craig Roberts to describe me as "the bravest man I know."

Apparently the combination of all these factors at long last grew too worrisome for the ADL, and stirring from their secret hiding place, its activists have now finally released a short and rather milquetoast response to my material, one which hardly much impresses me. A few days ago, they Tweeted out their column,

together with a photo of their new nemesis…

> California businessman Ron Unz has long been funding anti-Israel activists. Now, he's embracing hardcore #antiSemitism, denying the Holocaust & claiming Jews run the media & worship Satan. Learn more from our experts: https://t.co/KnngID3YCh

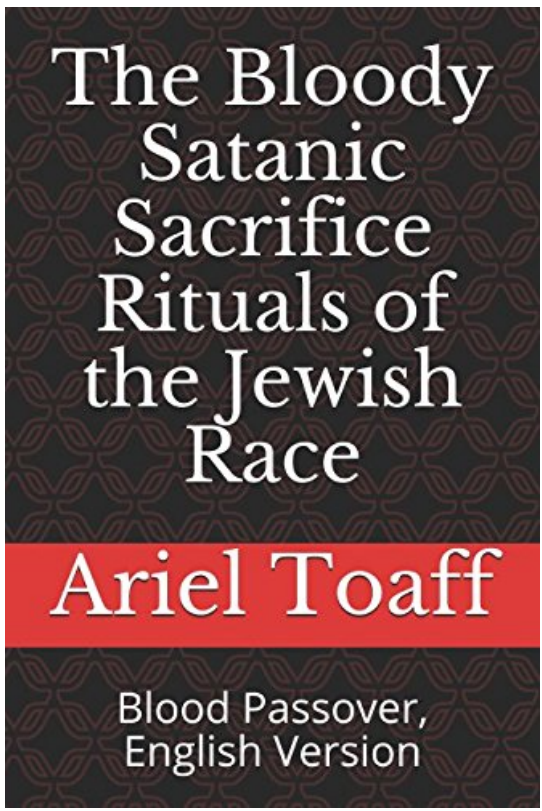
Jewish Fundamentalism in Israel
New Edition
Israel Shahak and Norton Mezvinsky
with a new introduction by Norton Mezvinsky
The Washington Report on Middle East Affairs

I was equally unimpressed that they so hotly denounced me for substantially relying upon the writings of Israel Shahak, whom they characterized as viciously "anti-Semitic." As I had repeatedly emphasized, my own total lack of Aramaic and Hebrew necessarily forces me to rely upon the research of others, and the late Prof. Shahak, an award-winning Israeli academic, certainly seemed a fine source to use. After all, famed linguist Noam Chomsky had lauded Shahak's works for their "outstanding scholarship," and several of our other most prominent public

intellectuals such as Christopher Hitchens, Edward Said, and Gore Vidal had been similarly lavish in their praise. Furthermore, one of Shahak's co-authors was Norton Mezvinsky, a prominent American academic specializing in Middle Eastern history, himself hardly an obscure figure given that both his brother and sister-in-law served in Congress and his nephew later married Chelsea Clinton. And as far as I'm aware almost none of Shahak's explicit claims about the Talmud or traditional Judaism have ever been directly challenged, while the online availability of his first book allows those so interested to conveniently read it and decide for themselves.



The ADL similarly denounced me for taking seriously the theories of Ariel Toaff, another Israeli academic. But Prof. Toaff, son of the Chief Rabbi of Rome, certainly ranks as one of the world's leading scholarly authorities on Medieval Jewry, and working together with his graduate students and other colleagues, he had devoted many years of effort to the research study in question, drawing upon extensive primary and secondary sources produced in eight different languages. I found his 500 page book quite persuasive, as did Israeli journalist Israel Shamir, and I have seen

no credible rebuttals.

Now the work of all these prominent academics and intellectuals may not necessarily be correct, and perhaps I am mistaken in accepting their factual claims. But I would need to see something far more weighty than a casual dismissal in a few paragraphs contained within an anonymous ADL column, whose author for all I know might have been some ignorant young intern.

Those glaring flaws aside, most of the ADL's remaining catalogue of my numerous heretical positions seemed reasonably accurate, though obviously presented in a somewhat hostile and derogatory fashion and sorely lacking any links to my original pieces. But even this desultory listing of my mortal transgressions was woefully incomplete, with the ADL strangely failing to include mention of some of my most controversial claims.

For example, the authors excluded all reference to my discussion of the thoroughly documented Nazi-Zionist economic partnership of the 1930s, which played such a crucial role in laying the basis for the State of Israel. And the ADL similarly avoided mentioning the nearly 20,000 words I had allocated to discussing the very considerable evidence that the Israeli Mossad had played a central role in both the JFK Assassination and the 9/11 Attacks. Surely this must be one of the few times that the ADL has deliberately avoided leveling the charge of "conspiracy theorist" against an opponent whom they might have so easily slurred in that fashion. Perhaps they felt the evidence I provided was simply too strong for them to effectively challenge.

- American Pravda: The ADL in American Society
  *From the Leo Frank Case to the Present Day*

Ron Unz • ***The Unz Review*** • October 15, 2018 • 7,300 Words • 752 Comments

Both the *Guardian* and *Harvard Crimson* articles had highlighted the Holocaust so I should also note that my 2018 article on the Harvard lawsuit had included several exceptionally controversial paragraphs on exactly that subject:

> Jannol's account also contains a particularly intriguing element. Personal essays have become a crucial component of application packages to elite colleges, and these are considered especially effective if they provide strong evidence of hardships and victimhood. Given her extremely wealthy and privileged background, Jannol had originally considered focusing on her status as the granddaughter of a Holocaust survivor, but ultimately decided against it because so many of her peers would be following exactly that same stratagem, explaining to Steinberg that "Everyone's going to write about their Holocaust grandma."
>
> Over the last few decades, our news and entertainment industries have elevated Jewish suffering during World War II into the most horrific and monumental tragedy of the modern era, and it not impossible that a substantial fraction of the unfair Jewish advantage in elite admissions may derive from something as simple as the ability of the children of elite Jewish families to wrap themselves in the ultimate victimhood of Holocaust survivor status.
>
> If so, this situation would be particularly ironic, given the considerable evidence that the Holocaust is substantially fraudulent, or even almost entirely so, merely a hoax promoted by heavily Jewish Hollywood, perhaps partially intended to conceal the inescapable reality that in *per capita* terms Jews worldwide were surely the greatest mass-murderers of the twentieth century.

Furthermore, during the years since 2018, I've greatly compounded my egregious heresies. I've published a long series of articles arguing that the global Covid epidemic that has killed twenty million people including more than a million Americans was very likely the result of a botched American biowarfare attack against China (and Iran) and also suggesting that AIDS might not exist as a real disease, quite possibly merely amounting to a medical media hoax.

- American Pravda: AIDS and the Revival of the Duesberg Hypothesis
  Ron Unz • ***The Unz Review*** • December 29, 2021 • 4,100 Words

During the last five years any enterprising American journalist who read and reported my October 15 and October 22, 2018 articles could have produced a major blockbuster expose that might have rocked the Harvard lawsuit and perhaps derailed it in the courts, thereby winning the plaudits of his peers. But none did so and it was left to a British publication to finally break the story a couple of weeks ago, long after the justices had already finalized their ruling. Moreover, even after the *Guardian* broke the ice with a headline declaring that the Harvard lawsuit had been based upon the work of a "Holocaust denier" not a single American media outlet picked up on that lead and reported the story except for the student-journalists of the *Harvard Crimson*. What explains this near total silence from our entire media class?

I think the answer to this puzzle lies in the enormous influence of the Anti-Defamation League (ADL) of B'nai B'rith, which in recent years has become a primary ideological gatekeeper to the Internet. My October 2018 article had revealed the extremely unsavory history and activities of that organization:

> There is also a far more serious aspect to the situation. The choice of the ADL as the primary ideological overseer of America's Internet may seem natural and appropriate to politically-ignorant Americans, a category that unfortunately includes the technology executives leading the companies involved. But this reflects the remarkable cowardice and dishonesty of the American media from which all these individuals derive their knowledge of our world. The true recent history of the ADL is a remarkably sordid and disreputable tale.
>
> In January 1993, the San Francisco Police Department reported that it had recently raided the Northern California headquarters of the ADL based upon information provided by the FBI. The SFPD discovered that the organization had been keeping intelligence files on more than 600 civic organizations and 10,000 individuals, overwhelmingly of a liberal orientation, with the SFPD inspector estimating that 75% of the material had been illegally obtained, much of it by secret payments to police

officials. This was merely the tip of the iceberg in what clearly amounted to the largest domestic spying operation by any private organization in American history, and according to some sources, ADL agents across the country had targeted over 1,000 political, religious, labor, and civil rights organizations, with the New York headquarters of the ADL maintaining active dossiers on more than a million Americans.

Not long afterward, an ACLU official who had previously held a high-ranking position with the ADL revealed in an interview that his organization had been the actual source of the highly controversial 1960s surveillance on Martin Luther King, Jr., which it had then provided to FBI Director J. Edgar Hoover. For many years Hoover had been furiously denounced in the national media headlines for his use of tapes and other secret information on King's activities, but when a local San Francisco newspaper revealed that an ADL spying operation had actually been the source of all that sordid material, the bombshell revelation was totally ignored in the national media and only reported by fringe organizations, so that today almost no Americans are aware of that fact.

I know of no other private organization in American history that has been involved in even a sliver of such illegal domestic espionage activity, which appears to have been directed against almost all groups and prominent individuals—left, right, and center—suspected of being insufficiently aligned with Jewish and Israeli interests. Some of the illegal material found in the ADL's possession even raised dark suspicions that it had played a role in domestic terrorist attacks and political assassinations directed against foreign leaders. I am no legal expert, but given the massive scale of such illegal ADL activities, I wonder whether a plausible case might have been made to prosecute the entire organization under RICO statutes and sentence all of its leaders to long prison terms.

Instead, the resulting government charges were quickly settled with merely a trivial fine and a legal slap on the wrist, demonstrating the near-total impunity provided by massive Jewish political power in modern American society.

In effect, the ADL seems to have long operated as a privatized version of our country's secret political police, monitoring and enforcing its ideological doctrines on behalf of Jewish groups much as the Stasi did for the Communist rulers of East Germany.

> Given such a long history of criminal activity, allowing the ADL to extend its oversight to our largest Social Media platforms amounts to appointing the Mafia to supervise the FBI and the NSA, or taking a very large step towards implementing George Orwell's " Ministry of Truth" on behalf of Jewish interests.
>
> In his 1981 memoirs, the far right Classics scholar Revilo P. Oliver characterized the ADL as "the formidable organization of Jewish cowboys who ride herd on their American cattle" and this seems a reasonably apt description to me.

Moreover, the bulk of that long article had recounted the origins of the ADL just over a century ago. The organization had been founded to protect Leo Frank, a notorious pedophile rapist and murderer, who attempted to secure his freedom by orchestrating the lynching of a couple of completely innocent black men, and I had summarized this shocking story earlier this year:

> As a further example of the widely promoted but apparently fraudulent history, the Jewish writers who have overwhelmingly dominated accounts of the Frank case have frequently claimed that it sparked the revival of the Ku Klux Klan soon afterward, with the group of citizens responsible for Frank's 1915 lynching supposedly serving as the inspiration for William Simmons' reestablishment of that organization a couple of years later. But there seems no evidence for this. Indeed, Simmons strongly emphasized the philo-Semitic nature of his new organization, which attracted considerable Jewish membership.
>
> The primary factor behind the rebirth of the KKK was almost certainly the 1917 release of D.W. Griffith's overwhelmingly popular landmark film *Birth of a Nation*, which glorified the Klan of the Reconstruction Era. Given that the American film industry was so overwhelmingly Jewish at the time and the film's financial backers and leading Southern distributors came from that same background, it could be plausibly argued that the Jewish contribution to the creation of the 1920s Klan was a very crucial one, while the revenue from the film's distribution throughout the South actually financed Samuel Goldwyn's creation of MGM, Hollywood's leading studio.
>
> In their introduction, the NOI authors make the fascinating point that the larger historical meaning of the Frank case in American racial history has been entirely lost. Prior to that trial, it was unprecedented for Southern courts to allow black testimony

against a white man, let alone against a wealthy man being tried on serious charges; but the horrific nature of the crime and Conley's role as the sole witness required a break from that longstanding tradition. Thus, the authors not unreasonably argued that the Frank case may have been as important to the history of black progress in America as such landmark legal verdicts as *Plessy v. Ferguson* or *Brown v. Board*. But since almost the entire historical narrative has been produced by fervent Jewish advocates, these facts have been completely obscured and the case entirely misrepresented as an example of anti-Semitic persecution and public murder.

Let us summarize what seems to be the solidly established factual history of the Frank case, quite different than the traditional narrative. There is not the slightest evidence that Frank's Jewish background was a factor behind his arrest and conviction, nor the death sentence he received. The case set a remarkable precedent in Southern courtroom history with the testimony of a black man playing a central role in a white man's conviction. From the earliest stages of the murder investigation, Frank and his allies continually attempted to implicate a series of different innocent blacks by planting false evidence and using bribes to solicit perjured testimony, while the exceptionally harsh racial rhetoric that Frank and his attorneys directed towards those blacks was presumably intended to provoke their public lynching. Yet despite all these attempts by the Frank forces to play upon the notorious racial sentiments of the white Southerners of that era, the latter saw through these schemes and Frank was the one sentenced to hang for his rape and murder of that young girl.

Now suppose that all the facts of this famous case were exactly unchanged except that Frank had been a white Gentile. Surely the trial would be ranked as one of the greatest racial turning points in American history, perhaps even overshadowing *Brown v. Board* because of the extent of popular sentiment, and it would have been given a central place in all our modern textbooks. Meanwhile, Frank, his lawyers, and his heavy financial backers would probably be cast as among the vilest racial villains in all of American history for their repeated attempts to foment the lynching of various innocent blacks so that a wealthy white rapist and murderer could walk free. But because Frank was Jewish rather than Christian, this remarkable history has been completely inverted for over one hundred years by our Jewish-dominated media and historiography.

> These are the important consequences that derive from control of the narrative and the flow of information, which allows murderers to be transmuted into martyrs and villains into heroes. The ADL was founded just over a century ago with the central goal of preventing a Jewish rapist and killer from being held legally accountable for his crimes, and over the decades, it eventually metastasized into a secret political police force not entirely dissimilar from the widely despised East German Stasi, but with its central goal seeming to be the maintenance of overwhelming Jewish control in a society that is 98% non-Jewish.
>
> We should ask ourselves whether it is appropriate for an organization with such origins and such recent history to be granted enormous influence over the distribution of information across our Internet.

- American Pravda: The Leo Frank Case and the Origins of the ADL
  Ron Unz • ***The Unz Review*** • March 27, 2023 • 5,300 Words

The lengthy 2018 article I'd published revealed those long-hidden truths about the activities and origins of the ADL, attracting considerable readership and more than 750 comments. Perhaps partly as a consequence, a few months later Amazon purged the scholarly book on the Leo Frank case that had so impressed me, ironically doing so during Black History Month. However, it's still available for sale on the NOI website.

- American Pravda: Amazon Book Censorship
  Ron Unz • ***The Unz Review*** • March 11, 2019 • 7,600 Words

As I discussed late last year, the information I presented about the ADL was so potentially dangerous that the organization seems to have decided that enforcing absolute media silence was the safest policy:

> After that initial exchange, the ADL apparently reconsidered its media strategy and concluded that discretion was the better part of valor, slinking back into hiding. Indeed, the highly counter-productive consequences of any challenge either to myself or to my publication became so obvious that they seem to have issued a general edict, forbidding any mention whatsoever in all the media outlets under their editorial influence. Their leadership rightly realized that although we might suffer from their attacks, by drawing much greater attention to our information, such actions might prove severely damaging or even fatal to their long-

term interests.

The reality of this presumably ADL-enforced media blockade became apparent in 2020, when the SPLC and its journalistic allies launched a ferocious wave of coordinated attacks aimed at forcing the resignation of Stephen Miller, perhaps the most hated member of the Trump Administration, a drive that came just a few months before the presidential election. The central charge against Miller was that in his private emails he had promoted several controversial posts by blogger Steve Sailer, all of which had originally been published on our website.

Such attacks typically rely upon guilt by association, and the Sailer pieces in question had run on the same page as articles promoting Holocaust Denial and various other exceptionally controversial topics, so the connection was irrefutable. And if those other issues had been publicly linked to Miller, his political fall would have become certain. But the lengthy research report denouncing Miller and the pieces he had endorsed scrupulously avoided any mention of our website or the vastly more controversial material it contained, and as a consequence Miller managed to survive. Apparently maintaining the prohibition against any hint of our existence was far more important than claiming the political scalp of a top Trump advisor. To the ADL and its allies, we constituted a terrifying Lord Voldemort, and merely mentioning our name might result in their destruction.

  Ron Unz • ***The Unz Review*** • July 14, 2020 • 3,900 Words

I think this apparent ADL policy of enforced media silence probably explains why virtually the entire American journalistic community has spent the last five years avoiding any mention of my controversial involvement in the Harvard lawsuit, even if doing so might have derailed the case that now threatens to eliminate Affirmative Action in college admissions.

# Affirmative Action and the Jewish Elephant in the Room

***The Unz Review*** • July 3, 2023 • 6,800 Words

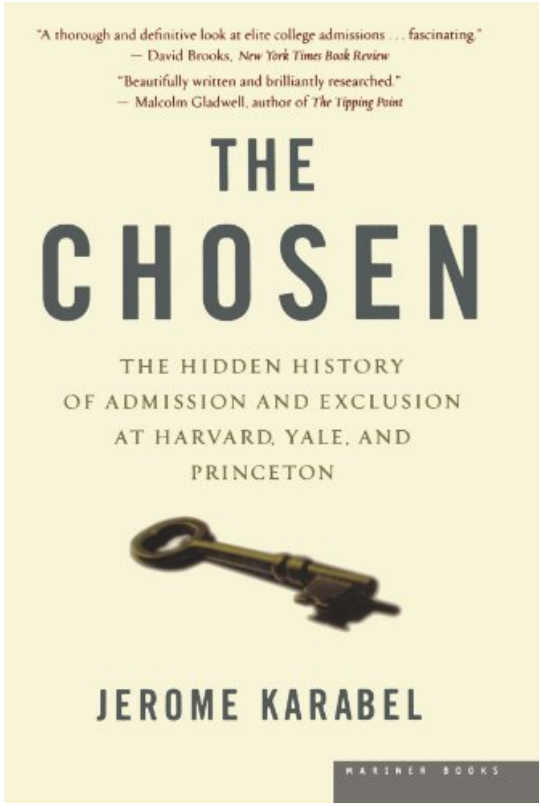
The top American news story at the end of last week was the Supreme Court's 6-3 decision in *Students for Fair Admissions v. President and Fellows of Harvard College*, striking down the use of race in college admissions and thereby overturning nearly a half-century of its own past rulings.

The print editions of our leading national newspapers carried virtually identical front-page banner headlines, with the *New York Times* announcing "Justices Gut College Affirmative Action" and the *Wall Street Journal* declaring "Court Guts College Affirmative Action." The banner headline in my own local *Palo Alto Daily Post*, a small distribution newspaper that closely tracks the media consensus, was even more emphatic: "Court Ends Affirmative Action."

Although the ultimate consequences of any major legal decision may take years to be fully understood, the potentially sweeping implications of this dramatic ruling were suggested by the lead story on the Saturday website edition of the *Times*: "Affirmative Action Ruling May Upend Hiring Policies, Too."

The editors of our national newspaper of record had apparently prepared themselves for this verdict. The ruling was announced Thursday morning and by that evening the *Times* website had already published a lengthy opinion piece on the long political conflict over racial preferences by Jerome Karabel, an eminent Berkeley sociologist. Karabel's essay was allocated a full page in the next day's prestigious print edition, thereby establishing him as the primary voice selected by the *Times* to respond to the controversial court decision.

- The Decades-Long Fight to Dismantle Affirmative Action
  Jerome Karabel • ***The New York Times*** • June 29, 2023 • 2,400 Words



"A thorough and definitive look at elite college admissions . . . fascinating."
— David Brooks, New York Times Book Review
"Beautifully written and brilliantly researched."
— Malcolm Gladwell, author of The Tipping Point
THE
CHOSEN
THE HIDDEN HISTORY
OF ADMISSION AND EXCLUSION
AT HARVARD, YALE, AND
PRINCETON
JEROME KARABEL
MARINER BOOKS

Although the history presented by Karabel seemed reasonably even-handed and accurate, I noticed a striking omission. As a scholar, he is best known for his award-winning 2005 study *The Chosen*, a magisterial narrative history of the last hundred years of Jewish enrollment at Harvard, Yale, and Princeton. His research had heavily focused on the secret use of discriminatory practices to sharply restrict Jewish admissions, yet despite its obvious relevance to the current court case no mention of that topic appeared anywhere in his lengthy essay.

Karabel's seminal research on Jews in the Ivy League served as the foundation for my own 2012 Meritocracy analysis, and although he carefully avoided that subject in his *Times* piece, I had explained in my article why I regarded it as central to understanding the long struggle over elite admissions:

> Karabel's massive documentation—over 700 pages and 3000 endnotes—establishes the remarkable fact that America's uniquely complex and subjective system of academic admissions actually arose as a means of covert ethnic tribal warfare. During the 1920s, the established Northeastern Anglo-Saxon elites who

then dominated the Ivy League wished to sharply curtail the rapidly growing numbers of Jewish students, but their initial attempts to impose simple numerical quotas provoked enormous controversy and faculty opposition.[10] Therefore, the approach subsequently taken by Harvard President A. Lawrence Lowell and his peers was to transform the admissions process from a simple objective test of academic merit into a complex and holistic consideration of all aspects of each individual applicant; the resulting opacity permitted the admission or rejection of any given applicant, allowing the ethnicity of the student body to be shaped as desired. As a consequence, university leaders could honestly deny the existence of any racial or religious quotas, while still managing to reduce Jewish enrollment to a much lower level, and thereafter hold it almost constant during the decades which followed.[11] For example, the Jewish portion of Harvard's entering class dropped from nearly 30 percent in 1925 to 15 percent the following year and remained roughly static until the period of the Second World War.[12]

As Karabel repeatedly demonstrates, the major changes in admissions policy which later followed were usually determined by factors of raw political power and the balance of contending forces rather than any idealistic considerations. For example, in the aftermath of World War II, Jewish organizations and their allies mobilized their political and media resources to pressure the universities into increasing their ethnic enrollment by modifying the weight assigned to various academic and non-academic factors, raising the importance of the former over the latter. Then a decade or two later, this exact process was repeated in the opposite direction, as the early 1960s saw black activists and their liberal political allies pressure universities to bring their racial minority enrollments into closer alignment with America's national population by partially shifting away from their recently enshrined focus on purely academic considerations. Indeed, Karabel notes that the most sudden and extreme increase in minority enrollment took place at Yale in the years 1968–69, and was largely due to fears of race riots in heavily black New Haven, which surrounded the campus.[13]

Philosophical consistency appears notably absent in many of the prominent figures involved in these admissions battles, with both liberals and conservatives sometimes favoring academic merit and sometimes non-academic factors, whichever would produce the particular ethnic student mix they desired for personal or ideological reasons. Different political blocs waged long battles

for control of particular universities, and sudden large shifts in admissions rates occurred as these groups gained or lost influence within the university apparatus: Yale replaced its admissions staff in 1965 and the following year Jewish numbers nearly doubled. [14]

At times, external judicial or political forces would be summoned to override university admissions policy, often succeeding in this aim. Karabel's own ideological leanings are hardly invisible, as he hails efforts by state legislatures to force Ivy League schools to lift their *de facto* Jewish quotas, but seems to regard later legislative attacks on "affirmative action" as unreasonable assaults on academic freedom.[15] The massively footnoted text of *The Chosen* might lead one to paraphrase Clausewitz and conclude that our elite college admissions policy often consists of ethnic warfare waged by other means, or even that it could be summarized as a simple Leninesque question of "Who, Whom?"

Although nearly all of Karabel's study is focused on the earlier history of admissions policy at Harvard, Yale, and Princeton, with the developments of the last three decades being covered in just a few dozen pages, he finds complete continuity down to the present day, with the notorious opacity of the admissions process still allowing most private universities to admit whomever they want for whatever reasons they want, even if the reasons and the admissions decisions may eventually change over the years. Despite these plain facts, Harvard and the other top Ivy League schools today publicly deny any hint of discrimination along racial or ethnic lines, except insofar as they acknowledge providing an admissions boost to under-represented racial minorities, such as blacks or Hispanics. But given the enormous control these institutions exert on our larger society, we should test these claims against the evidence of the actual enrollment statistics.

For more than one hundred years and especially in recent decades, our elite colleges have served as a direct channel to the commanding heights of American academics, law, business, finance, and media, so dominating those institutions and determining their enrollment provides a considerable measure of control over our entire society. And as Karabel demonstrated in his fascinating volume, throughout the twentieth century those colleges therefore became the battleground of a silent struggle for power between white Gentiles and Jews. The former initially held the upper hand, but the latter ultimately proved victorious, and towards the end of his book the

author celebrated their supposedly meritocratic triumph:

> Indeed, Karabel opens the final chapter of his book by …noting the extreme irony that the WASP demographic group which had once so completely dominated America's elite universities and "virtually all the major institutions of American life" had by 2000 become "a small and beleaguered minority at Harvard," being actually fewer in number than the Jews whose presence they had once sought to restrict. Very similar results seem to apply all across the Ivy League, with the disproportion often being even greater than the particular example emphasized by Karabel.

Indeed, I think our nation's fifty year struggle over Affirmative Action can best be understood as an element of that hidden ethnic struggle. As I explained in the closing paragraphs of my 2018 article:

> Many years ago as a young and naive undergraduate, I would usually spend my dinners discussing all sorts of political and policy issues with my fellow classmates in our Harvard dining hall.
>
> Affirmative Action was a regular topic of our conversations, and I would occasionally note how odd America was in that regard. No other example came to mind in which an ethnic group had established a legalized system of racial discrimination against its own members, while similar sorts of systems aimed at excluding or disadvantaging rival ethnic groups were all too common in world history.
>
> As the decades went by, I gradually noticed that the huge and continuing increase in the enrollment of non-white and foreign students at our most elite universities had caused a complete collapse in the enrollment of white American Gentiles, but oddly enough, no similar reduction in Jewish numbers. It was well-known that Jewish activists had been the primary force behind the establishment of Affirmative Action and related policies in college admissions, and I began to wonder about their true motivation, whether conscious or unconscious.
>
> Had the goal been the stated one, of providing educational opportunities to previously excluded groups? Or had that merely been the excuse used to advance a policy that eliminated the majority of white Gentiles, their primary ethnic competitors? With the Jewish population numbering merely 2%, there was an obvious limit as to how many elite college slots they themselves

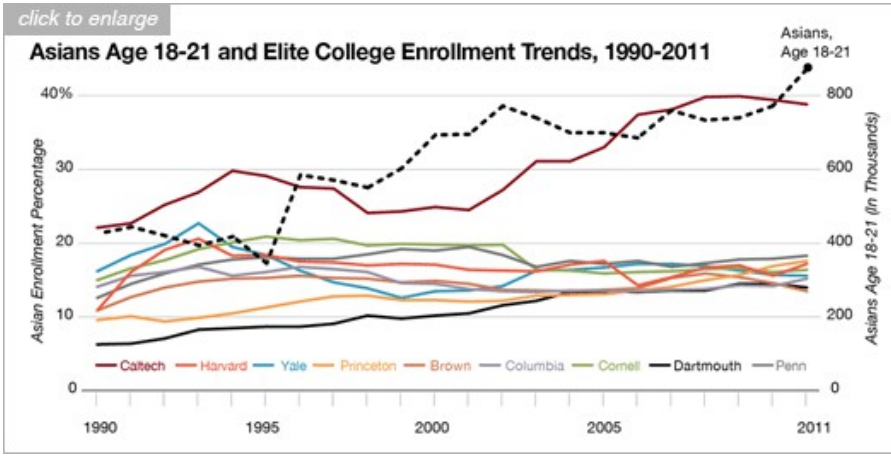
could possibly fill, but if enough other groups were also brought in, then Gentile numbers could easily be reduced to low levels, despite the fact that they constituted the bulk of the national population.

Asians represented an interesting test-case. As their numbers rapidly grew, white Gentiles were consequently pushed out, and this process was celebrated across the academic community. But by the late 1980s, Asian numbers had increased to such an extent that they inevitably began to impinge upon elite Jewish enrollment as well and future increases would surely worsen the situation. And at that point, the process suddenly halted, with Asian numbers being sharply reduced and thereafter permanently capped. The implications of this situation were already in the back of my mind when I published my 1998 *Wall Street Journal* column describing some of these striking racial facts.

The current high-profile trial in Boston is widely portrayed by the media as a conflict between Asian-American groups, whose educational interests suffer under the current subjective and opaque admissions system, and black and Hispanic groups, whose numbers might be sharply reduced under some proposed changes. Whites are largely portrayed as bystanders, with Harvard indicating that their numbers would scarcely shift even under drastic changes in admissions policy. But the term “white” encompasses both Jews and Gentiles, and thus may conceal more than it reveals.

The implications of my 2012 Meritocracy analysis are certainly well-known to all of the prominent participants and observers in the ongoing legal battle, but the fearsome power of the ADL and its media allies ensures that certain important aspects of the current situation are never subjected to widespread public discussion. Asian advocates rightly denounce the unfairness of the current elite academic admissions system, but remain absolutely mute about which American group actually controls the institutions involved.

Throughout the enormous media controversy surrounding the Harvard trial in Boston, all sides are doing their utmost to avoid noticing the 2% elephant in the room. And that fact provides the best proof of the tremendous size and power of that elephant in today’s American society.



Most American journalists and academics quietly recognize that matters touching upon Jewish sensitivities constitute the deadly "third rail" of their professions and the quantitative analysis that I had presented in my 2012 Meritocracy analysis was probably one of the most explosive published anywhere in many decades. In that study I demonstrated that the distribution of students at our elite colleges sharply diverged from that of our society as a whole or its highest performing segment, but instead showed a strikingly different ethnic skew:

> The evidence of the recent NMS semifinalist lists seems the most conclusive of all, given the huge statistical sample sizes involved. As discussed earlier, these students constitute roughly the highest 0.5 percent in academic ability, the top 16,000 high school seniors who should be enrolling at the Ivy League and America's other most elite academic universities. In California, white Gentile names outnumber Jewish ones by over 8-to-1; in Texas, over 20-to-1; in Florida and Illinois, around 9-to-1. Even in New York, America's most heavily Jewish state, there are more than two high-ability white Gentile students for every Jewish one. Based on the overall distribution of America's population, it appears that approximately 65–70 percent of America's highest ability students are non-Jewish whites, well over ten times the Jewish total of under 6 percent.
>
> Needless to say, these proportions are considerably different from what we actually find among the admitted students at Harvard and its elite peers, which today serve as a direct funnel to the commanding heights of American academics, law, business, and

finance. Based on reported statistics, Jews approximately match or even outnumber non-Jewish whites at Harvard and most of the other Ivy League schools, which seems wildly disproportionate. Indeed, the official statistics indicate that non-Jewish whites at Harvard are America's most under-represented population group, enrolled at a much lower fraction of their national population than blacks or Hispanics, despite having far higher academic test scores.

When examining statistical evidence, the proper aggregation of data is critical. Consider the ratio of the recent 2007–2011 enrollment of Asian students at Harvard relative to their estimated share of America's recent NMS semifinalists, a reasonable proxy for the high-ability college-age population, and compare this result to the corresponding figure for whites. The Asian ratio is 63 percent, slightly above the white ratio of 61 percent, with both these figures being considerably below parity due to the substantial presence of under-represented racial minorities such as blacks and Hispanics, foreign students, and students of unreported race. Thus, there appears to be no evidence for racial bias against Asians, even excluding the race-neutral impact of athletic recruitment, legacy admissions, and geographical diversity.

However, if we separate out the Jewish students, their ratio turns out to be 435 percent, while the residual ratio for non-Jewish whites drops to just 28 percent, less than half of even the Asian figure. As a consequence, Asians appear under-represented relative to Jews by a factor of seven, while non-Jewish whites are by far the most under-represented group of all, despite any benefits they might receive from athletic, legacy, or geographical distribution factors. The rest of the Ivy League tends to follow a similar pattern, with the overall Jewish ratio being 381 percent, the Asian figure at 62 percent, and the ratio for non-Jewish whites a low 35 percent, all relative to their number of high-ability college-age students.

Just as striking as these wildly disproportionate current numbers have been the longer enrollment trends. In the three decades since I graduated Harvard, the presence of white Gentiles has dropped by as much as 70 percent, despite no remotely comparable decline in the relative size or academic performance of that population; meanwhile, the percentage of Jewish students has actually increased. This period certainly saw a very rapid rise in the number of Asian, Hispanic, and foreign students, as well as

some increase in blacks. But it seems rather odd that all of these other gains would have come at the expense of whites of Christian background, and none at the expense of Jews.

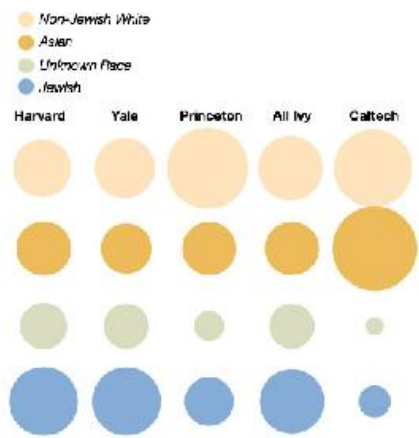
Based on these figures, Jewish students were roughly 1,000% more likely to be enrolled at Harvard and the rest of the Ivy League than white Gentiles of similar ability. This was an absolutely astonishing result given that under-representation in the range of 20% or 30% is often treated by courts as powerful *prima facie* evidence of racial discrimination.

- The Myth of American Meritocracy
  Ron Unz • ***The American Conservative*** • November 28, 2012 • 26,200 Words

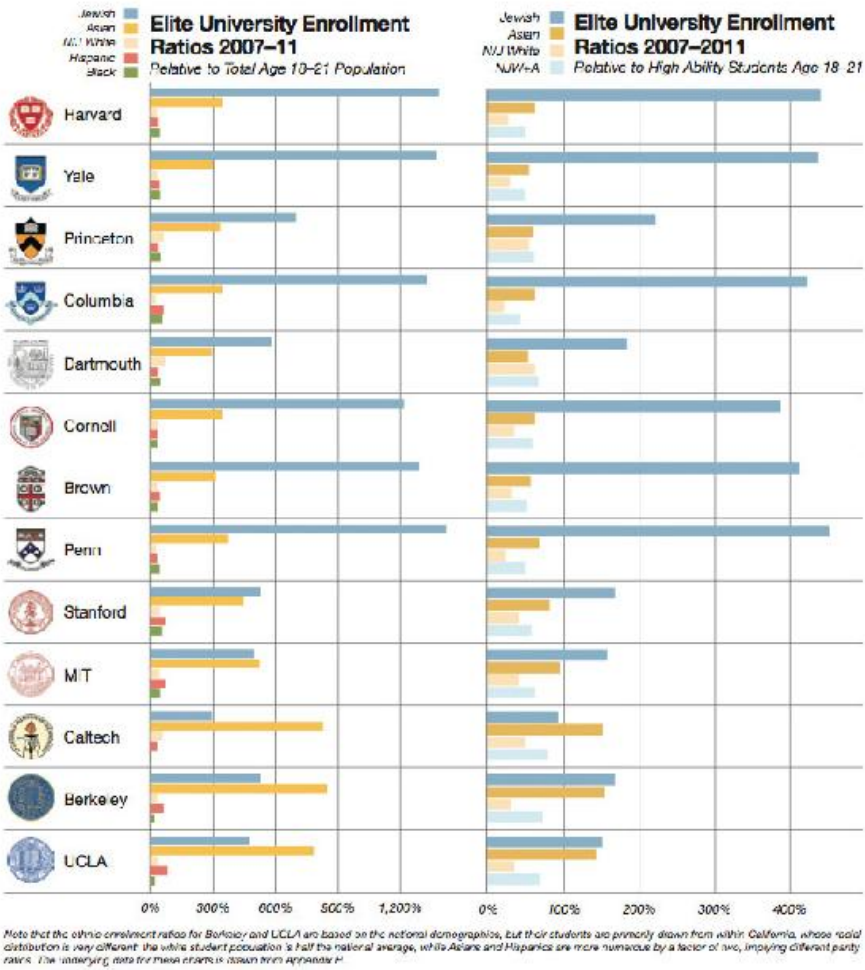
Several charts and graphs effectively presented these remarkable findings:

**Elite University Undergraduate Enrollments, 2007-2011**

| University | Non-Jewish White | Asian | Unknown Race | Jewish |
|---|---|---|---|---|
| Harvard | 18% | 16% | 12% | 26% |
| Yale | 20% | 14% | 11% | 28% |
| Princeton | 37% | 6% | 8% | 13% |
| Brown | 22% | 15% | 12% | 24% |
| Columbia | 15% | 16% | 10% | 25% |
| Cornell | 24% | 16% | 14% | 23% |
| Dartmouth | 42% | 14% | 8% | 11% |
| Penn | 17% | 18% | 15% | 27% |
| All Ivy League | 23% | 16% | 11% | 23% |
| Caltech | 33% | 39% | 2% | 9% |
| MIT | 27% | 25% | 6% | 9% |
| Stanford | 28% | 21% | 4% | 13% |
| UC Berkeley | 21% | 40% | 7% | 10% |
| UCLA | 24% | 37% | 4% | 9% |



Source: Appendices C-F



As I explained last year:

> These charts demonstrated the hidden reality that white Gentiles were heavily under-represented at elite colleges not merely with regard to their fraction of highest-performing students but even relative to their share of the college-age population. Academic administrators might publicly fret that blacks or Hispanics were not enrolled proportional to their national numbers, but the under-enrollment of non-Jewish whites was actually far more severe. To a considerable extent, the student bodies of our top colleges constitute the next generation of our national elites in embryonic form, and during recent decades white Gentiles had been increasingly excluded from that important pool.
>
> All these meritocracy statistics were originally compiled ten years

> ago, but when I've occasionally updated them, I noticed that little had changed except that they had sometimes grown even more extreme. As mentioned, legal discovery eventually revealed that an internal Harvard study had largely confirmed my analysis of Asian discrimination but had been suppressed. Meanwhile, my much more explosive analysis of massive Jewish over-representation had never been significantly challenged despite the angry fulminations of a few agitated Jewish activists, but the topic had unsurprisingly disappeared from any public debate.

Soon after I published my original article, the overwhelming evidence I provided of enormous Jewish over-representation relative to Jewish academic performance provoked a series of heated exchanges with a handful of outraged Jewish activists. As a consequence, I published a series of follow-up columns in which I explained and justified my methodology, confirming that my controversial conclusions had been entirely correct. Those so interested should read these pieces, weighing my own arguments against those of my critics and then decide for themselves:

- Meritocracy: The Yale Debate and Surname Analysis
  ***The American Conservative*** • February 1, 2013 • 1,800 Words
- Meritocracy: Response to Prof. Gelman on Jewish Elite Overrepresentation
  ***The American Conservative*** • February 13, 2013 • 2,800 Words
- Meritocracy: Admitting My Mistakes
  ***The American Conservative*** • February 21, 2013 • 2,200 Words
- Meritocracy: Gelman's Sixth Column
  ***The American Conservative*** • March 1, 2013 • 1,500 Words
- Meritocracy: Almost as Wrong as Larry Summers
  ***The American Conservative*** • March 9, 2013 • 2,000 Words
- Meritocracy: Dangerous Cancer Statistics
  ***The American Conservative*** • March 16, 2013 • 1,100 Words

Karabel must certainly be well aware of my findings, so his complete silence on Jewish matters in his lengthy *Times* piece was only to be expected. Karabel himself was a student of my late friend Nathan Glazer, the longtime dean of American ethnic sociology, who had been very impressed by my Meritocracy analysis and promoted it in his circles. Moreover, I had fully recognized the exceptionally explosive nature of my conclusions and therefore provided an advance copy of my work to the highly-regarded Berkeley scholar:

> My first decision was to place my Asian Quota section near the front of my very long text. Aside from the intrinsic importance,

this would also provide interested readers with a relatively safe "hook" that they could use to describe and promote my analysis, while allowing them to avoid mentioning any of the "third rail" material that constituted the bulk of my text; and this was exactly what eventually occurred. But such a strategy would obviously fail unless I could also somehow induce hair-trigger activist groups to maintain silence about my article rather than begin crudely demonizing it. Therefore, I decided to launch what I considered a decapitating first strike against those central organs of Jewish activism but to do so in a rather oblique manner.

Jerome Karabel certainly ranked as the world's foremost authority on Jewish admissions to the Ivy League, and his celebrated opus had been the central text I had used, although my ultimate conclusions were radically different than his own. It seemed likely to me that once Jewish organizations became aware of the controversial elements of my article, he would be among the first individuals they contacted, both to seek his assessment of my analysis and perhaps also receive suggestions for an effective rebuttal.

Therefore, I obtained Karabel's contact information and sent him an advance copy of my completed article weeks before it was generally released, explaining that I thought he would find it rather interesting although some of my conclusions were quite different than his own. My expectation was that once he carefully read my detailed analysis, he would conclude that the case I made was far too strong to be effectively refuted, and he would pass along that verdict to the activist organizations when they eventually contacted him, thus leading them adopt a policy of "strategic silence" in order to avoid drawing attention to my claims. For whatever reason, that was exactly how they reacted, and no prominent Jewish activist or group ever issued a public response to my extremely controversial findings despite the considerable attention these ultimately attracted.

In 2016 I had launched a high-profile campaign to elect a slate of candidates to the Harvard Board of Overseers, with one of our central issues being greater transparency in admissions, and although our effort failed, it may have had some longer-term consequences.

Neither our own slate nor that of our bitter opponents ever raised the issue of Jewish numbers, but the front-page story in the *New York*

*Times* announcing our effort must surely have reminded activist groups of the explosive contents of my original 2012 paper, and the risk that the surprising facts I had provided might eventually slip past their media blockade and reach the American public, perhaps with fateful consequences.

All my enrollment figures had been drawn from the public estimates annually provided by Hillel, the nationwide Jewish campus organization, whose numbers had been used for decades by academic researchers and media outlets. My article had noted that even slight declines in Jewish enrollment had sometimes provoked enormous public controversies and demands that they be immediately reversed. As I wrote in 2012:

> Meanwhile, any hint of "anti-Semitism" in admissions is regarded as an absolutely mortal sin, and any significant reduction in Jewish enrollment may often be denounced as such by the hair-trigger media. For example, in 1999 Princeton discovered that its Jewish enrollment had declined to just 500 percent of parity, down from more than 700 percent in the mid-1980s, and far below the comparable figures for Harvard or Yale. This quickly resulted in four front-page stories in the *Daily Princetonian*, a major article in the *New York Observer*, and extensive national coverage in both the *New York Times* and the *Chronicle of Higher Education*. These articles included denunciations of Princeton's long historical legacy of anti-Semitism and quickly led to official apologies, followed by an immediate 30 percent rebound in Jewish numbers. During these same years, non-Jewish white enrollment across the entire Ivy League had dropped by roughly 50 percent, reducing those numbers to far below parity, but this was met with media silence or even occasional congratulations on the further "multicultural" progress of America's elite education system.

The year after our unsuccessful Harvard Overseer campaign, the Hillel website reported a sudden, massive collapse in Jewish enrollment at Harvard and many other top universities, a decline of more than 50% that was totally ignored by both the national media and normally alert Jewish activist organizations, and this striking disappearance of Jews at elite colleges has continued down to the present day. However, I quickly determined that this shift seemed merely to be one of redefinition, with students apparently now only counted in that category if they declared themselves to be practitioners of the Jewish religion, a change that had an enormous impact, as I explained in 2018:

These arguments based on general plausibility are strongly supported by quantitative evidence, and ironically enough, it is Baytch herself who provided it. Around the time she produced her lengthy and unpublished document, Harvard Hillel was claiming a Jewish undergraduate enrollment of 25%, and near the beginning of her text, she claimed that figure was obviously false by citing a *Harvard Crimson* survey indicating that only 9.5% of the Class of 2017 were Jewish. However, she failed to notice that the survey referred to being *religiously* Jewish, which is entirely different than being Jewish in the broader ethnic or ancestral sense, especially since Jews are among the most secular populations in American society and a full 42% of the Harvard students described their religious beliefs as atheist, agnostic, or "other." Indeed, a worldwide survey finds that only 38% of (ethnic) Jews follow the Jewish *religion*. So if the *Crimson* survey were correct and Harvard Jews were typical in their religiosity, this would imply that 9.5% / 0.38 = 25%(!!!) of Harvard freshman were ethnically Jewish, *exactly* the figure claimed by Harvard Hillel. Fanatic ideologues such as Baytch sometimes have a tendency to score game-ending own-goals without even realizing what they have done.

In general, Jewish classification has a rather protean nature, with somewhat overlapping definitions based on religion, ethnicity, and full or partial ancestry, allowing it to be drastically expanded or contracted for various reasons. I suspect that Baytch's confusion on this matter was entirely sincere, related to the obsessive tendencies she exhibited in real life. But others may employ these shifting definitions based upon more pragmatic considerations.

It is well known that for many decades the American Communist Party and especially its top leadership were overwhelmingly Jewish, even at a time when Jews were just 3% of the national population. But Jewish community leaders were not pleased with this situation, and they sometimes flatly denied the reality, insisting that there were actually no Jewish Communists whatsoever—how could there be, when Communists were hostile to all religious belief?

Similarly, my findings that Jews were apparently enrolled at Harvard and other elite colleges at a rate some 1,000% greater than white Gentiles of similar academic performance must surely have set off alarm bells within the leadership of Jewish activist organizations, who wondered how best to manage or conceal this

potentially dangerous information. With a high-profile Asian discrimination lawsuit wending its way through the courts and my own unsuccessful 2016 attempt to run a slate of candidates for the Board of Harvard Overseers, the likelihood of growing public scrutiny surely loomed very large.

Baytch's apparent confusion between having Jewish ancestry and practicing the Jewish religion would have been well-known in these circles, and offered an obvious solution. If Jewish numbers were suddenly narrowed to only include those students who claimed to follow Jewish religious practices, the flagrant over-representation of Jews on elite campuses would be greatly reduced. Meanwhile, large numbers of lesser-qualified applicants of Jewish ancestry but no religious belief could continue to gain unfair admission by writing essays about their "Holocaust grandmas" with America's 98% Gentile population being none the wiser.

For whatever reason, Hillel seems to have recently adopted this practice, drastically reducing its published estimates of the Jewish enrollment at Harvard and other elite colleges, thus eliminating a glaring example of ethnic bias by a simple act of redefinition. For example, the Hillel website now claims that merely 11% of Harvard undergraduates are Jewish, a huge reduction from the previous 25% figure, and a total suspiciously close to the *Crimson* survey of a few years ago which counted Jews only based upon their religious beliefs. The Hillel figures for Yale, Princeton, and most other elite colleges have experienced equally sudden and huge declines.

One very strong clue regarding this new definition of Jewish enrollment comes from Caltech, an elite science and engineering school which is quite unlikely to attract Jews professing religious faith. According to the Hillel website, the Jewish enrollment is 0%, claiming that there absolutely no Jews on campus. Despite this, the website also describes the vibrant Jewish life at Caltech, with Caltech Jews involved in all sorts of local activities and projects. This absurd paradox is obviously due to the distinction between individuals who are Jewish by religion and those who are Jewish by ancestry.

As the 1999 media firestorm engulfing Princeton demonstrated, in the past even slight and gentle declines of Jewish enrollment over a fifteen year period would provoke massive controversy and angry denunciations from Jewish organizations. The absolute lack

of any organized response to the recent sudden disappearance of nearly 60% of Harvard's Jews certainly suggests that little more than a mere change in definition had occurred.

As I discussed last year, this apparent shift from a classification based upon Jewish ethnicity to one based upon Jewish religion seems to have successfully obscured the central issue:

> My own Meritocracy analysis was viewed hundreds of thousands of times, but such numbers represent merely a tiny sliver within the vastness of the Internet, and after a few months my explosive Jewish findings had permanently vanished from any secondary coverage or other public discussion. So although well-informed individuals interested in Jewish matters or elite college admissions must be aware of my results, the complete silence of the broader media has ensured that everyone else remained entirely ignorant.
>
> As an example of this, a few days ago a friend of mine pointed me to a *Tablet* podcast series on Jews in the Ivy League entitled "Gatecrashers" and hosted by Mark Oppenheimer, an Orthodox Jewish journalist who often focuses on religious matters. Although I listened to the episode "Harvard and the End of the Jewish Ivy League," I found Oppenheimer's obvious lack of quantitative skills or any true understanding of the issues involved rather disheartening.
>
> However, the podcast page did provide a link to a very helpful article in the *Harvard Crimson*, presenting the results of four years of Freshman surveys on a variety of lifestyle issues, including religious faith. During 2013-2016, there had been a very sharp decline in most religious affiliations, with the percentage of Catholics and Protestants together dropping from over 42% to less than 35% in just four years, and a corresponding, even stronger decline in followers of Judaism, while the combined category of Atheists, Agnostics, and "Other" grew from under 42% to nearly 53%. We can safely assume that a very substantial portion of the adherents in those latter categories are Jewish by ethnicity.
>
> Freshmen who were religiously Jewish had dropped to just 6.3% in 2016, but during the other three years the percentage had closely clustered around 10%, which is also the figure currently reported for Harvard on the Hillel website. So if we assume that Harvard College attracts Jews who are average in their religious faith, this indicates that the ethnically Jewish fraction of the

undergraduate population would be roughly 25% or perhaps a bit higher.

If this estimate of Jewish numbers is even remotely correct, the implications are quite astonishing, and we can easily understand why switching from ethnicity to religion was employed as a subterfuge to conceal that reality. Since 1980 every college and university in America has been required to report the demographic characteristics of its student body to the National Center for Education Statistics. Our own website provides this public data in a highly-convenient form, allowing easy examination of the historical trajectory of all our thousands of undergraduate academic institutions, and we can examine a table showing the changing enrollment at Harvard College since 2012:

HARVARD COLLEGE DEMOGRAPHICS PERCENTAGES

| Year | White | Black | Hispanic | Asian | Foreign |
|---|---|---|---|---|---|
| 2012 | 45.1 | 6.4 | 9.2 | 17.8 | 11.2 |
| 2013 | 44.9 | 6.5 | 9.3 | 18.1 | 11.5 |
| 2014 | 43.8 | 6.8 | 9.9 | 18.6 | 11.2 |
| 2015 | 42.7 | 6.3 | 10.4 | 19.2 | 11.7 |
| 2016 | 41.2 | 7.0 | 11.2 | 19.6 | 12.0 |
| 2017 | 40.4 | 7.6 | 11.6 | 20.2 | 11.5 |
| 2018 | 39.1 | 8.3 | 11.2 | 20.2 | 12.4 |
| 2019 | 37.6 | 8.6 | 11.1 | 21.0 | 12.3 |
| 2020 | 34.2 | 11.0 | 12.3 | 21.7 | 11.7 |
| 2021 | 35.4 | 9.2 | 11.6 | 21.3 | 12.8 |

One of the most striking facts is that during the five years 2015-2020, the percentage of black students grew from 6.3% to 11.0%, a remarkable rise of 75%, certainly the most rapid in Harvard's history, and despite the decline in 2021, the numbers are still up by nearly 50% since 2015. This dramatic rise was driven by extremely high

acceptance rates, with blacks being 14.8% of the students admitted in 2020 and a whopping 18% of the 2021 admissions. The number of Hispanic, Asian, and foreign students also rose substantially during those same years.

The Iron Law of Arithmetic demands that percentages must sum to 100, so during this same period, Harvard's white enrollment dropped by nearly 10 percentage points, steadily falling from 45.1% in 2012 to just 35.4% in 2021. And if, as seems likely, ethnically Jewish students are in the approximate range of 25%, the unavoidable conclusion is that although white Gentiles are nearly 60% of the American population and probably at least 60% of our highest-performing students, they are now approaching a single digit presence at our most elite college. As I noted in my original 2012 article, Harvard has long enrolled American blacks at a considerably higher rate than non-Jewish whites, but the former are now probably comparable in *absolute numbers* even though the latter are more than four times more numerous in our society.

These shocking conclusions must be carefully hedged with a couple of caveats. It is possible that for some reason Jews at Harvard are far more religious than the Jewish population as a whole, which would impact our ethnic estimates. There also seems to be some anecdotal evidence that the lure of Affirmative Action admissions has increasingly persuaded some white students to falsely claim non-white status, and perhaps those numbers have now become large enough to significantly distort Harvard's official statistics. But aside from these two possible factors, both quite difficult to evaluate, the shocking conclusions I have drawn seem inescapable.

The increasing elimination of non-Jewish whites from Harvard and other top colleges is real, but the underlying factors responsible are far from certain. However, I should quote a relevant paragraph from my 2012 article, which noted the close historical parallel described in Jerome Karabel's volume:

> It would be unreasonable to ignore the salient fact that this massive apparent bias in favor of far less-qualified Jewish applicants coincides with an equally massive ethnic skew at the topmost administrative ranks of the universities in question, a situation which once again exactly parallels Karabel's account from the 1920s. Indeed, Karabel points out that by 1993 Harvard, Yale, and Princeton all had presidents of Jewish ancestry,[80] and the same is true for the current presidents of Yale, Penn, Cornell, and possibly Columbia, as well as Princeton's president

> throughout during the 1990s and Yale's new incoming president, while all three of Harvard's most recent presidents have either had Jewish origins or a Jewish spouse.[81]

When I published that article a decade ago, probably half of the eight Ivy League colleges had Jewish presidents, and that figure still remains true today; the ratio had been much higher last year before Amy Gutmann left the presidency of Penn to become our ambassador to Germany, while on July 1st Harvard's Jewish President Lawrence Bacow was replaced by Claudine Gay, the first black to hold that position.

Relatively few Americans ever consider applying to Harvard or the other elite Ivy League schools. Indeed, I suspect that much of our citizenry probably regards the composition of those student bodies as totally irrelevant, of far less significance than the identities of our top professional athletes or pop music stars. Yet as I have repeatedly emphasized, those educational institutions tend to provide the next generation of America's ruling elites, and this applies to the world of politics as well as many other sectors.

Consider, for example, the leading figures in our current Biden Administration, who are playing a crucial role in determining the future of our own country and the rest of the world. The list of Cabinet departments has wildly proliferated since Washington's day, but suppose we confine our attention to the half-dozen most important, led by the individuals who control national security and the economy, and then also add the names of the President, Vice President, Chief of Staff, and National Security Advisor. Although "Diversity" may have become the sacred motto of the Democratic Party, the background of the handful of individuals running our country appears strikingly non-diverse, especially if we exclude the two political figureheads at the very top.

- President Joe Biden (Jewish in-laws)
- Vice-President Kamala Harris (Jewish spouse)
- Chief of Staff Jeff Zients (Jewish), replacing Ron Klain (Jewish, Harvard)
- Secretary of State Antony Blinken (Jewish, Harvard)
- Secretary of the Treasury Janet Yellen (Jewish, Yale)
- Secretary of Defense Lloyd Austin III (Black)
- Attorney General Merrick Garland (Jewish, Harvard)
- National Security Advisor Jake Sullivan (White Gentile, Yale)

- Director of National Intelligence Avril Haines (Jewish)
- Secretary of Homeland Security Alejandro Mayorkas (Jewish)

As I wrote last year:

> In 2013 Russian President Vladimir Putin visited Moscow's Jewish Center and noted in his remarks that 80-85% of the first Bolshevik government was Jewish. Although that statement was probably somewhat exaggerated, it does seem a very reasonable characterization of today's American government, despite Jews constituting less than 2% of our population.
>
> When a nation's top leadership is drawn from such a narrowly insular, almost incestuous circle, in which standards of strict meritocracy have long since been replaced by shared ideological beliefs and perhaps even widespread implicit ethnic nepotism, enormous problems may develop. Our current inflation rate is now the highest in forty years, and a few days ago, prestigious *Foreign Affairs*, mouthpiece of the American political establishment, carried a major article discussing the looming possibility of a simultaneous war against both Russia and China and how we could successfully triumph in such a difficult conflict. Since my infancy, no American president has seriously contemplated a war with either Russia or China, but our current national leadership seems quite eager to embroil us in a global war with both of them at the same time.

My original 2012 article had closed with a strongly cautionary note:

> Following the 1991 collapse and disintegration of the Soviet Union, some observers noted with unease that the United States was left as about the only remaining large and fully-functional multi-ethnic society, and the subsequent collapse and disintegration of ethnically diverse Yugoslavia merely strengthened these concerns. China is sometimes portrayed by the ignorant American media as having large and restive minority populations, but it is 92 percent Han Chinese, and if we exclude a few outlying or thinly populated provinces—the equivalents of Alaska, Hawaii, and New Mexico—closer to 95 percent Han, with all its top leadership drawn from that same background and therefore possessing a natural alignment of interests. Without doubt, America's great success despite its multiplicity of ethnic nationalities is almost unique in modern human history. But such success should not be taken for granted.

Many of the Jewish writers who focus on the history of elite university admissions, including Karabel, Steinberg, and Lemann, have critiqued and rebuked the America of the first half of the Twentieth Century for having been governed by a narrow WASP ascendency, which overwhelmingly dominated and controlled the commanding heights of business, finance, education, and politics; and some of their criticisms are not unreasonable. But we should bear in mind that this dominant group of White Anglo-Saxon Protestants—largely descended from among the earliest American settlers and which had gradually absorbed and assimilated substantial elements of Celtic, Dutch, German, and French background—was generally aligned in culture, religion, ideology, and ancestry with perhaps 60 percent of America's total population at the time, and therefore hardly represented an alien presence.[119] By contrast, a similarly overwhelming domination by a tiny segment of America's current population, one which is completely misaligned in all these respects, seems far less inherently stable, especially when the institutional roots of such domination have continually increased despite the collapse of the supposedly meritocratic justification. This does not seem like a recipe for a healthy and successful society, nor one which will even long survive in anything like its current form.

Power corrupts and an extreme concentration of power even more so, especially when that concentration of power is endlessly praised and glorified by the major media and the prominent intellectuals which together constitute such an important element of that power. But as time goes by and more and more Americans notice that they are poorer and more indebted than they have ever been before, the blandishments of such propaganda machinery will eventually lose effectiveness, much as did the similar propaganda organs of the decaying Soviet state. Kahlenberg quotes Pat Moynihan as noting that the stagnant American earnings between 1970 and 1985 represented "the longest stretch of 'flat' income in the history of the European settlement of North America."[120] The only difference today is that this period of economic stagnation has now extended nearly three times as long, and has also been combined with numerous social, moral, and foreign policy disasters.

Over the last few decades America's ruling elites have been produced largely as a consequence of the particular selection methods adopted by our top national universities in the late 1960s. Leaving aside the question of whether these methods have been fair or have instead been based on corruption and ethnic

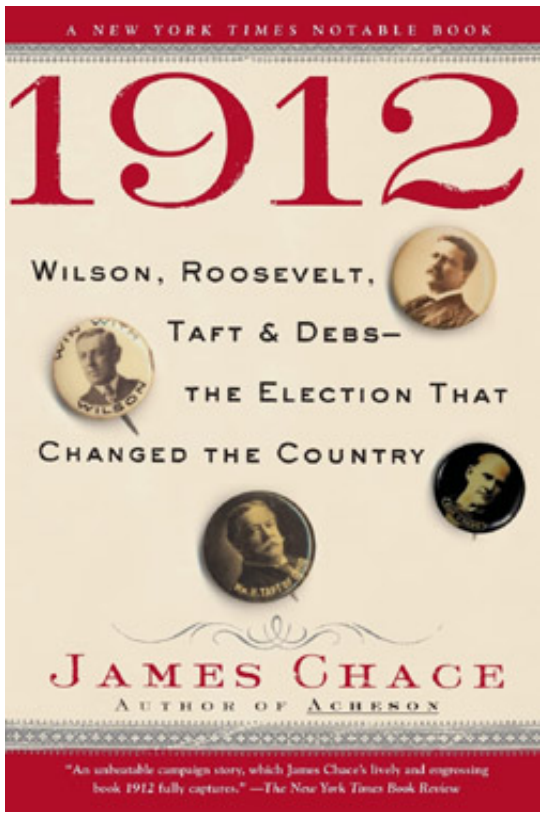
favoritism, the elites they have produced have clearly done a very poor job of leading our country, and we must change the methods used to select them.

# Donald Trump, Eugene Debs, and AMLO

*The American Political System as Laughingstock or Trainwreck*

***The Unz Review*** • August 7, 2023 • 4,900 Words

I'm not sure whether Donald Trump has ever heard of Eugene Debs, the austerely incorruptible early leader of America's Socialist Party. But I think there's a growing likelihood that their two names will soon be paired in many news stories as we move towards the 2024 election.



A NEW YORK TIMES NOTABLE BOOK
1912
WILSON, ROOSEVELT,
TAFT & DEBS—
THE ELECTION THAT
CHANGED THE COUNTRY
JAMES CHACE
AUTHOR OF ACHESON
"An unbeatable campaign story, which James Chace's lively and engrossing book 1912 fully captures." —The New York Times Book Review

Although almost forgotten today, Debs was a very prominent political figure a century ago, and he usually received brief mention in my introductory history textbooks, which occasionally noted the five times he had run for the Presidency on the Socialist Party ticket. His high-water mark came in the 1912 election when he pulled a remarkable 6% of the national vote, possibly even influencing the

outcome of the bitter three-way race between incumbent President Howard Taft, former President Theodore Roosevelt, and New Jersey Gov. Woodrow Wilson, which was won by the latter. Historian James Chace, former managing editor of *Foreign Affairs*, told that story in an interesting 2004 book.

The horrific First World War broke out the year after Wilson was inaugurated, and Debs, a strong anti-militarist, sat out the 1916 race as Wilson won a very narrow reelection victory partly on the strength of the campaign slogan "He kept us out of war." But America's industrial giants had sold enormous quantities of munitions to the Allies, much of it on credit, and without an Allied victory, those loans could never be repaid. So once the votes were counted and after a failed attempt to negotiate peace, Wilson soon reversed himself and took America into the stalemated European conflict.

Armies of many millions had already spent several years clashing on the Western Front, and only an enormous American force could tip the balance, so Wilson enacted a military draft, the first and only such measure in our national history except for the Civil War fought more than two generations earlier. Forcing millions of Americans to fight and die thousands of miles from home in a foreign war proved extremely unpopular in many parts of the country, and harsh sedition laws were soon passed, threatening long prison sentences for anyone who challenged those controversial government policies.

At a 1918 political rally, Debs made some disparaging remarks about his government's actions and the military draft, and he was quickly prosecuted and convicted despite his free speech defense, receiving a ten-year sentence in federal prison. That exemplary punishment hardly deterred him or his committed supporters, so the Socialist Party nominated him as its candidate in the 1920 Presidential race. Despite campaigning from his prison cell, he still won nearly a million votes—3.4% of the total. That achievement probably became the most memorable incident of his long career, and was almost always worth a sentence in history textbooks written many decades later.

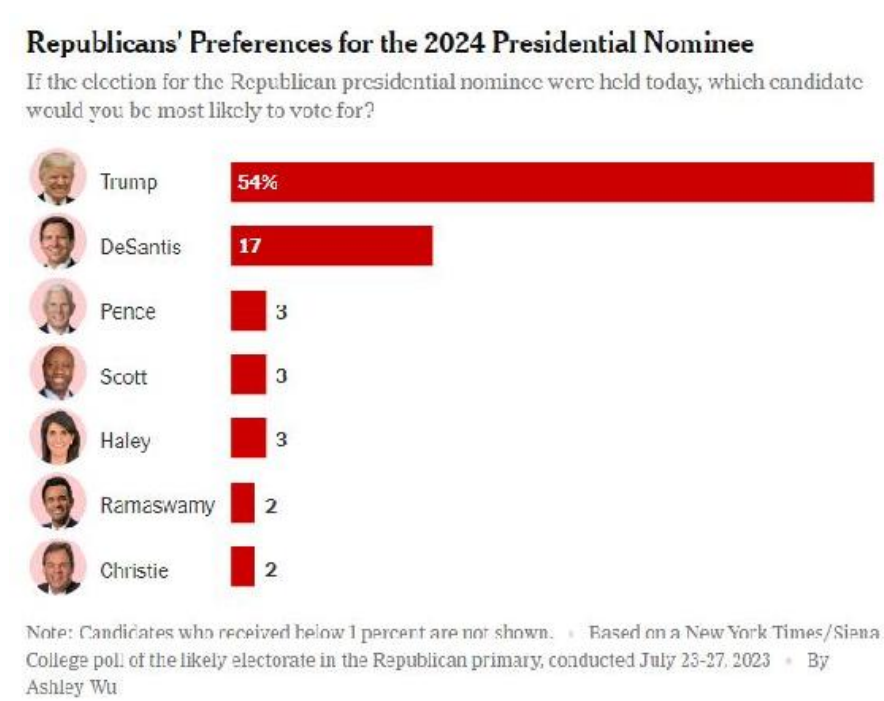
That bizarre story of a candidate running for the Presidency while serving time in federal prison has surely brought a smile to the faces of generations of high school and college students, an amusing historical tidbit that leavened the otherwise dull profusion of obscure names and dates from a century ago. But today the sheer political insanity of America's Democratic Party establishment has now brought our unfortunate country to a far stranger situation. Depending upon the speed of the judicial process, we face the very real prospect of

former President Donald J. Trump running—and ***winning***—the Presidency while sitting on his cot in state or federal prison.

Media is the oxygen of political campaigns, and Trump's totally unexpected primary and general election victories in 2016 were driven by the massive attention he received for his sometimes outrageous public statements, coverage greatly amplified by the unprecedented number of Twitter followers he had quickly amassed on social media. His bitter political enemies recognized the enormous, unfiltered power of that latter communication tool, and after he reached the White House, they exerted enormous pressure upon Twitter to begin censoring him. The notion of an American tech company restricting the political speech of a sitting American President seemed like something out of a Monty Python sketch, but it actually happened. Meanwhile, many of his leading activist supporters and pundit allies were completely purged from that platform, blows that greatly hindered his reelection campaign. Then after his November defeat and Joseph Biden's inauguration, Trump himself suffered the same fate, with his Twitter account permanently suspended.

With Trump banned from Twitter in early 2021, his political standing soon ebbed away as more and more of his low-information political base gradually forgot about him. This led many observers to conclude that his time had passed and some rival would likely capture the Republican nomination in the 2024 primaries.

However, that decline was quickly reversed when Trump's bitterly self-destructive Democratic Party enemies launched a series of prosecutions against him on a variety of different charges, ranging from mishandling secret documents to paying hush money to a former girlfriend to election fraud, all rather dubious charges. With such exciting new topics, the endless Trump Political Reality show had suddenly returned as popular entertainment, regaining the very high ratings it had previously enjoyed. Trump once again became the great hero of his populist Republican supporters, with recent polls showing he was drawing far more support in the 2024 primaries than all his Republican rivals combined.



Republicans' Preferences for the 2024 Presidential Nominee
If the election for the Republican presidential nominee were held today, which candidate would you be most likely to vote for?
Trump
54%
DeSantis
17
Pence
3
Scott
3
Haley
3
Ramaswamy
2
Christie
2
Note: Candidates who received below 1 percent are not shown. • Based on a New York Times/Siena College poll of the likely electorate in the Republican primary, conducted July 23-27, 2023 • By Ashley Wu

Indeed, some cynical observers even suggested that this outcome might have been intentional. Perhaps the Democrats regarded Trump as the weakest Republican candidate they might face in 2024, and sought to ensure his renomination. Such a deeply Machiavellian strategy might be possible, but all of these various prosecutions and trials will surely keep Trump at the top of the news cycle from now until November 2024, whether Election Day finds him still on trial or already serving time behind bars. It's easy to imagine that the same tidal wave of backlash sentiment now propelling Trump to a landslide victory in the forthcoming primaries might also carry over into November, returning him to the Presidency, whether from the courtroom or the jail house.

We should consider that even a couple of months ago when Trump's legal problems were only just beginning, he already began attracting strongly sympathetic remarks from unexpected ideological quarters.

Columnist Kevin Barrett is a Muslim convert friendly towards Iran, and in May he published a short item that opened by characterizing Trump as "an odious figure…A narcissistic semi-literate scoundrel." But his piece was entitled "Why I'm ALMOST Ready to Vote for Trump," and he explained that the totally unhinged campaign of vilification by our entire political and media establishment against the obnoxious former President had largely shifted him in that direction.

He also cited the analysis of a popular progressive podcaster:

> Jimmy Dore makes a good case that Trump's civil trial for sexual assault and defamation was "A Pure Democratic Hit Job." Dore points out that New York's bizarre one-year repeal of the statute of limitations was specifically designed to grease the skids for Carroll-v-Trump. Since when did governments start temporarily repealing statutes of limitations so they can go after political figures they don't like? The move seems especially egregious because it involved an almost three-decade-old case in which the alleged victim can't even remember which year the alleged assault happened, and has no evidence whatsoever other than her word against his. If you're going to do something as extreme as suspending the statute of limitations so you can prosecute a specific case, shouldn't you at least have some evidence?

Around the same time, other influential progressive journalists such as Max Blumenthal and Aaron Mate similarly ridiculed Trump's indictment on hush-money charges by an NYC prosecutor.

As of a week ago, Trump had already been facing 71 separate state and federal felony indictments. Then he was struck by the weightiest federal charge of all, accusing him of organizing a conspiracy to overturn the 2020 election results. These days American society is deeply polarized and most of the charges against Trump will be tried

in venues such as DC, Manhattan, and Atlanta where the jury-pools are sure to be heavily larded with Trump-haters. Add to that the uniformly hostile media coverage, and Trump's prospects of acquittal seem as dim as those faced by Debs in the wartime atmosphere of 1918. With so many dozens of serious charges against him, our 45th President seems likely to end up behind bars.

These latest indictments finally moved longtime progressive columnist and cartoonist Ted Rall into that same camp of outright Trump sympathizers. On Friday he published a column entitled "Hail to the Jailbird President," arguing that Trump might very well regain the Presidency on the strength of the unrelenting judicial and media campaign against him. According to Rall, the legal and political establishment fails to understand "that we, the people, hate their guts much more than we look down on…someone like Trump."

Although Trump's legion of enemies in the political and media firmament would probably regard Rall's reaction as incomprehensible, the point he is making is a very simple one. In recent years, enormous numbers of Americans, possibly even a considerable majority, have come to regard our country's ruling elite establishment as their deepest, sworn enemy. The massive vilification of Trump in such quarters indicates that those elites fear Trump as their most dangerous foe, so many voters may eventually conclude that the enemy of their enemy is at least worth a casual vote on the November ballot.

Although Trump's previous legal troubles had received a great deal of media attention, the coverage of the latest charges—that he had illegally conspired to subvert American democracy by challenging the results of the 2020 election and remaining in office—was vastly greater.

Only a fraction of *New York Times* subscribers still receive the national print edition, but it usefully provides a congealed record of those issues most important to the editors, and on both Thursday and Friday the upper section of each front page—nearly two-thirds of the available space—was filled with multiple stories describing Trump's federal indictment on election conspiracy charges.

I only very lightly skimmed the arguments and they're mostly a jumble in my mind, but apparently the blowhard Trump felt he'd actually won the 2020 election and spoke with his leading supporters

about challenging the official results, which they all believed were heavily tainted with fraud. But although countless American candidates throughout our history have bitterly complained about stolen elections and sometimes contested the outcomes, our rabidly partisan Democratic prosecutors have now decided to treat that behavior as a crime, apparently hoping to destroy their Trumpian nemesis using the power of the courts.

This judicial innovation may be unique in the developed world and seems extremely rare even outside it. Trump's crude insults about "Mexican rapists" had hardly endeared him to the citizens of our Southern neighbor, but by all accounts Mexico's leftist President Andrés Manuel López Obrador—AMLO—seemed quite supportive and sympathetic towards Trump during his reelection campaign, and was also one of the last major world leaders to accept Biden's victory and acknowledge that Trump had lost.

López Obrador being proclaimed "Legitimate President of Mexico" by his supporters in November 2006

Probably one of the factors behind this surprising political twist was that the populist AMLO had himself been bitterly opposed by the united political establishment of his own country when he'd run for the presidency in 2006 and 2012, and twice claimed that he had been cheated of victory by government fraud. His extremely narrow loss in 2006 had been particularly suspicious, and after his apparent election-night victory had suddenly been transmuted into defeat, he and his outraged supporters began a massive protest campaign that disrupted life in the capital city, with his sympathizers even publicly swearing him in as "the Legitimate President of Mexico."

Yet while many Americans—Trumpists most of all—regularly disparage and insult Mexico as a Third World "shithole country," the Mexican political elites tolerated AMLO's protests with good grace.

Rather than being prosecuted and imprisoned, AMLO eventually gave up on his unofficial presidency and after creating a new party as his vehicle, ran for president a third time in 2018, winning in a huge landslide despite any election fraud. So while Trump faces time in prison for complaining about a stolen election, his Mexican counterpart who had earlier done much the same thing is completing his very successful six-year term, ranked as one of the world's most popular leaders and having a good chance that his hand-picked candidate will succeed him.

Fortunately for AMLO, his protests of a stolen election had occurred in 2006, long before Trump entered the scene, so any attempt by his own government to prosecute and imprison him would have surely been denounced and ridiculed by the American establishment as an outrageous violation of basic democratic principles. But these days, the globally-dominant and Trump-hating American media plays a very different tune, so the precedent of prosecuting a losing candidate for protesting alleged election fraud may soon spread worldwide.

In Brazil, the conservative establishment had used a somewhat doubtful corruption conviction to block former President Lula from seeking to regain the presidency, but once it was overturned by the courts, he successfully did so, and his own courts then used the excuse of election protests to prohibit his defeated rightwing opponent President Bolsonaro from trying to do the same in four years time.

In India, the ultra-rightwing Modi government is overwhelmingly popular, but still decided to take no chances. The parliamentary opposition is led by Rahul Gandhi, the son, grandson, and great-grandson of past Prime Ministers, but the government prosecuted him for making a public statement seeming to imply that Modi was crooked, successfully banning him from politics as a consequence, though on Friday a court overturned the verdict. But just a day later, former Prime Minister Imran Khan of neighboring Pakistan was sent to prison for three years, thereby preventing him from contesting the forthcoming elections; the massive public protests Khan had led against his sudden removal from office last year had deeply outraged the country's powerful military.

I fear that all too many democratic or semi-democratic governments around the world will now eagerly seize upon the innovative electoral strategy pioneered by our own Democratic Party and henceforth use judicial means to eliminate their political rivals.

Moreover, while the ferociously anti-Trumpist media would never admit the possibility, the Donald and his angry supporters actually have a very strong case in their bitter complaints of a stolen 2020 election. I explained those simple facts back in January 2021.

> Although hardly suggested by our mainstream media, the officially-reported results demonstrated that our 2020 presidential election was extraordinarily close.
>
> All the regular pre-election polls had shown the Democratic candidate with a comfortable lead, but just as had been the case four years earlier, the actual votes tabulated revealed an entirely contrary outcome. According to the official vote-count, the Biden/Harris ticket ended up millions of votes ahead, having racked up huge leads in overwhelmingly Democratic states such as my own California, and also won by a very comfortable 306 to 232 margin in Electoral Votes. But control of the White House depends upon the state-by-state tallies, and these told a very different story.
>
> Incumbent Donald Trump lost Arizona, Georgia, and Wisconsin by such extremely narrow margins that a swing of less than 22,000 votes in those crucial states would have gotten him reelected. With a record 158 million votes cast, this amounted to a victory margin of around 0.01%. So if just one American voter in 7,000 had changed his mind, Trump might have received another four years in office. ***One American voter in 7,000.***
>
> Such an exceptionally narrow victory is extremely unusual in modern American history. For decades, the very tight Kennedy-Nixon race of 1960 had been a byword for close results, but Biden's margin of victory was much smaller. More recently, George W. Bush won a narrow reelection over Sen. John F. Kerry in 2004, but Kerry would have required a voter swing nearly five times greater than Trump's in order to claim victory. Indeed, with the sole exception of the notorious "dangling chads" Florida decision of the 2000 Bush-Gore election, no American presidential candidate in over 100 years had lost by so narrow a voter margin as Donald J. Trump.
>
> If our incompetent or dishonest media had correctly reported these simple facts, perhaps Democratic partisans would have been somewhat more understanding of the outrage expressed by so many of their Republican counterparts, who believed they had been cheated of their election victory. Admittedly, Trump backers seem equally unaware of the historically slender margin of their

candidate's defeat.

Furthermore, not only was the 2020 Presidential election remarkably close, but any objective examination of the facts clearly proves that outcome was stolen from Trump. This easily explains the widespread protests by his supporters in DC on January 6th, as I discussed a few days later.

> I haven't investigated the matter, but there does seem to be considerable circumstantial evidence of widespread ballot fraud by Democratic Party forces, hardly surprising given the apocalyptic manner in which so many of their leaders had characterized the threat of a Trump reelection. After all, if they sincerely believed that a Trump victory would be catastrophic for America why would they not use every possible means, fair and foul alike, to save our country from that dire fate?
>
> In particular, several of the major swing-states contain large cities —Detroit, Milwaukee, Philadelphia, and Atlanta—that are both totally controlled by the Democratic Party and also notoriously corrupt, and various eye-witnesses have suggested that the huge anti-Trump margins they provided may have been heavily "padded" to ensure the candidate's defeat.
>
> Even leaving aside some of these plausible claims, the case for a stolen election seems almost airtight. I don't know or care anything about Dominion voting machines, whether they are controlled by Venezuelan Marxists, Chinese Communists, or Martians. But the most blatant election-theft was accomplished in absolutely plain sight.
>
> Not long before the election, the hard drive of an abandoned laptop owned by Joe Biden's son Hunter revealed a gigantic international corruption scheme, quite possibility involving the candidate himself. But the facts of this enormous political scandal were entirely ignored and boycotted by virtually every mainstream media outlet. And once the story was finally published in the pages of the *New York Post*, America's oldest newspaper, all links to the *Post* article and its website were suddenly banned by Twitter, Facebook, and other social media outlets to ensure that the voters remained ignorant until after they had cast their ballots.
>
> Renowned international journalist Glenn Greenwald was hardly a Trump partisan, but he became outraged that the editors of

the *Intercept*, the $100 million publication he himself had co-founded, refused to allow him to cover that massive media scandal, and he angrily resigned in protest. In effect, America's media and tech giants formed a united front to steal the election and somehow drag the crippled Biden/Harris ticket across the finish line.

The Hunter Biden corruption scandal seemed about as serious as any in modern presidential election history and Biden's official victory margin was just 0.01%. So if the American voters had been allowed to learn the truth, Trump almost certainly would have won the election, quite possibly in an Electoral College landslide. Given these facts, anyone who continues to deny that the election was stolen from Trump is simply being ridiculous.

Heated election campaigns have consequences, and this is especially true when all of America's most powerful corporations and ruling elites unite to essentially steal a reelection from a populist incumbent, hero-worshiped by many tens of millions of Americans. And when despite all that blatant unfairness and theft, the final margin of defeat is just one vote in 7,000, an explosion of popular outrage should only be expected.

Solid estimates appear unavailable, but it seems that hundreds of thousands of grass-roots Trump supporters traveled to our nation's capital to protest against what they regarded as a stolen election, and then peacefully assembled to listen to their hero's speech.

Afterwards, a tiny sliver of this vast multitude of angry individuals—perhaps less than one in a thousand—barged their way into the strangely-undefended Capitol building of Congress, took souvenir selfies, livesteamed their antics, and generally played the role of tourist-protesters while the lawmakers they so despised as corrupt mostly fled or hid. These Trumpists and some of their colorful costumes brought to mind the radical Yippies of the late 1960s.

The previous year had seen an unprecedented wave of violent riots, arson, and looting across some 200 American cities, which our entirely corrupt and dishonest media had generally characterized as “mostly peaceful protests.” In previous years, angry mobs of organized Democratic activists had repeatedly invaded and occupied the Wisconsin Legislature, sometimes winning praise from the media. But when unarmed Trump supporters now did something similar for a few hours in Washington, they were quickly branded “domestic terrorists” seeking to overthrow our democracy.

A video shows Ashli Babbitt, an unarmed female protester, being shot dead by a security guard as she tried to climb through a window, an incident not dissimilar to the famous Kent State shootings of a 1960s campus protest, but hardly treated by the media in a similar manner.

- American Pravda: Our Disputed Election
  Ron Unz • ***The Unz Review*** • January 14, 2021 • 2,000 Words

The total tech and media suppression of the contents of the Hunter Biden laptop probably cost Trump an easy or even overwhelming reelection victory. Highly-regarded former longtime CIA Analyst Ray McGovern, certainly no Trump supporter, noted that it has now come out that current Secretary of State Antony Blinken—then a top Biden aide—had helped orchestrate the public declaration by 51 former Intelligence officers that the contents of the Hunter Biden laptop should be disregarded as likely "Russian disinformation."

Others have come to similar conclusions regarding the media cover-up of massive Biden corruption. Jonathan Turley, a leading establishmentarian figure holds the Shapiro Chair of Public Interest Law at George Washington University. As his 5,000 word Wikipedia entry describes, he has spent decades as one of our most prolific and influential media commentators on legal matters, publishing numerous pieces in the *New York Times* and the *Washington Post* while being a regular guest on our broadcast networks.

*The Hill* is one of DC's leading political newspapers and a couple of months ago, Turley published an outraged column, expressing his amazement at the total unwillingness of our media to report the plain facts of the evidence of massive financial corruption engulfing the Biden family.

> This week, Rep. Byron Donalds (R-Fla.) tried to do the impossible. After he and his colleagues presented a labyrinth of LLC shell companies and accounts used to funnel as much as $10 million to Biden family members, Donalds tried to induce the press to show some interest in the massive corruption scandal. "For those in the press, this easy pickings & Pulitzer-level stuff right here," he pleaded.
>
> The response was virtually immediate. Despite showing nine Biden family members allegedly receiving funds from corrupt figures in Romania, China and other countries, The New

Republic quickly ran a story headlined “Republicans Finally Admit They Have No Incriminating Evidence on Joe Biden.”

For many of us, it was otherworldly. A decade ago, when then-Vice President Joe Biden was denouncing corruption in Romania and Ukraine and promising action by the United States, massive payments were flowing to his son Hunter Biden and a variety of family members, including Biden grandchildren.

The brilliance of the Biden team was that it invested the media in this scandal at the outset by burying the laptop story as “Russian disinformation” before the election. That was, of course, false, but it took two years for most major media outlets to admit that the laptop was authentic.

But the media then ignored what was on that “authentic laptop.” Hundreds of emails detailed potentially criminal conduct and raw influence peddling in foreign countries.

When media outlets such as the New York Post confirmed the emails, the media then insisted that there was no corroboration of the influence peddling payments and no clear proof of criminal conduct. It entirely ignored the obvious corruption itself.

Now that the House has released corroboration in actual money transfers linking many in the Biden family, the media is insisting that this is no scandal because there is no direct proof of payments to Joe Biden.

Putting aside that this is only the fourth month of an investigation, the media’s demand of a direct payment to President Biden is laughably absurd. The payments were going to his family, but he was the object of the influence peddling.

The House has shown millions of dollars going to at least nine Bidens like dividends from a family business. As a long-time critic of influence peddling among both Republicans and Democrats, I have never seen the equal of the Bidens.

The whole purpose of influence peddling is to use family members as shields for corrupt officials. Instead of making a direct payment to a politician, which could be seen as a bribe, you can give millions to his or her spouse or children.

Moreover, these emails include references to Joe Biden getting a 10 percent cut of one Chinese deal. It also shows Biden associates warning not to use Joe Biden's name but to employ code names like "the Big Guy." At the same time, the president and the first lady are referenced as benefiting from offices and receiving payments from Hunter.

Indeed, Hunter complains that his father is taking half of everything that he is raking in.

- American Pravda: The Limits of Media Corruption
  Ron Unz • ***The Unz Review*** • May 22, 2023 • 3,400 Words

The leftist *Moon of Alabama* blogger recently emphasized that there seems to be a striking correspondence between the timing of emerging revelations of the Biden corruption scandal and the criminal indictments made against Trump.

As Adam Smith once observed, "There is a great deal of ruin in a nation," but our own country may be rapidly approaching its limit. Nearly 70% of Republicans believe that Donald Trump actually won the 2020 election and only voting fraud put Joseph Biden in the White House, but Trump now faces a lengthy prison sentence for taking that same position.

As a recent *New York Times* article emphasized, the notion of a jailed former President running for the White House is an absolutely extraordinary event and our country would be entering "uncharted territory." But there is also a very real possibility that

Trump would win and none of the legal experts consulted by the *Times* had any idea of what that would entail: “No one knows.”

America’s political system is facing an enormous crisis of legitimacy, perhaps just as serious and potentially fatal as the one that brought down the old USSR in the early 1990s. Our horrendous budget and trade deficits seem permanent but clearly unsustainable, we recently suffered the highest inflation in four decades, and three years ago we experienced the worst urban rioting since the 1960s, as well as the largest spike in the national homicide rate since record-keeping began. We have spent the last eighteen months fighting a losing proxy-war against nuclear-armed Russia on Russia’s own border, astonishingly reckless behavior that would have been unimaginable at the height of the old Cold War. The Covid epidemic took more than a million American lives and last year I argued that the calamity was closely analogous to the 1986 Chernobyl nuclear disaster that played such a major role in the collapse of the Soviet Union a few years later.

- A Thousand Times Greater Than the Chernobyl Nuclear Disaster
  Ron Unz • ***The Unz Review*** • July 11, 2022 • 2,300 Words

As a longstanding political regime loses legitimacy, more and more individuals begin to question the fundamental narrative that it had promoted, wondering which of those beliefs are merely falsehoods endlessly repeated by a dishonest media. Over the last five years, my own American Pravda series has heavily explored these sorts of issues, and last week I discussed these topics with Michael Rectenwald, a former NYU professor.

As of today, there is a serious possibility that Donald Trump will win the Presidency while campaigning from a prison cell.  That astonishing prospect perfectly symbolizes the current state of the American political system.

# Why the Media Fears RFK Jr.

*Investigating the Sounds of Silence*

***The Unz Review*** • August 14, 2023 • 8,200 Words

## Avoiding Kennedy Assassination Conspiracies

Last week the *New York Times* ran a lengthy front-page hit-piece against Robert F. Kennedy Jr., scion of America's most famous political family and an underdog challenger to President Joseph Biden in the Democratic Primaries.

Kennedy's unexpectedly strong campaign had recently stumbled when the novice candidate made some incautious remarks at a private dinner regarding the ethnic skew of Covid vulnerability, and a video clip of his explosive words touched off a media feeding-frenzy. The *Times* and the rest of the mainstream media are intensely hostile to Kennedy's effort and the editors may have hoped that this piling-on attack might permanently cripple his fledgling campaign.

- Anguish in Camelot: Kennedy Campaign Roils Storied Political Family
  Peter Baker • ***The New York Times*** • August 6, 2021 • 2,600 Words

Probably few readers, whether Kennedy supporters or opponents, found anything unexpected in the article authored by Chief White House Correspondent Peter Baker. Near the beginning, we were told that Kennedy "has become a source of deep anguish among his many siblings, cousins, nieces, and nephews." The candidate was described as a former drug-addict, expelled from his private schools, who had been married three times and whose second wife had committed suicide. Meanwhile, almost any mention of the great accomplishments in his long and successful career as an environmental attorney were left on the cutting-room floor.

The main focus of the piece was Kennedy's frayed relations with his extended family, die-hard Democrats all, who were bewildered and saddened by the strange and self-destructive political behavior of their errant relative. The text was heavily laced with harshly negative quotes regarding his beliefs—"deplorable and untruthful" according to his sister Kerry Kennedy, "morally and factually wrong" by his brother

Joseph P. Kennedy II, while his nephew Joseph P. Kennedy III Tweeted "I unequivocally condemn what he said." The article opened with a denunciation by the only grandson of President John F. Kennedy, who declared that his "conspiracy-minded" cousin was "tarnishing the legacy of his grandfather and their storied family" with his "vanity project." I counted a total of 13 different Kennedys cited in the piece, almost all of them providing these sorts of unflattering remarks.

The entire tone of the article was unrelentingly negative and clearly intended to present the dissenting Democratic candidate as someone who held bizarre beliefs or was even unhinged, definitely not an individual to be entrusted with our nation's future. I'd assume that the Democratic Party's lavishly-funded corps of opposition researchers have carefully parsed every spoken or written word of Kennedy for the last couple of decades and then gifted the choicest morsels they uncovered to their numerous media allies including the *Times*.

Thus, we can safely assume that every misstep or bit of dirt about Kennedy would have been discovered by now, allowing us to draw some important inferences from any silence. So as I carefully read the *Times* article, I focused not so much on what it contained but rather what it strangely omitted.

Over the years, Kennedy has publicly and repeatedly declared that both his father and his uncle had died at the hands of a conspiracy, pointing to the CIA as the most likely culprit. Probably at least a couple of million Americans have read his words or listened to his interviews, clearly establishing him as the most explicit sort of "conspiracy theorist," a highly pejorative term that the media always eagerly seeks to inflict upon disfavored political candidates.

Yet across the full 2,600 words of the article, most of it heavily focused upon Kennedy family matters, mention of that topic was limited to just a single glancing sentence. Why would the *Times* have almost entirely avoided such a tempting target, one that seemingly supported its portrayal of Kennedy as holding bizarre and irrational beliefs? I think that the best explanation is that the editors knew perfectly well that Kennedy's facts were rock-solid on that issue, and that challenging him would merely bring his information to much wider attention, perhaps leading many additional millions of Americans to conclude that their own media had been lying to them for six decades just as Kennedy himself had Tweeted out last year:

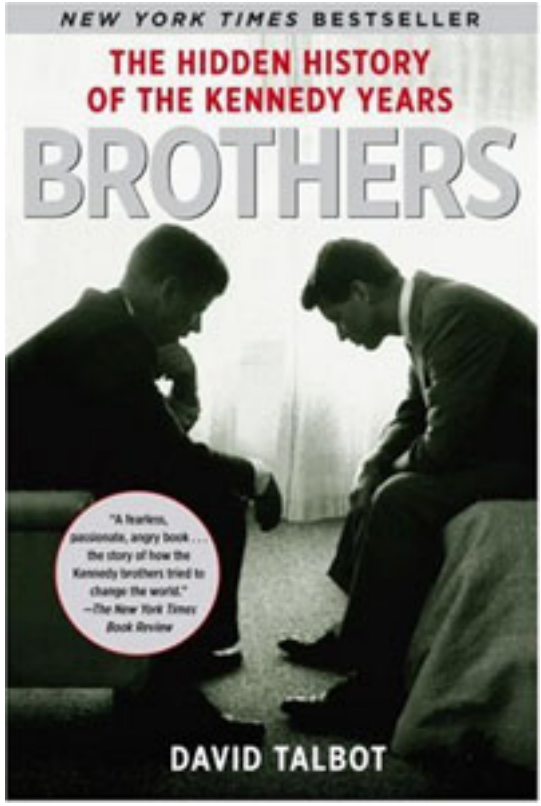
Only a week before sending that Tweet, Kennedy had published a long piece in the *San Francisco Chronicle* presenting the incontrovertible facts of his own father's killing, and if these came to widespread attention, decades of media lies might begin to unravel.

- Sirhan Sirhan didn't kill my father. Gov. Newsom should set him free
  Robert F. Kennedy Jr. • ***The San Francisco Chronicle*** • December 8, 2021 • 1,000 Words

Consider, for example, prominent liberal pundit Bill Maher, someone who would certainly never classify himself as a "conspiracy theorist." When he interviewed Kennedy a few weeks ago and heard the factual evidence regarding the assassination of the candidate's father in 1968, he immediately declared himself completely convinced that Kennedy was correct about the existence of a conspiracy.

Moreover, the particular focus of the *Times* article would have put the newspaper on especially risky ground. With thirteen different members of the Kennedy family mentioned or quoted in the text, any substantial discussion of the 1960s assassinations might reveal that many or most of Kennedy's relatives fully agreed with the candidate about the existence of a conspiracy, thereby blowing a huge hole in the media's decades-long blockade of the truth. If the American people discovered that the entire Kennedy family was filled with "Kennedy assassination conspiracy theorists," tens of millions of minds might be changed.

Consider another piece published a couple of months earlier by *Times* columnist Michelle Goldberg, which had appeared as part of a large barrage of media attacks and insults against the conspiratorial beliefs of Kennedy and his supporters. Although she treated his views on the assassinations as an element of his irrationality, she couldn't help mentioning that *Salon* founder David Talbot, her old boss and a highly-regarded national journalist, entirely agreed with Kennedy about those historical facts.



NEW YORK TIMES BESTSELLER
THE HIDDEN HISTORY
OF THE KENNEDY YEARS
BROTHERS
"A fearless, passionate, angry book . . . the story of how the Kennedy brothers tried to change the world."
—The New York Times Book Review
DAVID TALBOT

Indeed, I regard Talbot's 2005 national bestseller *Brothers* as probably the most important Kennedy assassination book of the last twenty years because it revealed that so many individuals near the top of the American government, including most of the Kennedy family itself, had almost immediately concluded that our 35th President died in a conspiracy. A leading mainstream historian lavishly praised Talbot's research in the *Times* itself and suggested that the existence of a conspiracy was obvious. But the editors running the *Times* news pages have continued to avert their eyes from these facts, perhaps leading their younger colleagues such as Goldberg to remain blissfully unaware.

## Totally Ignoring Kennedy's AIDS Denialism

When hostile journalists seek to destroy a candidate, they naturally direct their coverage where they believe he is most vulnerable and do their best to ignore his greatest strengths. A shrewd campaign might use such biased reporting as a road-map, one that provides the photographic negative of the issues that should be emphasized. So if the *Times* and other media outlets seek to avoid the Kennedy

assassination conspiracies, perhaps those are exactly the right issues to discuss.

But there is another incendiary topic on which the silence surrounding Kennedy's position has been far more absolute across both the mainstream and the alternative media, so much so that probably only the tiniest sliver of Americans are even aware of Kennedy's views. Based upon his extremely controversial writings, the candidate would seem so tremendously vulnerable that any such media coverage would immediately destroy his campaign and his reputation. Yet not a single hostile publication has ever reported those facts, suggesting that the true situation is actually quite different from what it appears to be. Perhaps this total silence implies that the *Times* and other media outlets dread that subject, fearing that it could destroy their entire media establishment if the facts came out and Kennedy were proven correct.

Until late 2021 I'd been only slightly aware of Kennedy, having vaguely heard that he'd become a leading figure in the growing anti-vaxxing movement. My own views on vaccines had always been quite conventional, not too different from those advocated by the *Times*, but I was persuaded to read his new book in order to get his side of the story.

To my utter amazement I discovered that the main subject of his text was something entirely different than what I had been led to believe. Kennedy had devoted nearly half the length—200 pages—to promoting the theory that AIDS did not exist as a real disease and was instead merely a medical media hoax concocted by Dr. Anthony Fauci and his greedy corporate allies. But not a single one of those describing his book, whether supportive or critical, had ever hinted at this. Indeed, when I mentioned the true subject of Kennedy's text to a couple of people, they almost seemed to think that I was delusional, considering it impossible that no one would have revealed such a startling fact.

Kennedy's book quickly became the #1 Amazon bestseller and he soon drew extremely harsh media attacks, including a 4,000 word article produced by a large team of *Associated Press* journalists. But as I noted, although they denounced him on every other point none of them ever mentioned his explosive AIDS claims.

> A great deal of effort had obviously been invested in this attack, and the byline of the named author was shared by five additional *AP* writers and researchers, underscoring the

> journalistic resources devoted to demolishing the reputation of an individual who has obviously made such powerful enemies. But in reading the article, the phrase that came to my mind was "the Sounds of Silence" or perhaps the famous Sherlockian clue of "the Dog That Didn't Bark."
>
> Almost half of the entire book under attack—around 200 pages—is devoted to presenting and promoting the astonishing claim that everything we have been told about HIV/AIDS for more than 35 years probably amounts to a hoax.
>
> By any reasonable standard, Robert F. Kennedy, Jr. has now established himself as America's #1 "HIV/AIDS Denier," and prior to the Covid outbreak, AIDS had probably spent almost four decades as the world's highest-profile disease, reportedly absorbing some two trillion dollars in research and treatment costs. So for someone to essentially claim that the disease doesn't actually exist would seem the height of utter lunacy, on a par with Flat Earthism. Yet not a single word of this astonishing situation appears in the long *AP* article, that attacks Kennedy on almost all other possible grounds, fair or unfair. Did all *six* of the *AP* writers and researchers somehow skip over those 200 pages in Kennedy's bestseller?
>
> That large team of *AP* journalists seems to have spent at least ten days working on their lengthy article, mining Kennedy's record for almost everything controversial they could possibly find, even highlighting a photograph that merely shows him standing next to Trump allies Roger Stone and Michael Flynn.
>
> - How a Kennedy Built an Anti-Vaccine Juggernaut Amid COVID-19
> Michelle R. Smith et. al. • ***The Associated Press*** • December 15, 2021 • 4,000 Words

I noticed this same total silence about AIDS was maintained in a similar attack the following month by the managing editor of *Counterpunch*.

- Vaccines, RFK Jr. and The Science of Misinformation
Joshua Frank • ***Counterpunch*** • January 14, 2022 • 1,900 Words

With Kennedy's book passing the million mark in sales and his influence still growing, this pattern of omission continued and became even stranger.  In late February, the *New York Times* launched a

blistering front-page attack against him, tarring the author and his book as a font of total irrationality and dangerous misinformation, but the 2,600 words never hinted at his central focus on AIDS.

Moreover, the writer was longtime *Times* journalist Adam Nagourney, identified as the co-author of a history of the modern Gay Rights movement, and surely the AIDS epidemic must have been a central part of his research for that 2001 volume. But he never mentioned the 200 pages in which Kennedy had made the incendiary claim that AIDS was just a medical media hoax, an omission perhaps suggesting that he feared that Kennedy might well be correct and that certain doors should be kept firmly closed.

- A Kennedy's Crusade Against Covid Vaccines Anguishes Family and Friends
  Adam Nagourney • ***The New York Times*** • February 26, 2022 • 2,600 Words

As I later noted, this silence very suspiciously contrasted with the firestorms of media outrage that had once greeted those who raised even mild doubts about the AIDS issue.

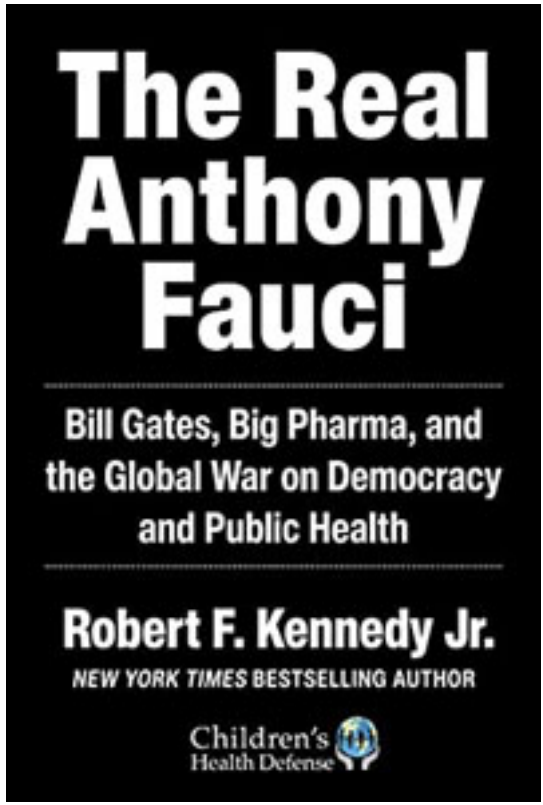
> Since the 1980s AIDS has been an explosive topic in the public sphere, and anyone—whether scientist or layman—who questioned the orthodox narrative was viciously denounced as having blood on his hands. During the early 2000s South African President Thabo Mbeki had cautiously raised such possibilities and was massively vilified by the international media and the academic community. Yet when Kennedy's #1 Amazon bestseller went much farther, devoting seven full chapters to making the case that HIV/AIDS was merely a medical hoax, his media antagonists carefully avoided that subject even while they attacked him on all other grounds.
>
> Once again, the only plausible explanation is that the hostile journalists and their editors have recognized that Kennedy's factual evidence was too strong and any such attacks might prove disastrously counter-productive. As far back as the 1990s, a former Harvard professor had publicly declared that the AIDS hoax was as great a scientific scandal as the notorious Lysenko fraud, and if a substantial portion of the American public concluded that AIDS was indeed a medical phantom that had been promoted for 35 years by our gullible and dishonest media, the credibility of the latter on current vaccination issues might be completely annihilated.

> It would have been the easiest thing in the world for the media to accurately blast Kennedy as “a conspiracy theorist whose book claims that AIDS is a hoax,” and that simple, short phrase would have immediately dealt a massive body-blow to his public reputation. But many people would then have begun looking into the facts, and once they did so, the tables might have quickly turned, destroying the credibility of his critics. The total silence of the media suggests that they greatly feared that possibility.

## Understanding the Bitter HIV/AIDS Controversy

After reading Kennedy’s book in December 2021, I published a long and favorable review, which attracted a great deal of readership and squarely emphasized his heretical AIDS claims, thereby finally bringing them into the public square. Websites closely allied with Kennedy highlighted my piece so it seems unlikely that any of his media adversaries could have still remained unaware.

> As all of us know from the media, AIDS is a deadly auto-immune disease that was first diagnosed in the early 1980s, primarily afflicting gay men and intervenous drug users. Transmitted by bodily fluids, the disease usually spread through sexual activity, blood transfusions, or the sharing of needles, and HIV, the virus responsible, was finally discovered in 1984. Over the years, a variety of medical treatments were developed, mostly ineffective at first, but more recently so successful that although being HIV-positive was once considered a death-sentence, the infection has now become a chronic, controllable condition. The current Wikipedia page on HIV/AIDS runs more than 20,000 words, including over 300 references.



The Real Anthony Fauci
Bill Gates, Big Pharma, and the Global War on Democracy and Public Health
Robert F. Kennedy Jr.
NEW YORK TIMES BESTSELLING AUTHOR
Children's Health Defense

Yet according to the information provided in Kennedy's #1 Amazon bestseller, this well-known and solidly-established picture, which I had never seriously questioned, is almost entirely false and fraudulent, essentially amounting to a medical media hoax. Instead of being responsible for AIDS, the HIV virus is probably harmless and had nothing to do with the disease. But when individuals were found to be infected with HIV, they were subjected to the early, extremely lucrative AIDS drugs, which were actually lethal and often killed them. The earliest AIDS cases had mostly been caused by very heavy use of particular illegal drugs, and the HIV virus had been misdiagnosed as being responsible. But since Fauci and the profit-hungry drug companies soon built enormous empires upon that misdiagnosis, for more than 35 years they have fought very hard to maintain and protect it, exerting all their influence to suppress the truth in the media while destroying the careers of any honest researchers who challenged that fraud. Meanwhile, AIDS in Africa was something entirely different, probably caused mostly by malnutrition or other local conditions.

I found Kennedy's account as shocking as anything I have ever

encountered.

In 1985 AZT, an existing drug, was found to kill the HIV virus in laboratory tests. Fauci then made tremendous efforts to speed it through clinical trials as an appropriate treatment for healthy, HIV-positive individuals, with FDA approval finally coming in 1987, producing Fauci's first moment of triumph. Priced at \ $10,000/year per patient, AZT was one of the most expensive drugs in history, and with the cost covered by health insurance and government subsidies, it produced an unprecedented financial windfall for its manufacturer.

Kennedy devotes an entire chapter to the story of AZT, and the tale he tells is something out of Kafka or perhaps Monty Python. Apparently, Fauci had been under enormous pressure to produce medical breakthroughs justifying his large budget, so he manipulated the AZT trials to conceal the extremely toxic nature of the drug, which rapidly killed many of the patients who received it, with their symptoms being ascribed to AIDS. So following FDA approval in 1987, hundreds of thousands of perfectly healthy individuals found to be infected with HIV were placed on a regimen of AZT, and the large number of resulting deaths was misattributed to the virus rather than to the anti-viral drug. According to the scientific experts cited in the book, the vast majority of post-1987 "AIDS deaths" were actually due to AZT.

Prior to the Covid outbreak, AIDS had spent almost four decades as the world's highest-profile disease, absorbing perhaps a couple of trillion dollars of funding and becoming the central focus of an army of scientists and medical experts. It simply boggles the mind for someone to suggest that HIV/AIDS might have largely been a hoax, and that the vast majority of deaths were not from the illness but from the drugs taken to treat it.

My science textbooks sometimes mentioned that during the benighted 18th century, leading Western physicians treated all manner of ailments with bleeding, a quack practice that regularly caused the deaths of their patients, with our own George Washington often numbered among the victims. Indeed, some have argued that for several centuries prior to modern times, standard medical treatments inadvertently took far more lives than they saved, and those too poor or backward to consult a doctor probably benefited from that lack. But I had never dreamed that this same situation might have occurred during the

most recent decades of our modern scientific age.

From reading the newspapers during the early 1990s, I had been dimly aware of the dispute regarding the true nature of AIDS, but had never paid much attention to the controversy at the time. So when the media coverage faded away, I assumed that the debate had been successfully resolved.

But according to Kennedy's #1 Amazon bestseller, this was not the case. He claimed that for three decades the entire Western media has been promoting and maintaining a gigantic medical hoax, a conspiracy orchestrated by Dr. Anthony Fauci and his greedy corporate allies that had cost the lives of many hundreds of thousands of Americans.

Such bizarre accusations seemed almost impossible to me, more like the ranting of a deranged lunatic than anything that could happen in the real world. But the case he laid out across his 200 pages of text was a surprisingly persuasive one.

> Extraordinary claims obviously require extraordinary evidence. Kennedy's chapters on AIDS include more than 900 source-references, many of them to academic journal articles or other supposedly authoritative scientific information. But although I have a strong science background, with my original academic training having been in theoretical physics, I am not a medical doctor nor a virologist, let alone someone with specialized expertise in AIDS research, and these articles would mean nothing to me even if I had attempted to read them. So I was forced to seek other indications that Kennedy's 200 pages on AIDS represented something more than sheerest lunacy.
>
> His book carries glowing praise from a long list of medical doctors and scientists, but their names and backgrounds are completely unknown to me, and with nearly a million practicing physicians in America, a few could surely be found to endorse almost anything. However, the first endorsement on the back cover is from Prof. Luc Montagnier, the medical researcher who won a Nobel Prize for discovering the HIV virus in 1984, and he writes: "Tragically for humanity, there are many, many untruths emanating from Fauci and his minions. RFK Jr. exposes the decades of lies." Moreover, we are told that as far back as the San Francisco International AIDS Conference of June 1990, Montagnier had publicly declared "the HIV virus is harmless and passive, a benign virus."

Perhaps this Nobel Laureate endorsed the book for other reasons and perhaps the meaning of his striking 1990 statement has been misconstrued. But surely the opinion of the researcher who won a Nobel Prize for discovering the HIV virus should not be totally ignored in assessing its possible role.

And he was hardly alone. Kennedy explains that the following year, a top Harvard microbiologist organized a group containing some of the world's most distinguished virologists and immunologists and they issued a public statement, endorsed by three additional science Nobel Laureates, that raised the same questions:

> It is widely believed by the general public that a retrovirus called HIV causes a group of diseases called AIDS. Many biomedical scientists now question this hypothesis. We propose a thorough reappraisal of the existing evidence for and against this hypothesis, to be conducted by a suitable independent group. We further propose that the critical epidemiological studies be designed and undertaken.

As Kennedy tells the story, by that point AIDS researchers and the mainstream media were completely in thrall to the ocean of government funding and pharmaceutical advertising controlled by Fauci and his corporate allies, so these calls by eminent scientists were almost entirely ignored and unreported. According to one journalist, some two trillion dollars has been spent on HIV/AIDS research and treatment over the decades, and with so many research careers and personal livelihoods dependent upon what amounts to an "HIV/AIDS industrial-complex," few have been willing to critically examine the basic foundations of that empire.

Until a couple of weeks ago, I had never given any thought to questioning AIDS orthodoxy. But discovering the longstanding scientific skepticism of so many knowledgeable experts, including four Nobel Laureates, one of them the actual discoverer of the HIV virus, has completely shifted my perspective. I cannot easily ignore or dismiss the theories Kennedy presents, but can only briefly summarize them and leave it to individual readers to investigate further then decide for themselves. And in basic fairness to the author, he himself also repeatedly emphasizes that he can "take no position on the relationship between HIV and AIDS" but is simply disturbed that Fauci has successfully used his government funding and media clout to suppress an ongoing and perfectly legitimate scientific debate. According to Kennedy, his

book is intended “to give air and daylight to dissenting voices.”

His narrative of the origins of the HIV/AIDS connection is absolutely stunning and seems well-documented. Dr. Robert Gallo, an NIH researcher in Fauci’s orbit, originally announced HIV as the apparent cause of AIDS at a packed 1984 press conference, which he held before any of his supportive research findings had actually been published and reviewed by his scientific peers. Only long after the theory had become firmly embedded in the national media did it come out that only 26 of the 76 AIDS victims in his seminal study showed any traces of the HIV virus, an extremely slender reed for such a momentous conclusion.

Furthermore, critics eventually noted that many thousands of documented AIDS victims similarly lacked any signs of the HIV virus, while millions of those infected by HIV exhibited absolutely no symptoms of AIDS. Correlation does not imply causality, but in this case, even the correlation seemed a very loose one. According to Kennedy, fully orthodox AIDS researchers grudgingly admit that no scientific study has ever demonstrated that HIV causes AIDS. The widespread accusations of serious scientific misbehavior and outright intellectual theft that long swirled around Gallo’s laboratory research were eventually confirmed by legal proceedings, and that helped explain why his name was not included on the Nobel Prize for the HIV discovery.

AIDS had originally come under the purview of the National Cancer Institute, but once it was blamed on a virus, Fauci’s own infectious disease center managed to gain control. That resulted in an enormous gusher of Congressional funding and media attention for what had previously been a sleepy and obscure corner of the NIH, and Fauci soon established himself as America’s reigning “AIDS Czar.” The HIV-AIDS link may or may not be scientifically valid, but it carried enormous political and financial implications for Fauci’s career.

One of the major scientific heroes in Kennedy’s account is Prof. Peter H. Duesberg of Berkeley. During the 1970s and 1980s, Duesberg had been widely regarded as among the world’s foremost virologists, elected to the prestigious National Academy of Sciences at age 50, making him one of its youngest members in history. As early as 1987 he began raising serious doubts about the HIV/AIDS hypothesis and highlighting the dangers of AZT, eventually publishing a series of journal articles on the subject

that gradually won over many others, including Montagnier. In 1996 he published *Inventing the AIDS Virus*, a massive 712 page volume setting forth his case, with the Foreword provided by Nobel Laureate Kary Mullis, the renowned inventor of PCR technology and himself another leading public critic of the HIV/AIDS hypothesis. Duesberg even underscored the confidence of his HIV skepticism by offering to be injected with HIV-tainted blood.

But rather than openly debate such a strong scientific opponent, Fauci and his allies blacklisted Duesberg from receiving any government funding, thereby wrecking his research career, while also vilifying him and pressuring others to do the same. According to fellow researchers quoted by Kennedy, Duesberg was destroyed as a warning and an example to others. Meanwhile, Fauci deployed his influence to have his critics banned from the major national media, ensuring that few outside a narrow segment of the scientific community ever even became aware of the continuing controversy.

- American Pravda: Vaxxing, Anthony Fauci, and AIDS
  Ron Unz • ***The Unz Review*** • December 6, 2021 • 6,100 Words

## Investigating the Duesberg Hypothesis on HIV/AIDS

I subsequently spent several weeks carefully reading the arguments of Duesberg and his scientific allies as well as those of their opponents, and then described the results of my inquiry:

So the theory I needed to investigate amounted to the Duesberg Hypothesis, the long-suppressed challenger to our reigning HIV/AIDS orthodoxy.

Fortunately for my purposes, scientific heresies starved of research funding and blacklisted from leading journals tend to produce a very manageable body of work. The annual billions spent on orthodox AIDS research has spawned well over 100,000 academic journal articles, more than a diligent reader could digest in a dozen lifetimes. But the most recent academic publication I could locate on the other side was a lengthy review article published eighteen years ago by Duesberg and two of his collaborators. Indeed, according to their Epilogue, the authors had spent several years struggling to get their article into print

against the unremitting hostility of the reigning AIDS establishment, which had successfully pressured two previous journals into cancelling publication.

- The chemical bases of the various AIDS epidemics: recreational drugs, anti-viral chemotherapy and malnutrition (PDF)
  Peter Duesberg, Claus Koehnlein, and David Rasnick • *Journal of Bioscience* • June 2003 • 24,000 Words

Although I have a strong scientific background, I lack the necessary expertise in medicine or microbiology to properly evaluate their paper. But reading it carefully as a layman, I found it solid and persuasive, certainly worthy of publication. And when I passed it along to someone with a professional medical background, he considered it extremely impressive, a convincing exposition of the authors' revolutionary thesis.

One of Duesberg's central claims was that the disease known as "AIDS" didn't actually exist, but was merely the official label attached to a group of more than two dozen different illnesses, all of which had a variety of different causes, with only some of these being infectious agents. Indeed, most of these illnesses had been known and treated for many decades, but they were only designated "AIDS" if the victim was also found to test positive for the HIV virus, which probably had nothing to do with the condition.

In support of their contrary position, the authors noted that the various groups at high risk for "AIDS" only tended to get particular versions of the disease, with the "AIDS" suffered by hemophiliacs usually being very different from the "AIDS" of African villagers and only slightly overlapping with the diseases of gay men or intervenous drug addicts. Indeed, the pattern of "AIDS" in Africa seemed utterly divergent from that in the developed world. But if all these different illnesses were actually caused by a single HIV virus, such completely disparate syndromes would seem puzzling anomalies, difficult to explain from a scientific perspective.

In 2009, a half-dozen years after the publication of that lengthy article, an independent film-maker named Brent Leung produced a 90 minute documentary on AIDS, strongly sympathetic to Duesberg's thesis, and someone recently brought it to my attention. There is a great paucity of pro-Duesberg material, so

although I only rarely find videos useful sources of information, this case was an important exception. The film highlighted the tremendous inconsistencies of the orthodox scientific position, and also included important interviews with Duesberg, Mullis, Fauci, and numerous other key researchers and journalists on all sides of the debate. The entire documentary is conveniently available on Youtube, so those interested can watch it and decide for themselves.

Journalist John Lauritsen had been covering the HIV/AIDS controversy for decades, writing two books on the subject and serving as an important source for Kennedy's own work. He recently joined one of the discussion-threads on our website, and suggested that I republish his 2018 conference talk, which usefully summarized the history and current state of the issue.

- Making Our Case In the Battle for Truth
  *Challenging Avaricious Viral Paradigms*
  John Lauritsen • *Vers Pont du Gard Conference* • June 16, 2018 • 2,500 Words

Although I found all this pro-Duesberg material helpful in fleshing out the arguments, most of it overlapped with the contents of the Kennedy book, and the analysis was necessarily one-sided. Under pressure of the medical establishment and its AIDS lobby, the

mainstream media has almost entirely shut its doors to any dissent on the issue and refuses to engage the critics, instead seeming to rely upon the blacklist and the boycott. This suggested the relative weakness of the orthodox case, but lacking the give-and-take of argument and counter-argument, I could not easily weigh the strength of the two sides. Fortunately, I discovered that this situation had been quite different in the past.

I spent most of the early 2000s creating a content-archiving system that includes near-complete collections of a couple of hundred of our leading opinion magazines of the last 150 years, those influential publications that have shaped our understanding of the world. The project was nearly a total failure since very few people have ever used it, but it still comes in handy when I want to investigate something, and I easily located a long list of articles focused on the Duesberg Hypothesis, most of them from the 1990s. During that period, the iron wall of censorship had not yet come down, and the topic had been widely and respectfully treated in major publications.

I carefully read more than a dozen of the most substantial articles, all of which had appeared in fully mainstream and respectable liberal, conservative, and libertarian periodicals. One major surprise was how little the debate seemed to have changed. The evidence and arguments that Duesberg and his scientific allies had been making thirty years ago seemed remarkably similar to what was presented in Kennedy's book published only just last month.

The Summer 1990 issue of *Policy Review*, one of America's most sober and influential conservative policy journals, had offered Duesberg and a co-author a platform for the controversial theory, and their resulting piece ran nearly 9,000 words. According to the editor, this topic provoked more letters and responses—both positive and negative—than anything in the publication's history, and became one of their most talked-about articles. As a result, the next issue of the quarterly featured some of those reactions as well as the replies of the two authors, with the entire exchange running almost 13,000 words.

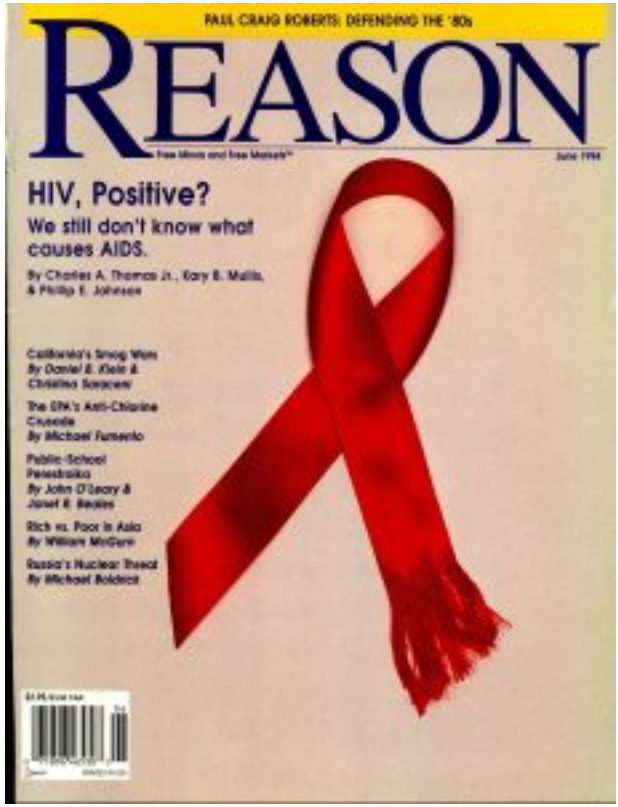
- Is HIV the Cause of AIDS? (PDF)
  Critics Respond • *Policy Review* • Fall 1990 • 12,700 Words



Several years later, a similar development unfolded at *Reason*, the glossy flagship publication of America's libertarian movement. The magazine ran a long cover story endorsing Duesberg's claims and authored by three of his scientific allies, one of them a former Harvard Medical School professor and another a recent Nobel Laureate. Once again the result was a huge outpouring of both supportive and critical reactions, and the lengthy debate was published in a subsequent issue.

*The Lancet* is one of the world's leading medical journals and in 1996, the year after he become its chief editor, Richard Horton

took to the pages of the intellectually-prestigious *New York Review of Books* to produce a 10,000 word discussion of Duesberg's theories, as propounded in three of the researcher's recent books and collections. Horton was obviously among the most respectable of establishmentarian figures, but although he mostly came down in support of the orthodox HIV/AIDS consensus, he presented Duesberg's entirely contrary perspective in a fair-minded manner, respectfully though not uncritically.

However, what struck me most about Horton's account was how appalled he seemed at Duesberg's treatment by America's ruling medical-industrial complex, as suggested by his title "Truth and Heresy about AIDS."

The very first sentence of his long review article mentioned the "vast academic and commercial industry built around…HIV" along with the fundamental challenge Duesberg posed to its scientific basis. As a consequence, the "brilliant virologist" had become "the most vilified scientist alive" and the subject of "excoriating attacks." The leading professional science journals had displayed an "alarmingly uneven attitude," and partly as a consequence, other potential dissidents had been dissuaded from pursuing their alternative theories.

According to Horton, financial considerations had become a central element of the scientific process, and he noted with horror that a press conference on research questioning the effectiveness of a particular anti-AIDS drug was actually packed with financial journalists, focused on the efforts of the corporate executives to destroy the credibility of a study that they themselves had helped to design but which had now gone against their own product.

Most importantly, although Horton was generally skeptical of Duesberg's conclusions, he was absolutely scathing towards the opponents of the dissident virologist.

> One of the most disturbing aspects of the dispute between Duesberg and the AIDS establishment is the way in which Duesberg has been denied the opportunity to test his hypothesis. In a discipline governed by empirical claims to truth, experimental evidence would seem the obvious way to confirm or refute Duesberg's claims. But Duesberg has found the doors of the scientific establishment closed to his frequent calls for tests…

> Duesberg deserves to be heard, and the ideological assassination that he has undergone will remain an embarrassing testament to the reactionary tendencies of modern science…At a time when fresh ideas and new paths of investigation are so desperately being sought, how can the AIDS community afford *not* to fund Duesberg's research?"

That ringing last sentence closed the entire review, which appeared in a prestigious and influential publication over a quarter-century ago. But as near as I can tell, Horton's heartfelt criticism fell entirely on deaf ears, and the AIDS establishment simply ignored the entire controversy while gradually pressuring the media to end any coverage. This seems to fully confirm the narrative history provided in Kennedy's current bestseller.

- Truth and Heresy About AIDS
  Richard Horton • *The New York Review of Books* • May 23, 1996 • 10,100 Words

Taken together, these five articles run more than 45,000 words, the length of a short book, and probably provide as good and even-handed a debate on the Duesberg Hypothesis as can be found anywhere. Individual readers may judge for themselves, but I thought the that Duesberg camp certainly got the better of all those exchanges.

American Pravda: AIDS and the Revival of the Duesberg Hypothesis
Ron Unz • ***The Unz Review*** • December 29, 2021 • 4,100 Words

In 1996 Duesberg had published a book setting forth his controversial theories for a general audience, but its length of more than 700 pages initially intimidated me and the used copies on Amazon started at over \$600. However, I soon learned that the public-spirited author had simultaneously released a freely downloadable PDF copy on the Internet, and I discovered that academic journal articles and end notes filled almost half the length, reducing the body of the main text to very manageable proportions, considerably shorter than the Kennedy book.

The endorsement and Foreword by Nobel Laureate Mullis persuaded me to try a chapter or two, and I found the material so fascinating I quickly read the entire work. Duesberg very persuasively placed the HIV/AIDS controversy within the broader context of past public health debacles and the massive professional pressures faced by infectious disease researchers. His

book had apparently been produced under difficult political circumstances and was ultimately released by the Regnery Company, the leading conservative press, whose publisher provided an unusual explanatory Preface, containing the following paragraphs:

> The book you are about to read has been a long time in coming. Why? It is at once enormously controversial and impeccably documented. It comes from a scientist and writer of great ability and courage. It will cause, we believe, a firestorm of yet undetermined proportions in both the scientific and lay communities. And it is, I think I am safe in saying, about the most difficult book that the Regnery Company has published in nearly 50 years in the business.
>
> If Duesberg is right in what he says about AIDS, and we think he is, he documents one of the great science scandals of the century. AIDS is the first political disease, the disease that consumes more government research money, more press time, and indeed probably more heartache—much of it unnecessary—than any other. Duesberg tells us why.

Although the text is easy reading, well-written for a general audience, it contains a huge amount of surprising medical information difficult for the non-specialist to check, and this would normally leave me cautious. However, the *Lancet* is one of the world's leading medical journals, and although its editor was a strong supporter of the orthodox HIV/AIDS consensus, his 10,000 word review in the *New York Review of Books* treated both Duesberg and his book very respectfully, so I doubt the work contains any obvious errors or blatant falsehoods. Although Duesberg's opus is now a quarter-century old, as far as I can tell, very little has changed since it was written, and the same disputes of the mid-1990s are just as relevant today, so I would urge everyone interested in the subject to read it. Since the original PDF was so enormous, I have broken it up by chapters for the convenience of readers.

- Inventing the AIDS Virus
  Peter H. Duesberg • *Regnery Publishing* • 1996 • 712 Pages

The story that Duesberg tells is a simple one. After the successful eradication of polio in the 1950s, America's enormous existing infrastructure of infectious disease professionals lost most of the reason for its existence, and its leaders eventually began

searching for some new means of justifying their continued government funding. The War on Cancer begun in the late 1960s proved a dismal failure and the massively-hyped warnings of a deadly Swine Flu epidemic in 1976 became a complete debacle, leading to the ouster of some top officials. So a few years later when the AIDS label was affixed to a group of apparently unrelated illnesses, Anthony Fauci and others had a tremendous incentive to claim that the cause was an infectious agent, and despite the lack of any solid evidence soon fingered the HIV virus as the culprit. Once that original misdiagnosis had spawned an enormous multi-billion-dollar industry, its researchers, administrators, and corporate beneficiaries were committed to protecting it.

Celia Farber was a leading AIDS journalist during the 1990s, who covered Duesberg and the other main figures in the controversy, and just a few days ago she released on Substack a long 2004 article she had originally written for *Harpers* on the controversial Berkeley researcher, which later became the first chapter of one of her books.

- The Passion of Peter Duesberg
  *How Anthony Fauci And His AIDS Industry Sacrificed One Of America's Greatest Cancer Scientists*
  Celia Farber • *Substack* • January 2, 2022 • 11,000 Words

Duesberg's writings provide by far the most comprehensive exposition of his material, but for those who prefer a different format, I would strongly recommend his hour-long *Red Ice* podcast interview from a decade ago, conveniently available on Youtube.

Youtube videos are widely popular among those less inclined to read, and the same year that Duesberg's opus was published, Starvision Productions released a two hour documentary entitled "HIV = AIDS: Fact or Fraud," which very effectively covers much of the same material. The feature includes interviews with the Berkeley researcher and several of his key scientific allies in the controversy, one of whom describes the scandal in American medical science as worse than the notorious Lysenko fraud of the old Soviet Union.

Among the many telling points, the documentary notes that although nearly 90% of those Americans suffering from AIDS are male, HIV tests administered to our new military recruits indicate that the general rate of HIV infection in the population is equal between men and women, a very strange divergence between the illness and its alleged cause. Furthermore, the incidence rates of sexually-transmitted diseases and HIV have sharply diverged over the years, raising serious doubts about whether the virus actually follows that mode of transmission.

Although both Duesberg and most of the other scientists in his camp seemed to be very conventional and even buttoned-down researchers, an important exception was Nobel Laureate Kary Mullis, widely regarded as a brilliant but eccentric and iconoclastic figure. For those interested in his views on the HIV/AIDS debate, I would recommend the following two hour interview by Dr. Gary Null, also released in 1996.

Mullis's demeanor is extremely informal and almost boyish, and some of the questions he raises have an "Emperor's New Clothes" feel about them. He notes that substantial numbers of the young military enlistees who annually test positive for HIV grew up in small rural towns that are hardly likely to be AIDS hotbeds, and suggests that their mothers be tested for the virus, which is known to be transmitted to the newborn. If those women also tested positive, that would prove the virus had already been widespread eighteen or twenty years earlier, completely

demolishing the established AIDS narrative. Naturally, none of our many thousands of dedicated AIDS researchers showed any interest in implementing this extremely simple research proposal.

- American Pravda: Our Public Health Problems
  Ron Unz • ***The Unz Review*** • January 10, 2022 • 5,500 Words

## Interpreting the Sounds of Silence on AIDS Denial

I am not a medical professional let alone an expert virologist, and I've spent only a few weeks exploring the complex and longstanding scientific dispute regarding the true nature of AIDS, a subject that has absorbed the efforts of top researchers for decades. The summary material presented above is merely intended to provide an introductory roadmap for those who might wish to investigate the subject in much greater depth.

However, in recent years I have become quite experienced in analyzing the severe distortions and deliberate omissions so often found in our media, a skill that I had honed during the production of my lengthy American Pravda series. And the evidence I see in the total media silence surrounding the astonishing claims about HIV/AIDS advanced by Robert F. Kennedy Jr. in his #1 Amazon bestseller seems decisive to me.

As a consequence of the publication of his book and especially since the recent rise of his Presidential campaign, Kennedy has endured an endless barrage of very harsh media criticism, including a couple of front-page stories in the *New York Times*. These attacks portrayed him as a reckless purveyor of bizarre, irrational, and harmful beliefs, the worst sort of dangerous conspiracy-monger. The controversial ideas presented in his book were often the focus of this relentless vilification.

Yet the largest portion of Kennedy's book—seven full chapters totaling some 200 pages—promoted the astonishing theory that AIDS doesn't really exist as a disease but was merely a medical media hoax concocted by Dr. Anthony Fauci and his profit-hungry corporate allies, a hoax that ultimately cost the lives of many hundreds of thousands of Americans. It is difficult to imagine a more outrageous accusation or one so apparently indicative of severe mental illness.

A single sentence uttered by Kennedy's bitter enemies in the media could have seemingly destroyed him: ***"Robert F. Kennedy Jr. is a conspiracy theorist whose book claims that AIDS is a hoax."***

However, our entire media establishment—so eager to attack Kennedy on every other matter—has completely avoided engaging him on that issue. One of the early attacks on his book came from a *Times* journalist with deep expertise in Gay Rights history, but he completely excluded any mention of Kennedy's extreme AIDS Denialism. "The Dog That Didn't Bark."

The only logical explanation I see for this total reluctance to engage Kennedy on what would seem his greatest vulnerability is that the media fears that he might very well be right. So after consulting trusted medical experts who had carefully reviewed Kennedy's 200 pages of analysis, all these different editors concluded that discretion was the better part of valor.

If Kennedy is correct, our entire American media has spent the last 35 years promoting and protecting a medical fraud that cost us many hundreds of billions of dollars and many hundreds of thousands of lives. As far back as the 1990s, a former Harvard professor had declared that the AIDS hoax was a worse scientific scandal than the notorious Lysenko fraud. So the media rightly fears that if they engage Kennedy on the issue, they themselves would suffer the total destruction of their reputation.

Some 700,000 Americans died in the AIDS epidemic, but according to Kennedy the overwhelming majority of these victims were perfectly healthy individuals whose agonizing deaths were caused by the lethal but very lucrative AIDS drugs they were prescribed, a public health policy enthusiastically supported by our entire media establishment. More than half of those casualties were gay men, and gay activists are an influential and highly-organized political force. The desperate effort of the media to prevent Kennedy's accusations from receiving any significant attention is quite understandable.

Ironically enough, I think it was the sheer magnitude of Kennedy's AIDS heresy that insulated him from any public attack. If his book had contained just a few sentences suggesting such shocking claims, his enemies would have eagerly seized on those statements and denounced him as a deranged AIDS Denier. But his 200 pages of text and 900 end notes made too strong a case so instead they fearfully went into hiding. I've become quite familiar with that sort of reaction.

Kennedy should recognize that his true opponent in this 2024 campaign is not the elderly and enfeebled Joseph Biden nor the incompetent and unpopular Vice President Kamala Harris, both of whom were dragged across the 2020 finish line by their establishment

backers. Kennedy's true opponent is the American media, and they should be a primary target of his attacks.

The topics that the media most avoids are the topics that the media most fears, and Kennedy should make those topics a major part of his current political campaign.

If he successfully brought some of these long suppressed truths to widespread public awareness, he will have won a great political victory even if his campaign ultimately falls short of reaching the White House.

# The Rise of the BRICS and the Fall of the USSA?

***The Unz Review*** • September 4, 2023 • 3,300 Words

For Americans such as myself who came of age during the 1970s or early 1980s, the Soviet Union always carried the whiff of a decaying ideological empire, ruled by a decrepit political leadership class that had long since lost the trust of its own people.

Such was my opinion at the time, and nothing I have learned since then has changed it. Three Soviet leaders ruled during that era—Leonid Brezhnev, Yuri Andropov, and Konstantin Chernenko—all elderly and infirm, with the reigns of the last two being so brief that our own President Ronald Reagan once quipped that they died too rapidly for him to schedule a summit. Given that the top leaders of the USSR were so obviously enfeebled, analysts recognized that they were hardly the real decision-makers of the declining Soviet colossus that they nominally controlled; instead, most power was presumably vested in the hands of shifting coalitions of their senior aides and advisors, persons often obscure to the outside world. Perhaps partly as a consequence of this severe weakness at the top, the USSR entered a period of steep social and economic decline, and within just a few more years it had disappeared from the world.

All this was certainly true, but it is quite sobering to consult Wikipedia and discover the exact ages of those elderly Soviet leaders, who had been so widely ridiculed in the Western media as decrepit or even senile. Brezhnev was 75 when he died in 1982, while Andropov came to power at age 68 and died fifteen months later, replaced by his successor Chernenko, age 72, who only survived a year. So in today's America, all those confused, befuddled Soviet leaders whom we regarded with such scorn would be youthful political figures compared to our own President Joe Biden, currently seeking reelection at the age of 80, or his leading rival, former President Donald Trump, age 77.  Medical science has obviously advanced quite a bit in the last four decades, but I think the total Western domination of the global media is a more important factor in this large difference of perceptions. Is Biden really so much sharper than Brezhnev and Chernenko, or is it simply that our media is better at hiding his inability from most of the general public?

During his entire political career, Biden had been notorious for merely reading the scripts and speeches written for him by others, and even in his 40s he sometimes seemed completely unaware of the falsehoods and total absurdities he was spouting. Lately he has sometimes begun confusing our official positions on crucial policy matters, requiring his aides to quickly "clarify" them. I'm sure that Brezhnev or Chernenko would have done the same if they'd been put into that position.

Although he ranked as the world's leading Communist, Brezhnev personally indulged himself by accumulating a large collection of luxury automobiles, including Maseratis, Rolls Royces, and Jaguars, an embarrassing story widely promoted by the powerful Western media as proof of Soviet hypocrisy. But although the direct evidence of the Hunter Biden laptop revealed that Biden and his family had taken many, many millions of dollars in secret payoffs from foreigners, our mainstream media has hidden that reality, so much of the public probably still remains unaware of it.

Below the General Secretary of the USSR, political authority was held by the Supreme Soviet, a parliament generally portrayed in the West as a rubber-stamp body filled with corrupt, elderly time-servers, who mostly just approved the political decisions made by the figures who quietly pulled their strings. Such harsh criticism was probably correct, but is our own Congress today so very different? At the age of 81, Sen. Mitch McConnell has led the Republicans in the Senate for the last 16 years, and probably ranks as one of the two most powerful Republican leaders in America. But a few days ago, he revealed his inability to respond to a simple question due to a "brain freeze," as shown in a video clip that drew many millions of views on Twitter.

In his sneering commentary, Andrew Anglin noted that McConnell had grown up in modest circumstances, and then spent his entire career in politics, never earning more than \$174,000 per year; but he had nevertheless somehow managed to accumulate a personal fortune in the tens of millions of dollars. The corrupt and decaying USSR had far less wealth to siphon off, but its Communist leaders similarly enjoyed lifestyles vastly superior to that of their miserable subjects.

Source: Slate.com

California Sen. Dianne Feinstein has passed her 90th birthday and apparently is senile, yet still holds crucial positions on several important Senate committees. During her long decades in office, she exercised a great deal of political influence over our foreign relations with other countries, notably including China, and during exactly those years her late husband Richard Blum became a billionaire through his extremely successful investments in that same country.

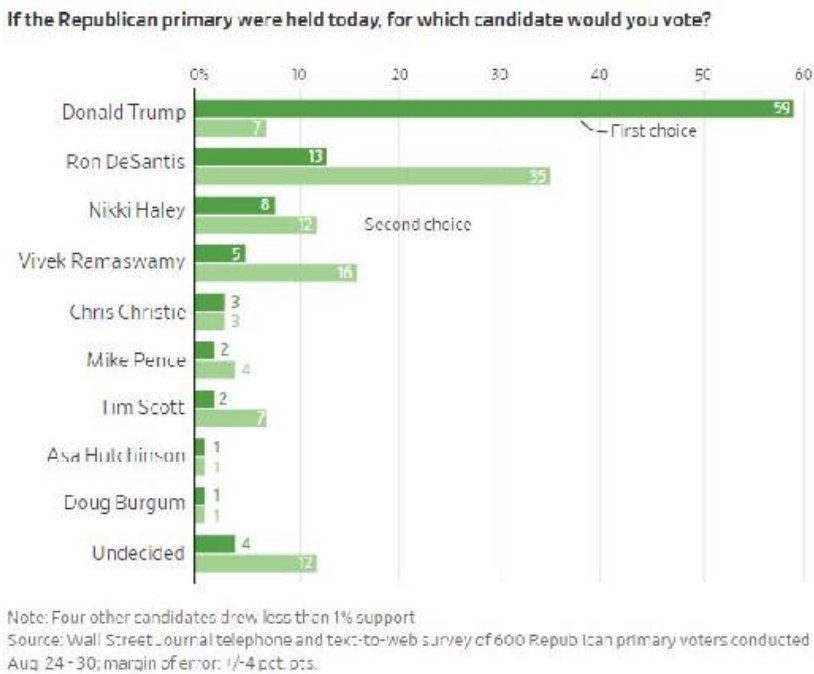
In many respects, the signs of apparent political instability in the U.S. these days seem far greater than anything that had been visible to outside observers in the USSR of the 1980s.

Just last week extremely harsh sentences were imposed upon several additional January 6th Trumpist protesters, including those whose crimes hardly seemed to exceed trespassing or petty vandalism. Joseph Biggs received 17 years in federal prison for moving a portable metal fence, while Dominic Pezzola got 10 years for breaking a window. These individuals were protesting an extremely close Presidential election that had obviously been stolen from incumbent Donald Trump, and their angry political demonstration took place just months after an almost unprecedented national wave of riots, arson, and looting had resulted in few if any serious prosecutions. Moreover, some have noted that these Trumpist protests at the Capitol were really not so very different in kind from those that the Democrats had earlier organized against Brett Kavanaugh's nomination to the Supreme Court; yet celebrity Amy Schumer and her allies received

media accolades rather than a decade or two in federal prison.

Commentator John Derbyshire, a conservative now in his late 70s, is normally quite restrained in his sentiments, but he described these extreme sentences and other related political developments as so outrageous that the recent Republican Presidential debate seemed like something "irrelevant…the acting-out of some formal ritual that no longer has any actual significance, from which nothing of any consequence will follow." Indeed, the title of his piece suggested that the U.S. was "moving beyond electoral solutions."

Trump himself had bitterly challenged that stolen election and as a consequence is facing some 90 felony counts in state and federal court that would put him away for 500 years. Yet on Friday the latest poll revealed that these charges had caused his Republican Presidential support to grow even stronger, now rising to 59% and putting him 46 points ahead of his nearest Republican primary rival.



That same poll also placed him dead-even with President Biden, thus giving him an excellent chance of winning the November 2024 vote, whether or not he happens to be campaigning from a prison cell, an utterly bizarre situation that I had discussed at some length:

- American Pravda: Donald Trump, Eugene Debs, and AMLO
  *The American Political System as Laughingstock or Trainwreck*

By a wide margin, Tucker Carlson is the most popular media figure for Republicans and conservatives, and his Trump interview on Twitter attracted some 15 million video views, an audience far larger than the one that had watched the Republican Presidential debate held around the same time. A few days ago Carlson said that he expected Trump's political enemies will finally conclude that orchestrating his assassination is their best chance of preventing his triumphant return to the White House. In that same interview, Carlson casually mentioned that in 2008 it had become widely known in Washington media circles that Presidential Candidate Barack Obama had been having sex with men and smoking crack, but that no journalist, whether Democrat or Republican, was willing to report those astonishing facts to the oblivious American electorate.

Obama's Republican opponent in that bitter campaign had been Sen. John McCain, and perhaps we can now better understand why the Democrats were so unwilling to make use of the shocking evidence regarding the latter's own very sordid Vietnam War record:

- John McCain: When "Tokyo Rose" Ran for President
  Ron Unz • ***The Unz Review*** • March 9, 2015 • 4,200 Words

Last month I had closed my article on Trump's criminal prosecutions with the following appraisal of the collapsing legitimacy of America's political system:

> As Adam Smith once observed, "There is a great deal of ruin in a nation," but our own country may be rapidly approaching its limit. Nearly 70% of Republicans believe that Donald Trump actually won the 2020 election and only voting fraud put Joseph Biden in the White House, but Trump now faces a lengthy prison sentence for taking that same position.
>
> As a recent *New York Times* article emphasized, the notion of a jailed former President running for the White House is an absolutely extraordinary event and our country would be entering "uncharted territory." But there is also a very real possibility that Trump would win and none of the legal experts consulted by the *Times* had any idea of what that would entail: "No one knows."
>
> America's political system is facing an enormous crisis of legitimacy, perhaps just as serious and potentially fatal as the one that brought down the old USSR in the early 1990s. Our horrendous budget and trade deficits seem permanent but clearly unsustainable, we recently suffered the highest inflation in four decades, and three years ago we experienced the worst urban rioting since the 1960s, as well as the largest spike in the national homicide rate since record-keeping began. We have spent the last eighteen months fighting a losing proxy-war against nuclear-armed Russia on Russia's own border, astonishingly reckless behavior that would have been unimaginable at the height of the old Cold War. The Covid epidemic took more than a million American lives and last year I argued that the calamity was closely analogous to the 1986 Chernobyl nuclear disaster that played such a major role in the collapse of the Soviet Union a few years later.

- A Thousand Times Greater Than the Chernobyl Nuclear Disaster

These historical echoes between our own political decline and that of our vanished superpower rival of the Cold War are obviously disturbing. But there are also other important differences, and some of these are not necessarily to the advantage of our own situation.

The USSR of the late Soviet era was a sleepy place, whose cautious and conservative leaders were content to tread water even as their mighty empire gradually rusted away. I despised it at the time and certainly hoped and expected that it would eventually collapse, but I never feared its elderly leaders might provoke a world war in their dotage.

In sharp contrast, the exceptionally reckless and aggressive Neocons have gained complete mastery over the political and media levers that control both our political parties, and therefore they easily pull the strings of the elected officials who nominally govern us. Their years of determined NATO pressure against Russia have already provoked the bloody Ukraine war, the most devastating European conflict in more than three generations, while they have launched an assault on China that is now only just barely short of becoming military.

Earlier this year, Graham Allison, founding dean of the Harvard Kennedy School of Government, closed his important article in *Foreign Policy* by explaining how our relentless provocations had created a China-Russia alliance that now probably outweighed our own:

> An elementary proposition in international relations 101 states: "The enemy of my enemy is my friend." By confronting both China and Russia simultaneously, the United States has helped create what former U.S. National Security Advisor Zbigniew Brzezinski called an "alliance of the aggrieved." This has allowed Xi to reverse Washington's successful "trilateral diplomacy" of the 1970s that widened the gap between China and the United States' primary enemy, the Soviet Union, in ways that contributed significantly to the U.S. victory in the Cold War. Today, China and Russia are, in Xi's words, closer than allies.
>
> Since Xi and Putin are not just the current presidents of their two nations but leaders whose tenures effectively have no expiration dates, the United States will have to understand that it is confronting the most consequential undeclared alliance in the

world.

The disappearance of the Soviet Union over thirty years ago had left America as the sole global superpower. In the wake of that triumph, a generation of our political leadership class came of age who regarded worldwide American hegemony as natural and permanent, but their extremely aggressive behavior, particularly their unremitting hostility towards Russia and China may now be on the verge of finally ending that era.

Living their entire lives in a media propaganda-bubble, these arrogant individuals may not realize the scale of the potential forces confronting them. As I noted several months ago, China's real productive economy is already three times larger than America's and even exceeds the combined total for the U.S., the European Union, and Japan. Meanwhile, China's naturally-complementary partner Russia constitutes the world's greatest storehouse of energy supplies and other natural resources, as well as a military production capability now apparently larger than that America together with its European vassals.

- Playing a Game of "Fool's Mate" on the Grand Eurasian Chessboard
  Ron Unz • ***The Unz Review*** • April 3, 2023 • 3,000 Words

A central element of this new global coalition against American hegemony has been the rising BRICS alliance, promoted by China and Russia, which also incorporated India, Brazil, and South Africa. Last week, BRICS took a giant step forward by adding six new members: Iran, Saudi Arabia, the United Arab Emirates, Egypt, Ethiopia, and Argentina, with the prospects of many additional countries joining in future stages. This implicitly anti-Western bloc now already controls roughly half the world's energy supplies and population and possesses a total GDP considerably larger than that of the American-led G7.

With the rise of the BRICS, we may be witnessing a geopolitical shift as momentous as the disintegration of the Warsaw Pact alliance and the collapse of the Soviet regime that created it.

Although our lick-spittle mainstream media has under-emphasized or even ignored these tectonic developments, astute individuals have recognized which way the wind is blowing. For decades, Roger Cohen has been one of the most distinguished *New York Times* journalists based in Europe, and last Monday he published a front-page story describing the surprising shift towards Russia of many of the

Continent's top political figures, opening with these paragraphs:

> PARIS — Nicolas Sarkozy, the former French president, was once known as "Sarko the American" for his love of free markets, freewheeling debate and Elvis. Of late, however, he has appeared more like "Sarko the Russian," even as President Vladimir V. Putin's ruthlessness appears more evident than ever.
>
> In interviews coinciding with the publication of a memoir, Mr. Sarkozy, who was president from 2007 to 2012, said that reversing Russia's annexation of Crimea was "illusory," ruled out Ukraine joining the European Union or NATO because it must remain "neutral," and insisted that Russia and France "need each other."
>
> "People tell me Vladimir Putin isn't the same man that I met. I don't find that convincing. I've had tens of conversations with him. He is not irrational," he told Le Figaro. "European interests aren't aligned with American interests this time," he added.
>
> His statements, to the newspaper as well as the TF1 television network, were unusual for a former president in that they are profoundly at odds with official French policy. They provoked outrage from the Ukrainian ambassador to France and condemnation from several French politicians, including President Emmanuel Macron.

That very same day, a different front-page story in the *Wall Street Journal* focused on the terrible economic situation of Germany, Europe's leading industrial power. Among the most important factors in that country's predicament was the loss of cheap Russian energy and the decline of exports to China, both consequences of Germany's total subservience to American foreign policy. Although the current government leadership and all the traditional parties still remain in Washington's close political orbit, Alternative for Germany, a new populist party taking a very different position, has recently surged in the polls, now exceeding 20% support and reaching second place, prompting some outrageously anti-democratic talk of legally banning it.

The Nord Stream energy pipelines had represented some of Europe's most important civilian infrastructure, and the explosions that destroyed them have been responsible for much of Germany's suffering. Earlier this year, renowned investigative journalist Seymour Hersh revealed that the attacks had been carried out by an American

military sabotage team under orders from President Biden, an outright act of war against NATO's most important European member. So far the German media has successfully concealed this information from its country's electorate, but when and if the populace eventually discovers the truth, NATO may disintegrate.

  Ron Unz • ***The Unz Review*** • February 13, 2023 • 2,000 Words

Our economic and military confrontations with China and Russia have been disastrously wrong-headed, and this recognition has brought together leading figures from all across the ideological spectrum. Just over a week ago, Prof. Jeffrey Sachs, a renowned world economist and a moderate liberal, gave an interview in which he discussed the historic rise of the BRICS alliance in opposition to arrogant American world hegemony.

Around the same time, Prof. Michael Hudson, an influential Left economist, provided his somewhat similar overview of the BRICS expansion.

Then at the end of last week, Ray McGovern, a former high-ranking CIA official and political moderate, gave his perspective on America's losing proxy-war in Ukraine:

Col. Douglas Macgregor, a very distinguished military expert and

strong right-winger, had similar views on Ukraine.

These different individuals, all of them highly credentialed and reputable, span a very wide range of ideological positions, and other figures of similar stature, such as John Mearsheimer and Seymour Hersh, have been equally scathing in their criticism of our government's policies.

A couple of decades ago, many of these same figures had demonstrated their courage, integrity, and knowledge by being among the foremost critics of our calamitous Iraq War, which cost our country trillions of dollars and led to the destruction of much of the Middle East. In 2005, my old friend Bill Odom, the three-star general who ran the NSA for Ronald Reagan, had famously described our Iraq invasion as "the greatest strategic disaster in U.S. history." Now once again, our true national interests are being served by a very broad ideological coalition of the non-crazy.

We can only hope that their efforts help ensure that the looming collapse of our doomed American Empire involves as little bloodshed as did the disintegration of the equally doomed Soviet Empire more than a generation ago.

# Remembering the 9/11 Truth Movement

***The Unz Review*** • September 11, 2023 • 9,800 Words

## The Decline of the 9/11 Truth Movement

We are now at the 22nd anniversary of the 9/11 Attacks that ushered in our current century and unleashed a series of wars, killing or displacing many millions. The highest-profile terrorist attacks in human history had tremendous importance both for the world and our own country, but a couple of decades later their memory has now dimmed, especially after the worldwide Covid epidemic and Russia's Ukraine war, two much more recent events of even greater global magnitude.

These days the 9/11 Attacks are only occasionally mentioned, and even those individuals intensely focused upon conspiratorial matters have mostly shifted their attention elsewhere. Kevin Barrett was very actively involved in the 9/11 Truth movement from its inception, and last week he published one of his rare recent pieces on the topic. His short article noted the approaching anniversary and usefully summarized much of the information accumulated in two decades of research, but his overall verdict was hardly an optimistic one.

- 9/11, 22 Years Later: Will We Ever Get the Truth?
  Kevin Barrett • ***The Unz Review*** • September 2, 2022 • 1,800 Words

Two years ago the twentieth anniversary had passed with little public attention. Soon afterward, Dr. Alan Sabrosky, an important 9/11 Truth figure, published an even more despairing appraisal in which he described the total failure of the effort that had absorbed so many years of his life.

> It gives me no pleasure at all to write these words. I personally came to the movement late in 2009, then met many excellent people and worked with many fine editors at a time when overt censorship was still minimal. The best of the "Truthers" shared one thing in common: they were right that the US Government explanation of the 9/11 attacks was singularly flawed, in whole and in all its major parts. But they [illegible] and I include myself here [illegible]

were ***never*** able to convey that message in a politically significant way to enough of the American public to matter.

The net effect is that despite innumerable articles, speeches, seminars, videos, protests and the like by tens of thousands of activists, the 20th anniversary of 9/11 came and went with barely a whimper. It was preceded by the collapse of the 9/11 lawyers effort in New York City on which so many had staked their hopes, and the dismissal of Richard Gage ♦ the founder of the seminal "Architects & Engineers for 9/11 Truth" ♦ from his own organization by his own board. It is tragic enough when evil triumphs, which is what the real planners and perpetrators of 9/11 did. It is even worse when the collapse of the efforts to expose them and to bring them to justice ends in farce.

- Out-Thought, Out-Bought, Out-Fought: Why the "9/11 Truth" Movement Failed
  Alan Sabrosky • ***The Unz Review*** • October 23, 2021 • 2,300 Words

As he mentioned, Richard Gage, founder and CEO of the foremost 9/11 Truth organization, had just recently been fired by his board when his controversial remarks on Covid vaccines were used by the media to torpedo a long-awaited prime-time broadcast of their 9/11 theories hosted by director Spike Lee.

I myself came very late to the 9/11 Truth issue, largely accepting the official narrative for nearly the first decade after the attacks. But when I published my own twenty year recapitulation in September 2021, the Covid epidemic was at its height and my article was one of the very few that appeared to mark that important milestone.

Although the 9/11 Truth movement has lost much of its energy and visibility, each year's anniversary does still occasionally prompt the publication of new articles, including on our own website. These pieces sometimes attract considerable readership and heated commentary, but the authors often seem compelled to avoid merely repeating familiar arguments, so they instead promote novel and implausible theories that are far less solidly grounded in evidence. I suspect that these may do much more harm than good, obfuscating the basic facts while driving away any curious newcomers.

Some of these activists now claim that the World Trade Center was

destroyed by nuclear explosions or mysterious energy weapons or that no planes were actually involved in the attacks. Although only a small minority of 9/11 Truthers take such positions, these individuals are often loud and energetic advocates, and thereby may serve to taint and discredit the more sober positions of the vast majority. Furthermore, with so many of the more mainstream 9/11 Truthers having gradually abandoned the issue, supporters of these fringe theories now probably constitute a growing fraction of the diehard Truthers. I suspect that the result has been to undermine the credibility of whatever remains of the 9/11 Truth movement.

This unfortunate situation is hardly surprising. Movements such as 9/11 Truth sharply oppose powerful official narratives so they naturally tend to attract persons with strongly contrarian and conspiratorial tendencies, individuals who are willing and eager to challenge all orthodoxies, including those of their own allies. Such activists may enthusiastically embrace wild ideas that capture their imagination, failing to comprehend that for responsible researchers, extraordinary claims require extraordinary evidence.

Furthermore, establishment forces may easily take advantage of such psychological weaknesses. As I discussed in an article last year, the late Michael Collins Piper, a leading conspiracy-researcher, strongly suspected that many of the implausible conspiratorial theories he considered so damaging to his cause may have been seeded and promoted by pro-establishment operatives engaging in Cass Sunstein-type deceptions, protecting official lies by manipulating excitable activists into discrediting their entire community.

> Conspiracy theorists have a notable tendency towards paranoia, but as a wit once observed “Even paranoids have enemies.” Once it became known that a high-ranking Obama Administration official had previously suggested that the government employ online operatives to infiltrate and disrupt the conspiracy community, the story spread like wildfire, with rival individuals and factions sometimes accusing each other of serving as such “cognitive infiltrators”…
>
> During that period, I was paying little attention to the 9/11 issue and was barely aware of the existence of a 9/11 Truth movement. But individuals who were very actively involved at the time have told me that they believe much of their movement’s momentum was lost when certain prominent figures were diverted into various bizarre theories of what had happened.

> Some began to argue that no actual planes had hit the towers in New York City, and the images seen were merely holograms. Others claimed that nuclear explosions or mysterious energy-weapons had inflicted the destruction. And naturally enough, the more exciting and shocking the theory, the more it tended to capture the imagination and enthusiasm of the rank-and-file activists. Moreover, many of these different factions bitterly opposed each other, and the resulting infighting together with the sometimes outlandish nature of the claims soon cost the 9/11 Truth movement much of the little support it had gained in media circles and among the public…
>
> Transgressive individuals who adhere to some heterodox beliefs are also usually willing to accept many others as well, and are often quite eager to do so, sometimes exhibiting the troubling lack of logical thinking and careful analytical judgment that may taint their entire community. This leaves them open to eagerly nibbling the poisoned bait of fraudulent but attractive theories, whether these are advanced by well-meaning advocates, self-serving charlatans, or covert agents of the establishment engaged in "cognitive infiltration."

- American Pravda: Alex Jones, Cass Sunstein, and "Cognitive Infiltration"
  Ron Unz • ***The Unz Review*** • August 8, 2022 • 5,400 Words

This situation has played out on our own website. Last September we published a long 9/11 article by Laurent Guyénot, who has produced a series of useful and important works on that topic over the last decade. However, his latest piece drew upon very thin evidence to argue that the simultaneous attacks on the World Trade Center and the Pentagon had actually been organized by entirely different groups of conspirators for entirely different reasons. I was even more dismayed to see him suggest that no actual planes had been hijacked nor had hit the World Trade Center, claims that I regarded with extreme skepticism. Unfortunately, this No Planes Hypothesis dominated much of the resulting discussion in the comments, which easily exceeded a half-million words.

- The 9/11 "Double-Cross" Conspiracy Theory
  *Pentagon Inside Job – World Trade Center Israeli Job*
  Laurent Guyénot • ***The Unz Review*** • September 6, 2022 • 8,100 Words • 2,143 Comments

As it happens, I recently came across a short video taken by a visitor to New York City who was filming the first tower as it burned and then captured the second plane as it hit. The street scene and all the other details seem totally authentic to me and I would hope that the partisans of the No Planes Hypothesis will watch it and abandon their mistaken theories but I doubt that almost any of them will do so.

Similarly, several weeks ago we published an article by Mark H. Gaffney. The first half of his presentation did a fine job of summarizing the implausibility of the official 9/11 narrative and described some of the strong evidence that military-grade explosives had been used to destroy the two towers in NYC. But in the second half, he then promoted the theory that the World Trade Center attacks had also involved fission-fusion nuclear blasts, a hypothesis I consider extremely implausible given the lack of any detectable radiation or noticeable large-scale explosions, and a longtime commenter who is a Stanford Physics Ph.D. was even more scathing in his criticism. The article provoked another huge outpouring of nearly 1,600 comments, totaling well over 300,000 words.

Unfortunately, I have heard that this nuclear 9/11 theory has gradually become popular within some influential conservative and anti-establishment circles, and I wonder whether it has not been deliberately promoted by those who seek to make 9/11 Truthers look ridiculous.

In sharp contrast, a few months ago I discovered a very sober and careful 2016 presentation by the late Prof. Graeme MacQueen to the Lawyers' Committee for 9/11 Inquiry in NYC, focusing upon the evidence provided in government records obtained via freedom of information requests. This released material included interviews of more than 150 eyewitnesses who mentioned hearing small explosions as the buildings collapsed, with some of them describing these as the sort of synchronized series of blasts used in demolition projects. This important testimony, overwhelmingly by first responders and rescue workers, was totally inconsistent with the official explanation that the collapses had been caused by office fires and therefore was completely ignored and excluded from the published government report. I should also note that all this powerful eyewitness evidence seems just as inconsistent with claims of a large nuclear explosion or an energy weapon.

MacQueen was an important figure in the 9/11 Truth movement and his presentation was made to a distinguished audience, but the crucial information he provided lacked the "excitement" of a hypothetical

nuclear blast or energy ray, so after four years the video has only attracted 822 views on Youtube and just five comments.

The shocking reality that government investigators might simply ignore the contrary testimony of over 150 eyewitnesses, most of them experienced fire-fighters, becomes less implausible when one considers the parallel cover-up involving the mid-air explosion of TWA Flight 800 that had occurred a half-dozen years earlier in the same New York City area. As I explained in a 2016 article:

> However, from a broader perspective, I believe that the truly horrifying aspect of the incident is the tremendous ease with which our government and its lapdog media managed to so utterly suppress the reality of what had happened—an American jumbo jet shot down by a missile—and did so although this occurred not in some obscure, faraway foreign land, but within the very sight of Steven Spielberg's home in the exclusive Hamptons, on a flight that had just departed New York City, and despite such overwhelming physical evidence and hundreds of direct eye-witnesses. The successful cover-up is the important story, and constitutes a central subtext in all of the books and documentaries on the disaster.

- American Pravda: The Destruction of TWA Flight 800
  Ron Unz • ***The Unz Review*** • September 26, 2016 • 2,800 Words

I suspect that those unfamiliar with the longstanding case against the official narrative might be easily driven away if they encountered wild speculation about nuclear explosions or energy rays. Instead, more conventional discussions of the issues would make a better introduction.

Earlier this year, my series of interviews on various controversial topics were aired on Iranian broadcast television, reaching a potential audience of ten million. In two of these half-hour segments, I presented my views on the 9/11 attacks and they're now available on the Rumble video platform, so those interested can easily watch them:

My own twentieth anniversary 9/11 article provided a much more comprehensive summary of this analysis, with the bulk of the material originally published in 2018.

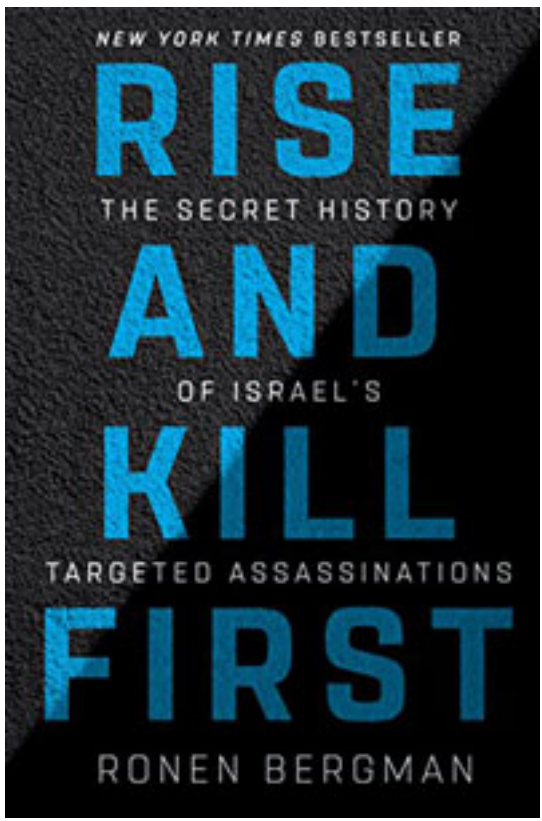
- American Pravda: Seeking 9/11 Truth After Twenty Years
  *Who Attacked America in 2001…and Why?*
  Ron Unz • ***The Unz Review*** • September 7, 2021 • 7,800 Words • 1,063 Comments

Since none of my views have much changed during the last few years, I'm republishing it below, as a helpful introduction to this complex and controversial topic.

## Twenty Years After the 9/11 Attacks

The twentieth anniversary of the 9/11 Attacks is almost upon us, and although their immediacy has been somewhat reduced by the events of the last eighteen months, we must recognize that they have drastically shaped the world history of the last two decades, greatly changing the daily lives and liberties of most ordinary Americans.

The widespread doubts about the reality of the official story provided by our government and almost universally promoted by our media has severely diminished popular faith in the credibility of those two crucial institutions, with consequences that are still very apparent in today's highest profile issues.



Over the years, diligent researchers and courageous journalists have largely demolished the original narrative of those events, and have made a strong, perhaps even overwhelming case that the Israeli Mossad together with its American collaborators played the central role. My own reconstruction, substantially relying upon this accumulated evidence, came to such conclusions, and I am therefore republishing it below, drawn from my previous articles which had appeared in late 2018 and early

2020, with the later material making heavy use of Ronen Bergman's authoritative 2018 history of the Mossad, which ran more than 750 pages.

Immediately following my own analysis is a link to a particularly noteworthy article along the same lines by French writer Laurent Guyénot, which we had originally released simultaneously with my own, then followed by more than a dozen other significant articles of the previous decade, all published or republished on this website. In coming days, some of these may also be separately featured as part of the twenty-year commemoration.

## The 9/11 Attacks – What Happened?

Although somewhat related, political assassinations and terrorist attacks are distinct topics, and Bergman's comprehensive volume explicitly focuses on the former, so we cannot fault him for providing only slight coverage of the latter. But the historical pattern of Israeli activity, especially with regard to false-flag attacks, is really quite remarkable, as I noted in a 2018 article:

One of history's largest terrorist attacks prior to 9/11 was the 1946 bombing of the King David Hotel in Jerusalem by Zionist militants dressed as Arabs, which killed 91 people and largely destroyed the structure. In the famous Lavon Affair of 1954, Israeli agents launched a wave of terrorist attacks against Western targets in Egypt, intending to have those blamed on anti-Western Arab groups. There are strong claims that in 1950 Israeli Mossad agents began a series of false-flag terrorist bombings against Jewish targets in Baghdad, successfully using those violent methods to help persuade Iraq's thousand-year-old Jewish community to emigrate to the Jewish state. In 1967, Israel launched a deliberate air and sea attack against the *U.S.S. Liberty*, intending to leave no survivors, killing or wounding over 200 American servicemen before word of the attack reached our Sixth Fleet and the Israelis withdrew.

The enormous extent of pro-Israel influence in world political and media circles meant that none of these brutal attacks ever drew serious retaliation, and in nearly all cases, they were quickly thrown down the memory hole, so that today probably no more than one in a hundred Americans is even aware of them. Furthermore, most of these incidents came to light due to chance circumstances, so we may easily suspect that many other attacks

of a similar nature have never become part of the historical record.

Of these famous incidents, Bergman only includes mention of the King David Hotel bombing. But much later in his narrative, he describes the huge wave of false-flag terrorist attacks unleashed in 1981 by Israeli Defense Minister Ariel Sharon, who recruited a former high-ranking Mossad official to manage the project.

Under Israeli direction, large car bombs began exploding in the Palestinian neighborhoods of Beirut and other Lebanese cities, killing or injuring enormous numbers of civilians. A single attack in October inflicted nearly 400 casualties, and by December, there were eighteen bombings per month, with their effectiveness greatly enhanced by the use of innovative new Israeli drone technology. Official responsibility for all the attacks was claimed by a previously unknown Lebanese organization, but the intent was to provoke the PLO into military retaliation against Israel, thereby justifying Sharon's planned invasion of the neighboring country.

Since the PLO stubbornly refused to take the bait, plans were put into motion for the huge bombing of an entire Beirut sports stadium using tons of explosives during a January 1st political ceremony, with the death and destruction expected to be "of unprecedented proportions, even in terms of Lebanon." But Sharon's political enemies learned of the plot and emphasized that many foreign diplomats including the Soviet ambassador were expected to be present and probably would be killed, so after a bitter debate, Prime Minister Begin ordered the attack aborted. A future Mossad chief mentions the major headaches they then faced in removing the large quantity of explosives that they had already planted within the structure.

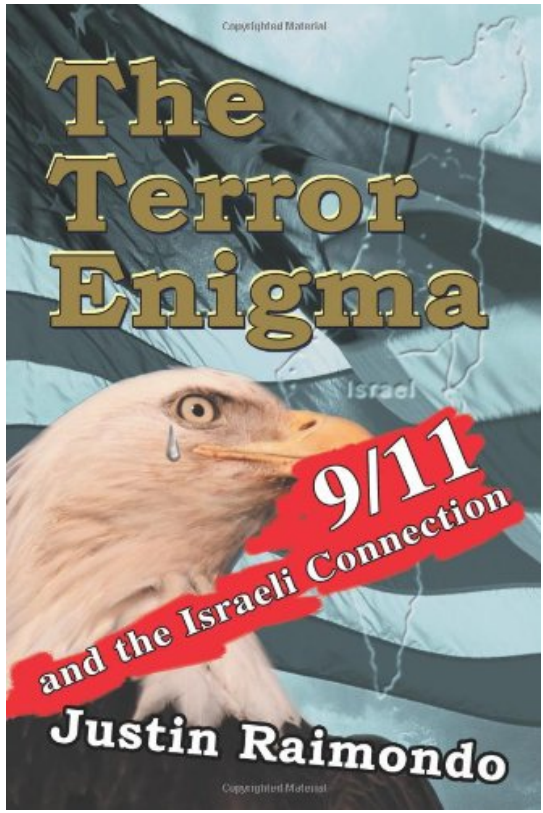
I think that this thoroughly documented history of major Israeli false-flag terrorist attacks, including those against American and other Western targets, should be carefully kept in mind when we consider the 9/11 attacks, whose aftermath has massively transformed our society and cost us so many trillions of dollars. I analyzed the strange circumstances of the attacks and their likely nature at considerable length in my 2018 article:

Oddly enough, for many years after 9/11, I paid very little

attention to the details of the attacks themselves. I was entirely preoccupied with building my content-archiving software system, and with the little time I could spare for public policy matters, I was totally focused on the ongoing Iraq War disaster, as well as my terrible fears that Bush might at any moment suddenly extend the conflict to Iran. Despite Neocon lies shamelessly echoed by our corrupt media, neither Iraq nor Iran had had anything whatsoever to do with the 9/11 attacks, so those events gradually faded in my consciousness, and I suspect the same was true for most other Americans. Al Qaeda had largely disappeared and Bin Laden was supposedly hiding in a cave somewhere. Despite endless Homeland Security "threat alerts," there had been no further Islamic terrorism on American soil, and relatively little anywhere else outside of the Iraq charnel house. So the precise details of the 9/11 plots had become almost irrelevant to me.

Others I knew seemed to feel the same way. Virtually all the exchanges I had with my old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan, had concerned the Iraq War and risk it might spread to Iran, as well as the bitter anger he felt toward Bush's perversion of his beloved NSA into an extra-constitutional tool of domestic espionage. When the *New York Times* broke the story of the massive extent of domestic NSA spying, Gen. Odom declared that President Bush should be impeached and NSA Director Michael Hayden court-martialed. But in all the years prior to his untimely passing in 2008, I don't recall the 9/11 attacks themselves even once coming up as a topic in our discussions.

Admittedly, I'd occasionally heard of some considerable oddities regarding the 9/11 attacks here and there, and these certainly raised some suspicions. Most days I would glance at the *Antiwar.com* front page, and it seemed that some Israeli Mossad agents had been caught while filming the plane attacks in NYC, while a much larger Mossad "art student" spy operation around the country had also been broken up around the same time. Apparently, *FoxNews* had even broadcast a multi-part series on the latter topic before that expose was scuttled and "disappeared" under ADL pressure.



Although I wasn't entirely sure about the credibility of those claims, it did seem plausible that Mossad had known of the attacks in advance and allowed them to proceed, recognizing the huge benefits that Israel would derive from the anti-Arab backlash. I think I was vaguely aware that *Antiwar.com* editorial director Justin Raimondo had published *The Terror Enigma*, a short book about some of those strange facts, bearing the provocative subtitle "9/11 and the Israeli Connection," but I never considered reading it. In 2007, *Counterpunch* itself published a fascinating follow-up story about the arrest of that group of Israeli Mossad agents in NYC, who were caught filming and apparently celebrating the plane attacks on that fateful day, and the Mossad activity seemed to be far larger than I had previously realized. But all these details remained a little fuzzy in my mind next to my overriding concerns about wars in Iraq and Iran.

However, by the end of 2008 my focus had begun to change. Bush was leaving office without having started an Iranian war,

and America had successfully dodged the bullet of an even more dangerous John McCain administration. I assumed that Barack Obama would be a terrible president and he proved worse than my expectations, but I still breathed a huge sigh of relief every day that he was in the White House.

Moreover, around that same time I'd stumbled across an astonishing detail of the 9/11 attacks that demonstrated the remarkable depths of my own ignorance. In a *Counterpunch* article, I'd discovered that immediately following the attacks, the supposed terrorist mastermind Osama bin Laden had publicly denied any involvement, even declaring that no good Muslim would have committed such deeds.

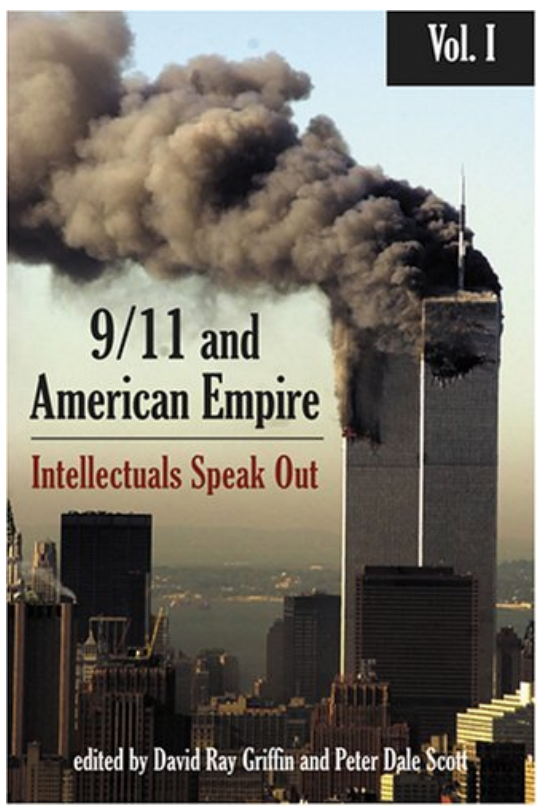
Once I checked around a little and fully confirmed that fact, I was flabbergasted. 9/11 was not only the most successful terrorist attack in the history of the world, but may have been greater in its physical magnitude than all past terrorist operations combined. The entire purpose of terrorism is to allow a small organization to show the world that it can inflict serious losses upon a powerful state, and I had never previously heard of any terrorist leader denying his role in a successful operation, let alone the greatest in history. Something seemed extremely wrong in the media-generated narrative that I had previously accepted. I began to wonder if I had been as deluded as the tens of millions of Americans in 2003 and 2004 who naively believed that Saddam had been the mastermind behind the September 11th attacks. We live in a world of illusions generated by our media, and I suddenly felt that I had noticed a tear in the paper-mache mountains displayed in the background of a Hollywood sound-stage. If Osama was probably not the author of 9/11, what other huge falsehoods had I blindly accepted?

A couple of years later, I came across a very interesting column by Eric Margolis, a prominent Canadian foreign policy journalist purged from the broadcast media for his strong opposition to the Iraq War. He had long published a weekly column in the *Toronto Sun* and when that tenure ended, he used his closing appearance to run a double-length piece expressing his very strong doubts about the official 9/11 story, even noting that the former director of Pakistani Intelligence insisted that Israel had been behind the attacks.

I eventually discovered that in 2003 former German Cabinet Minister Andreas von Bülow had published a best-selling book

strongly suggesting that the CIA rather than Bin Laden was behind the attacks, while in 2007 former Italian President Francesco Cossiga had similarly argued that the CIA and the Israeli Mossad had been responsible, claiming that fact was well known among Western intelligence agencies.

Over the years, all these discordant claims had gradually raised my suspicions about the official 9/11 story to rather strong levels, but it was only very recently that I finally found the time to begin to seriously investigate the subject and read eight or ten of the main 9/11 Truther books, mostly those by Prof. David Ray Griffin, the widely acknowledged leader in that field. And his books, together with the writings of his numerous colleagues and allies, revealed all sorts of very telling details, most of which had previously been unknown to me. I was also greatly impressed by the sheer number of seemingly reputable individuals of no apparent ideological bent who had become adherents of the 9/11 Truth movement over the years.



When utterly astonishing claims of an extremely controversial nature are made over a period of many years by numerous

seemingly reputable academics and other experts, and they are entirely ignored or suppressed but never effectively rebutted, reasonable conclusions seem to point in an obvious direction. Based on my very recent readings in this topic, the total number of huge flaws in the official 9/11 story has now grown extremely long, probably numbering in the many dozens. Most of these individual items seem reasonably likely and if we decide that even just two or three of them are correct, we must totally reject the official narrative that so many of us have believed for so long.

Now I am merely just an amateur in the complex intelligence craft of extracting nuggets of truth from a mountain of manufactured falsehood. Although the arguments of the 9/11 Truth Movement seem quite persuasive to me, I would obviously have felt much more comfortable if they were seconded by an experienced professional, such as a top CIA analyst. A few years ago, I was shocked to discover that was indeed the case.

William Christison had spent 29 years at the CIA, rising to become one of its senior figures as Director of its Office of Regional and Political Analysis, with 200 research analysts serving under him. In August 2006, he published a remarkable 2,700 word article explaining why he no longer believed the official 9/11 story and felt sure that the 9/11 Commission Report constituted a cover-up, with the truth being quite different. The following year, he provided a forceful endorsement to one of Griffin's books, writing that "[There's] a strong body of evidence showing the official U.S. Government story of what happened on September 11, 2001 to be almost certainly a monstrous series of lies." And Christison's extreme 9/11 skepticism was seconded by that of many other highly regarded former US intelligence professionals.

We might expect that if a former CIA intelligence officer of Christison's rank were to denounce the official 9/11 report as a fraud and a cover-up, such a story would constitute front-page news. But it was never reported anywhere in our mainstream media, and I only stumbled upon it a decade later.

Even our supposed "alternative" media outlets were nearly as silent. Throughout the 2000s, Christison and his wife Kathleen, also a former CIA analyst, had been regular contributors to *Counterpunch*, publishing many dozens of articles there and certainly being its most highly credentialed writers on intelligence and national security matters. But editor Alexander

Cockburn refused to publish any of their 9/11 skepticism, so it never came to my attention at the time. Indeed, when I mentioned Christison's views to current *Counterpunch* editor Jeffrey St. Clair a couple of years ago, he was stunned to discover that the friend he had regarded so very highly had actually become a "9/11 Truther." When media organs serve as ideological gatekeepers, a condition of widespread ignorance becomes unavoidable.

With so many gaping holes in the official story of the events of seventeen years ago, each of us is free to choose to focus on those we personally consider most persuasive, and I have several of my own. Danish Chemistry professor Niels Harrit was one of the scientists who analyzed the debris of the destroyed buildings and detected the residual presence of nano-thermite, a military-grade explosive compound, and I found him quite credible during his hour-long interview on *Red Ice Radio*. The notion that an undamaged hijacker passport was found on an NYC street after the massive, fiery destruction of the skyscrapers is totally absurd, as was the claim that the top hijacker conveniently lost his luggage at one of the airports and it was found to contain a large mass of incriminating information. The testimonies of the dozens of firefighters who heard explosions just before the collapse of the buildings seems totally inexplicable under the official account. The sudden total collapse of Building Seven, never hit by any jetliners is also extremely implausible.

## The 9/11 Attacks – Who Did It?

Let us now suppose that the overwhelming weight of evidence is correct, and concur with high-ranking former CIA intelligence analysts, distinguished academics, and experienced professionals that the 9/11 attacks were not what they appeared to be. We recognize the extreme implausibility that three huge skyscrapers in New York City suddenly collapsed at free-fall velocity into their own footprints after just two of them were hit by airplanes, and also that a large civilian jetliner probably did not strike the Pentagon leaving behind absolutely no wreckage and only a small hole. What actually did happen, and more importantly, who was responsible?

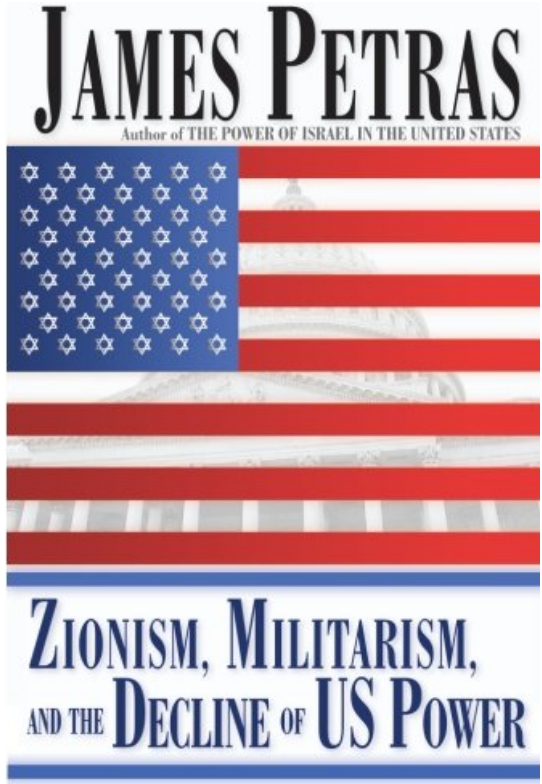
The first question is obviously impossible to answer without an honest and thorough official investigation of the evidence. Until that occurs, we should not be surprised that numerous, somewhat

conflicting hypotheses have been advanced and debated within the confines of the 9/11 Truth community. But the second question is probably the more important and relevant one, and I think it has always represented a source of extreme vulnerability to 9/11 Truthers.

The most typical approach, as generally followed in the numerous Griffin books, is to avoid the issue entirely and focus solely on the gaping flaws in the official narrative. This is a perfectly acceptable position but leaves all sorts of serious doubts. What organized group would have been sufficiently powerful and daring to carry off an attack of such vast scale against the central heart of the world's sole superpower? And how were they possibly able to orchestrate such a massively effective media and political cover-up, even enlisting the participation of the U.S. government itself?

The much smaller fraction of 9/11 Truthers who choose to address this "whodunit" question seem to be overwhelmingly concentrated among rank-and-file grassroots activists rather than the prestigious experts, and they usually answer "inside job!" Their widespread belief seems to be that the top political leadership of the Bush Administration, probably including Vice President Dick Cheney and Defense Secretary Donald Rumsfeld, had organized the terrorist attacks, either with or without the knowledge of their ignorant nominal superior, President George W. Bush. The suggested motives included justifying military attacks against various countries, supporting the financial interests of the powerful oil industry and military-industrial complex, and enabling the destruction of traditional American civil liberties. Since the vast majority of politically-active Truthers seem to come from the far left of the ideological spectrum, they regard these notions as logical and almost self-evident.

Although not explicitly endorsing those Truther conspiracies, filmmaker Michael Moore's leftist box office hit *Fahrenheit 9/11* seemed to raise such similar suspicions. His small budget documentary earned an astonishing \$220 million by suggesting that the very close business ties between the Bush family, Cheney, the oil companies, and the Saudis were responsible for the Iraq War aftermath of the terrorist attacks, as well as the domestic crackdown on civil liberties, which was part-and-parcel of the right-wing Republican agenda.



Unfortunately, this apparently plausible picture seems to have almost no basis in reality. During the drive to the Iraq War, I read *Times* articles interviewing numerous top oil men in Texas who expressed total puzzlement at why America was planning to attack Saddam, saying that they could only assume that President Bush knew something that they themselves did not. Saudi Arabian leaders were adamantly opposed to an American attack on Iraq, and made every effort to prevent it. Prior to his joining the Bush Administration, Cheney had served as CEO of Halliburton, an oil services giant, and his firm had heavily lobbied for the lifting of U.S. economic sanctions against Iraq. Prof. James Petras, a scholar of strong Marxist leanings, published an excellent 2008 book entitled *Zionism, Militarism, and the Decline of US Power* in which he conclusively demonstrated that Zionist interests rather than those of the oil industry had dominated the Bush Administration in the wake of the 9/11 attacks, and promoted the Iraq War.

As for the Michael Moore film, I remember at the time sharing a laugh with a (Jewish) friend of mine, both of us finding it ridiculous that a government so overwhelmingly permeated by

fanatically pro-Israel Neocons was being portrayed as being in thrall to the Saudis. Not only did the plotline of Moore's film demonstrate the fearsome power of Jewish Hollywood, but its huge success suggested that most of the American public had apparently never heard of the Neocons.

Bush critics properly ridiculed the president for his tongue-tied statement that the 9/11 terrorists had attacked America "for its freedoms" and Truthers have reasonably branded as implausible the claims that the massive attacks were organized by a cave-dwelling Islamic preacher. But the suggestion that they were led and organized by the top figures of the Bush Administration seems even more preposterous.

Cheney and Rumsfeld had both spent decades as stalwarts of the moderate pro-business wing of the Republican Party, each serving in top government positions and also as CEOs of major corporations. The notion that they capped their careers by joining a new Republican administration in early 2001 and almost immediately set about organizing a gigantic false-flag terrorist attack upon the proudest towers of our largest city together with our own national military headquarters, intending to kill many thousands of Americans in the process, is too ridiculous to even be part of a leftist political satire.

Let's step back a bit. In the entire history of the world, I can think of no documented case in which the top political leadership of a country has launched a major false-flag attack upon its own centers of power and finance and tried to kill large numbers of its own people. The America of 2001 was a peaceful and prosperous country run by relatively bland political leaders focused upon the traditional Republican goals of enacting tax-cuts for the rich and reducing environmental regulations. Too many Truther activists have apparently drawn their understanding of the world from the caricatures of leftist comic-books in which corporate Republicans are all diabolical Dr. Evils, seeking to kill Americans out of sheer malevolence, and Alexander Cockburn was absolutely correct to ridicule them at least on that particular score.

Consider also the simple practicalities of the situation. The gigantic nature of the 9/11 attacks as postulated by the Truth movement would have clearly required enormous planning and probably involved the work of many dozens or even hundreds of

skilled agents. Ordering CIA operatives or special military units to organize secret attacks against civilian targets in Venezuela or Yemen is one thing, but directing them to mount attacks against the Pentagon and the heart of New York City would be fraught with stupendous risk.

Bush had lost the popular vote in November 2000 and had only reached the White House because of a few dangling chads in Florida and the controversial decision of a deeply divided Supreme Court. As a consequence, most of the American media regarded his new administration with enormous hostility. If the first act of such a newly-sworn presidential team had been ordering the CIA or the military to prepare attacks against New York City and the Pentagon, surely those orders would have been regarded as issued by a group of lunatics, and immediately leaked to the hostile national press.

The whole scenario of top American leaders being the masterminds behind 9/11 is beyond ridiculous, and those 9/11 Truthers who make or imply such claims—doing so without a single shred of solid evidence—have unfortunately played a major role in discrediting their entire movement. In fact, the common meaning of the "inside job" scenario is so patently absurd and self-defeating that one might even suspect that the claim was encouraged by those seeking to discredit the entire 9/11 Truth movement as a consequence.

The focus on Cheney and Rumsfeld seems particularly ill-directed. Although I've never met nor had any dealings with either of those individuals, I was quite actively involved in DC politics during the 1990s, and can say with some assurance that prior to 9/11, neither of them were regarded as Neocons. Instead, they were the archetypical examples of moderate business-type mainstream Republicans, stretching all the way back to their years at the top of the Ford Administration during the mid-1970s.

Skeptics of this claim may note that they signed the 1997 declaration issued by the Project for the New American Century (PNAC), a leading Neocon foreign policy manifesto organized by Bill Kristol, but I would regard that as something of a red herring. In DC circles, individuals are always recruiting their friends to sign various declarations, which may or may not be indicative of anything, and I remember Kristol trying to get me to sign the PNAC statement as well. Since my private views on

that issue were absolutely 100% contrary to the Neocon position, which I regarded as foreign policy lunacy, I deflected his request and very politely turned him down. But I was quite friendly with him at the time, so if I had been someone without strong opinions in that area, I probably would have agreed.

This raises a larger point. By 2000, the Neocons had gained almost total control of all the major conservative/Republican media outlets and the foreign policy wings of nearly all the similarly aligned thinktanks in DC, successfully purging most of their traditional opponents. So although Cheney and Rumsfeld were not themselves Neocons, they were swimming in a Neocon sea, with a very large fraction of all the information they received coming from such sources and with their top aides such as "Scooter" Libby, Paul Wolfowitz, and Douglas Feith being Neocons. Rumsfeld was already somewhat elderly while Cheney had suffered several heart-attacks starting at age 37, so under those circumstances it may have been relatively easy for them to be shifted toward certain policy positions.

Indeed, the entire demonization of Cheney and Rumsfeld in anti-Iraq War circles has seemed somewhat suspicious to me. I always wondered whether the heavily Jewish liberal media had focused its wrath upon those two individuals in order to deflect culpability from the Jewish Neocons who were the obvious originators of that disastrous policy; and the same may be true of the 9/11 Truthers, who probably feared accusations of anti-Semitism. Regarding that former issue, a prominent Israeli columnist was characteristically blunt on the matter in 2003, strongly suggesting that 25 Neocon intellectuals, nearly all of them Jewish, were primarily responsible for the war. Under normal circumstances, the president himself would have surely been portrayed as the evil mastermind behind the 9/11 plot, but "W" was too widely known for his ignorance for such accusations to be credible.

It does seem entirely plausible that Cheney, Rumsfeld, and other top Bush leaders may have been manipulated into taking certain actions that inadvertently fostered the 9/11 plot, while a few lower-level Bush appointees might have been more directly involved, perhaps even as outright conspirators. But I do not think this is the usual meaning of the "inside job" accusation.

So where do we now stand? It seems very likely that the 9/11 attacks were the work of an organization far more powerful and professionally-skilled than a rag-tag band of nineteen random Arabs armed with box-cutters, but also that the attacks were very unlikely to have been the work of the American government itself. So who actually attacked our country on that fateful day seventeen years ago, killing thousands of our fellow citizens?

Effective intelligence operations are concealed in a hall of mirrors, often extremely difficult for outsiders to penetrate, and false-flag terrorist attacks certainly fall into this category. But if we apply a different metaphor, the complexities of such events may be seen as a Gordian Knot, almost impossible to disentangle, but vulnerable to the sword-stroke of asking the simple question "Who benefited?"

America and most of the world certainly did not, and the disastrous legacies of that fateful day have transformed our own society and wrecked many other countries. The endless American wars soon unleashed have already cost us many trillions of dollars and set our nation on the road to bankruptcy while killing or displacing many millions of innocent Middle Easterners. Most recently, that resulting flood of desperate refugees has begun engulfing Europe, and the peace and prosperity of that ancient continent is now under severe threat.

Our traditional civil liberties and constitutional protections have been drastically eroded, with our society having taken long steps toward becoming an outright police state. American citizens now passively accept unimaginable infringements on their personal freedoms, all originally begun under the guise of preventing terrorism.

I find it difficult to think of any country in the world that clearly gained as a result of the 9/11 attacks and America's military reaction, with one single, solitary exception.

During 2000 and most of 2001, America was a peaceful prosperous country, but a certain small Middle Eastern nation had found itself in an increasingly desperate situation. Israel then seemed to be fighting for its life against the massive waves of domestic terrorism that constituted the Second Palestinian Intifada.

Ariel Sharon was widely believed to have deliberately provoked

that uprising in September 2000 by marching to the Temple Mount backed by a thousand armed police, and the resulting violence and polarization of Israeli society had successfully installed him as Prime Minister in early 2001. But once in office, his brutal measures failed to end the wave of continuing attacks, which increasingly took the form of suicide-bombings against civilian targets. Many believed that the violence might soon trigger a huge outflow of Israeli citizens, perhaps producing a death-spiral for the Jewish state. Iraq, Iran, Libya, and other major Muslim powers were supporting the Palestinians with money, rhetoric, and sometimes weaponry, and Israeli society seemed close to crumbling. I remember hearing from some of my DC friends that numerous Israeli policy experts were suddenly seeking berths at Neocon thinktanks so that they could relocate to America.

Sharon was a notoriously bloody and reckless leader, with a long history of undertaking strategic gambles of astonishing boldness, sometimes betting everything on a single roll of the dice. He had spent decades seeking the Prime Ministership, but having finally obtained it, he now had his back to the wall, with no obvious source of rescue in sight.

The 9/11 attacks changed everything. Suddenly the world's sole superpower was fully mobilized against Arab and Muslim terrorist movements, especially those connected with the Middle East. Sharon's close Neocon political allies in America used the unexpected crisis as an opportunity to seize control of America's foreign policy and national security apparatus, with an NSA staffer later reporting that Israeli generals freely roamed the halls of the Pentagon without any security controls. Meanwhile, the excuse of preventing domestic terrorism was used to implement newly centralized American police controls that were soon employed to harass or even shut down various anti-Zionist political organizations. One of the Israeli Mossad agents arrested by the police in New York City as he and his fellows were celebrating the 9/11 attacks and producing a souvenir film of the burning World Trade Center towers told the officers that "We are Israelis…Your problems are our problems." And so they immediately became.

General Wesley Clark reported that soon after the 9/11 attacks he was informed that a secret military plan had somehow come into being under which America would attack and destroy seven major Muslim countries over the next few years, including Iraq, Iran,

Syria, and Libya, which coincidentally were all of Israel's strongest regional adversaries and the leading supporters of the Palestinians. As America began to expend enormous oceans of blood and treasure attacking all of Israel's enemies after 9/11, Israel itself no longer needed to do so. Partly as a consequence, almost no other nation in the world has so enormously improved its strategic and economic situation during the last seventeen years, even while a large fraction of the American population has become completely impoverished during that same period and our national debt has grown to insurmountable levels. A parasite can often grow fat even as its host suffers and declines.

I have emphasized that for many years after the 9/11 attacks I paid little attention to the details and had only the vaguest notion that there even existed an organized 9/11 Truth movement. But if someone had ever convinced me that the terrorist attacks had been false-flag operations and someone other than Osama had been responsible, my immediate guess would have been Israel and its Mossad.

Certainly no other nation in the world can remotely match Israel's track-record of remarkably bold high-level assassinations and false-flag attacks, terrorist and otherwise, against other countries, even including America and its military. Furthermore, the enormous dominance of Jewish and pro-Israel elements in the American establishment media and increasingly that of many other major countries in the West has long ensured that even when the solid evidence of such attacks was discovered, very few ordinary Americans would ever hear those facts.

Once we accept that the 9/11 attacks were probably a false-flag operation, a central clue to the likely perpetrators has been their extraordinary success in ensuring that such a wealth of enormously suspicious evidence has been totally ignored by virtually the entire American media, whether liberal or conservative, left-wing or right-wing.

In the particular case at hand, the considerable number of zealously pro-Israel Neocons situated just beneath the public surface of the Bush Administration in 2001 could have greatly facilitated both the successful organization of the attacks and their effective cover-up and concealment, with Libby, Wolfowitz, Feith, and Richard Perle being merely the most obvious names.

Whether such individuals were knowing conspirators or merely had personal ties allowing them to be exploited in furthering the plot is entirely unclear.

Most of this information must surely have long been apparent to knowledgeable observers, and I strongly suspect that many individuals who had paid much greater attention than myself to the details of the 9/11 attacks may have quickly formed a tentative conclusion along these same lines. But for obvious social and political reasons, there is a great reluctance to publicly point the finger of blame towards Israel on a matter of such enormous magnitude. Hence, except for a few fringe activists here and there, such dark suspicions remained private.

Meanwhile, the leaders of the 9/11 Truth movement probably feared they would be destroyed by media accusations of deranged anti-Semitism if they had ever expressed even a hint of such ideas. This political strategy may have been necessary, but by failing to name any plausible culprit, they created a vacuum that was soon filled by "useful idiots" who shouted "inside job!" while pointing an accusing finger toward Cheney and Rumsfeld, and thereby did so much to discredit the entire 9/11 Truth movement.

This unfortunate conspiracy of silence finally ended in 2009 when Dr. Alan Sabrosky, former Director of Studies at the US Army War College, stepped forward and publicly declared that the Israeli Mossad had very likely been responsible for the 9/11 attacks, writing a series of columns on the subject, and eventually presenting his views in a number of media interviews, along with additional analyses.

Obviously, such explosive charges never reached the pages of my morning *Times*, but they did receive considerable if transitory coverage in portions of the alternative media, and I remember seeing the links very prominently featured at *Antiwar.com* and widely discussed elsewhere. I had never previously heard of Sabrosky, so I consulted my archiving system and immediately discovered that he had a perfectly respectable record of publication on military affairs in mainstream foreign policy periodicals and had also held a series of academic appointments at prestigious institutions. Reading one or two of his articles on 9/11, I felt he made a rather persuasive case for Mossad involvement, with some of his information already known to me

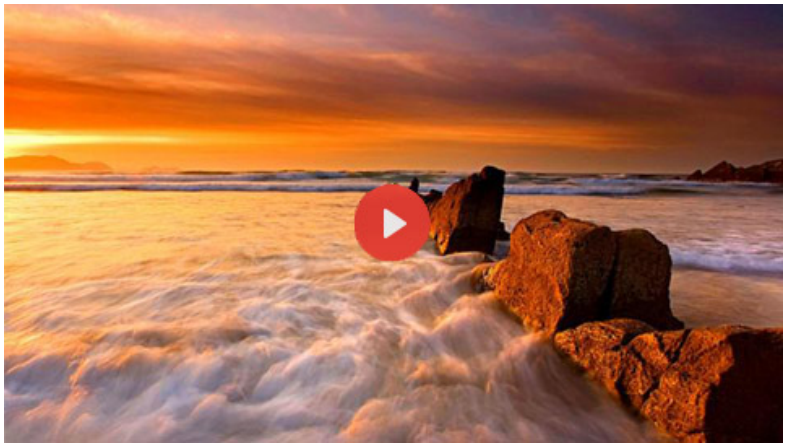
but much of it not.

Since I was very busy with my software work and had never spent any time investigating 9/11 or reading any of the books on the topic, my belief in his claims back then was obviously quite tentative. But now that I have finally looked into the subject in much greater detail and done a great deal of reading, I think it seems quite likely that his 2009 analysis was entirely correct.

I would particularly recommend his long 2011 interview on Iranian Press TV, which I first watched just a couple of days ago. He came across as highly credible and forthright in his claims:

I have had long conversations over
the last two weeks with contacts
at the Army War College and the
headquarters, Marine Corps and
I've made it absolutely clear in
both cases that it is 10
rtain
that 9/11 was a Mossa
ation
Period
The Zionists are playing this as an
all-or-nothing exercise
If they lose this one, they're done..
Alan Sabrosky
US Army War College Retired

He also provided a pugnacious conclusion in a much longer 2010 radio interview:



Sabrosky focused much of his attention upon a particular segment of a Dutch documentary film on the 9/11 attacks produced several years earlier. In that fascinating interview, a professional demolition expert named Danny Jowenko who was largely ignorant of the 9/11 attacks immediately identified the filmed collapse of WTC Building 7 as a controlled-demolition, and the remarkable clip was broadcast worldwide on *Press TV* and widely discussed across the Internet.

And by a very strange coincidence, just three days after Jowenko's broadcast video interview had received such heavy attention, he had the misfortune to die in a frontal collision with a tree in Holland. I'd suspect that the community of professional demolition experts is a small one, and Jowenko's surviving industry colleagues may have quickly concluded that serious misfortune might visit those who rendered controversial expert opinions on the collapse of the three World Trade Center towers.

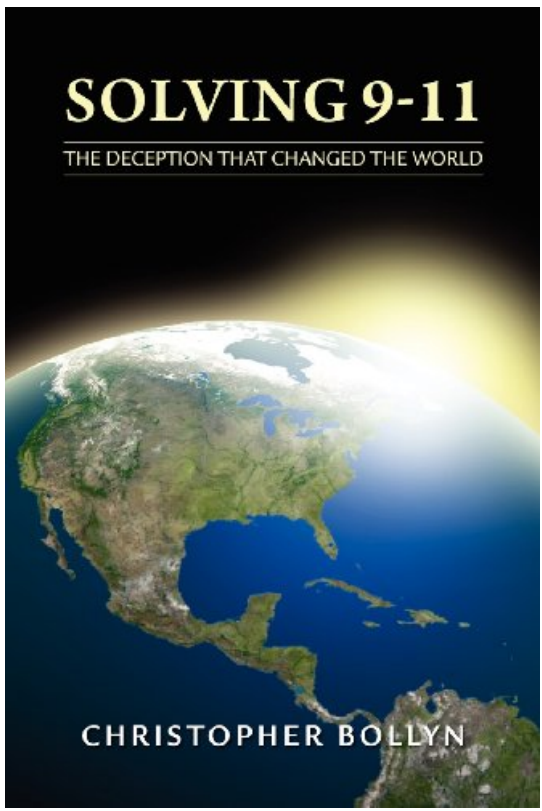
Meanwhile, the ADL soon mounted a huge and largely successful effort to have *Press TV* banned in the West for promoting "anti-Semitic conspiracy theories," even persuading YouTube to entirely eliminate the huge video archive of those past shows, notably including Sabrosky's long interview.

Most recently, Sabrosky provided an hour-long presentation at

this June's Deep Truth video panel conference, during which he expressed considerable pessimism about America's political predicament, and suggested that the Zionist control over our politics and media had grown even stronger over the last decade.

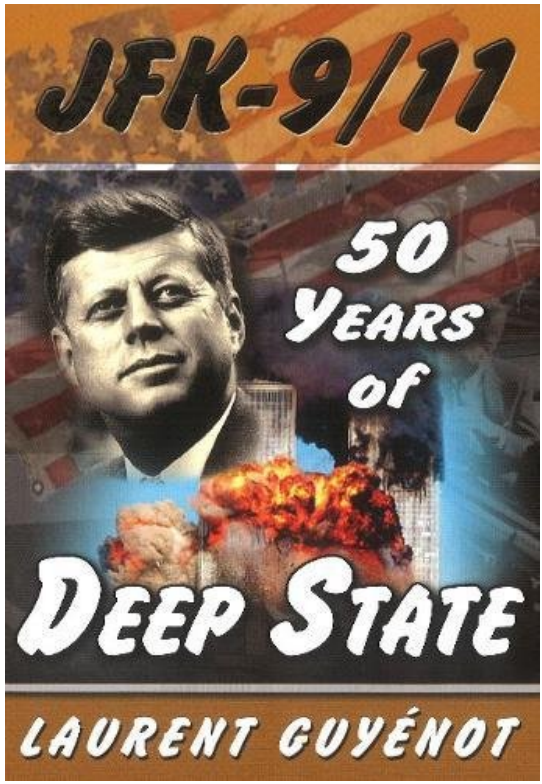
His discussion was soon rebroadcast by *Guns & Butter*, a prominent progressive radio program, which as a consequence was soon purged from its home station after seventeen years of great national popularity and strong listener support.

The late Alan Hart, a very distinguished British broadcast journalist and foreign correspondent, also broke his silence in 2010 and similarly pointed to the Israelis as the likely culprits behind the 9/11 attacks. Those interested may wish to listen to his extended interview.



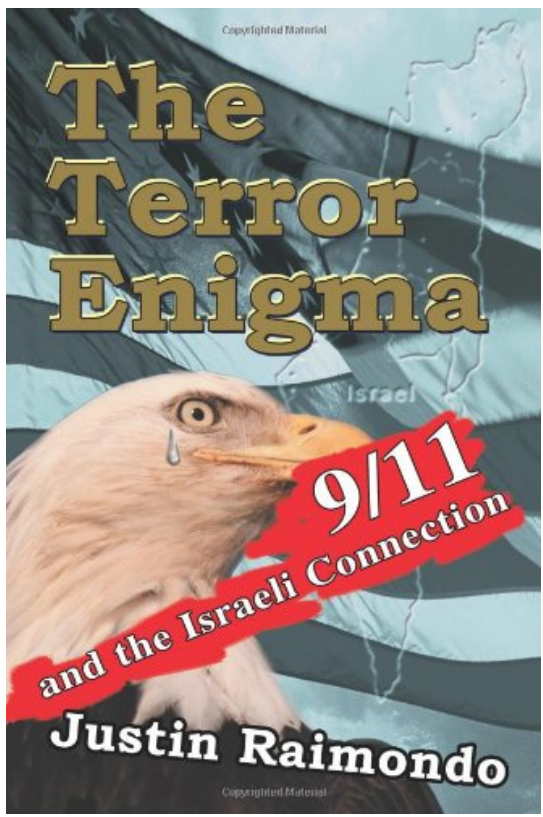
Journalist Christopher Bollyn was one of the first writers to explore the possible Israeli links to the 9/11 attacks, and the details contained in his long series of newspaper articles are often quoted by other researchers. In 2012, he gathered together this

material and published it in the form of a book entitled *Solving 9-11*, thereby making his information on the possible role of the Israeli Mossad available to a much wider audience, with a version being available online. Unfortunately his printed volume severely suffers from the typical lack of resources available to the writers on the political fringe, with poor organization and frequent repetition of the same points due to its origins in a set of individual articles, and this may diminish its credibility among some readers. So those who purchase it should be forewarned about these serious stylistic weaknesses.



Probably a much better compendium of the very extensive evidence pointing to the Israeli hand behind the 9/11 attacks has been more recently provided by French writer Laurent Guyénot, both in his 2017 book *JFK-9/11: 50 Years of the Deep State* and also his 8,500 word article "9/11 was an Israeli Job", published concurrently with this one and providing a far greater wealth of detail than is contained here. While I would not necessarily endorse all of his claims and arguments, his overall analysis seems fully consistent with my own.

These writers have provided a great deal of material in support of the Israeli Mossad Hypothesis, but I would focus attention on just one important point. We would normally expect that terrorist attacks resulting in the complete destruction of three gigantic office buildings in New York City and an aerial assault on the Pentagon would be an operation of enormous size and scale, involving very considerable organizational infrastructure and manpower. In the aftermath of the attacks, the US government undertook great efforts to locate and arrest the surviving Islamic conspirators, but scarcely managed to find a single one. Apparently, they had all died in the attacks themselves or otherwise simply vanished into thin air.



But without making much effort at all, the American government did quickly round up and arrest some 200 Israeli Mossad agents, many of whom had been based in exactly the same geographical locations as the purported 19 Arab hijackers. Furthermore, NYC police arrested some of these agents while they were publicly celebrating the 9/11 attacks, and others were caught driving vans in the New York area containing explosives or their residual traces. Most of these Mossad agents refused to answer any

questions, and many of those who did failed polygraph tests, but under massive political pressure all were eventually released and deported back to Israel. A couple of years ago, much of this information was very effectively presented in a short video available on YouTube.

There is another fascinating tidbit that I have very rarely seen mentioned. Just a month after the 9/11 attacks, two Israelis were caught sneaking weapons and explosives into the Mexican Parliament building, a story that naturally produced several banner-headlines in leading Mexican newspapers at the time but which was greeted by total silence in the American media. Eventually, under massive political pressure, all charges were dropped and the Israeli agents were deported back home. This remarkable incident was only reported on a small Hispanic-activist website, and discussed in a few other places. Some years ago I easily found the scanned front pages of the Mexican newspapers reporting those dramatic events on the Internet, but I can no longer easily locate them. The details are obviously somewhat fragmentary and possibly garbled, but certainly quite intriguing.

One might speculate that if supposed Islamic terrorists had followed up their 9/11 attacks by attacking and destroying the Mexican parliament building a month later, Latin American support for America's military invasions in the Middle East would have been greatly magnified. Furthermore, any scenes of such massive destruction in the Mexican capital by Arab terrorists would surely have been broadcast non-stop on *Univision*, America's dominant Spanish-language network, fully solidifying Hispanic support for President Bush's military endeavors.

Although my growing suspicions about the 9/11 attacks stretch back a decade or more, my serious investigation of the topic is quite recent, so I am certainly a newcomer to the field. But sometimes an outsider can notice things that may escape the attention of those who have spent so many years deeply immersed in a given topic.

From my perspective, a huge fraction of the 9/11 Truth community spends far too much of its time absorbed in the particular details of the attacks, debating the precise method by which the World Trade Center towers in New York were brought down or what actually struck the Pentagon. But these sorts of issues seem of little ultimate significance.

I would argue that the only important aspect of such technical issues is whether the overall evidence is sufficiently strong to establish the falsehood of the official 9/11 narrative and also demonstrate that the attacks must have been the work of a highly sophisticated organization with access to advanced military technology rather than a rag-tag band of 19 Arabs armed with box-cutters. Beyond that, none of those details matter.

In that regard, I believe that the volume of factual material collected by determined researchers over the last seventeen years has easily met that requirement, perhaps even ten or twenty times over. For example, even agreeing upon a single particular item such as the clear presence of nano-thermite, a military-grade explosive compound, would immediately satisfy those two criteria. So I see little point in endless debates over whether nano-thermite was used, or nano-thermite plus something else, or just something else entirely. And such complex technical debates may serve to obscure the larger picture, while confusing and intimidating any casually-interested onlookers, thereby being quite counter-productive to the overall goals of the 9/11 Truth movement.

Once we have concluded that the culprits were part of a highly sophisticated organization, we can then focus on the *Who* and the *Why*, which surely would be of greater importance than the particular details of the *How*. Yet currently all the endless debate over the *How* tends to crowd out the *Who* and the *Why*, and I wonder whether this unfortunate situation might even be intentional.

Perhaps one reason is that once sincere 9/11 Truthers do focus on those more important questions, the vast weight of the evidence clearly points in a single direction, implicating Israel and its Mossad intelligence service, with the case being overwhelmingly strong in motive, means, and opportunity. And leveling accusations of blame at Israel and its domestic collaborators for the greatest attack ever launched against America on our own soil entails enormous social and political risks.

But such difficulties must be weighed against the reality of three thousand American civilian lives and the subsequent seventeen years of our multi-trillion-dollar wars, which have produced tens of thousands of dead or wounded American servicemen and the death or displacement of many millions of innocent Middle Easterners.

The members of the 9/11 Truth movement must therefore ask themselves whether or not “Truth” is indeed the central goal of their efforts.

# Elon Musk and the True History of the ADL

*Mike Whitney Interview with Ron Unz*

***The Unz Review*** • September 13, 2023 • 6,800 Words

**Elon Musk controls one of the world's most powerful media megaphones. If he chose to do so, he could easily ensure that tens of millions of Americans learned the true origins and history of the ADL, an organization that today controls much of what our citizens are allowed to read or see. Such a bold stroke might completely break the power the ADL possesses over him and the rest of our society –Ron Unz, Editor, The Unz Review**

## Question 1: The Nature of the ADL

*Let's talk about the ADL. Some of your readers may not know that you have written extensively on the ADL and that your analysis prompted Paul Craig Roberts to call you "the bravest man I know." What Roberts was referring to, I think, is your riveting 2018 account of the ADL's shadowy history as well as its controversial activities and methods. Here's a short excerpt from a piece you wrote in 2018 that helps to illustrate what I'm talking about:*

> In January 1993, the San Francisco Police Department reported that it had recently raided the Northern California headquarters of the ADL based upon information provided by the FBI. **The SFPD discovered that the organization had been keeping intelligence files on more than 600 civic organizations and 10,000 individuals**, overwhelmingly of a liberal orientation, with **the SFPD inspector estimating that 75% of the material had been illegally obtained, much of it by secret payments to police officials. This was merely the tip of the iceberg in what clearly amounted to the largest domestic spying**

> **operation by any private organization in American history**, and according to some sources, ADL agents across the country had targeted over 1,000 political, religious, labor, and civil rights organizations, with the New York headquarters of the ADL maintaining active dossiers on more than a million Americans."

*This is shocking information that perhaps only a handful of Americans know anything about. The recent dust-up with Elon Musk has put the ADL's methods under a microscope particularly their alleged role in censoring people on the Internet. So, my question to you is this:* ***What is the ADL?*** *Is it really a civil rights organization that "combats extremism and antisemitism" or is it something else altogether?*

**Ron Unz**—Founded in 1913, the ADL—the Anti-Defamation League of B'nai B'rith—is a very formidable Jewish activist organization that has great influence over the media and other important elements of American society, and therefore is widely feared in elite circles. As I explained in my 2018 article:

> In our modern era, there are surely few organizations that so terrify powerful Americans as the Anti-Defamation League (ADL) of B'nai B'rith, a central organ of the organized Jewish community.
>
> Mel Gibson had long been one of the most popular stars in Hollywood and his 2004 film *The Passion of the Christ* became among the most profitable in world history, yet the ADL and its allies destroyed his career, and he eventually donated millions of dollars to Jewish groups in desperate hopes of regaining some of his public standing. When the ADL criticized a cartoon that had appeared in one of his newspapers, media titan Rupert Murdoch provided his personal apology to that organization, and the editors of *The Economist* quickly retracted a different cartoon once it came under ADL fire. Billionaire Tom Perkins, a famed Silicon Valley venture capitalist, was forced to issue a heartfelt apology after coming under ADL criticism for his choice of words in a *Wall Street Journal* column. These were all proud, powerful individuals, and they must have deeply resented being forced to seek such abject public forgiveness, but they did so nonetheless. The total list of ADL supplicants over the years is a very long one.

Because of its media influence, the ADL's coverage has almost always been extremely favorable, portraying it as one of America's leading watchdogs against dangerous extremism, especially anti-Semitism or racism. **Given this powerful, positive image, the ADL successfully**

**gained the role of content gatekeeper at some of America's largest Internet companies, helping to determine what may or may not be said on such important platforms as Facebook, Youtube, and Twitter.** Indeed, a few years ago Silicon Valley's *San Jose Mercury News* profiled the ADL Director who was responsible for policing "hate speech" across the American-dominated global Internet.

Meanwhile, that same media influence has ensured that only very few people have ever become aware of the organization's long history of illegal spying upon enormous numbers of Americans, including such notable figures as Martin Luther King. Jr. I discussed this in my 2018 article:

> The choice of **the ADL as the primary ideological overseer of America's Internet** may seem natural and appropriate to politically-ignorant Americans, a category that unfortunately includes the technology executives leading the companies involved. But this reflects the remarkable cowardice and dishonesty of the American media from which all these individuals derive their knowledge of our world. The true recent history of the ADL is actually a sordid and disreputable tale.
>
> In January 1993, the San Francisco Police Department reported that it had recently raided the Northern California headquarters of the ADL based upon information provided by the FBI. The SFPD discovered that the organization had been keeping intelligence files on more than 600 civic organizations and 10,000 individuals, overwhelmingly of a liberal orientation, with the SFPD inspector estimating that 75% of the material had been illegally obtained, much of it by secret payments to police officials. This was merely the tip of the iceberg in what clearly amounted to the largest domestic spying operation by any private organization in American history, and according to some sources, ADL agents across the country had targeted over 1,000 political, religious, labor, and civil rights organizations, with the New York headquarters of the ADL maintaining active dossiers on more than a million Americans.
>
> Not long afterward, an ACLU official who had previously held a high-ranking position with the ADL revealed in an interview that his organization had been the actual source of the highly controversial 1960s surveillance on Martin Luther King, Jr., which it had then provided to FBI Director J. Edgar Hoover. For many years **Hoover had been furiously denounced in the national media headlines for his use of tapes and other secret**

**information on King's activities, but when a local San Francisco newspaper revealed that an ADL spying operation had actually been the source of all that sordid material, the bombshell revelation was totally ignored in the national media** and only reported by fringe organizations, so that today almost no Americans are aware of that fact.

I know of no other private organization in American history that has been involved in even a sliver of such illegal domestic espionage activity, which appears to have been directed against almost all groups and prominent individuals—left, right, and center—suspected of being insufficiently aligned with Jewish and Israeli interests. **Some of the illegal material found in the ADL's possession even raised dark suspicions that it had played a role in domestic terrorist attacks and political assassinations directed against foreign leaders.** I am no legal expert, but given the massive scale of such illegal ADL activities, I wonder whether a plausible case might have been made to prosecute the entire organization under RICO statutes and sentence all of its leaders to long prison terms.

Instead, the resulting government charges were quickly settled with merely a trivial fine and a legal slap on the wrist, demonstrating the near-total impunity provided by massive Jewish political power in modern American society.

In effect, **the ADL seems to have long operated as a privatized version of our country's secret political police, monitoring and enforcing its ideological doctrines on behalf of Jewish groups much as the Stasi did for the Communist rulers of East Germany.** Given such a long history of criminal activity, allowing the ADL to extend its oversight to our largest Social Media platforms amounts to appointing the Mafia to supervise the FBI and the NSA, or taking a very large step towards implementing George Orwell's " Ministry of Truth" on behalf of Jewish interests.

In his 1981 memoirs, the far right Classics scholar Revilo P. **Oliver characterized the ADL as "the formidable organization of Jewish cowboys who ride herd on their American cattle"** and this seems a reasonably apt description to me.

## Question 2: The Origins of the ADL

*Could you give us a thumbnail sketch of the origins of the ADL so that readers have a more informed view of the organization's history?*

**Ron Unz**—Earlier this year, both the *New York Times* and the *Wall Street Journal* gave considerable space to the coverage of "Parade," the revival of a 1998 Broadway musical on the 1915 killing of Leo Frank, a Jewish factory manager in Atlanta, Georgia, arguably the most famous lynching in American history.

**Frank had been convicted and sentenced to death for the rape and murder of a young girl in his employ and the ADL was founded in an effort to save his life.** After numerous legal appeals failed, the state's governor eventually commuted Frank's sentence and a group of outraged citizens responded by hanging Frank. The

incident was portrayed in both the musical and past decades of media coverage as a particularly horrifying example of American anti-Semitism.

According to this near-universal media narrative, despite this initial failure the ADL then spent the next one hundred years leading the struggle against both anti-Semitism and racism. However, **the true facts of the Leo Frank case were very different from what has been presented, and understanding the real history provides important insights into the actual nature of the ADL and its activities.** Moreover, the ADL's long success in concealing those facts demonstrates the power the organization exercises over the media and the academic community. The ADL is inseparable from the Leo Frank case that inspired its creation, and earlier this year I explained those circumstances.

> The basic outline of events is not disputed. In 1913 Georgia, a 13-year-old pencil company worker named Mary Phagan was last seen alive visiting the office of factory manager Leo Frank on a Saturday morning to collect her weekly paycheck, while her raped and murdered body was found in the basement early the next morning and Frank eventually arrested for the crime. As the wealthy young president of the Atlanta chapter of B'nai B'rith, Frank ranked as one of the most prominent Jewish men in the South, and great resources were deployed in his legal defense, but after the longest and most expensive trial in state history, he was quickly convicted and sentenced to death.
>
> The facts of the case against Frank eventually became a remarkable tangle of complex and often conflicting evidence and eyewitness testimony, with sworn statements regularly being retracted and then counter-retracted. But the crucial point that the NOI authors emphasize for properly deciphering this confusing situation is the enormous scale of the financial resources that were deployed on Frank's behalf, both prior to the trial and afterward, with virtually all of the funds coming from Jewish sources. Currency conversions are hardly precise, but relative to the American family incomes of the time, **the total expenditures by Frank supporters may have been as high as \ $25 million in present-day dollars, quite possibly more than any other homicide defense in American history** before or after, and an almost unimaginable sum for the impoverished Deep South of that period. Years later, **a leading donor privately admitted that much of this money was spent on perjury and similar falsifications**, something which is very readily apparent

to anyone who closely studies the case. When we consider this vast ocean of pro-Frank funding and the sordid means for which it was often deployed, the details of the case become far less mysterious. There exists a mountain of demonstrably fabricated evidence and false testimony in favor of Frank, and no sign of anything similar on the other side.

The police initially suspected the black night watchman who found the girl's body, and he was quickly arrested and harshly interrogated. Soon afterward, a bloody shirt was found at his home, and Frank made several statements that seemed to implicate his employee in the crime. At one point, this black suspect may have come close to being summarily lynched by a mob, which would have closed the case. But he stuck to his story of innocence with remarkable composure, in sharp contrast to Frank's extremely nervous and suspicious behavior, and the police soon shifted their scrutiny toward the latter, culminating in his arrest. All researchers now recognize that the night watchman was entirely innocent, and the evidence against him planted.

The case against Frank steadily mounted. He was the last man known to have seen the young victim and he repeatedly changed important aspects of his story. Numerous former female employees reported his long history of sexually aggressive behavior toward them, especially directed towards the murdered girl herself. At the time of the murder, Frank claimed to have been working alone in his office, but a witness who went there reported he had been nowhere to be found. A vast amount of circumstantial evidence implicated Frank.

**A black Frank family servant soon came forward with sworn testimony that Frank had confessed the murder to his wife on the morning after the killing**, and this claim seemed supported by the latter's strange refusal to visit her husband in jail for the first two weeks after the day of his arrest.

Two separate firms of experienced private detectives were hired by Frank's lavishly-funded partisans, and the agents of both eventually came to the reluctant conclusion that Frank was guilty as charged.

As the investigation moved forward, a major break occurred as a certain Jim Conley, Frank's black janitor, came forward and confessed to having been Frank's accomplice in concealing the crime. At the trial he testified that Frank had regularly enlisted

him as a lookout during his numerous sexual liaisons with his female employees, and **after murdering Phagan, Frank had then offered him a huge sum of money to help remove and hide the body in the basement so that the crime could be pinned upon someone else.** But with the legal noose tightening around Frank, Conley had begun to fear that he might be made the new scapegoat, and went to the authorities in order to save his own neck. Despite Conley's damning accusations, Frank repeatedly refused to confront him in the presence of the police, which was widely seen as further proof of Frank's guilt.

By the time of the trial itself, all sides were agreed that the murderer was either Frank, the wealthy Jewish businessman, or Conley, the semi-literate black janitor with a first-grade education and a long history of public drunkenness and petty crime. Frank's lawyers exploited this comparison to the fullest, emphasizing Frank's Jewish background as evidence for his innocence and indulging in the crudest sort of racial invective against his black accuser, whom they claimed was obviously the true rapist and murderer due to his bestial nature.

Those attorneys were the best that money could buy and the lead counsel was known as the one of the most skilled courtroom interrogators in the South. But although he subjected Conley to a grueling sixteen hours of intense cross-examination over three days, the latter never wavered in the major details of his extremely vivid story, which deeply impressed the local media and the jury. Meanwhile, Frank refused to take the stand at his own trial, thereby avoiding any public cross-examination of his often changing account.

Two notes written in crude black English had been discovered alongside Phagan's body, and everyone soon agreed that these were written by the murderer in hopes of misdirecting suspicion. So they were either written by a semi-literate black such as Conley or by an educated white attempting to imitate that style, and to my mind, the spelling and choice of words strongly suggests the latter, thereby implicating Frank.

Taking a broader overview, the theory advanced by Frank's legion of posthumous advocates seems to defy rationality. These journalists and scholars uniformly argue that Conley, a semi-literate black menial, had brutally raped and murdered a young white girl, and the legal authorities soon became aware of this fact, but conspired to set him free by supporting a complex and

risky scheme to instead frame an innocent white businessman. Can we really believe that the police officials and prosecutors of a city in the Old South would have violated their oath of office in order to knowingly protect a black rapist and killer from legal punishment and thereby turn him loose upon their city streets, presumably to prey on future young white girls? This implausible reconstruction is particularly bizarre in that nearly all its advocates across the decades have been the staunchest of Jewish liberals, who have endlessly condemned the horrific racism of the Southern authorities of that era, but then unaccountably chose to make a special exception in this one particular case.

In many respects, the more important part of the Frank case began after his conviction and death sentence when **many of America's wealthiest and most influential Jewish leaders began mobilizing to save him from the hangman. They soon established the ADL as a new vehicle for that purpose and succeeded in making the Frank murder case one of the most famous in American history to that date.**

Although his role was largely concealed at the time, the most important new backer whom Frank attracted was Albert Lasker of Chicago, the unchallenged monarch of American consumer advertising, which constituted the life's blood of all of our mainstream newspapers and magazines. Not only did he ultimately provide the lion's share of the funds for Frank's defense, but he focused his energies upon shaping the media coverage surrounding the case. Given his dominant business influence in that sector, we should not be surprised that a huge wave of unremitting pro-Frank propaganda soon began appearing across the country in both local and national publications, extending to most of America's most popular and highly-regarded media outlets, with scarcely a single word told on the other side of the story. This even included all of Atlanta's own leading newspapers, which suddenly reversed their previous positions and became convinced of Frank's innocence.

Lasker also enlisted other powerful Jewish figures in the Frank cause, including *New York Times* owner Adolph Ochs, *American Jewish Committee* president Louis Marshall, and leading Wall Street financier Jacob Schiff. The *Times*, in particular, began devoting enormous coverage to this previously-obscure Georgia murder case, and many of its articles were widely republished

elsewhere. The NOI authors highlight this extraordinary national media attention: “The Black janitor whose testimony became central to Leo Frank’s conviction became the most quoted Black person in American history up to that time. More of his words appeared in print in the *New York Times* than those of W.E.B. Du Bois, Marcus Garvey, and Booker T. Washington—*combined.*”

Back a century ago just as today, our media creates our reality, and with Frank’s innocence being proclaimed nationwide in near-unanimous fashion, a long list of prominent public figures were soon persuaded to demand a new trial for the convicted murderer, including Thomas Edison, Henry Ford, and Jane Addams.

Ironically enough, Lasker himself plunged into this crusade despite apparently having very mixed personal feelings about the man whose cause he was championing. **His later biography reveals that upon his first personal meeting with Frank, he perceived him as “a pervert” and a “disgusting” individual, so much so that he even hoped that after he managed to free Frank, the latter would quickly perish in some accident.** Furthermore, in his private correspondence he freely admitted that a large fraction of the massive funding that he and numerous other wealthy Jews from across the country were providing had been spent on perjured testimony and there are also strong hints that he explored bribing various judges. Given these facts, Lasker and Frank’s other major backers were clearly guilty of serious felonies, and could have received lengthy prison terms for their illegal conduct.

With the *New York Times* and the rest of the liberal Northern media now providing such heavy coverage of the case, Frank’s defense team was forced to abandon the racially-inflammatory rhetoric aimed at his black accuser which had previously been the centerpiece of their trial strategy. Instead, **they began concocting a tale of rampant local anti-Semitism, previously unnoticed by all observers, and adopted it as a major grounds for their appeal of the verdict.**

The unprincipled legal methods pursued by Frank’s backers is illustrated by a single example. Georgia law normally required that a defendant be present in court to hear the reading of the verdict, but given the popular emotions in the case, the judge suggested that this provision be waived, and the prosecution assented only if the defense lawyers promised not to use this

small irregularity as grounds for appeal. But after Frank was convicted, AJC President Marshall and his other backers orchestrated numerous unsuccessful state and federal appeals on exactly this minor technicality, merely hiring other lawyers to file the motions.

For almost two years, the nearly limitless funds deployed by Frank's supporters covered the costs of thirteen separate appeals on the state and federal levels, including to the U.S. Supreme Court, while the national media was used to endlessly vilify Georgia's system of justice in the harshest possible terms. Naturally, this soon generated a local reaction, and during this period **outraged Georgians began denouncing the wealthy Jews who were spending such enormous sums to subvert the local criminal justice system.**

One of the very few journalists willing to oppose Frank's position was Georgia publisher Tom Watson, a populist firebrand, and in an editorial he reasonably declared "We cannot have …one law for the Jew, and another for the Gentile" while he also later lamented that "It is a bad state of affairs when the idea gets abroad that the law is too weak to punish a man who has plenty of money." A former Georgia governor indignantly inquired "Are we to understand that anybody except a Jew can be punished for a crime." The clear facts indicate that there was indeed a massive miscarriage of justice in Frank's case, but virtually all of it occurred in Frank's favor.

All appeals were ultimately rejected and Frank's execution date for the rape and murder of the young girl finally drew near. But just days before he was scheduled to leave office, Georgia's outgoing governor commuted Frank's sentence, provoking an enormous storm of popular protest, especially since he was the business partner of Frank's chief defense lawyer, an obvious conflict of interest. Given the enormous funds that Frank's national supporters had been deploying on his behalf and the widespread past admissions of bribery in the case, there are obviously dark suspicions about what had prompted such a remarkably unpopular decision, which soon forced the former governor to exile himself from the state. **A few weeks later, a group of Georgia citizens stormed Frank's prison farm, abducting and hanging him, with Frank becoming the first and only Jew lynched in American history.**

Naturally, Frank's killing was roundly denounced in the national

media that had long promoted his cause. But even in those quarters, there may have been a significant difference between public and private sentiments. No newspaper in the country had more strongly championed Frank's innocence than the *New York Times* of Adolph Ochs. Yet according to the personal diary of one of the *Times* editors, Ochs privately despised Frank, and perhaps even greeted his lynching with a sense of relief. No effort was ever made by Frank's wealthy supporters to bring any of the lynching party to justice.

## Question 3: The Implications of the Leo Frank Case

*What is the real importance of the Leo Frank case, which led to the founding of the ADL?*

**Ron Unz**—Once we discover the true history of the Leo Frank case and the origins of the ADL, I think the broader implications are profound.

For more than one hundred years, **the ADL has successfully portrayed itself as an anti-racist organization dedicated to safeguarding the rights of all Americans, including American blacks, but the truth is exactly the opposite.** And when we recognize that the ADL has managed to conceal that reality for more than four generations, we better understand the sort of control the organization has long exercised over both the media and the academic community.

Seen in its proper light, the Leo Frank case marked a huge milestone in the history of black-white relations in America, but that significance has deliberately been kept hidden. I discussed the importance of the case in 2018:

> The NOI authors devote nearly all of their lengthy book to a careful analysis of the Frank case provided in suitably dispassionate form, but a sense of their justifiable outrage does occasionally poke through. In the years prior to Frank's killing, many thousands of black men throughout the South had been lynched, often based on a slender thread of suspicion, with few of these incidents receiving more than a few sentences of coverage in a local newspaper, and large numbers of whites had also perished under similar circumstances. Meanwhile, Frank had received benefit of the longest trial in modern Southern history, backed by the finest trial lawyers that money could buy, and based on overwhelming evidence had been sentenced to death for the rape and murder of a young girl. But when Frank's legal verdict was carried out by extra-judicial means, he immediately became the most famous lynching victim in American history, perhaps even attracting more media attention than all those thousands of other cases combined. **Jewish money and Jewish media established him as a Jewish martyr who thereby effectively usurped the victimhood of the enormous number of innocent blacks who were killed both before and after him, none of whom were ever even recognized as individuals.**
>
> As Prof. Shahak has effectively demonstrated, traditional

Talmudic Judaism regarded all non-Jews as being sub-human, with their lives possessing no value. Given that Frank's backers were followers of Reform Judaism, it seems quite unlikely that they accepted this doctrine or were even aware of its existence. But religious traditions of a thousand years standing can easily become embedded within a culture, and such unrecognized cultural sentiments may have easily shaped their reaction to Frank's legal predicament.

In their introduction, the NOI authors make the fascinating point that the larger historical meaning of the Frank case in American racial history has been entirely lost. Prior to that trial, it was unprecedented for Southern courts to allow black testimony against a white man, let alone against a wealthy man being tried on serious charges; but the horrific nature of the crime and Conley's role as the sole witness required a break from that longstanding tradition. Thus, the authors not unreasonably argued that **the Frank case may have been as important to the history of black progress in America as such landmark legal verdicts as *Plessy v. Ferguson* or *Brown v. Board*.** But since almost the entire historical narrative has been produced by fervent Jewish advocates, these facts have been completely obscured and the case willfully misrepresented as an example of anti-Semitic persecution and public murder.

Let us summarize what seems to be the solidly established factual history of the Frank case, quite different than the traditional narrative. **There is not the slightest evidence that Frank's Jewish background was a factor behind his arrest and conviction, nor the death sentence he received.** The case set a remarkable precedent in Southern courtroom history with the testimony of a black man playing a central role in a white man's conviction. From the earliest stages of the murder investigation, Frank and his allies continually attempted to implicate a series of different innocent blacks by planting false evidence and using bribes to solicit perjured testimony, while the exceptionally harsh racial rhetoric that Frank and his attorneys directed towards those blacks was presumably intended to provoke their public lynching. Yet despite all these attempts by the Frank forces to play upon the notorious racial sentiments of the white Southerners of that era, the latter saw through these schemes and Frank was the one sentenced to hang for his rape and murder of that young girl.

Now suppose that all the facts of this famous case were exactly unchanged except that Frank had been a white Gentile. Surely the

trial would be ranked as one of the greatest racial turning points in American history, perhaps even overshadowing *Brown v. Board* because of the extent of popular sentiment, and it would have been given a central place in all our modern textbooks. Meanwhile, Frank, his lawyers, and his heavy financial backers would probably be cast as among the vilest racial villains in all of American history for their repeated attempts to foment the lynching of various innocent blacks so that a wealthy white rapist and murderer could walk free. But because Frank was Jewish rather than Christian, this remarkable history has been completely inverted for over one hundred years by our Jewish-dominated media and historiography.

These are the important consequences that derive from control of the narrative and the flow of information, which allows murderers to be transmuted into martyrs and villains into heroes. **The ADL was founded just over a century ago with the central goal of preventing a Jewish rapist and killer from being held legally accountable for his crimes, and over the decades, it eventually metastasized into a secret political police force not entirely dissimilar from the widely despised East German Stasi**, but with its central goal seeming to be the maintenance of overwhelming Jewish control in a society that is 98% non-Jewish.

We should ask ourselves whether it is appropriate for an organization with such origins and such recent history to be granted enormous influence over the distribution of information across our Internet.

## Question 4: The Influence of the ADL

*Here's a short quote from one of your articles that questions whether the ADL has the moral standing to act as the Internet's* de facto *"thought police":*

> In effect, the ADL seems to have long operated as a privatized

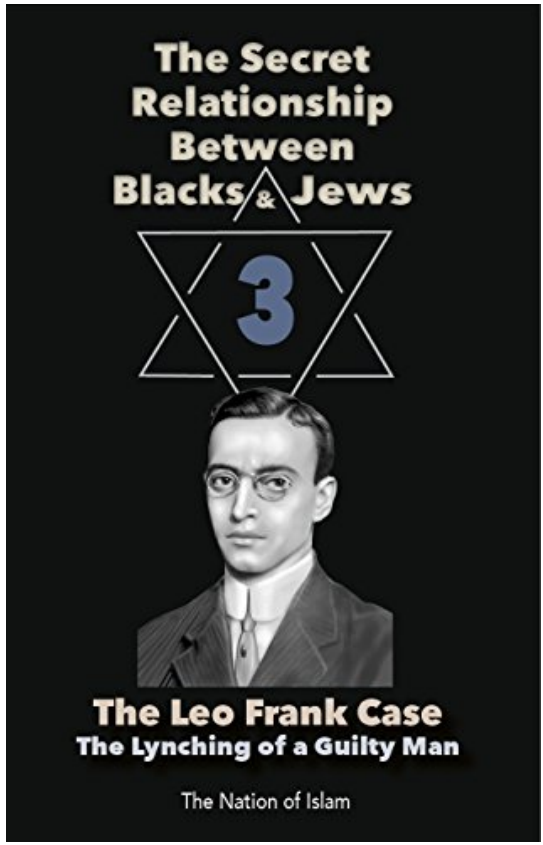
> version of our country's secret political police, monitoring and enforcing its ideological doctrines on behalf of Jewish groups much as the Stasi did for the Communist rulers of East Germany. Given such a long history of criminal activity, **allowing the ADL to extend its oversight to our largest Social Media platforms amounts to appointing the Mafia to supervise the FBI and the NSA, or taking a very large step towards implementing George Orwell's "Ministry of Truth" on behalf of Jewish interests.**

*This is the most scathing indictment of the ADL I've ever read. If you're right, then we must assume that "combating extremism and hate" is merely a fig leaf concealing the organization's real objective which is to censor anyone whose views do not align with those of the ADL. Is that how you see it? Is the real purpose of the ADL to silence anyone with whom it disagrees?*

**Ron Unz**—Yes, **the ADL has maintained its power by the extremely effective censorship blockade it maintains on all contrary information.**

Once I began investigating the origins of the ADL and the Leo Frank case, I discovered that the only account challenging the established mainstream narrative came from a totally unexpected source. As I explained in late 2018:

> Mainstream publishers may often reject books that too sharply conflict with reigning dogma and sales of such works are unlikely to justify the extensive research required to produce the manuscript. Furthermore, both authors and publishers may face widespread vilification from a hostile media for taking such positions. For these reasons, those who publish such controversial material will often be acting from deep ideological motives rather than merely seeking professional advancement or monetary gain. As an example, **it took a zealous Trotskyite leftist such as Lenni Brenner to brave the risk of ferocious attacks and invest the time and effort to produce his remarkable study of the crucial Nazi-Zionist partnership of the 1930s.** And for similar reasons, we should not be totally surprised that the leading book arguing for the guilt of Leo Frank appeared as a volume in the series on the pernicious aspects of Jewish-Black historical relations produced by Louis Farrakhan's Nation of Islam (NOI), nor that the text lacked any identified author.



> Anonymous works published by heavily-demonized religious-political movements naturally engender considerable caution, but once I began reading the 500 pages of *The Leo Frank Case: The Lynching of a Guilty Man* I was tremendously impressed by the quality of the historical analysis. I think I have only very rarely encountered a research monograph on a controversial historical event that provided such an enormous wealth of carefully-argued analysis backed by such copious evidence. The authors seemed to display complete mastery of the major secondary literature of the last one hundred years while drawing very heavily upon the various primary sources, including court records, personal correspondence, and contemporaneous publications, with the overwhelming majority of the 1200 footnotes referencing newspaper and magazine articles of that era. **The case they made for Frank's guilt seemed absolutely overwhelming.**

The weighty historical text that so impressed me had been published a couple of years earlier and received relatively little attention. But my article highlighting its importance soon attracted a great deal of readership and interest, and as I later explained, this may have

prompted the ADL into having it banned from Amazon:

> But for me, the most remarkable ADL revelation came in a book I purchased last year on Amazon, a book Amazon has now banned from sale. It seems that the ADL's very origin story of one hundred years ago, frequently mentioned in my introductory history textbooks and which I had never previously questioned, actually represented an absolute inversion of historical reality.
>
> Prior to the creation of the Internet and the establishment of Amazon's book-selling operation, this fascinating history would have remained completely unknown to me. Given its influential political role in our society, the ADL would certainly be concerned if it became widely known that the organization was founded with the central mission of ensuring that no wealthy and powerful Jew ever suffered punishment for the rape and murder of a young Christian girl, nor for trying to orchestrate the lynching of innocent black men in order to cover his own guilt.
>
> When I published my original article in October, I naturally encouraged readers to order the remarkable book in question and decide for themselves. **But Amazon has now chosen to ban that book of outstanding black historical scholarship at the height of Black History Month, a step taken just a few days after the ADL President made his annual glowing tribute to that national celebration of black pride.** Those interested can still read my lengthy analysis of that book and the important historical event it describes.
>
> - American Pravda: Amazon Book Censorship
> *Banning Black Historiography During Black History Month*
> Ron Unz • ***The Unz Review*** • March 11, 2019 • 7,600 Words

The ADL usually launches ferocious public attacks against any individuals or publications that challenge its authority. But if such tactics of intimidation fail, the ADL then apparently reverts to a fallback strategy of "blackout" and censorship, working to absolutely minimize the visibility and reach of its antagonists, such as by having their books banned by Amazon.

**In my own case, after the initial attacks failed, the organization seems to have prohibited any mention of our website or my writings from all those publications under its strong influence. Eventually both Facebook and Google, the two leading gatekeepers of the global Internet, banned or deranked all of our**

**pages, making it very difficult for people to discover our website.** I've described the very bizarre aspects of this media blackout, which I call "the Lord Voldemort Effect."

> This hypothesis was strongly supported by a second incident later that same month. We had previously published an article by Prof. Eric Rasmusen of Indiana University, and I read in my morning *Times* that he had suddenly become embroiled in a major Internet controversy, with a chorus of angry critics seeking to have him removed. According to the article, he had apparently promoted the "vile and stupid" views of some anti-feminist website in one of his Tweets, which had come to the attention of an enraged activist. The resulting firestorm of denunciations on Twitter had been viewed 2.5 million times, provoking a major academic controversy in the national media.
>
> Being curious about what had happened, I contacted Rasmusen to see whether he might want to submit a piece regarding the controversy, which he did. But to my utter astonishment, I discovered that the website involved had actually been our own, a fact that I never would have suspected from the extremely vague and circuitous discussion provided in the newspaper. Apparently, the old-fashioned Who-What-Where provisions of the *Times* style manual had been quietly amended to prohibit providing any hint of our existence even when we were at the absolute center of one of their thousand word news stories.

## Question 5: How to Cope with the ADL?

*What suggestions would you give Elon Musk for handling the ADL in his current confrontation?*

**Ron Unz**—I think **the power of the ADL comes from the influence it exerts over the media and other information choke-points of our society.**

**But that influence is almost entirely based upon a compelling set of falsehoods regarding the origins of the ADL and its activities over the decades since its founding.** As I've said, suppose

> it became widely known that the organization was founded with the central mission of ensuring that no wealthy and powerful Jew ever suffered punishment for the rape and murder of a young Christian girl, nor for trying to orchestrate the lynching of innocent black men in order to cover his own guilt.

Or if the public discovered that

> an ACLU official who had previously held a high-ranking position with the ADL revealed in an interview that his organization had been the actual source of the highly controversial 1960s surveillance on Martin Luther King, Jr., which it had then provided to FBI Director J. Edgar Hoover.

**Under these circumstances, I think that much of the power and influence of the ADL would quickly evaporate under the strong sunlight of such public scrutiny.**

Perhaps the organization itself might suffer severe internal stress. I doubt if more than a tiny sliver of the American public is aware of the true history of the ADL, but exactly that same condition of ignorance may also exist among the ADL employees, activists, and donors. Almost all of those individuals probably derive their knowledge of their own organization's history and activities from the same biased media publications and sanitized accounts as does the general public. Even a large majority of the ADL leadership may be completely shocked by the facts I have provided in this interview, and they might grow fearful of the consequences if this information became public knowledge. Some of them might consider resigning out of such concerns.

After the ADL posted their rather milquetoast criticism of my activities produced by an anonymous staffer, I responded by publishing a lengthy history of their own organization. As a result, they immediately abandoned the battle and avoided any further engagement.

Unlike myself or my publication, **Elon Musk controls one of the world's most powerful media megaphones. If he chose to do so, he could easily ensure that tens of millions of Americans learned the true origins and history of the ADL, an organization that**

**today controls much of what our citizens are allowed to read or see.**

**Such a bold stroke might completely break the power the ADL possesses over him and the rest of our society.**

# Mutually-Assured Political Destruction

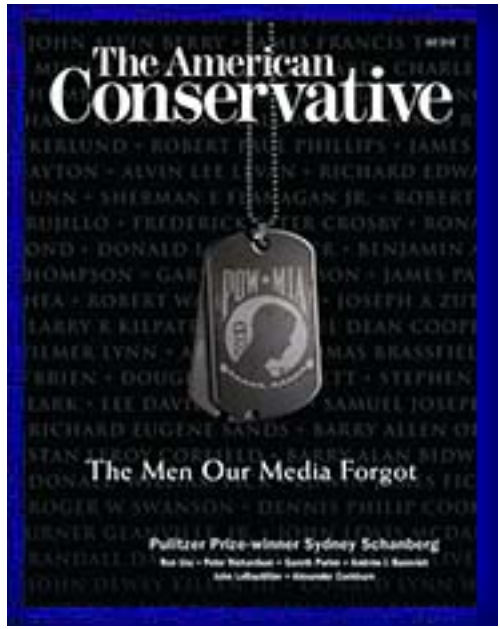
*Treason, Drugs, Homosexuality, Blackmail, and Murder in the 2008 McCain-Obama Presidential Race*

***The Unz Review*** • September 18, 2023 • 7,700 Words

I launched my American Pravda series just over a decade ago and during the last five years it has grown enormously, now including many dozens of individual articles and encompassing more than a half-million words of text. I'd still stand behind at least 99% of its contents, and the series probably constitutes one of the most comprehensive historical counter-narratives of the modern era found anywhere on the Internet.

Yet its roots actually go back a few years earlier than that and the entire series might never have come into existence if a link on a fringe website hadn't caught my eye. I told that story in a short piece I published in 2010:

> In the closing days of the 2008 presidential campaign, I clicked an ambiguous link on an obscure website and stumbled into a parallel universe.
>
> During the previous two years of that long election cycle, the media narrative surrounding Sen. John McCain had been one of unblemished heroism and selfless devotion to his fellow servicemen. Thousands of stories on television and in print had told of his brutal torture at the hands of his North Vietnamese captors, his steely refusal to crack, and his later political career aimed at serving the needs of fellow Vietnam veterans. This storyline had first reached the national stage during his 2000 campaign, then returned with even greater force as he successfully sought the 2008 Republican nomination. Seemingly accepted by all, this history became a centerpiece of his campaign. McCain's supporters touted his heroism as proof that he possessed the character to be entrusted with America's highest office, while his detractors merely sought to change the subject.



Once I clicked that link, I encountered a very different John McCain.

I read copious, detailed evidence that hundreds of American POWs had been condemned to death at enemy hands by top American leaders, apparently because their safe return home would have constituted a major political embarrassment. I found documentation that the cover-up of this betrayal had gone on for decades, eventually drawing in a certain Arizona senator. According to this remarkable reconstruction of events, the average teenage moviegoer of the 1980s watching mindless action films such as “Rambo,” “Missing in Action,” and “Uncommon Valor” was seeing reality portrayed on screen, while the policy expert reading sober articles in the pages of *The New Republic* and *The Atlantic* was absorbing lies and propaganda. Since I had been believing those very articles, this was a stunning revelation.

But was this alternate description of reality correct? Could this one article be true and all the countless contrary pieces I had read in America’s most prestigious publications be false, merely the presentation of official propaganda endlessly repeated? I cannot say. I am not an expert on the history of the Vietnam War and its aftermath.

Yet consider the source. The author of that remarkable 8,000-

> word exposé—"McCain and the POW Cover-Up," published on The Nation Institute's website—was Sydney Schanberg, one of America's foremost Vietnam War journalists. His reporting won him a Pulitzer Prize, and his subsequent book on Cambodia was made into "The Killing Fields," an Oscar-winning movie. Schanberg later served as one of the highest-ranking editors at the *New York Times*, with a third of the reporters at our national newspaper of record working under him. A case can be made that no living American journalist can write with greater credibility on Vietnam War matters. And he had labored for years researching and exhaustively documenting the story of American POWs abandoned in Indochina—a story that if true might easily represent the single greatest act of national dishonor ever committed by our political leaders.
>
> He presented a mass of evidence with names, dates, and documentary detail. Many of the individuals mentioned are still alive and could be interviewed or called to testify. Sealed government records could be ordered unsealed. If America wishes to determine the truth, it can do so.

In the years following the 9/11 Attacks and the Iraq War WMDs, I'd grown increasingly suspicious of the mainstream media, beginning to suspect that it was far less reliable than I'd always assumed. The growth of the Internet had unleashed a vast torrent of additional material, much of it from alternative or fringe sources that sometimes made wild, conspiratorial claims about all sorts of things. My own views on such matters had always been quite mainstream and conventional, so I was very reluctant to abandon a lifetime of media habits and begin navigating an information jungle of implausible or often contradictory claims. Could I really take that sort of material seriously compared to the professionally-printed pages of my regular newspapers and magazines?

However, I explained that Sydney Schanberg's astonishing John McCain revelations had finally tipped the balance and forced me to recognize that I had long been living in a world of comforting illusions based upon media lies:

> Yet what I found most remarkable about Schanberg's essay were not its explosive historical claims but the absolute silence with which they were received in the mainstream media. In 2008, John McCain's heroic war record and personal patriotism were central to his quest for supreme power—a goal he came very close to achieving. But when one of America's most eminent

> journalists published an exhaustive report that the candidate had instead served as one of the leading figures in a monumental act of national treachery, our media took no notice. McCain's public critics and the operatives of his Democratic opponent might eagerly seize upon every rumor that the senator had had a private lunch with a disreputable corporate lobbyist, but they ignored documented claims that he had covered up the killing of hundreds of American POWs. These allegations were serious enough and sufficiently documented to warrant national attention —yet they received none.
>
> A couple of years ago, in one of my last exchanges with my late friend Lt. Gen. Bill Odom, who ran the National Security Agency for President Ronald Reagan, we agreed a case could be made that today's major American media had become just as dishonest and unreliable as the old Soviet propaganda outlets of the late 1970s. At the time, we were discussing the coverage of our road to the Iraq War, but subsequent events have demonstrated that this national illness is far more advanced than either of us had suspected. Whether or not Schanberg is proven correct, the shameful cowardice of our mainstream media is already proven by the wall of silence surrounding his work.

- American Pravda: Was Rambo Right?
  *Hundreds of POWs may have been left to die in Vietnam, abandoned by their government—and our media*
  Ron Unz • ***The American Conservative*** • May 25, 2010 • 1,300 Words

Once a single large hole has breached a dam of disbelief, the forces of hydraulic pressure will steadily widen it, and I gradually became convinced that many of the astonishing claims I'd seen mentioned on alternative websites over the years were probably correct. Three years later, I published my original American Pravda article, summarizing much of that surprising material.

- Our American Pravda
  Ron Unz • ***The American Conservative*** • April 29, 2013 • 4,500 Words

A couple of years after that I delved much deeper into the John McCain story and concluded that it was far more shocking than I had realized. I found very strong evidence that the senator had spent most of his Vietnam War years serving as a leading Communist propagandist and collaborator, then afterward returned home to be

proclaimed one of our greatest war heroes and soon launched his very successful political career based upon that foundation. A story like that was so twisted and implausible it surely would never have passed muster even as a satirical Hollywood film, but it seemed to be true. I summarized this apparent history and the broader implications in a 2015 article that represented something of a sequel to Schanberg's seminal McCain/POW blockbuster.

- John McCain: When "Tokyo Rose" Ran for President
  *What Was John McCain's True Wartime Record in Vietnam?*
  Ron Unz • ***The Unz Review*** • March 9, 2015 • 4,200 Words

A year or two after we had republished Schanberg's remarkable McCain expose as part of our cover-symposium, someone had released a video on Youtube that collected together portions of interviews by those accusing McCain of concealing his true Vietnam War record. Although I only very recently came across it, the claims made seem generally correct.

McCain's eventual death in 2019 unleashed a flood of adulation and sorrow that swept across nearly every prominent organ of the mainstream media, with most of these pieces scarcely containing a single skeptical paragraph. This complete airbrushing of McCain's

very questionable record had troubling implications that I explored in a long article, arguing that blackmail probably served as an important political lubricant within the higher reaches of the American government:

> On the face of it, such undiluted political love for McCain might seem a bit odd to those who have followed his activities over the last couple of decades. After all, the *Times* and most of the other leading lights of our media firmament are purportedly liberal and claim to have become vehement critics of our disastrous Iraq War and other military adventures, let alone the calamitous possibility of an attack upon Iran. Meanwhile, McCain was universally regarded as the leading figure in America's "War Party," eagerly supporting all prospective and retrospective military endeavors with gleeful fury, and even making his chant of "Bomb, Bomb, Bomb Iran" the most widely remembered detail of his unsuccessful 2008 presidential campaign. So either our major media outlets somehow overlooked such striking differences on an absolutely central issue, or perhaps their true positions on certain matters are not exactly what they seem to be, and merely constitute elements of a Kabuki-performance aimed at deceiving their more naive readers.
>
> Even more remarkable were the discordant facts airbrushed out of McCain's history.
>
> The story of the abandoned Vietnam POWs and McCain's own Communist propaganda broadcasts hardly exhaust the catalog of the major skeletons in the late Senator's closet. McCain was regularly described by reporters as being remarkably hot-headed and having a violent temper, but the national press left it to the alternative media to investigate the real-life implications of those rather suggestive phrases.
>
> In a September 1, 2008 *Counterpunch* expose later published online, Alexander Cockburn reported that interviews with two emergency room physicians in Phoenix revealed that around the time that McCain was sucked into the political maelstrom of the Keating Five Scandal, his wife Cindy was admitted to her local hospital suffering from a black eye, facial bruises, and scratches consistent with physical violence, and this same situation occurred two additional times over the next few years. Cockburn also noted several other highly suspicious marital incidents during the years that followed, including the Senator's wife appearing with a bandaged wrist and her arm in a sling not long

after she joined her husband on the 2008 campaign trail, an injury reported by our strangely incurious political journalists as being due to "excessive hand-shaking." It's an odd situation when a tiny leftist newsletter can easily uncover facts that so totally eluded the vast resources of our entire national press corps. If there were credible reports that Melania Trump had repeatedly been admitted to local emergency rooms suffering from black eyes and facial bruises, would our corporate media have remained so uninterested in any further investigation?

McCain had first won his Arizona Congressional seat in 1982, not long after he moved into the state, with his campaign bankrolled by his father-in-law's beer-distributorship fortune, and that inheritance eventually elevated the McCain household into one of the wealthiest in the Senate. But although the Senator spent the next quarter-century in public life, even nearly upsetting George W. Bush for the 2000 Republican presidential nomination, only in late 2008 did I learn from the *Times* that the Phoenix beer-monopoly in question, then valued at around $200 million, had accrued to a man whose lifelong business partner Kemper Marley had long been deeply linked to organized crime. Indeed, close associates of that latter individual had been convicted by a jury of the car-bomb assassination of a Phoenix investigative crime reporter just a few years before McCain's sudden triumphal entrance into Arizona politics. Perhaps such guilt-by-association is improper, but would our national press-corps have remained silent if the personal fortune of our current president were only a step or two removed from the car-bomb assassins of an inquisitive journalist who died while investigating mobsters?

As I gradually became aware of these enormities casually hidden in McCain's background, my initial reaction was disbelief that someone whose record was so deeply tarnished in so many different ways could ever have reached such a pinnacle of American political power. But as the media continued to avert its eyes from these newly revealed facts, even those disclosed in the pages of the *Times* itself, I gradually began to consider matters in a different light. Perhaps McCain's elevation to great American political power was not *in spite* of the devastating facts littering his personal past, but *because* of them. As I wrote a few years ago:

Today when we consider the major countries of the world we see that in many cases the official leaders are also the leaders in actuality: Vladimir Putin calls the shots in Russia, Xi Jinping and his top Politburo colleagues do the same in China, and so forth.

> However, in America and in some other Western countries, this seems to be less and less the case, with top national figures merely being attractive front-men selected for their popular appeal and their political malleability, a development that may eventually have dire consequences for the nations they lead. As an extreme example, a drunken Boris Yeltsin freely allowed the looting of Russia's entire national wealth by the handful of oligarchs who pulled his strings, and the result was the total impoverishment of the Russian people and a demographic collapse almost unprecedented in modern peacetime history.
>
> An obvious problem with installing puppet rulers is the risk that they will attempt to cut their strings, much like Putin soon outmaneuvered and exiled his oligarch patron Boris Berezovsky. One means of minimizing such risk is to select puppets who are so deeply compromised that they can never break free, knowing that the political self-destruct charges buried deep within their pasts could easily be triggered if they sought independence. I have sometimes joked with my friends that perhaps the best career move for an ambitious young politician would be to secretly commit some monstrous crime and then make sure that the hard evidence of his guilt ended up in the hands of certain powerful people, thereby assuring his rapid political rise.

Once I properly understood the implications of the terrible secrets that had probably been used to control a powerful senator such as John McCain, other such examples became obvious, as I noted in one of those same articles:

> John McCain is hardly the only prominent political figure whose problematic Vietnam War activities have at times come under harsh scrutiny but afterwards been airbrushed away and forgotten by our subservient corporate media. Just as McCain was widely regarded as the most prominent Republican war-hero of that conflict, his Democratic counterpart was probably Vietnam Medal of Honor winner Bob Kerrey, a former Nebraska governor and senator who had run for president in 1992 and then considered doing so again in the late 1990s.

His seemingly unblemished record of wartime heroism suddenly collapsed in 2001 with the publication of a devastating 8,000 word expose in *The New York Times Magazine* together with a *Sixty Minutes II* television segment. Detailed eyewitness testimony and documentary evidence persuasively established that Kerrey had ordered his men to massacre over a dozen innocent Vietnamese civilians—women, children, and infants—for being witnesses to his botched SEAL raid on a tiny Vietnamese hamlet, an action that somewhat recalled the infamous My Lai massacre of the previous year, though certainly on a much smaller scale. Kerrey's initial response to these horrific accusations—that his memory of the incident was "foggy"—struck me as near-certain proof of his guilt, and others drew similar conclusions.

As a supposed war-hero and a moderate Democrat, Kerrey had always been very popular in political circles, but even the once-friendly *New Republic* was shocked by the alacrity with which pundits and the media sought to absolve him of his apparent crimes. The revelations also seem to have had no impact on his tenure as president of the prestigious New School in New York City, an academic institution with an impeccable liberal reputation, which he held for another decade before leaving to make an unsuccessful attempt to recapture his old Senate seat in Nebraska. Bob Dreyfuss, a principled left-liberal journalist, might still characterize him as a "mass murderer" in a 2012 blog post at *The Nation*, but for years almost no one else in the mainstream media had ever alluded to the incident in any of the articles mentioning Kerrey's activities, just as the media also completely ignored all of Schanberg's remarkable revelations. I suspect that Kerrey's war crimes have almost totally vanished from public consciousness.

We must always draw an important distinction between the actions of individual journalists and the behavior of the American media taken as a whole. I believe that the overwhelming majority of reporters and editors are honest and sincere, and although their coverage may sometimes be slanted or mistaken, they do seek to inform rather than to mislead. Consider how many of the explosive facts discussed above or in Schanberg's massive expose were drawn directly from the *New York Times* and other leading media outlets. But after those crucial stories run, the facts they have established often seem to vanish from subsequent coverage, causing them to be forgotten by most casual readers. Thus, the detailed account of Kerrey's apparent massacre of civilians

received the greatest possible initial coverage—a huge cover story in *The New York Times Magazine* and a top-rated *CBS News* television segment—but within a year or so the history had seemingly been flushed down the memory hole by almost all political reporters. The facts are still available for interested readers to uncover, but the latter must do the work themselves rather than simply relying upon the summary narratives produced by mainstream publications.

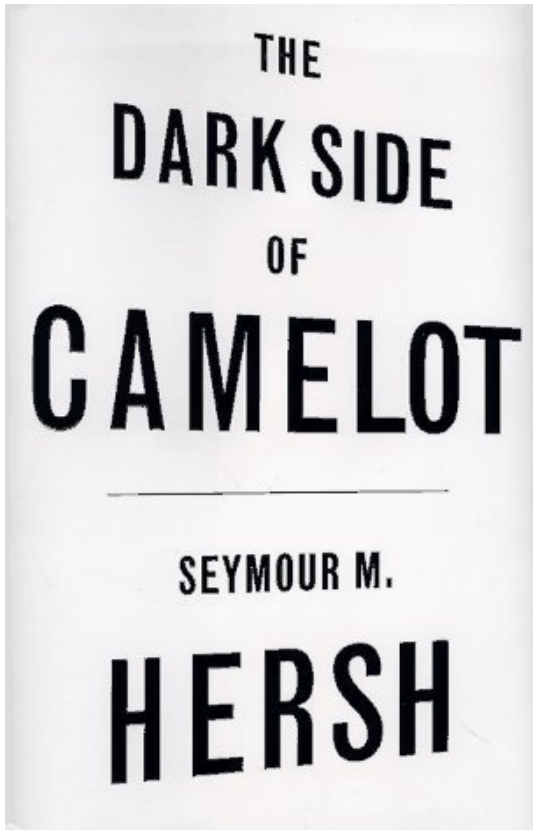
The realization that many of our political leaders may be harboring such terrible personal secrets, secrets that our media outlets regularly conceal, raises an important policy implication independent of the particular secrets themselves. In recent years I have increasingly begun to suspect that some or even many of our national leaders may occasionally make their seemingly inexplicable policy decisions under the looming threat of personal blackmail, and that this may have also been true in the past.

Consider the intriguing case of J. Edgar Hoover, who spent nearly half a century running our domestic intelligence service, the FBI. Over those many decades he accumulated detailed files on vast numbers of prominent people and most historians agree that he regularly used such highly sensitive material to gain the upper hand in disputes with his nominal political masters and also to bend other public figures to his will. Meanwhile, he himself was hardly immune from similar pressures. These days it is widely believed that Hoover lived his long life as a deeply closeted homosexual and there are also serious claims that he had some hidden black ancestry, a possibility that seems quite plausible to me given his features. Such painful personal secrets may be connected with Hoover's long denials that organized crime actually existed in America and his great reluctance to allocate significant FBI resources to combat it.

That last example of the likely sexual secrets held over Hoover seemed to represent the most typical form of political blackmail. Indeed, as I noted, such methods had apparently been widely used to exert control over powerful political figures, both earlier in the twentieth century and in more recent years:

In physics, when an object deviates from its expected trajectory for inexplicable reasons, we assume that some unknown force has been at work, and tracing the record of such deviations may help

to determine the characteristic properties of the latter. Over the years, I've increasingly become aware of such strange ideological deviations in public policy, and although some are readily explained, others suggest the existence of hidden forces far beneath the surface of our regular political world. This same situation may have occurred throughout our history, and sometimes the reasons for political decisions that so baffled contemporaries eventually came to light decades later.



In *The Dark Side of Camelot*, famed investigative reporter Seymour Hersh claimed that secret blackmail evidence of JFK's extra-marital affairs probably played a crucial role in having his administration overrule the unanimous verdict of all top Pentagon advisors and award the largest military procurement contract in U.S. history to General Dynamics instead of Boeing, thereby saving the former company from likely bankruptcy and its major organized-crime shareholders from devastating financial losses. Hersh also suggests that a similar factor likely explains JFK's last-minute reversal in the choice of his Vice President, a decision that landed Lyndon Johnson on the 1960 ticket and placed him in the

White House after Kennedy's 1963 assassination.

As I recently mentioned, Sen. Estes Kefauver shifted the focus of his 1950s Organized Crime Hearings after the Chicago Syndicate confronted him with the photographs of his sexual encounter with two mob-supplied women. A decade later, California Attorney-General Stanley Mosk suffered much the same fate, with the facts remaining hidden for over twenty years.

Similar rumors swirl around events much farther back in history as well, sometimes with enormous consequences. Well-placed contemporary sources have claimed that Samuel Untermyer, a wealthy Jewish lawyer, purchased the secret correspondence between Woodrow Wilson and his longtime mistress, and that the existence of that powerful leverage may have been an important factor behind Wilson's astonishingly rapid rise from president of Princeton in 1910 to governor of New Jersey in 1911 to president of the United States in 1912. Once in office, Wilson signed the controversial legislation establishing the Federal Reserve system in 1913 and also named Louis Brandeis as the first Jewish member of the U.S. Supreme Court despite the public opposition of nearly our entire legal establishment. Wilson's swiftly changing views on American involvement in the First World War may also have been influenced by such personal pressures rather than solely determined by his perceptions of the national interest.

Without naming any names, since 2001 it has been difficult to avoid noticing that one of the most zealous and committed supporters of the Neocon party-line on all Middle Eastern foreign policy matters has been a leading Republican senator from one of the most socially-conservative Southern states, a man whose rumored personal inclinations have long circulated on the Internet. The strikingly-sudden reversal of this individual on a major policy question certainly supports these suspicions. There have also been several other such examples involving prominent Republicans.

The decades-long career of the late Jeffrey Epstein seems to have been almost entirely focused upon accumulating a large portfolio of such sexual blackmail evidence against powerful figures in business, finance, and politics.

Once we recognize the likely role of blackmail, we can easily understand many puzzling aspects of the near-total immunity from serious media scrutiny that Sen. John McCain had enjoyed throughout

his long political career. One or more powerful hidden factions or puppet-masters probably owned and controlled him, and as a leading Senator, he was an immensely valuable political asset, one that needed to be protected from exposure at all costs. Indeed, I had closed that same article by noting that this protection even extended past the end of his life:

> The senator had died on a Saturday afternoon, and readership of Sydney Schanberg's long 2008 expose quickly exploded, with numerous individuals Tweeting out the story and a large fraction of our incoming traffic therefore coming from Twitter. This continued until the following morning, at which point the huge flood of Tweets continued to grow, but all incoming Twitter traffic suddenly and permanently vanished, presumably because "shadow banning" had rendered those Tweets invisible. My own article on McCain's very doubtful war record simultaneously suffered the same fate, as did numerous other articles of a controversial nature that we published later that same week.
>
> Perhaps that censorship decision was made by some ignorant young intern at Twitter, casually choosing to ban as "hate speech" or "fake news" a massively-documented 8,400 word expose by one of America's most distinguished journalists, a Pulitzer-prize winning former top editor at *The New York Times*.
>
> Or perhaps certain political-puppeteers who had spent decades controlling that late Arizona senator sought to ensure that their political puppet-strings remained invisible even after his death.

Despite all these revelations, one puzzling question still always remained in my mind. Under normal political circumstances, McCain's hidden masters might have easily warded off any coverage of his true wartime record, but why would his Democratic opponents have given him a pass on that same issue during the heated 2008 Presidential campaign?

Lehman Brothers collapsed and triggered the financial mortgage meltdown just a few weeks before the November vote, ensuring an easy Democratic victory. But prior to that, McCain had seemed the odds-on favorite to triumph over his opponent, a little-known freshman senator, whose full name—Barack Hussein Obama—almost seemed a mash-up of America's two recent foreign enemies, Saddam Hussein and Osama bin-Laden. The Democrats had already gone eight

long years without holding the White House, and their hungry political partisans would have been desperately eager for a turn of their own at the patronage trough, especially after George W. Bush's unexpected reelection victory in 2004. Perhaps the mainstream media might have been reluctant to reopen the Vietnam POW controversy nearly two decades after it had been firmly closed, but if influential Democratic Party operatives had heavily pushed the issue, the press probably would have gone along. As a result, Schanberg would have ended his long career once again ranked as one of the world's most famous journalists.

Obama's chief campaign strategist was David Axelrod, someone with notoriously sharp political elbows. During 2004, Obama's path to the U.S. Senate had been blocked by Blair Hull and Jack Ryan, very wealthy and formidable Democratic and Republican opponents, but both their campaigns had been demolished by devastating personal scandals orchestrated by that ruthless consultant. Axelrod himself was a former journalist so how could he have possibly ignored the heaven-sent opportunity to use Schanberg's meticulous research to similarly sink McCain?

Obama's own background was hardly pristine, given his financial involvement with Tony Rezko, a crooked Chicago developer, and his long association with fiery Afrocentric preacher Rev. Jeremiah Wright. But McCain's vulnerabilities were clearly of an entirely different magnitude.

As was inevitable in all modern Presidential campaigns, Obama-hating fringe activists had filled the Internet with all sorts of outlandish and mutually-contradictory accusations against the object of their venom, claiming that Obama was secretly an Islamicist or a Communist or a longtime CIA asset or a drug-addicted homosexual, or even a foreigner, constitutionally ineligible for the Presidency. But these were totally unsubstantiated accusations, nothing at all like the overwhelming evidence that John McCain had spent long years in service to our Communist wartime enemies. In strategic terms, the Democrats possessed complete "escalation dominance," allowing them to deploy lethal political weapons while the Republicans would be unable to reply in kind. Four years earlier, Bush supporters had unleashed the brutal "Swift Boat Veterans for Truth" advertising campaign against supposed war-hero Sen. John F. Kerry, costing him an expected victory in that close election. Yet now, neither the official Obama campaign nor any of its allies attempted to exploit McCain's devastating vulnerability on his Vietnam War record, instead keeping entirely silent.

For almost fifteen years, I'd remained puzzled by this mystery, but I think it has now finally been resolved. Tucker Carlson had spent his entire career in elite DC media circles, and over the last few years he had become the biggest star on television, partly because he was willing to voice many of the controversial truths that others would not. These recent years of media stardom had left him independently wealthy, so when *FoxNews* finally purged him a few months ago in the aftermath of a disastrous lawsuit over claims of election fraud, Carlson became a free agent, soon producing his own political discussion show and broadcasting it by video on Twitter, now providing himself a platform to speak even more candidly than he had before.

About a month ago, Carlson's personal interview with Donald Trump had attracted considerably more viewers than the official Republican Presidential Debate that aired around the same time. Soon afterward, Carlson demonstrated his newfound freedom of speech by boldly suggesting that Trump's bitter political enemies might conclude that assassination was their best remaining chance of preventing him from regaining the White House in 2024. But in that same show, he also mentioned some shocking facts about the 2008 Presidential race that had previously been unknown to me.

According to Carlson, a man named Larry Sinclair had suddenly come forward during that campaign, claiming to have been sexually involved with Obama several years earlier, encounters during which the future Presidential candidate had also smoked crack. The man's story was very detailed and seemingly credible, he'd filed a legal affidavit attesting to his claim, and he had even submitted to a polygraph exam. In June of that year, Sinclair held a press conference at DC's National Press Club, answering numerous questions from the hundred-odd journalists attending, and emphasizing that Obama's personal phone records could easily be used to establish the truth of his remarkable claims.

Not only had Carlson found Sinclair quite credible at the time, but so had a large majority of the entire Washington press corps. As Carlson put it, everyone in DC media circles was fully convinced that Obama was secretly having sex with "dudes" while smoking crack, but due to harsh threats of Democratic Party retaliation, none of those journalists and editors were willing to report those important facts to the American people whom they supposedly served.

In support of Sinclair's 2008 claims, Carlson noted that last month a *Daily Mail* story had revealed that recently unredacted portions of private letters from Obama to one of his college girlfriends showed that the future President was heavily preoccupied by gay sex fantasies.

Sinclair had never tried to conceal his troubled personal life nor his past criminal record, and he came across as quite credible when I watched him tell his story a couple of days ago, though others should decide for themselves. Although a lengthy article in the *Daily Mail* had summarized Carlson's bombshell interview, all my regular news outlets had totally ignored it, so I didn't learn of it until much later.

- 'Today it's Grindr, then it was the limo driver'

Words

Sinclair's original June 18, 2008 presentation at the National Press Club is also available on Youtube and his remarks seem reasonably convincing and entirely consistent with his current statements. At that event, he had also distributed a 2,100 word Press Statement while pointing people to his personal website that conveniently provided his background information and some of his other evidence. Although that website has long since disappeared, it is still easily available on Archive.org.

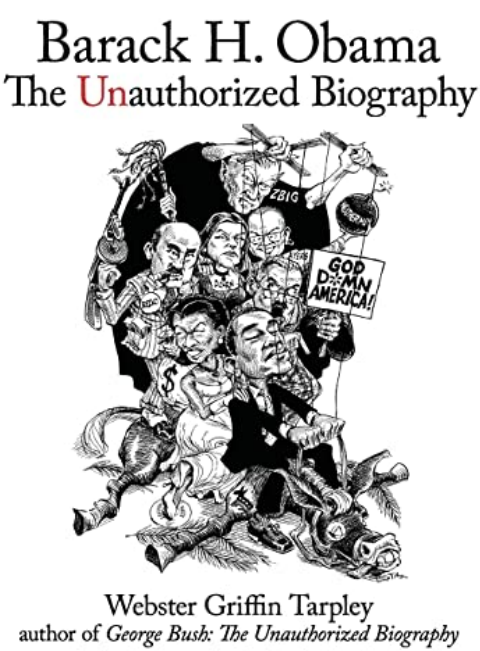
According to Sinclair, his two sexual encounters with Obama had occurred back in 1999 when the latter was merely an obscure Illinois State Senator, so Sinclair was shocked a few years later to see Obama on television giving the keynote address to the 2004 Democratic Party Convention. By 2007 Obama had become a leading Presidential contender, publicly boasting that he had never used drugs after high school, and such total dishonesty from the crack-smoking candidate outraged Sinclair, who complained to the campaign.

Events then took a much more ominous turn. Although he had never mentioned his sexual involvement with Obama, Sinclair was soon contacted by a certain Donald Young, who falsely claimed to be

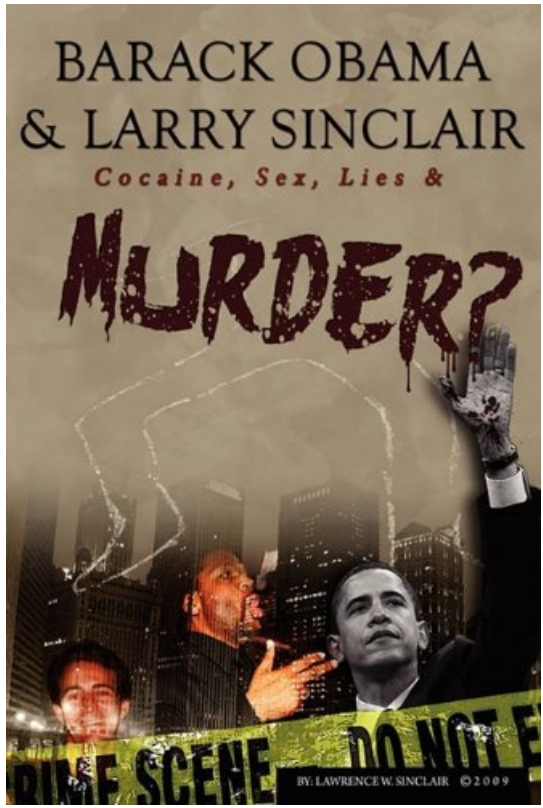
associated with the Obama campaign. During their phone conversations over the next four months, Young seemed fully aware of the sexual relationship and indicated that he himself was another one of Obama's male lovers, while repeatedly pressing Sinclair to disclose the names of any other individuals to whom he had confided his story. Sinclair declined to provide that information and the phone calls eventually ceased.

But soon afterward, Sinclair learned that Young, the gay longtime choir director of Obama's own Trinity United church, had been found shot to death execution-style in his own home, with no signs of forced entry nor property stolen. This naturally raised severe concerns, so Sinclair fully cooperated with the Chicago detectives investigating the case and filed a legal affidavit describing all his conversations with Young. He also spoke to Young's mother, a former employee of the Chicago police department, and he claims she and Young's other relatives were absolutely convinced that her son had been killed to protect Obama from public embarrassment. Just the previous month, another homosexual in Obama's black congregation had been found shot to death under similar circumstances, while a third died three days after Young. The local Chicago media began carrying stories about this strange wave of sudden deaths among gay blacks affiliated with Trinity United, but the rest of the American press showed no interest.

Given such alarming developments, Sinclair's subsequent eagerness to get his account on the record and in front of national journalists becomes quite understandable, since it might provide him a life-insurance policy. Once the media knew his story, his sudden death would be much more damaging to the Obama campaign than if he were allowed to continue telling his uncorroborated tales of sex and drugs. Whether or not such concerns were warranted, Sinclair is still alive fifteen years later, while none of the killings of homosexuals in Obama's local church congregation have ever been solved.



Given my total ignorance of these important events and my fading memories of the better known elements of Obama's rise to political prominence and his victorious 2008 campaign, I decided to read Webster Tarpley's book *Barack H. Obama: The Unauthorized Biography* published that same year, which provide all of this information at great length. Long associated with the Lyndon LaRouche movement, Tarpley is very conspiratorial in his focus and also intensely hostile to Obama, whom he considered a puppet of the nefarious Trilateral Commission, so I'd hardly consider much of his analysis very convincing, but he does provide a reasonable summary of numerous important facts that have been carefully excluded from Obama's massive 30,000 word Wikipedia entry. I'm sure there are far better sources of accurate information about Obama, but Tarpley's work was the one that happened to come to my attention.



Sinclair himself had released his own short, self-published book at the beginning of 2009. Although the cheapest used copies are now priced at nearly $500, there is also a much more reasonable Kindle edition, which I read. The work provided a very useful description of the ultimately successful efforts of the Obama campaign and its Internet allies to dissuade any national media outlets such as the *New York Post* or the *Chicago Tribune* from covering the author's own story. Despite Sinclair's very sordid background and his numerous personal flaws, I think most of his material came across as reasonably credible.

Based upon all this testimony, there seems a very real possibility that our 2008 Presidential campaign was punctuated by one or more political murders. But since our national media failed to report any of this information, neither I nor most other Americans were any the wiser, and we never learned of the devastating personal scandals that might have precipitated those lethal decisions.

Perhaps this sort of dramatic scenario might seem highly implausible to those who remain firmly committed to a strictly non-conspiratorial

view of American politics, but I think there is actually ample historical precedent. In one of my earliest American Pravda articles, I had noted that soon after the end of World War II, quite a number of our leading political figures had suffered untimely deaths, usually under strange and suspicious circumstances. I had opened that article by drawing an indirect historical analogy:

> Although my main academic focus was theoretical physics, I always had a very strong interest in history as well, especially that of the Classical Era. Trying to extract the true pattern of events from a collection of source material that was often fragmentary, unreliable, and contradictory was a challenging intellectual exercise, testing my analytical ability. I believe I even contributed meaningfully to the field, including a short 1985 article in *The Journal of Hellenic Studies* that sifted the ancient sources to conclude that Alexander the Great had younger brothers whom he murdered when he came to the throne.
>
> However, I never had any interest in 20th century American history. For one thing, it seemed so apparent to me that all the basic political facts were already well known and conveniently provided in the pages of my introductory history textbooks, thereby leaving little room for any original research, except in the most obscure corners of the field.
>
> Also, the politics of ancient times was often colorful and exciting, with Hellenistic and Roman rulers so frequently deposed by palace coups, or falling victim to assassinations, poisonings, or other untimely deaths of a highly suspicious nature. By contrast, American political history was remarkably bland and boring, lacking any such extra constitutional events to give it spice. The most dramatic political upheaval of my own lifetime had been the forced resignation of President Richard Nixon under threat of impeachment, and the causes of his departure from office—some petty abuses of power and a subsequent cover-up—were so clearly inconsequential that they fully affirmed the strength of our American democracy and the scrupulous care with which our watchdog media policed the misdeeds of even the most powerful.
>
> In hindsight perhaps I should have asked myself whether the coups and poisonings of Roman Imperial times were accurately reported in their own day, or if most of the toga-wearing citizens of that era might have remained blissfully unaware of the nefarious events secretly determining the governance of their own society.

- American Pravda: Our Deadly World of Post-War Politics
  Ron Unz • ***The Unz Review*** • July 2, 2018 • 5,700 Words

The contours of the 2008 Presidential race now become much more apparent. Both the McCain and the Obama campaigns possessed a stockpile of extremely lethal political weapons that could be used to completely destroy the reputation of the rival candidate. For exactly that reason, the resulting balance of terror based upon the prospect of mutually-assured political destruction meant that neither arsenal was ever used, while the oblivious American voting public remained completely unaware.

In trying to recollect the details of the 2008 campaign, I dimly recall having possibly seen discussion of some of these strange accusations at the time, perhaps in the comment-threads of fringe websites, but since they were never reported in the media, I merely dismissed them as nonsense and paid no attention.

And I was hardly alone in this. When I recently brought the shocking Sinclair story to the attention of an academic whom I know, someone situated in the elite establishment and well-connected to left-liberal Democratic Party circles but also personally very much open to "conspiratorial" theories, he said he'd never heard a peep about it. But as an aside, he told me that he knew for a fact that during the earlier 1992 race between George H.W. Bush and Bill Clinton, the two rival campaigns had quietly agreed to avoid any focus on "bimbo eruptions" since both candidates had such major personal vulnerabilities in that regard.

The collapse of Lehman Brothers and the ensuing mortgage meltdown ultimately swept Obama into the White House, along with greatly strengthened Democratic majorities in both houses of Congress. But although Obama's enthusiastic partisans assumed that the result would be a vast political revolution overturning eight years of Republican rule, the actual consequences were very different, and the powerful personal secrets held over Obama's head may have contributed to this outcome, secrets that might have recently been capped by a political murder or two. As I wrote in 2012:

> Consider the pattern of the last decade. With two ruinous wars and a financial collapse to his record, George W. Bush was widely regarded as one of the most disastrous presidents in American history, and at times his public approval numbers sank to the

lowest levels ever measured. The sweeping victory of his successor, Barack Obama, represented more a repudiation of Bush and his policies than anything else, and leading political activists, left and right alike, characterized Obama as Bush's absolute antithesis, both in background and in ideology. This sentiment was certainly shared abroad, with Obama being selected for the Nobel Peace Prize just months after entering office, based on the widespread assumption that he was certain to reverse most of the policies of his detested predecessor and restore America to sanity.

Yet almost none of these reversals took place. Instead, the continuity of administration policy has been so complete and so obvious that many critics now routinely speak of the Bush/Obama administration.

The harsh violations of constitutional principles and civil liberties which Bush pioneered following the 9/11 attacks have only further intensified under Obama, the heralded Harvard constitutional scholar and ardent civil libertarian, and this has occurred without the excuse of any major new terrorist attacks. During his Democratic primary campaign, Obama promised that he would move to end Bush's futile Iraq War immediately upon taking office, but instead large American forces remained in place for years until heavy pressure from the Iraqi government finally forced their removal; meanwhile, America's occupation army in Afghanistan actually tripled in size. The government bailout of the hated financial manipulators of Wall Street, begun under Bush, continued apace under Obama, with no serious attempts at either government prosecution or drastic reform. Americans are still mostly suffering through the worst economic downturn since the Great Depression, but Wall Street profits and multimillion-dollar bonuses soon returned to record levels.

In particular, the continuity of top officials has been remarkable. As Bush's second defense secretary, Robert Gates had been responsible for the ongoing management of America's foreign wars and military occupations since 2006; Obama kept him on, and he continued to play the same role in the new administration. Similarly, Timothy Geithner had been one of Bush's most senior financial appointments, playing a crucial role in the widely unpopular financial bailout of Wall Street; Obama promoted him to Treasury secretary and authorized continuation of those same policies. Ben Bernanke had been appointed chairman of the Federal Reserve by Bush and was reappointed by Obama. Bush wars and bailouts became Obama wars and bailouts. The

American public voted for an anti-Bush, but got Bush's third term instead.

During the Cold War, Soviet propagandists routinely characterized our democracy as a sham, with the American public merely selecting which of the two intertwined branches of their single political party should alternate in office, while the actual underlying policies remained essentially unchanged, being decided and implemented by the same corrupt ruling class. This accusation may have been mostly false at the time it was made but seems disturbingly accurate today.

The following year I returned to the same theme in the closing paragraphs of my original American Pravda article:

Most of the Americans who elected Barack Obama in 2008 intended their vote as a total repudiation of the policies and personnel of the preceding George W. Bush administration. Yet once in office, Obama's crucial selections—Robert Gates at Defense, Timothy Geither at Treasury, and Ben Bernanke at the Federal Reserve—were all top Bush officials, and they seamlessly continued the unpopular financial bailouts and foreign wars begun by his predecessor, producing what amounted to a third Bush term.

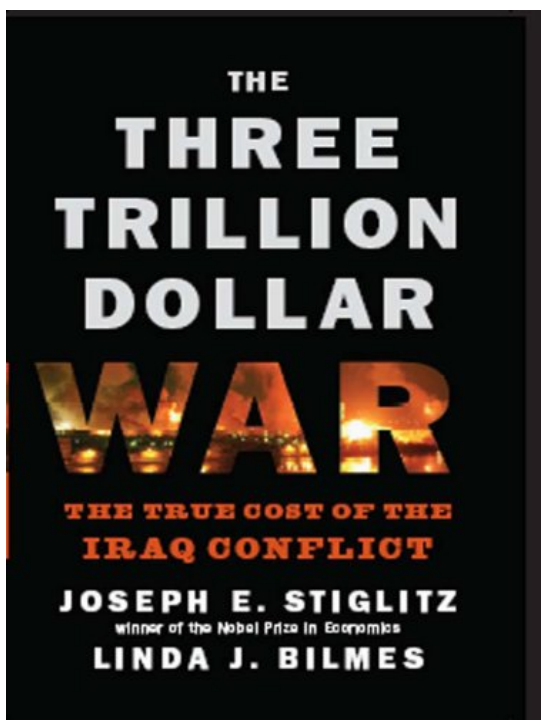
Consider the fascinating perspective of the recently deceased Boris Berezovsky, once the most powerful of the Russian oligarchs and the puppet master behind President Boris Yeltsin during the late 1990s. After looting billions in national wealth and elevating Vladimir Putin to the presidency, he overreached himself and eventually went into exile. According to the *New York Times*, he had planned to transform Russia into a fake two-party state—one social-democratic and one neoconservative—in which heated public battles would be fought on divisive, symbolic issues, while behind the scenes both parties would actually be controlled by the same ruling elites. With the citizenry thus permanently divided and popular dissatisfaction safely channeled into meaningless dead-ends, Russia's rulers could maintain unlimited wealth and power for themselves, with little threat to their reign. Given America's history over the last couple of decades, perhaps we can guess where Berezovsky got his idea for such a clever political scheme.

# The Forgotten Anthrax Attacks

*The Unz Review* • October 17, 2023 • 10,100 Words

## The Immense Historical Importance of the Anthrax Attacks

We just recently passed the 22nd anniversary of the 9/11 Attacks, the greatest terrorist strike in human history and an event whose political reverberations dominated world politics for most of the two decades that followed. Our Iraq War was soon triggered as a consequence, a disastrous decision that dramatically transformed the political map of the Middle East and eventually led to the death or displacement of many millions, while our failing twenty-year retaliatory occupation of Afghanistan only finally came to a humiliating end in 2021.



American society also underwent enormous changes, with a considerable erosion of our traditional civil liberties. On the fiscal side, by 2008 Economics Nobel Laureate Joseph Stiglitz and his collaborators had conservatively estimated that the total accrued cost of our military response had exceeded $3 trillion, a figure that later

studies raised to $6.4 trillion by 2019, or more than $50,000 per American household.

In the days after those dramatic events, the images of the burning World Trade Center towers and their sudden collapse were endlessly replayed on our television screens, accompanied by the near-universal verdict that American life would forever be changed by the massive terrorist assault that had taken place. But a tiny handful of skeptics argued otherwise.

The Internet was then in its childhood, with the initial dot-com bubble already deflating, while Mark Zuckerberg was still in high school and social media did not yet exist. But one of the earliest pioneers of web-based journalism was Mickey Kaus, a former writer at *The New Republic*, who had recently begun publishing short, informal bits of punditry one or more times each day on what he called his "web log," a term soon contracted to "blog." Along with his fellow *TNR* alumnus Andrew Sullivan, Kaus became one of our first bloggers, and was inclined to take contrarian positions on major issues.

Thus, even as a stunned world gaped at the smoking ruins of the WTC towers and the talking heads on cable declared that American life would never be the same again, Kaus took a very different position. I remember that not long after the attacks, he argued that our cable-driven 24-hour news cycle had so drastically shrunk the popular attention-span that coverage of the massive terrorist attacks would soon begin to bore most Americans. As a result, he boldly predicted that by Thanksgiving, the 9/11 Attacks would have become a rapidly-fading memory, probably displaced by the latest celebrity-scandal or high-profile crime, and that the long-term impact upon American public life would be minimal.

Obviously, Kaus' forecast was wrong, but I think it never had a fair test. Very soon after he wrote those words, our national attention was suddenly riveted by an entirely new wave of terrorism, as the offices of leading media and political figures in Manhattan, DC, and Florida began receiving envelopes filled with lethal anthrax spores together with short notes praising Allah and promising death to America.

Although nearly all Americans had seen the destruction of the WTC towers on their television screens and become outraged at the blow to our country, probably few had felt personally threatened by those September attacks. But now during October, the dreadful spectre of biological terrorism moved to the forefront of popular concerns, staying there for many months.

Those anthrax mailings had targeted particular high-profile individuals and the letters were tightly sealed, but the media soon revealed that rough handling at postal centers during the automatic sorting process had caused the tiny seeds of death to leak through the pores of the envelope paper, contaminating both the buildings and the other mail being processed. As a result, some of the subsequent fatalities were those of random individuals who had received an accidentally-contaminated letter, seeming to place all Americans at terrible risk.

Moreover, despite all the visual scenes of massive destruction inflicted on 9/11, only about 3,000 Americans had died, but then our political and media figures soon warned that terrorists could use anthrax or smallpox to kill hundreds of thousands or millions of our citizens. Indeed, we were told that just a few months earlier during June 2001, the government's Dark Winter simulation exercise had suggested that over a million Americans could die in a smallpox attack unleashed by foreign terrorists.

According to early news reports, the anthrax in the letters had been highly weaponized using techniques far beyond the rudimentary capabilities of al-Qaeda terrorists, facts that therefore indicated a state sponsor. Numerous anonymous government sources stated that the deadly spores had been coated in bentonite, a compound long used by the Iraqis to enhance the lethality of their anthrax bombs, thereby directly fingering Saddam Hussein's regime, and although those claims were later officially denied by the White House, large portions of the American public heard and believed them.

As the weeks went by, the FBI and most of the media declared that the anthrax had apparently come from our own domestic stockpiles, suggesting that the mailer was probably a lone domestic terrorist merely pretending to be an radical Islamicist, but much of the public never accepted this.

Indeed, a year later when Colin Powell made his famous presentation to the UN Security Council, attempting to justify America's planned invasion of Iraq, he held up a small vial of white powder, explaining that even such a tiny quantity of anthrax spores could kill many tens of thousands of Americans. His public focus demonstrated the continuing resonance of the biological warfare attacks that our country had suffered more than a year earlier, and which many die-hard Americans still stubbornly believed had been a combined effort by al-Qaeda and Saddam Hussein.

The handful of anthrax letters had only killed five Americans and sickened 17 more, a tiny sliver of the 9/11 casualties, and the last envelope sent had been postmarked on October 17, 2001. But I think the impact upon American public opinion during the year or two that followed was fully comparable to that of the massive physical attacks we had suffered a few weeks earlier, or perhaps even greater. For all the death and destruction inflicted on 9/11, without the subsequent anthrax mailings, the Patriot Act would never have passed Congress in anything like its final form, while President Bush might not have gained sufficient public support to launch his disastrous Iraq War.

The anthrax mailings were almost totally forgotten within just a few years and today my suggestion that their impact had matched or even exceeded that of the 9/11 Attacks themselves might seem utterly preposterous to most Americans, but when I recently reviewed the articles of that period, I discovered that I had hardly been alone in that appraisal.

Renowned investigative journalist Glenn Greenwald was just beginning his career, joining *Salon* in 2007. He soon began publishing a number of columns on the anthrax case, with one of the first including this paragraph near the beginning:

> The 2001 anthrax attacks remain one of the great mysteries of the post-9/11 era. After 9/11 itself, the anthrax attacks were probably the most consequential event of the Bush presidency. One could make a persuasive case that they were actually more consequential. The 9/11 attacks were obviously traumatic for the country, but in the absence of the anthrax attacks, 9/11 could easily have been perceived as a single, isolated event. It was really the anthrax letters — with the first one sent on September 18, just one week after 9/11 — that severely ratcheted up the fear levels and created the climate that would dominate in this country for the next several years after. It was anthrax — sent directly into the heart of the country's elite political and media institutions, to then-Senate Majority Leader Tom Daschle (D-SD), Sen. Pat Leahy (D-Vt), NBC News anchor Tom Brokaw, and other leading media outlets — that created the impression that social order itself was genuinely threatened by Islamic radicalism.

So I think it's perfectly possible that without those now long-forgotten anthrax mailings, Kaus might have been proven correct in his predictions and the 9/11 Attacks would have become a fading memory by the end of 2001. Without a handful of small envelopes filled with anthrax, there might never have been an Iraq war nor a

Patriot Act nor all the other momentous political and social changes in America during the years after September 11, 2001.

There were also some very direct consequences. American government support for biodefense had been strong under Clinton, then sharply reduced once Bush came into office. But those few deadly envelopes changed everything, and during the years 2002-2011, our government spent an estimated $70 billion on biowarfare and biodefense, vastly more than ever before. These days our total biowarfare outlays have far surpassed the hundred billion dollar mark, but almost all of that gusher of funding was triggered by a handful of envelopes bearing $0.23 stamps. During September 2001, a biological defense contractor named BioPort was on the verge of collapse and bankruptcy, but once the mailings reached the headlines, the company was saved by a flood of anthrax-vaccine government contracts; later renamed Emergent BioSolutions, it played a controversial role in the production of our Covid vaccines nearly twenty years later.

If Americans were asked to name the half-dozen most consequential global events of our young 21st century, I doubt whether even one in a thousand would include the forgotten anthrax attacks of 2001 on that list; but without those mailings our entire history and that of the world might have followed a very different trajectory.

## The Assaad Letter as the Crucial Evidence

Although the anthrax letters have never attracted more than a small fraction of the public debate surrounding the associated 9/11 Attacks, they were also shrouded in considerable controversy, with the true perpetrators and circumstances hotly debated from the very beginning. Back then and for many years afterward, I had never seriously questioned the official 9/11 narrative nor even closely investigated its details. But the glaring omissions in the news coverage of the anthrax mailings had always seemed very strange and suspicious to me, and thus had played an important role in my growing doubts about the reliability of our mainstream media. When I published my original American Pravda article a decade ago, I'd given pride of place to the anthrax story and included several paragraphs summarizing my own contrary analysis, which had remained unchanged during the dozen years since 2001:

> Consider the almost forgotten anthrax mailing attacks in the weeks after 9/11, which terrified our dominant East Coast elites and spurred passage of the unprecedented Patriot Act, thereby

eliminating many traditional civil-libertarian protections. Every morning during that period the *New York Times* and other leading newspapers carried articles describing the mysterious nature of the deadly attacks and the complete bafflement of the FBI investigators. But evenings on the Internet I would read stories by perfectly respectable journalists such as *Salon*'s Laura Rozen or the staff of the *Hartford Courant* providing a wealth of additional detail and pointing to a likely suspect and motive.

Although the letters carrying the anthrax were purportedly written by an Arab terrorist, the FBI quickly determined that the language and style indicated a non-Arab author, while tests pointed to the bioweapons research facility at Ft. Detrick, Md., as the probable source of the material. But just prior to the arrival of those deadly mailings, military police at Quantico, Va., had also received an anonymous letter warning that a former Ft. Detrick employee, Egyptian-born Dr. Ayaad Assaad, might be planning to launch a national campaign of bioterrorism. Investigators quickly cleared Dr. Assaad, but the very detailed nature of the accusations revealed inside knowledge of his employment history and the Ft. Detrick facilities. Given the near-simultaneous posting of anthrax envelopes and false bioterrorism accusations, the mailings almost certainly came from the same source, and solving the latter case would be the easiest means of catching the anthrax killer.

Who would have attempted to frame Dr. Assaad for bioterrorism? A few years earlier he had been involved in a bitter personal feud with a couple of his Ft. Detrick coworkers, including charges of racism, official reprimands, and angry recriminations all around. When an FBI official shared a copy of the accusatory letter with a noted language-forensics expert and allowed him to compare the text with the writings of 40 biowarfare lab employees, he found a perfect match with one of those individuals. For years I told my friends that anyone who spent 30 minutes with Google could probably determine the name and motive of the likely anthrax killer, and most of them successfully met my challenge.

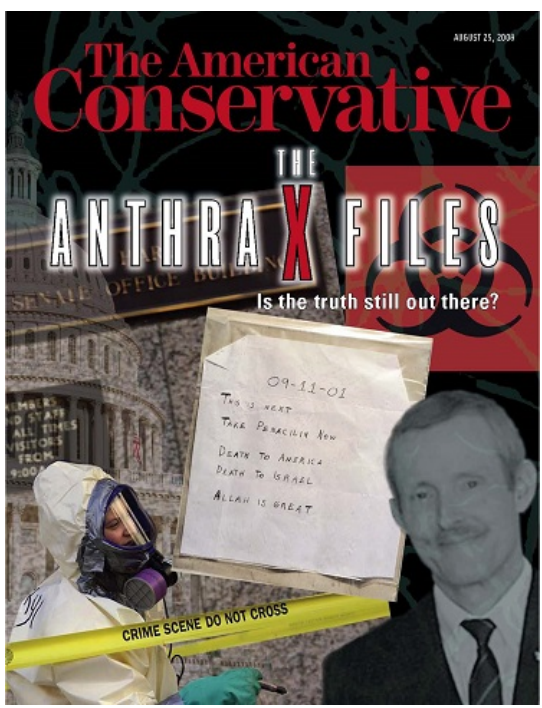
This powerful evidence received almost no attention in the major national media, nor is there any indication that the FBI ever followed up on any of these clues or interrogated the named suspects. Instead, investigators attempted to pin the attacks on a Dr. Steven Hatfill based on negligible evidence, after which he was completely exonerated and won a $5.6 million settlement from the government for its years of severe harassment. Later, similar hounding of researcher Bruce Ivins and his family led to

his suicide, after which the FBI declared the case closed, even though former colleagues of Dr. Ivins demonstrated that he had had no motive, means, or opportunity. In 2008, I commissioned a major 3,000-word cover story in my magazine summarizing all of this crucial evidence, and once again almost no one in the mainstream media paid the slightest attention.

- Our American Pravda
  Ron Unz • ***The American Conservative*** • April 29, 2013 • 4,500 Words

When I recently decided to revisit the story of the anthrax attacks and reexamine all the accumulated information from the last couple of decades, I felt that a good starting point might be that *TAC* cover story by Christ0pher Ketchum that I'd published back in 2008, which effectively summarized what I'd always considered the most crucial information:

> As early as November 2001, the *New York Times* was reporting that the bureau's "missteps" were "hampering the inquiry." Indeed, from the beginning, the FBI has been in possession of a key piece of evidence that it apparently ignored.



Among the first suspects to come into the FBI's sights was an

Egyptian-born ex-USAMRIID biologist named Ayaad Assaad. He appeared on the radar because of an anonymous letter sent to the bureau identifying him as part of a terrorist cell possibly linked to the anthrax attacks. Yet, according to the *Hartford Courant*, the FBI did not attempt to track down the author of the letter, "despite its curious timing, coming a matter of days before the existence of anthrax-laced mail became known."

Assaad was quickly exonerated by FBI investigators, and the matter swiftly dropped—though the letter may have provided the best piece of evidence in the case. It was sent prior to the arrival of the anthrax letters, suggesting foreknowledge of the attacks, and its language was similar to that of the deadly mail. Moreover, it displayed an intimate knowledge of USAMRIID operations, suggesting that it came from within the limited ranks of Fort Detrick researchers—a relatively small group with access to and expertise in weaponized anthrax.

The FBI has refused to make a copy of the letter publicly available —or even to give one to Assaad himself. It did, however, share the contents with a Vassar College professor and language forensics expert named Don Foster, who famously fingered Joe Klein as the anonymous author behind *Primary Colors* and helped to catch the 1996 Atlanta Olympics bomber. After reading news reports, he requested a copy of the letter, and, following his review of documents written by "some 40 USAMRIID employees," Foster "found writings by a female officer that looked like a perfect match," according to an article he authored in the October 2003 *Vanity Fair*. When he brought this seemingly crucial clue to the attention of the FBI's anthrax task force, however, the bureau declined to follow up. According to Foster, the senior FBI agent on the case had never even heard of the Assaad letter. (For the record, Foster isn't an unimpeachable source. He strayed from his area of professional expertise and published unrelated circumstantial evidence in his *Vanity Fair* piece that wrongly fingered Hatfill, who sued the magazine, which settled on undisclosed terms.)

"The letter-writer clearly knew my entire background, my training in both chemical and biological agents, my security clearance, what floor I work on, that I have two sons, what train I take to work, and where I live," Assaad told reporter Laura Rozen. Since he was almost immediately cleared, attempting to frame him served no purpose, except to indulge a personal enmity. To that end, Assaad suggested that the FBI question the

pair of USAMRIID colleagues most likely to carry a grudge against him, Marian Rippy and Philip Zack, who years earlier had been reprimanded for sending Assad a racist poem. Though the *Courant* reported video evidence of Zack making after-hours trips to labs where pathogens were stored, there is no record of the FBI ever investigating him or Rippy, a colleague with whom he was having an extramarital affair.

- The Anthrax Files
  Christopher Ketchum • ***The American Conservative*** • August 25, 2008 • 3,000 Words

The lengthy and detailed Assaad letter demonstrated foreknowledge of the anthrax mailings and very likely had been sent by someone fully aware of those attacks, so it had always seemed the obvious means of cracking the case. Yet it was completely ignored by the *New York Times* and the rest of the elite media, and only reported in relatively small outlets such as the *Hartford Courant* and *Salon*, whose extensive coverage had played an important role in the case.

## Media Coverage of the Anthrax Attacks

During the first year or two following the anthrax attacks, I'd tried to keep up with the flood of media coverage, much of it regularly highlighted for me on a daily basis by news-aggregator websites such as *Antiwar.com*. Under normal circumstances, now locating all those same stories two decades after they originally ran would have been an impossible undertaking given that many of those publications had long since purged their archives or even completely vanished from the Internet.

Fortunately, Edward Lake, a writer with neoconservative leanings, became deeply interested in the anthrax case, and aggregated together most of those early news stories on a website that he created, which served as a uniquely useful resource. Although that website also vanished from the Internet many years ago, its contents remain accessible at Archive.org, and here are links to several of the main sections:

- Articles from the *Washington Times* • 28 Items • 20,000 Words
- Articles from the *Hartford Courant* • 33 Items • 36,000 Words
- Other Media Articles, Part 1 • 45 Items • 57,000 Words
- Other Media Articles, Part 2 • 96 Items • 99,000 Words
- Barbara Hatch Rosenberg/FAS Articles • 9 Items • 7,500 Words

Possibly for reasons of copyright, Lake's website had excluded pieces originally published in the largest national newspapers such as the *New York Times*, the *Washington Post*, and the *Wall Street Journal*. Among these, a half-dozen *Times* columns published in 2002 by Nicholas Kristof had played an especially important role and provoked enormous attention. Kristof had repeatedly charged that the FBI was refusing to arrest an obvious suspect in the case and he ultimately fingered Dr. Steven Hatfill, who turned out to have been wrongly accused and successfully sued:

- Profile of a Killer • Jan 4, 2002
- Connecting Deadly Dots • May 24, 2002
- Anthrax? The F.B.I. Yawns • July 2, 2002
- The Anthrax Files • July 12, 2002
- Case of the Missing Anthrax • July 19, 2002
- The Anthrax Files • August 13, 2002

The important article by Don Foster mentioned above had originally run in *Vanity Fair*, but was later republished by the UCLA Department of Epidemiology, which also provided a very helpful annotated timeline of the outbreak:

- The Message in the Anthrax
  Don Foster • ***Vanity Fair*** • October 2003 • 9,500 Words

Beginning in 2007, Glenn Greenwald published a lengthy series of columns in *Salon*, totaling well over 30,000 words, with most of his pieces sharply challenging the official FBI narrative that blamed the attacks on Ft. Detrick anthrax researcher Bruce Ivins and then declared the case closed:

- The unresolved story of ABC News' false Saddam-anthrax reports • April 9, 2007
- Vital unresolved anthrax questions and ABC News • August 1, 2008
- Journalists, their lying sources, and the anthrax investigation • August 3, 2008
- Additional key facts re: the anthrax investigation • August 4, 2008
- The FBI's emerging, leaking case against Ivins • August 5, 2008
- The FBI's selective release of documents in the anthrax case • August 6, 2008
- What's the answer to this? • August 10, 2008
- Doubts over the anthrax case intensify — except among much of the media • August 18, 2008

- Key senators dispute FBI's anthrax case against Bruce Ivins • September 17, 2008
- Remembering the anthrax attack • March 4, 2009
- Unlearned lessons from the Steven Hatfill case • April 21, 2010
- An Army scientist denies the FBI's anthrax case • April 23, 2010
- Serious doubt cast on FBI's anthrax case against Bruce Ivins • February 16, 2011
- DOJ casts serious doubt on its own claims about the anthrax attack • July 19, 2011

In 2009 attorney Barry Kissin published a long and influential memo also challenging those FBI conclusions on numerous technical grounds, which he later updated and expanded in 2011:

- The Truth About The Anthrax Attacks and Its Cover-Up
  Barry Kissin • April 2, 2011 • 15,800 Words

Kissin heavily referenced a couple of columns that had run the previous year in the *Wall Street Journal* and the *New York Times* by Edward Jay Epstein and Richard Bernstein respectively. These had pointed out the enormous holes in the case against Ivins, whom they argued could not possibly have created the anthrax in his Ft. Detrick facilities as claimed by the FBI:

- The Anthrax Attacks Remain Unsolved
  *The FBI disproved its main theory about how the spores were weaponized*
  Edward Jay Epstein • ***The Wall Street Journal*** • January 24, 2010 • 1,400 Words
- Haste Leaves Anthrax Case Unconcluded
  Richard Bernstein • ***The New York Times*** • February 24, 2010 • 1,100 Words

Finally, Wikipedia also provides a lengthy establishmentarian account of the anthrax attacks, as does the more conspiratorial wikispooks website, which also provides a helpful timeline

- 2001 Anthrax Attacks • ***Wikipedia*** • 15,500 Words
- 2001 Anthrax Attacks • ***Wikispooks*** • 2,000 Words
- 2001 Anthrax attacks/Timeline • ***Wikispooks*** • 5,200 Words

## How the Media and the FBI Ignored the Obvious Suspect

I recently spent a few days carefully rereading those two hundred-odd news stories, most of them for the first time in nearly twenty years. Across the more than 250,000 words of text, I found very little to change my original analysis of the 2001 anthrax attacks.

In his numerous columns, Greenwald had described the FBI case presented against Ivins as extremely thin, while Epstein, Bernstein, and Kissin persuasively argued that Ivins could not possibly have produced the anthrax used in the mailings.

Meanwhile, just as I remembered, it seemed very likely that the long Assaad letter had been sent by someone fully aware of the anthrax being sent, and was therefore the most important lead to the culprit. Both the FBI and its strongest critics agreed that the anthrax used had originated at Ft. Detrick and Assaad's false accuser was clearly a present or former Ft. Detrick staffer. The letter had been mailed just a couple of days after the first wave of anthrax envelopes went out but long before their deadly contents came to public attention and began inspiring any copycats, and just like those anthrax mailings, accusations of Islamic bioterrorism had been the main theme. Such close correspondences seemed far too numerous to have been simply coincidental.

Just as in early 2002, I still found it extremely strange that while the *Hartford Courant* and *Salon* had run numerous stories on the Assaad letter, almost none of the 200 other news articles in mainstream outlets had ever mentioned a word about such a central clue to the mystery, perhaps reflecting the influence of their powerful establishmentarian sources, including those near the top of the FBI.

However, in properly assessing the implications of the Assaad letter, we must sharply distinguish between the solid and the speculative. When Assaad had originally been interviewed by the FBI prior to the anthrax outbreak, he had suggested Zack and Rippy as two of the most likely culprits since they had been among his chief personal antagonists at Ft. Detrick, but that was merely speculation on his part. Zack had been an anthrax biowarfare developer and reporters later found that he'd been given improper access to the Ft. Detrick facilities by Rippy, with whom he was having an extramarital affair. Furthermore, around the same time, there was evidence that unauthorized anthrax experiments had secretly been conducted in those labs. Obviously, these facts seemed highly suspicious and the total lack of any coverage in the major news media or apparent FBI investigation was a serious omission.

But as Lake had noted in his sharp rebuttal, all of these events had occurred nearly a decade before the anthrax mailings, and also long before the particular anthrax sent in the letters had been produced at the facility. Both Zack and Rippy had left Ft. Detrick years before the attacks took place and Lake suggested that they were probably no longer living on the East Coast at the time, perhaps giving them strong alibis. Finally, Zack's apparent deep hostility towards Arabs and Muslims had led to the widespread assumption that he was Jewish, and Lake effectively debunked that mistaken claim.

But none of those points diminishes the importance of the Assaad letter nor clears Zack. As a Ft. Detrick anthrax researcher who had previously been involved in suspicious activity, Zack was certainly an obvious suspect for the FBI to consider, although hardly an exclusive one. Determining the author of the Assaad letter was the crucial path to pursue, and according to Prof. Foster, after reviewing documents written by "some 40 USAMRIID employees," he had "found writings by a female officer that looked like a perfect match." It hardly mattered whether or not that individual happened to be Rippy, Zack's former confederate. Properly interrogating the author of the Assaad letter would probably have cracked the anthrax case, but the FBI refused to do so, or even make a copy of the letter publicly available to Assaad or anyone else, which raises all sorts of troubling issues.

Aside from the *Hartford Courant* and *Salon*, one of the very few publications to mention the Assaad letter was the *Washington Report on Middle East Affairs*, whose news editor wrote an article around the first anniversary of the attacks, summarizing the facts and suggesting that the likely culprit was Zack, whom she misidentified as Jewish. Aside from outlining the evidence, her piece also included several puzzling paragraphs based upon her questions to Dr. Barbara Hatch Rosenberg, a key figure in the anthrax case:

> When the *Washington Report on Middle East Affairs* asked Barbara Hatch Rosenberg, Ph.D., a biological arms control expert at the State University of New York, if the allegations regarding Dr. David Hatfill now took the heat off Lt. Col. Philip Zack, she replied, "Zack has NEVER been under suspicion as perpetrator of the anthrax attack."
>
> It is hard to believe that, with his connection to Fort Detrick, Dr. Zack is not one of the 20 to 50 scientists under intense investigation.
>
> When asked if Hatfill was part of the group that ganged up on Dr.

> Ayaad Assaad, Dr. Rosenberg answered, “Hatfill was NOT one of the persecutors of Assaad.”
>
> She is convinced that the FBI knows who sent the anthrax letters but isn’t arresting him because he knows too much about U.S. secret biological weapons research and production. But she isn’t naming names. Neither is Dr. Assaad, who did not return calls from the *Washington Report on Middle East Affairs*.

Reading this exchange more than twenty years later, it’s unclear to me whether Rosenberg was arguing that Zack had never been considered a suspect because he had an ironclad alibi or whether the FBI was simply unwilling to investigate him for some other reason, with the latter possibility obviously being very suspicious if true.

## Nine Books on the Anthrax Attacks

Having first established a solid foundation by rereading so much of the original anthrax media coverage, I decided to see what books had been published on the subject. Over the years, I’d read two short works on the anthrax attacks and I now reread those, along with eight others that I managed to locate, together constituting nearly all the available literature. With one very notable exception, I didn’t find the material particularly useful and indeed much of it blurred together in my mind.

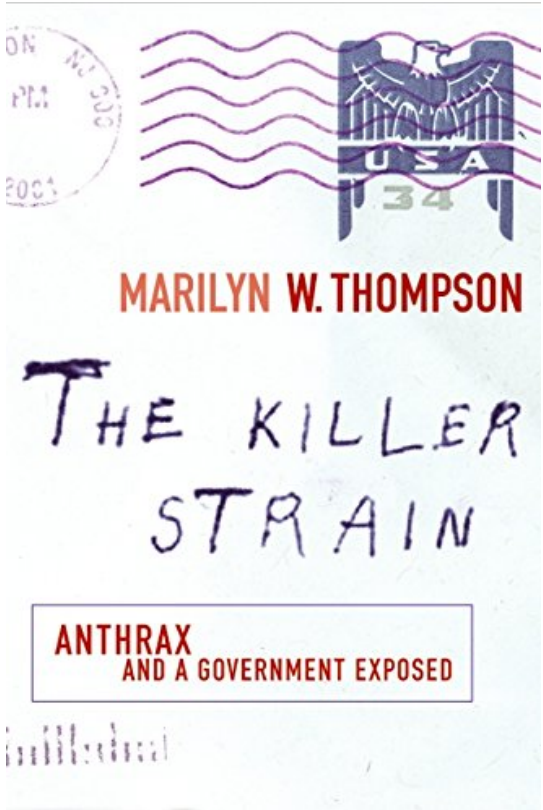
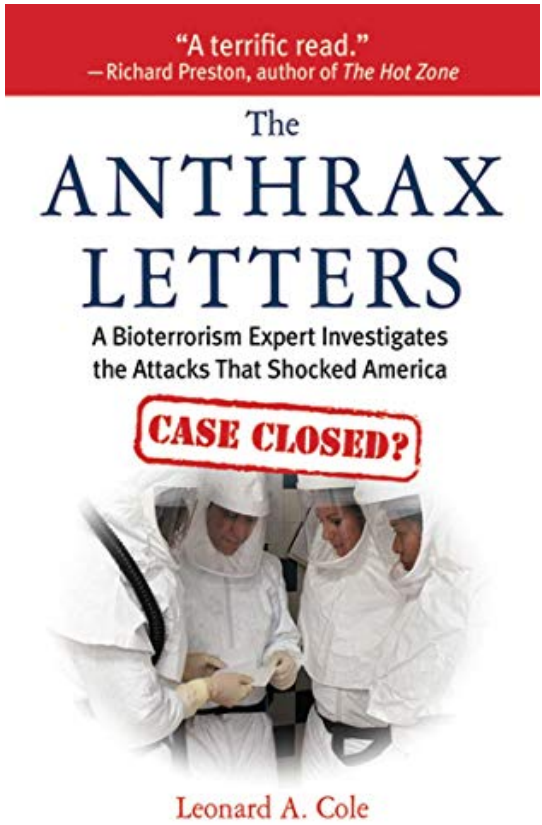
A True Story
THE DEMON IN THE FREEZER
"[Preston] turns a story about science and medicine into a theme-park ride of a thriller."
—The New York Times
Copyrighted Material

First out of the gate in late 2002 was Richard Preston's *The Demon in the Freezer*, a non-fiction work by a highly-successful writer of thrillers, which became a national bestseller. The book had obviously been in the works for some time, mostly focused upon deadly pathogens such as smallpox and also discussing bioweapons and Ft. Detrick's research in that field. The sudden events of October 2001 were then incorporated into the last one-third of the narrative, with the timeliness of those recent headlines boosting sales. According to the Ft. Detrick researchers, the second group of letters had contained highly weaponized anthrax, something far beyond what could have been produced in a simple lab, and Kissin extensively quoted some of author's descriptions in his analysis memo. However, researchers from Battelle, a different government-affiliated bioweapons facility, had stubbornly—and rather suspiciously—disputed that conclusion. Given Preston's focus, it's hardly surprising that there was no mention anywhere of the Assaad letter, and although the other elements of the book were interesting from a broader perspective, they provided little useful additional information on the anthrax mailings, which

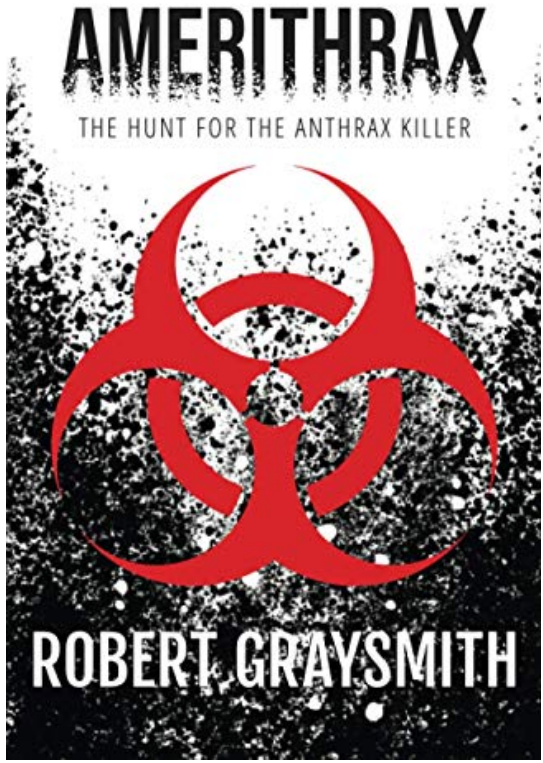
constituted only a small portion of the text.



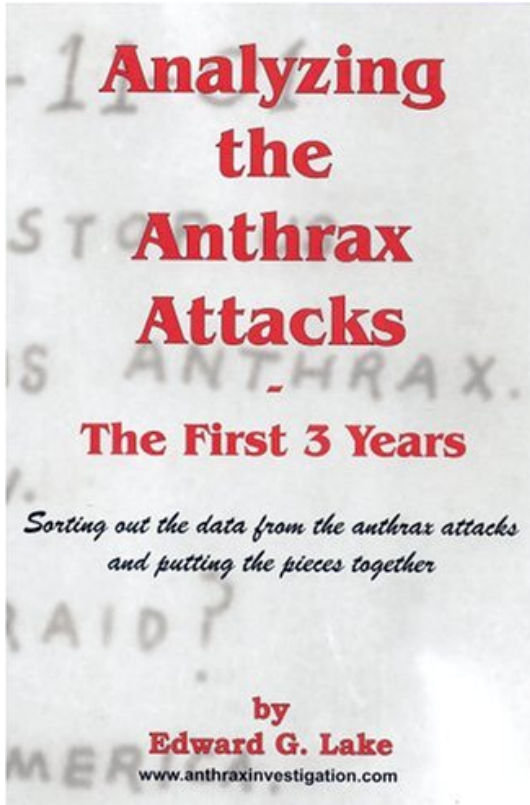
The cover jacket on Marilyn W. Thompson's 2003 book *The Killer Strain* identified the author as the award-winning Assistant Managing Editor for Investigations at the *Washington Post*, while noting that her team had won two Pulitzer Prizes for public service, and also included favorable blurbs from such notable journalistic figures as Benjamin Bradlee, Jimmy Breslin, Michael Isikoff, and David Maraniss. The text did a perfectly adequate job of telling the basic story of the attacks, and to its credit devoted three paragraphs of its 250 pages to the Assaad letter, though providing no indication of its potential importance and not even bothering to include the term in the lengthy index. One important fact that I did learn was that prior to the anthrax attacks, the new Bush Administration had planned deep cuts in biodefense preparedness.



Although I had hardly regarded Thompson's scanty coverage of the Assaad letter as adequate, it was far more than I found in *The Anthrax Letters*, published that same year by Prof. Leonard A. Cole of Rutgers University, described as an expert on bioterrorism, who entirely excluded the Assaad letter from his 280 pages of text. Like the Thompson book, his work provided a useful account of the basic narrative, attracting favorable blurbs from several major news outlets and Sen. Daschle, but seemed much less useful for someone primarily interested in solving the case. The book had originally appeared in 2003, but was reissued in 2009 following the FBI's declaration that the case had been closed with Ivins' suicide, though the author emphasized the extreme skepticism of so many prominent figures, including members of Congress, on that verdict.

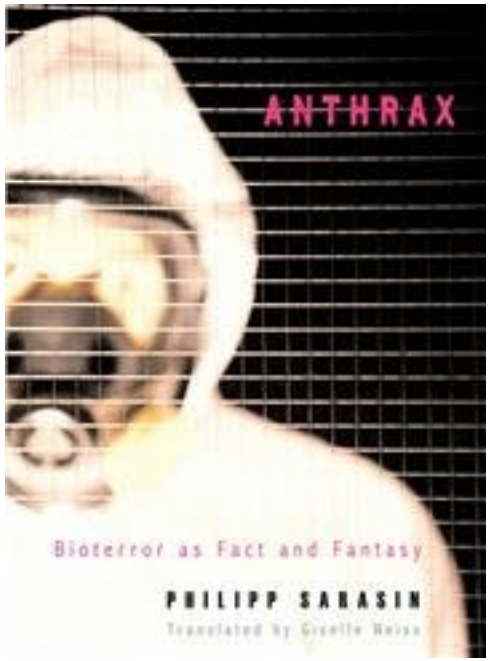


Also originally published in 2003 was *Amerithrax: The Hunt for the Anthrax Killer* by Robert Graysmith, a bestselling author of books on crime and terrorism, whose past works had become the basis for several major motion pictures. This background was apparent in the long text, which seemed to have the strongly fictional feel of an prospective screenplay rather than an analytical work, and also included extensive descriptions of the 9/11 Attacks and the broader history of American, Soviet, and Iraqi biowarfare programs. On the positive side, the author did devote a couple of pages to the Assaad letter, which he described as obviously connected to the anthrax mailings, even claiming that it had been a crucial factor convincing government investigators that the attacks were domestic in origin, but he never emphasized that it could have been used to crack the case. The book was later reissued with an Afterword in 2008, pointing to the deceased Ivins as the apparent culprit and even suggesting that he had written the Assaad letter. That latter notion seemed very unlikely to me since if there had been the slightest evidence for that possibility it would have been promoted as a centerpiece of the FBI case against Ivins.

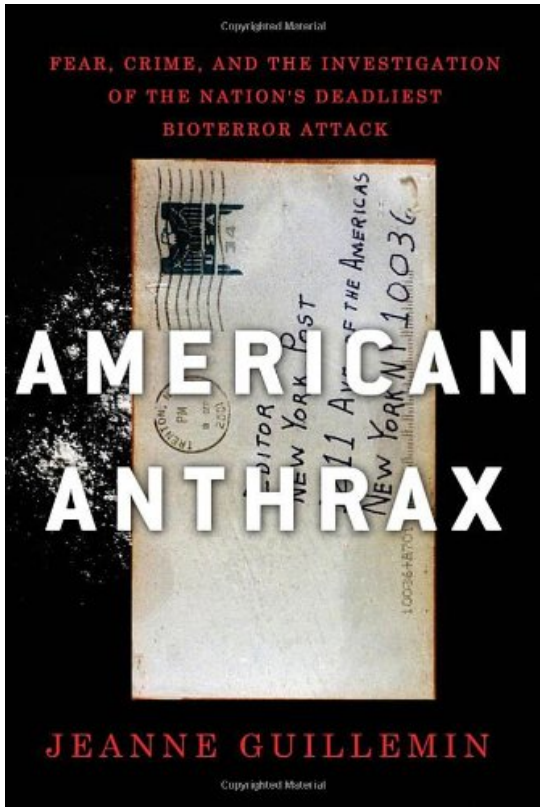


Analyzing the Anthrax Attacks
The First 3 Years
Sorting out the data from the anthrax attacks and putting the pieces together
by
Edward G. Lake
www.anthraxinvestigation.com

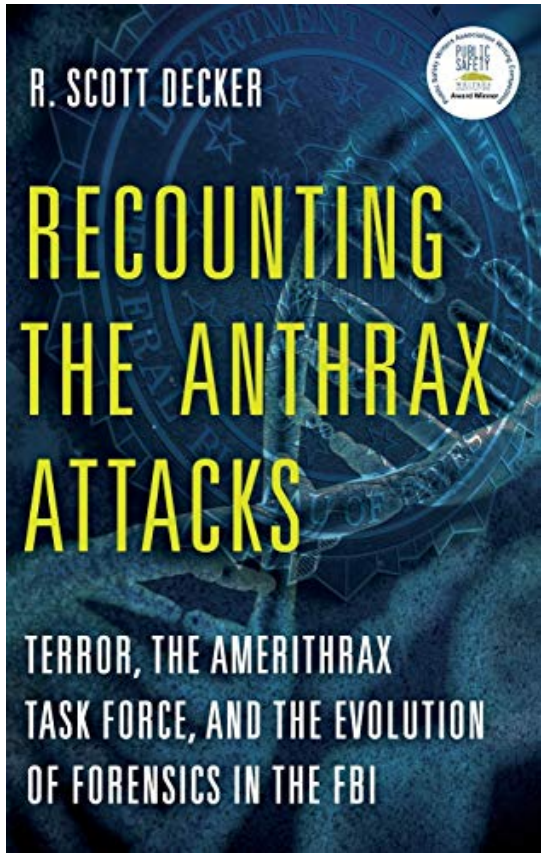
Edward Lake, whose website usefully aggregated so much of the early media coverage, self-published *Analyzing the Anthrax Attacks* in 2005. Lake was strongly critical of many of the arguments made by both Rosenberg and Foster, and very briefly mentioned the Assaad letter, arguing that it probably had no connection to the actual anthrax mailings and he therefore dismissed its significance. Although I obviously disagreed with this analysis, the author deserved considerable credit for explicitly arguing this point rather than just ignoring the issue. Lake also provided some interesting speculation that the anthrax killer probably lived and worked in central New Jersey and even suggested that the letters might have been written by a young child acting under adult supervision.



The following year, Harvard University Press released *Anthrax: Bioterror as Fact and Fantasy*, a short book by Phillip Sarasin, a professor of Modern History at the University of Zurich. His entire approach to the subject was cultural and ideological, including a focus upon popular literature and even videogames, while tying the discussion of biological terrorism to the 9/11 attacks and even broader themes such as globalization. Although I didn't find the work very useful for my own purposes, others interested in the particular cultural framework under which our society experienced the attacks might react differently.

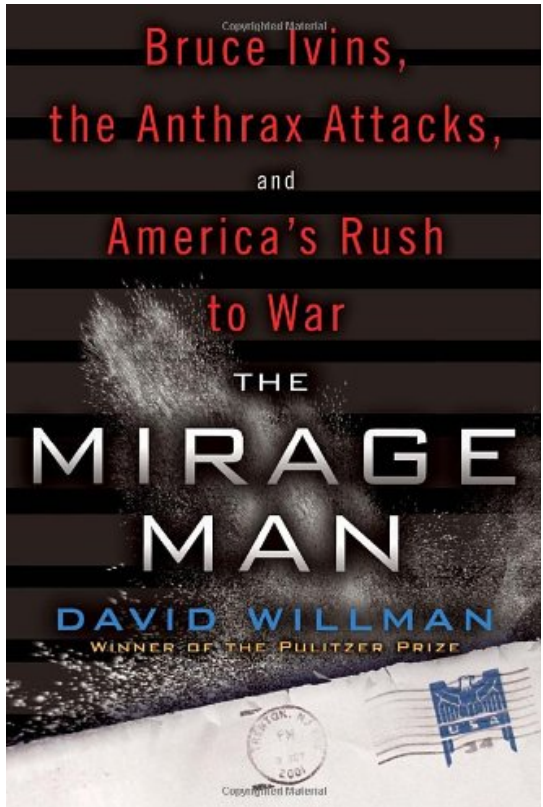


Subject to severe pressure and facing indictment, Bruce Ivins committed suicide in 2008, allowing the FBI to declare the case closed, though many senior members of Congress and journalists remained extremely skeptical that Ivins had been responsible or had acted alone. With the anthrax mailings temporarily back in the media headlines, new book contracts soon went out, and *American Anthrax* by Jeanne Guillemin, an academic affiliated with MIT, appeared in 2011. The author devoted a couple of paragraphs to the Assaad letter, and Zack was even mentioned as a subject with a reference to one of the *Salon* articles, but the author stated that the lead never "panned out," without providing any source for that supposed fact, so it probably represented her own interpretation of the puzzling later silence. She did mention that under severe FBI pressure an additional suspect besides Hatfill and Ivins apparently drank himself to death, perhaps further indicating that Ivins' suicide was not necessarily proof of his own guilt.



R. SCOTT DECKER
RECOUNTING THE ANTHRAX ATTACKS
TERROR, THE AMERITHRAX TASK FORCE, AND THE EVOLUTION OF FORENSICS IN THE FBI

I was especially disappointed by the most recent book in the collection, *Recounting the Anthrax Attacks*, published in 2018 by R. Scott Decker, one of the top FBI agents running the investigation. His coverage of the story was overwhelmingly procedural and quite dull, providing little broader perspective despite winning a non-fiction prize from the Public Safety Writers Association. Given his background and role, I was hardly surprised that he fully accepted Ivins' guilt, minimizing or excluding any contrary evidence, and he never mentioned the Assaad letter, perhaps even being unaware of it. If the enormous FBI investigation did ultimately prove unsuccessful, this book may help to explain that failure.



Considerably superior to most of these other texts was *The Mirage Man* published in 2011 by David Willman, a Pulitzer Prize winning investigative reporter at the *Los Angeles Times*, which ran a hefty 450 pages and heavily focused upon Bruce Ivins, the suspect whose suicide had allowed the FBI to declare the case closed. Willman himself had been given the original Ivins scoop in 2008, so he naturally expressed few doubts about the guilt of the dead vaccine researcher, but he did do his best to refute the extreme skepticism of Greenwald and numerous others, not entirely successfully but more than I had expected. Nearly a decade had passed since the attacks themselves and Willman was portraying the case as fully resolved with Ivins' guilt, so I couldn't really fault the author for making no mention of the Assaad letter. Relative to its apparent purpose, the book seemed a very solid work of investigative journalism, including a lengthy personal and family history of its central subject, and it carried a strongly favorable endorsement from Seymour Hersh, a towering figure in the author's own field.

I personally made some effort to weigh Willman's arguments against those of Greenwald, Epstein, Bernstein, and Kissin on the other side, but much of the dispute revolved around technical claims made by

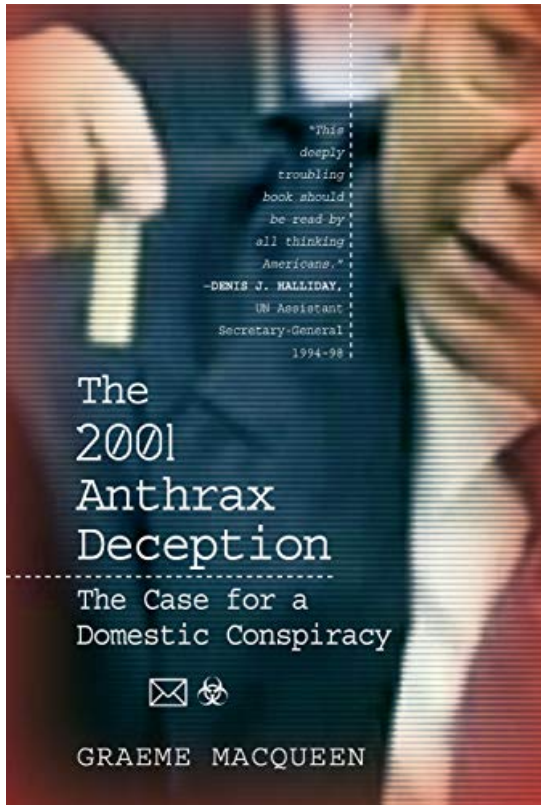
different experts that were difficult for me to judge. One critical question was whether or not the anthrax sent in the second set of envelopes had actually been "weaponized" with a silicon coating to enhance its effectiveness, with some experts sharply disputing that claim, though I thought that the weight of evidence favored that conclusion. Ivins' himself had no expertise nor equipment for such weaponization, so such a verdict would probably have cleared him.

When the FBI had originally declared Ivins' guilty, Greenwald noted that the timeline provided of the suspect's movements was completely impossible based upon the postmarked date of the letters sent and his own lab time-card. As a result, the Bureau had quickly modified its story to claim that Ivins had actually driven all night on an eight-hour round-trip in order to drop the letter in a Princeton mailbox, a suggestion that Greenwald ridiculed. But Willman strongly defended that theory, noting that Ivins had admitted sometimes taking long drives at night.

Although Willman hardly convinced me on this and other issues, I came away from his long book at least admitting the possibility of Ivins' guilt, something that I had previously dismissed as almost totally absurd.

## Graeme MacQueen and *The 2001 Anthrax Deception*

These nine books totaled more than a million words and spending a couple of weeks reading them greatly refreshed my memory of those important events of two decades ago. But although they highlighted interesting elements here and there, taken together they added very little to my framework, nor shifted any of my original conclusions. If I hadn't bothered reading any of them, none of my views about the 2001 anthrax attacks would be any different today.



"This deeply troubling book should be read by all thinking Americans."
-DENIS J. HALLIDAY, UN Assistant Secretary-General 1994-98
The 2001 Anthrax Deception
The Case for a Domestic Conspiracy
GRAEME MACQUEEN

However, the impact of the tenth book was completely different. Although the shortest of them all, *The 2001 Anthrax Deception* published in 2014 by the late Prof. Graeme MacQueen drastically transformed my understanding of those events, making a case in its 80,000 words that was entirely different from anything that I had previously read on the subject. MacQueen persuasively argued that first impressions had actually been correct and that the anthrax mailings were directly connected with the 9/11 Attacks of a week or two earlier. This had been the original assumption but was then very soon dismissed as a possibility and afterward completely ignored by almost everyone else analyzing the case during all the years that followed.

MacQueen's own background allowed him to boldly go where others did not. The authors of the previous nine books I have discussed were mainstream journalists or academics, therefore being quite reluctant to stray too far outside the safe confines of the standard narrative endorsed by establishmentarian sources, and none of them appear to have ever questioned the official story of 9/11. MacQueen himself had very respectable credentials, including a Ph.D. from Harvard and thirty years on the faculty of McMaster University in Canada, being

the founder and director of its Centre for Peace Studies. But in the years after 2001, he had become an important figure in the 9/11 Truth movement, serving as co-editor of *The Journal of 9/11 Studies*. So unlike those other writers, he was willing to explore controversial possibilities and highlight obvious connections that they had carefully ignored.

As I have already emphasized, without the anthrax mailings, the political impact of the 9/11 Attacks themselves might have quickly faded, perhaps being insufficient to reorient our country towards the many years of warfare that followed, including our invasion of Iraq, an invasion justified by Saddam's alleged stockpile of anthrax and other WMDs. So if we accept that the 9/11 Attacks were orchestrated by a conspiracy for that purpose, it becomes natural to ask whether the accompanying anthrax mailings were an entirely unexpected, fortuitous coincidence benefiting those plotters or whether they were instead an intrinsic element of the original plan. Without those anthrax deaths, Colin Powell's later UN presentation and the vial of white powder he employed as a stage prop would not have been possible, nor President Bush's public speeches on the deadly danger we faced from Iraqi WMDs.

MacQueen notes that although the 9/11 Attacks had involved entirely different types of terrorism—large-scale airplane hijackings—our East Coast media and political elites almost immediately began to focus upon the deadly risks of biowarfare attacks by Islamic radicals, especially involving anthrax, and they did so before the first anthrax letter had even been postmarked. *Washington Post* columnist Richard Cohen later revealed that he'd been warned by a high-ranking Bush Administration official to get a prescription for Cipro, the recommended antibiotic treatment for anthrax, and according to *New York Times* columnist Maureen Dowd, well-connected NYC residents also began carrying Cipro in the days immediately after 9/11. Not only was there a great deal of such apparent foreknowledge in the weeks before the first reported anthrax case, but fears of a looming anthrax attack by state-sponsored terrorists had actually long predated 9/11 itself. Perhaps this was all purely coincidental, but we should naturally be suspicious when such fearful concerns quietly promoted in elite media circles were immediately followed by actual anthrax mailings to very high-profile members of the same media establishment.

MacQueen and other members of the 9/11 Truth movement have long argued that the very public activities of Mohammed Atta and the other hijackers were intended to lay down a false narrative trail for

their supposed plot, and he noted that important elements of that trail seemingly revolved around biological warfare, including the terrorist ringleader's audacious talk of acquiring a crop-dusting plane that could release clouds of deadly anthrax over a major American city. Indeed, before the first anthrax case was even reported, there were frantic government investigations of all crop-dusters nationwide.

From very early on I had always regarded the Assaad letter as the key to unraveling the anthrax plot, but MacQueen focused my attention upon several other threatening hoax letters that had been sent out almost simultaneously with the first wave of anthrax mailings, letters that were also addressed to leading media figures but filled with harmless white powder instead of anthrax, together with strangely-formulated notes somewhat similar to those of their deadly counterparts. These envelopes had been postmarked St. Petersburg, Florida, and MacQueen argues that they were probably intended to provide an apparent link to the 9/11 Attacks, since most of the hijackers had been living in that state.

An additional connection has been regularly dismissed as merely an astonishing coincidence, but may have been more than that. The first anthrax death was that of Robert Stevens, a photo editor at the American Media offices in Florida, and Mike Irish was the top editor of his publication. Irish's own wife was a real estate agent, and she had personally arranged the rental home for a couple of the 9/11 hijackers, with whom she'd become friendly, while most of the other hijackers were also living in the close vicinity. As MacQueen notes, in a country of 285 million people, we are forced to believe that mere chance had caused the 9/11 hijackers to have such a direct personal connection to the first anthrax victim. But under his own very different reconstruction, the anthrax mailing to Irish's publication was meant to falsely suggest that the Islamic terrorists responsible for 9/11 had been directly involved in the biowarfare attacks.

Soon after the 9/11 Attacks, Neocon pundits and media outlets began promoting spurious links between the al-Qaeda Islamicists allegedly responsible and Saddam's secular, anti-Islamicist Iraqi regime. The anthrax mailings became a central element of their case given that the purity of the deadly spores could only have been produced by a regime possessing sophisticated biowarfare facilities. As Greenwald later noted with outrage, four separate official government sources also soon falsely informed *ABC News* that the anthrax had been weaponized with bentonite, regarded as proof that it was Iraqi in origin. So the weaponized anthrax represented the crucial evidence connecting the 9/11 Attacks with Saddam.

Unfortunately for those plotters, the FBI quickly determined that the anthrax was of the Ames strain rather than the type used by Iraq, and this pointed to the ultimate source being one of our own bioweapons facilities. MacQueen argues that the conspirators may have assumed that Ames was much more widely distributed internationally than it proved to be. So once their intended narrative of a foreign plot linked to Iraq had collapsed, they quickly shifted gears and began promoting the fallback theory of a lone wolf domestic terrorist, thereby deflecting attention away from any consideration of the sort of organized domestic conspiracy that might have eventually implicated them.

Based upon the facts presented by MacQueen, I would add one important caveat with which the author might or might not have agreed. He opens Chapter 6 by declaring his hypothesis that members of our own executive branch had carried out the anthrax attacks in accordance with their plan, and I support that theory. However, I think that this plot only involved certain elements of our government rather than its leadership as a whole. Later lawsuits revealed that George Bush, Dick Cheney, and other top White House officials had secretly begun taking Cipro immediately after September 11th, indicating that they believed they faced the personal threat of a large-scale anthrax attack rather than the tiny handful of false-flag letters that were actually sent out. I think this suggests that none of them were involved in the conspiracy and they were instead being manipulated by a few of their aides and advisors, just as I believe was the case with regard to the 9/11 Attacks themselves. This framework also helps to explain the contradictory claims and conflicting arguments that soon developed within the executive branch.

MacQueen had spent many years as a leading 9/11 researcher and his deep understanding of those issues allowed him to make this important case in merely a hundred-odd pages of text, perhaps lacking solid proof but in reasonably convincing fashion. His analysis successfully tied together many loose ends that would otherwise remain mysterious, while he also devoted a portion of his short book to sketching out some of the overwhelming evidence that the conventional 9/11 story itself was completely false. And in all fairness, I should mention that MacQueen sometimes drew upon the material in several of the other nine anthrax books that I had personally found much less useful.

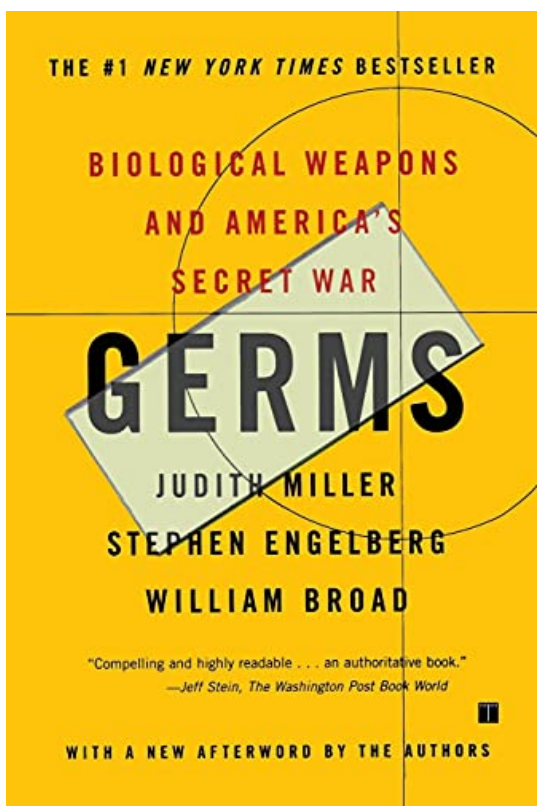
Proposing this elegant solution required an author of MacQueen's own background. There is an official story of the 9/11 Attacks and also an

official story of the anthrax mailings, and only someone who completely rejected both of those accounts could have argued that the two events were directly connected. A former UN Assistant Secretary-General urged all thinking Americans to read MacQueen's book, and I would strongly second that recommendation, given the importance of those events in shaping the history of the decades that followed.

## Judith Miller and *Germs*

My own decision to finally revisit the anthrax attacks after so many years was prompted by a particular book I noticed a couple of months ago at the local Palo Alto library sale.

In the aftermath of the 9/11 Attacks, Judith Miller, a longtime reporter at the *New York Times*, had published numerous front-page stories on Saddam's non-existent WMDs based upon information fed to her by her Neocon sources. Her falsehoods had played a hugely influential role in setting the political stage for our disastrous invasion, and she was forced to resign from the *Times* in 2005.



In a remarkably fortuitous example of timing, she had earlier been the

lead author of *Germs*, published with her *Times* colleagues Stephen Engelberg and William Broad, a book that was released on the very same day that the first anthrax victim was admitted to a hospital. Subtitled "Biological Weapons and America's Secret War" it purportedly represented a comprehensive history of biological warfare and the dangers America faced, with a major focus on the Iraqi program and its anthrax capabilities. Given such perfect timing, *Germs* quickly rocketed to the top of the best-seller lists in the aftermath of the 9/11 attacks and the anthrax mailings, further propelled when Miller herself received one of the anthrax hoax letters, containing harmless white powder. I'd always been aware of the major role her book had played in shaping the events of that period, so I purchased it for $0.50 and eventually read it, leading me to reexamine the anthrax story. Although the book obviously lacked any discussion of the anthrax letters themselves, I found it revealed much about the ideological biases of Miller and her co-authors.

Over the years I've noticed that respectable journalists writing books are reluctant to destroy their credibility by lying outright to their readers; instead, they prefer to mislead by selective omissions, carefully avoiding those items that would force them either to knowingly promote falsehoods or to present facts damaging to the intended sweep of their narrative. And this certainly seemed to be the case in Miller's very influential book.

Its account of America's own biological warfare programs and the Ft. Detrick facility correctly began with their establishment during World War II, and discussed America's plans for the possible use of anthrax against Germany and Japan as well as Japan's own biowarfare efforts during its invasion and occupation of China. But although the subsequent Korean War was mentioned, the narrative almost entirely skipped over that period, which I found extremely odd.

Surely the authors must have been aware of the very high-profile accusations of illegal "germ warfare" that were made against American forces during that conflict by Russia, China, and their international Communist bloc allies? These were the most serious biowarfare claims made anywhere in the world during the last eighty years, and prompted the establishment of an international commission of distinguished scientists, including Joseph Needham, one of Britain's most eminent scholars, which eventually published a long report declaring that the accusations were probably true. Admittedly, the American government and its allied media outlets always denied those claims and especially after the 1991 collapse of the Soviet Union, most American academics came to regard them as false. But as I pointed

out in an article two years ago, more recent evidence seems to show that the Communist charges had been correct:

- American Pravda: Waging Biological Warfare
  Ron Unz • ***The Unz Review*** • August 9, 2021 • 7,500 Words

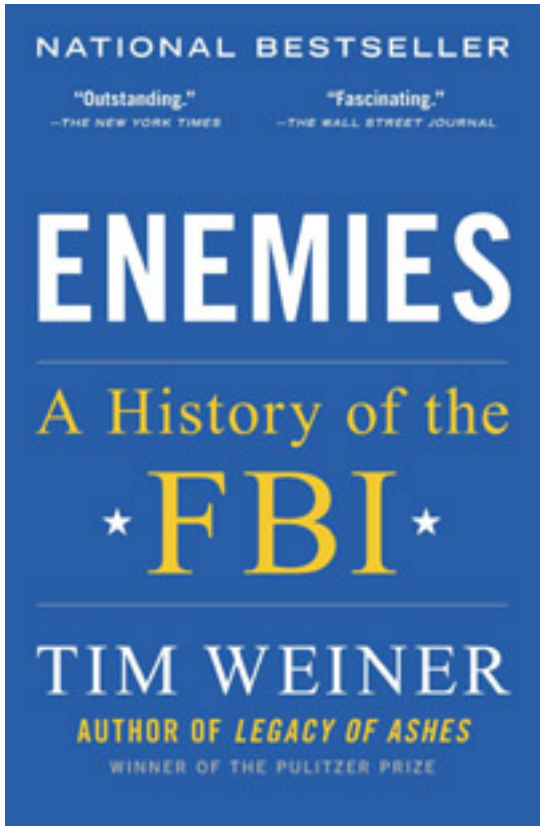
If Miller and her co-authors had mentioned those accusations only to dismiss them as debunked wartime propaganda, I would not have faulted them since that was a widely-held belief at the time the book was published in 2001. But to completely ignore the greatest international biowarfare controversy of the last three generations in a book focused on exactly that topic was inexcusable. Such total silence seems very suspicious to me and I wonder if the authors' extensive research had led them to conclude that the accusations had probably been true and the entire subject best avoided.

Similarly, the Middle East was a leading focus of the book's overall coverage and it repeatedly mentioned the possible development of ethnically-targeted bioweapons, a particularly alarming technological project. But just a couple of years earlier, the London *Sunday Times*, *Wired News*, and other international publications had broken the story of Israel's extensive research in exactly that area, with the Israelis working to develop ethnic bioweapons that would selectively target Arab populations. Yet the authors strangely chose to omit the only such real-life example that had reached the global headlines. Obviously, a book meant to concentrate American public fears upon the terrible threat of Iraq's biological warfare programs—which actually no longer existed at that point—would have lost much of its effectiveness if it had also included any mention of Israel's far more advanced capabilities in exactly that same area. Indeed, Israel was almost never mentioned anywhere in the text, a very strange omission given the heavy focus on the alleged biowarfare efforts of its regional adversaries such as Iraq and Iran.

While I have absolutely no reason to believe that Miller's book had been commissioned and funded by the Israeli Defense Ministry, I don't think the contents would have been all that different if such had actually been the case.

## Timothy Weiner and *Enemies: A History of the FBI*

Another book I read a month or two ago also contained certain extremely glaring omissions, including some that were directly relevant to the anthrax attacks.



In 2007, Pulitzer Prize-winning former *New York Times* reporter Timothy Weiner had published *Legacy of Ashes*, a widely-acclaimed history of the CIA, and in 2012, he followed it up with *Enemies: A History of the FBI*, running more than 500 pages and described as the first definitive history of that organization's intelligence operations. But although he provided a great deal of interesting material, I was less than impressed by the work, which struck me as something of an authorized account, showing signs of the careful trimming of a project produced along such lines.

Some of his early mistakes jumped out at me. He characterized FDR's Treasury Secretary Henry Morgenthau as a "sophisticated economist," when the latter was actually just a wealthy dilettante and gentleman-farmer, who had never graduated either high school or college and knew little of economics, obtaining his position primarily because he was FDR's friend and neighbor. Indeed, Morgenthau's total ignorance had left his powerful department in the hands of his subordinate, Harry Dexter White, a notorious Communist spy.

A page later, the author described famed aviator Charles Lindbergh as

“a potential Republican candidate for president in 1940,” a claim I’ve never seen made anywhere else, including in A. Scott Berg’s exhaustive biography. I suspect Weiner may have gotten the idea from Philip Roth’s alarmist 2004 novel *The Plot Against America*, which had similarly portrayed our greatest national hero as a secret Nazi.

Obviously, such errors were hardly central to Weiner’s subject, but they left me skeptical in accepting some of his far more important assertions. For example, these days it is very widely accepted that founding FBI Director J. Edgar Hoover lived his entire life as a deeply-closeted homosexual, with his long-time partner being Clyde Tolson, who also served as the FBI’s second-ranking official during Hoover’s half-century reign. Such factors would obviously have been very relevant to the Bureau’s operations, not least because syndicate boss Meyer Lansky had allegedly obtained hard proof of those secrets and used them for blackmail purposes; perhaps this explains why Hoover spent decades denying the existence of American organized crime and refusing to allow his FBI to combat it. Weiner attempts to casually debunk this established history in just a few paragraphs, suggesting it was mostly based upon malicious rumors spread by bureaucratic rivals and then emphasizing the statement of one of Hoover’s most loyal lieutenants that the accusations could not possibly have been true. Hoover ran the FBI in autocratic fashion for five decades and he was Weiner’s central figure, so the author hardly gave proper treatment to such a potentially explosive hidden factor influencing FBI policy during that entire period.

In his Afterword, Weiner explained that he heavily relied upon the copyrighted oral histories of the Society of Former Special Agents, which he cited with their permission, so perhaps use of that important resource had imposed constraints upon his treatment of certain delicate FBI topics.

Hoover died in 1972 but my doubts about the author’s candor obviously extended across the last one-third of the text, covering the three decades that followed, and I noticed certain absolutely glaring omissions during those years.

In 1996, TWA Flight 800 suddenly exploded in mid-air soon after taking off from JFK Airport in New York City, leading to widespread suspicions of a terrorist attack and prompting the largest, most comprehensive investigation in FBI history, an effort that involved 500 field agents. But as I explained in a 2016 article, the ultimate result was a notorious FBI cover-up. Weiner completely omitted all mention of that massive case from his lengthy FBI history.

- American Pravda: The Destruction of TWA Flight 800
  Ron Unz • ***The Unz Review*** • September 26, 2016 • 2,800 Words

A few years later, the FBI began its six-year investigation of the anthrax attacks, deploying resources completely eclipsing even that previous project. A 2010 *WSJ* column characterized that new FBI effort as "the largest inquest in its history, involving 9,000 interviews, 6,000 subpoenas, and the examination of tens of thousands of photocopiers, typewriters, computers and mailboxes," finally ending in 2008 when the Bureau declared Bruce Ivins to be the sole perpetrator and the case closed. Yet not a single word about these events appeared in Weiner's supposedly comprehensive history published several years later, with no mention of anthrax in his index.

So largest FBI investigation ever conducted was taking place exactly during the period that Weiner was producing his exhaustive volume on the history of that organization but he chose to completely exclude it from his coverage. The likely explanation is that he knew perfectly well that the FBI effort had ended in total failure with Ivins merely being an innocent scapegoat, but he was too heavily dependent upon the goodwill of his FBI sources to mention that fact. I think this example of "the Dog That Didn't Bark" strongly supports Ivins' innocence.

Meanwhile, in the immediate aftermath of the 9/11 Attacks themselves, the FBI had rounded up and arrested some 200 Mossad agents, many of them in the New York City area, including five who had been caught red-handed apparently celebrating the destruction of the WTC towers and taking souvenir photos of the burning buildings. Thus, the FBI had successfully broken the largest foreign spy ring ever found on American soil, yet not a word appeared anywhere in Weiner's FBI history, nor was Mossad even listed in his index. Once again, the reason for such strange silence is not too difficult to guess.

## Launching a Hundred Billion Dollar Biowarfare Industry

The story of our forgotten anthrax attacks of 2001 is really a quite remarkable one, possessing more strange twists and ironies than we would expect to find in any work of fiction.

Merely the first of these is that an event that had the greatest possible impact upon our society and world history has almost completely vanished from our national memory.

During the decades after World War II, our government had created the world's largest and most powerful biodefense infrastructure to protect our citizens from such deadly attack. Yet the only documented cases of American bioweapon deaths came in 2001 and resulted from the deadly anthrax spores produced in our own national laboratories, whether these had been deployed by Dr. Bruce Ivins or more likely someone else.

We soon discovered that the bioterrorism responsible for those American deaths and the resulting wave of national panic had actually been the home-grown product of our own biodefense industry, but our political response was to increase the funding for those same government biowarfare labs by ten- or twenty-fold, so that American spending on bioweapons eventually crossed the hundred-billion-dollar mark.

All of those facts are completely indisputable, but I think there may also be an additional twist.

It is obvious that the existence of a massive American bioweapons capability might produce dangerous temptations in the minds of some of our more reckless political leaders, and such temptations may have had disastrous consequences in 2019.

Over the last several years, I have published a long series of articles arguing that there is strong perhaps even overwhelming evidence that the global Covid outbreak was probably the unintended blowback from a botched American biowarfare attack against China (and Iran).

More than a million Americans died as a consequence, along with perhaps 26 million other deaths worldwide, and the lives of many billions were greatly disrupted, including those of our own entire population. So all of this massive death and devastation may have been the ultimate consequence of a handful of letters bearing $0.23 stamps that were mailed out in 2001.

# Israel, Gaza, and Broader Issues

***The Unz Review*** • October 23, 2023 • 11,000 Words

## A Sudden Attack by Hamas and Its Consequences

A couple of weeks ago, the smoldering political landscape of the Middle East suddenly exploded as the Hamas militants of Gaza launched a surprise attack against Israel, unprecedented in its size and success. News reports now place Israeli fatalities at around 1,400, more deaths in a single day than the country had ever suffered in any of its previous wars, and greater losses than in all of those conflicts combined since 1973, while as many as 200 Israelis were captured and taken back to Gaza as prisoners and hostages.

In recent years, Israel had focused upon technological solutions for its border defense, relying upon numerous sensors and remote-control machine-guns to guard the Gaza perimeter, but Hamas used small drones to quickly disable these and the signal-towers that controlled them. Meanwhile, discipline at the nearby IDF garrisons had apparently grown very lax with the sentries asleep or away from their posts, so the bases were easily overrun and the soldiers killed in their beds, by some accounts suffering up to 600 deaths in just a matter of hours, a tremendous military disaster.

The IDF had been widely regarded as one of the world's most formidable military organizations, while Hamas consisted of lightly-armed Palestinian militants lacking any heavy weaponry, so the very serious losses the former suffered at the hands of the latter constituted an enormous national humiliation.

Indeed, decades of boastful Israeli propaganda had inspired such an exaggerated sense of the invincibility of the IDF and its Mossad intelligence service that there were widespread conspiratorial claims all across the Internet, not least among the columnists and commenters of our own website, that the Israeli government must have deliberately allowed the attack to take place. It has long been known that the Israelis originally promoted Hamas as a means of dividing the Palestinians and weakening the PLO, so some even seized on that fact to argue that the Hamas attack had probably taken place under Israeli orders.

Although such conspiratorial beliefs were most common among sharp critics of Israel, they actually attained far broader acceptance. Charlie Kirk is the leader of a large pro-Israel conservative organization, and in an interview, he set forth exactly those same dark suspicions.

For many months, the Israeli government of Prime Minister Benjamin Netanyahu had been facing enormous public demonstrations by his

bitter political opponents, representing a historic division in his own society that was even verging on civil war. So according to this theory, Netanyahu had deliberately allowed that attack to take place, hoping to use it as his "Pearl Harbor" or "9/11" to solidify his own political position, perhaps even providing him an excuse to expel the Palestinians from Gaza and the West Bank, thereby achieving the political goal of the more extreme members of his coalition by expanding Israel's frontiers while permanently solving the festering "Palestinian problem."

Despite its apparent popularity, the likelihood of this scenario disintegrates upon any careful consideration. Israel probably suffered the worst one-day defeat in its national history, a strategic disaster. Even aside from the huge loss of life in such a small population, the tremendous Hamas success punctured the powerful myth of Israeli military strength, which for three generations has been the cornerstone of the country's national security strategy. Such heavy losses suggested that the IDF had become a paper-tiger, greatly amplifying the lesson of its 2006 military setbacks at the hands of Hezbollah in Lebanon. If poorly-armed Hamas militants could achieve such a serious blow, all of Israel's regional adversaries were surely emboldened, and this would have been obvious to any Israeli national security officials who might have considered such a gambit.

We should also remember that Israel had been on the very verge of achieving normalized relations with Saudi Arabia, the wealthiest and most influential Arab state, a prospect that has now completely vanished. Israeli leaders had been pursuing that particular objective for decades and it seems very unlikely that Israel's government would have sacrificed that opportunity by deliberately enabling a large Hamas attack.

But suppose that Netanyahu had actually been so politically desperate and so irrational that he had decided to allow a successful Hamas assault by standing down his own security defenses. How could he have possibly done so?

Aside from its regular army, Israel has three separate intelligence services, Mossad, Shin Bet, and Unit 8200, all of which tend to be rivals. So as former CIA Analyst Larry Johnson noted, Netanyahu would have needed to enlist the leadership of all three of those organizations in his treacherous plan to facilitate a successful Hamas attack, while making sure that none of the relevant rank-and-file officers disagreed and leaked the ultra-explosive story to the fiercely anti-Netanyahu media. This seems an impossibility.

Moreover, as already mentioned, Israeli society has recently been extremely divided, with the bulk of the nation's elites lined up against Netanyahu and trying to drive him from office. According to media reports, the leadership of Mossad was squarely in the anti-Netanyahu camp with claims that Mossad agents were even helping to orchestrate the huge public demonstrations demanding his resignation. Surely if they had gotten the slightest hint the Netanyahu was deliberately opening the country to a huge Hamas attack, they would have used that fact to destroy him.

Also, Netanyahu is running a coalition government, with many of his top ministers hating him and eager to undermine his reputation. Even his own lieutenants might welcome his fall so that they could replace him and rise to power and it's difficult to believe that so deadly a secret could have been kept in such a political snake-pit. And now that so many hundreds of Israeli civilians have been killed, a single outraged leaker could have Netanyahu and his fellow conspirators put on trial or even lynched. According to Seymour Hersh's Israeli sources, Netanyahu's long political career cannot possibly survive the aftermath of the military disaster his country has now suffered.

Reports that an Egyptian warning of a planned Hamas attack were ignored may or may not be a sign of negligence; perhaps numerous previous warnings along similar lines had always turned out to be false alarms. More serious are reports that Netanyahu had recently redeployed two of the three Israeli battalions based on the Gaza border to the West Bank in order to support Jewish settlers in their aggressive actions against the local Palestinians. But that seems more a sign of complacency and incompetence than treasonous plotting.

Under normal circumstances, the notion that the Hamas attack was an "inside job" facilitated by Israel's own government seems so totally absurd I would hardly have given it a single sentence. But with so many on the Internet promoting the idea, it was worth explaining some of the obvious flaws, not that this may do much good. Kevin Barrett is a Muslim convert who has spent decades as an active participant in the 9/11 Truth movement and embraced a very wide range of other conspiracy theories, but when he doubted that this one was correct, most of the commenters angrily disagreed with him, and I got the same reaction when I took a similar position.

Based upon my experience, I'd say that 90-95% of all the so-called "conspiracy theories" floating around on the Internet are false or at least unsubstantiated. But the remaining 5-10% still provide a shocking catalog of important exceptions, and when many individuals

first discover the reality of these, they often begin to gullibly accept all too many of the others as well.

Stunning military defeats naturally produce a wave of wild claims, and the theory that Netanyahu's government had deliberately allowed the disaster was hardly alone among these. Within days, the Internet and much of the media was awash with the particularly grotesque atrocity-tale that the Hamas fighters had beheaded 40 Israeli babies, an accusation heavily promoted by pro-Israel activists.

HORROR AT 'PURE EVIL BEHEADING OF BABIES'

This outrageous report had apparently originated with a particularly fanatic leader of Jewish settlers, no evidence was ever provided, and to its credit, the Israeli military refused to endorse the story. But nonetheless it still swept through social media and even reached the lips of our own befuddled President Joe Biden, who claimed to have seen the grisly photos before the White House "walked back" the story.

Mike Whitney published a good column summarizing the narrative arc of this debunked example of especially black propaganda:

- No, Hamas Did Not Behead 40 Babies at an Israeli Kibbutz Last Saturday
  Mike Whitney • ***The Unz Review*** • October 13, 2023 • 1,500 Words

While many Israeli civilians were certainly killed, I had been immediately skeptical of such extreme atrocity claims, whose huge distribution merely illustrated the overwhelming dominance that Israel and its partisans enjoyed over the Western media.

Around the same time I had come across a short interview of an Israeli woman with two young children who told a very different sort of story.  According to her, the Hamas militants who occupied her home for a couple of hours were quite respectful, even asking her permission to eat one of the bananas on her kitchen counter.  But such eyewitness accounts have received only an infinitesimal fraction of the attention given to those on the other side.

A similar but even more striking story came out in the radio interview of a Kibbutz survivor, who was one of about a dozen civilians taken prisoner by a group of Hamas militants. According to her, none of the captives were harmed and they were all treated “very humanely,” but many of them were later killed, probably by the Israeli forces that eventually arrived and engaged their Hamas captors in a fierce gun-battle. Questions are now being raised about exactly how many Israeli civilians died and who actually killed them.

In 1986, the Israeli government had adopted its notorious “Hannibal

Directive" requiring that any Israelis captured by Palestinians must either be rescued or killed to avoid allowing them to become future bargaining chips, so accounts like this raise the likelihood that many of the Israeli civilian victims actually died at the hands of their own troops. Indeed, the Hamas political leader claimed in an interview that his forces were not responsible for the civilian deaths, but instead blamed the Israeli military, an accusation supported by a growing number of eyewitness reports.

The outrageous hoax of 40 beheaded Israeli babies that swept across the Western media soon disappeared, supplanted by a far larger and more real catastrophe as a huge explosion on October 17th rocked the grounds of Gaza's largest Christian hospital. For days, the Israelis had demanded that the hospital be evacuated, underscoring that order by dropping several small bombs, but the staff refused to leave or drive away the many hundreds of desperate refugees sheltering in the vicinity.

Given these facts, few were surprised twenty minutes later when an official Israeli military spokesman took credit for the successful attack, which he claimed had killed a number of Hamas militants who had been using the nearby Palestinian civilians as "human shields." The Gaza Health Ministry similarly blamed Israel.

However, reports then began appearing of the enormous number of civilian casualties—perhaps as many as 500 dead—along with

devastating images of the scores or hundreds of bodies, many of them young children, sparking enormous outrage across most of the world, especially in the Middle East.  So the Israelis recognized the looming PR disaster, and quickly deleted their Tweet, while also beginning to argue that an errant Palestinian rocket had been responsible, soon producing a very doubtful alleged recording of two Hamas militants acknowledging that the Israelis were innocent.

In lock-step fashion, a spokesman for America's own National Security

Council declared that the Israelis were correct and the Palestinians had accidentally massacred their own people, and Biden took the same position in his Oval Office address. With the Israeli and American governments on the same page, nearly the entire Western mainstream media reversed itself and eagerly took up this new version of reality, just as a year earlier they had all declared that the Russians had destroyed their own Nord Stream pipelines, with the news headlines and several *New York Times* columnists leading the way. Among the latter, Michelle Goldberg courageously explained that the Israelis had notoriously lied about numerous far smaller atrocities over the years, which was why she hadn't initially believed them, but with the Biden Administration now supporting their story, perhaps this time it was true. My impression is that outside the immediate reach of the Western media, almost everyone in the world was convinced that Israel was responsible.

I'm hardly a military expert, but I certainly shared that conclusion. Videos of the explosive strike have been widely distributed on Twitter and elsewhere, and it sounded absolutely nothing like the small home-made rockets fired by Gaza militants, while the scenes of massive devastation are enormous compared to the small explosives used by Hamas and its allies.

Meanwhile, Larry Johnson, a former CIA analyst with considerable military expertise, spent several days carefully reviewing the evidence and reached a very similar verdict.

Over the last twenty years, Gaza militants have fired tens of thousands of rockets into Israel, only inflicting one or two deaths each year, so it's difficult to believe that a single one of those rockets could have now killed hundreds.

Chris Hedges, a Pulitzer Prize-winning journalist who had spent fifteen years at the *New York Times* and served as its Middle East Bureau Chief, published a scathing column condemning Israel for its long history of routine deceit.

- Israel's Culture of Deceit
  Chris Hedges • ***MintPress News*** • October 19, 2023 • 2,400 Words

Indeed, just a couple of days later, an Israeli airstrike hit Gaza's oldest Christian church, killing at least sixteen people, including several relatives of former U.S. Congressman Justin Amash, so there's no particular reason to think they would have been reluctant to target the Christian hospital.

## The Surprising Elements of Traditional Judaism

This deadly attack upon the largest Christian hospital in Gaza resulted in the apparent deaths of hundreds of the pitiful Palestinian refugees sheltering there, and stands as a remarkable atrocity, a blatant war-crime whose egregious nature was only magnified by Israel's immediate efforts to dishonestly blame the devastation upon the Palestinians themselves.

Unfortunately, such a pattern of behavior is hardly unusual in the history of the Jewish State, as I first began to recognize more than forty years ago. I described those circumstances at the beginning of a long 2018 article:

> About a decade ago, I happened to be talking with an eminent academic scholar who had become known for his sharp criticism of Israeli policies in the Middle East and America's strong support for them. I mentioned that I myself had come to very similar conclusions some time before, and he asked when that had happened. I told him it had been in 1982, and I think he found my answer quite surprising. I got the sense that date was decades earlier than would have been given by almost anyone else he knew.
>
> Sometimes it is quite difficult to pinpoint when one's world view on a contentious topic undergoes sharp transformation, but at other times it is quite easy. My own perceptions of the Middle East conflict drastically shifted during Fall 1982, and they have subsequently changed only to a far smaller extent. As some might remember, that period marked the first Israeli invasion of Lebanon, and culminated in the notorious Sabra-Shatila Massacre during which hundreds or even thousands of Palestinians were slaughtered in their refugee camps.

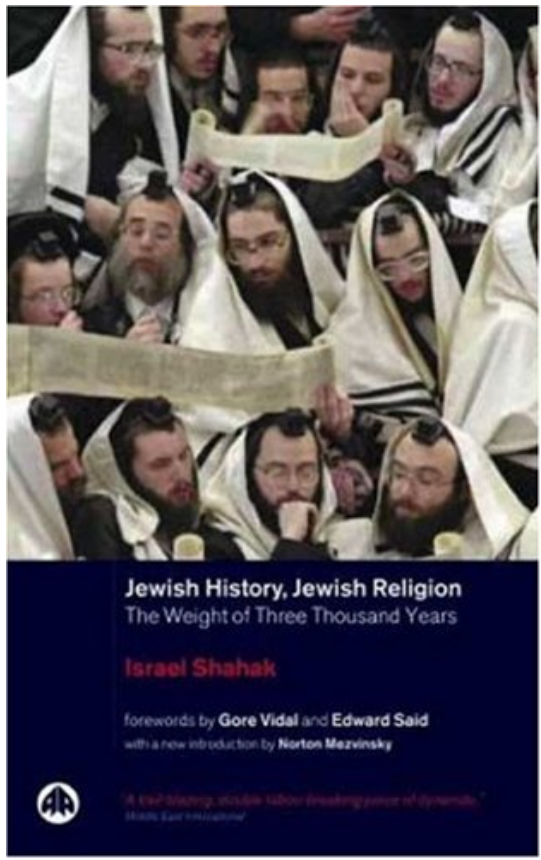
I went on to explain that around that same time I first became aware of the late Israel Shahak, an especially outspoken Israeli academic whose very harsh remarks regarding the behavior of his own government sometimes appeared in my mainstream publications such

as *The Economist* and *The New York Times*. Given that his views and statements totally diverged from everything else I read, at the time I had always regarded him as a marginal and eccentric ideological extremist.

Following the Gulf War and the Oslo Accords of the early 1990s, I began paying much less attention to the Middle East, but the 9/11 Attacks and the Iraq War eventually returned that region to center-stage. I then discovered that prior to his death in 2001, Shahak had published several short books on Judaism and Israel, which I eventually ordered and read. I explained how his works had an absolutely transformative impact upon my understanding of so many crucial issues.

> My first surprise was that Shahak's writings included introductions or glowing blurbs by some of America's most prominent public intellectuals, including Christopher Hitchens, Gore Vidal, Noam Chomsky, and Edward Said. Praise also came from quite respectable publications such as *The London Review of Books*, *Middle East International*, and *Catholic New Times* while Allan Brownfeld of *The American Council for Judaism* had published a very long and laudatory obituary. And I discovered that Shahak's background was very different than I had always imagined. He had spent many years as an award-winning Chemistry professor at Hebrew University, and was actually anything but a Communist. Whereas for decades, Israel's ruling political parties had been Socialist or Marxist, his personal doubts about Socialism had left him politically in the wilderness, while his relationship with Israel's tiny Communist Party was solely because they were the only group willing to stand up for the basic human rights issues that were his own central focus. My casual assumptions about his views and background had been entirely in error.
>
> Once I actually began reading his books, and considering his claims, my shock increased fifty-fold. Throughout my entire life, there have been very, very few times I have ever been so totally astonished as I was after I digested *Jewish History, Jewish Religion: The Weight of Three Thousand Years*, whose text runs barely a hundred pages. In fact, despite his solid background in the academic sciences and the glowing endorsements provided by prominent figures, I found it quite difficult to accept the reality of what I was reading. As a consequence, I paid a considerable sum to a young graduate student I knew, tasking him to verify the claims in Shahak's books, and as far as he could tell, all of the

hundreds of references he checked seemed to be accurate or at least found in other sources.



Jewish History, Jewish Religion
The Weight of Three Thousand Years
Israel Shahak
forewords by Gore Vidal and Edward Said
with a new introduction by Norton Mezvinsky

Even with all of that due diligence, I must emphasize that I cannot directly vouch for Shahak's claims about Judaism. My own knowledge of that religion is absolutely negligible, mostly being limited to my childhood, when my grandmother occasionally managed to drag me down to services at the local synagogue, where I was seated among a mass of elderly men praying and chanting in some strange language while wearing various ritualistic cloths and religious talismans, an experience that I always found much less enjoyable than my usual Saturday morning cartoons.

Although Shahak's books are quite short, they contain such a density of astonishing material, it would take many, many thousands of words to begin to summarize them. Almost everything I had known—or thought I had known—about the religion of Judaism, at least in its zealously Orthodox traditional

form, was utterly wrong.

If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.

Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver, it would be perfectly fine and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.

As a further illustration of the seething hatred traditional Judaism radiates towards all those of a different background, saving the life of a non-Jew is generally considered improper or even prohibited, and taking any such action on the Sabbath would be an absolute violation of religious edict. Such dogmas are certainly ironic given the widespread presence of Jews in the medical profession during recent centuries, but they came to the fore in Israel when a religiously-minded military doctor took them to heart and his position was supported by the country's highest religious authorities.

And while religious Judaism has a decidedly negative view towards all non-Jews, Christianity in particular is regarded as a total abomination, which must be wiped from the face of the earth.

Whereas pious Muslims consider Jesus as the holy prophet of God and Muhammed's immediate predecessor, according to the Jewish Talmud, Jesus is perhaps the vilest being who ever lived,

condemned to spend eternity in the bottommost pit of Hell, immersed in a boiling vat of excrement. Religious Jews regard the Muslim Quran as just another book, though a totally mistaken one, but the Christian Bible represents purest evil, and if circumstances permit, burning Bibles is a very praiseworthy act. Pious Jews are also enjoined to always spit three times at any cross or church they encounter, and direct a curse at all Christian cemeteries. Indeed, many deeply religious Jews utter a prayer each and every day for the immediate extermination of all Christians.

Over the years prominent Israeli rabbis have sometimes publicly debated whether Jewish power has now become sufficiently great that all the Christian churches of Jerusalem, Bethleham, and other nearby areas can finally be destroyed, and the entire Holy Land completely cleansed of all traces of its Christian contamination. Some have taken this position, but most have urged prudence, arguing that Jews needed to gain some additional strength before they should take such a risky step. These days, many tens of millions of zealous Christians and especially Christian Zionists are enthusiastic advocates for Jews, Judaism, and Israel, and I strongly suspect that at least some of that enthusiasm is based upon ignorance.

For the last two thousand years, Jews have almost invariably existed as small, relatively weak minorities living in the lands of others, whether Christian or Muslim, so a religious doctrine so unswervingly hostile to outsiders has naturally presented considerable obstacles for peaceful co-existence. The solution to this dilemma has been based on the divine mandate to preserve Jewish life and well-being above all else, superseding almost all other religious considerations. Thus, if any of the behaviors discussed above are considered likely to stir up resentment from powerful Gentile groups and put Jews at risk, they must be avoided.

If the Gentile population became aware of these Jewish religious beliefs and the behaviors they promote, major problems for Jews might develop, so an elaborate methodology of subterfuge, concealment, and dissimulation has come into being over the many centuries to minimize this possibility, especially including the mistranslation of sacred texts or the complete exclusion of crucial sections. Meanwhile, the traditional penalty for any Jew who “informs” to the authorities on any matter regarding the Jewish community has always been death, often preceded by

hideous torture.

Much of this dishonesty obviously continues down to recent times since it seems very unlikely that Jewish rabbis, except perhaps for those of the most *avant garde* disposition, would remain totally unaware of the fundamental tenets of the religion that they claim to lead, and Shahak is scathing toward their apparent self-serving hypocrisy, especially those who publicly express strongly liberal views. For example, according to mainstream Talmudic doctrine, black Africans are traditionally placed somewhere between people and monkeys in their intrinsic nature, and surely all rabbis, even liberal ones, would be aware of this religious dogma. But Shahak notes that the numerous American rabbis who so eagerly worked with Martin Luther King, Jr. and other black Civil Rights leaders during the 1950s and 1960s strictly concealed their religious beliefs while denouncing American society for its cruel racism, presumably seeking to achieve a political *quid pro quo* beneficial to Jewish interests with America's substantial black population.

Shahak also emphasizes the utterly totalitarian nature of traditional Jewish society, in which rabbis held the power of life and death over their congregants, and often sought to punish ideological deviation or heresy using those means. They were often outraged that this became difficult as states grew stronger and increasingly prohibited such private executions. Liberalizing rabbis were sometimes murdered and Baruch Spinoza, the famous Jewish philosopher of the Age of Reason, only survived because the Dutch authorities refused to allow his fellow Jews to kill him.

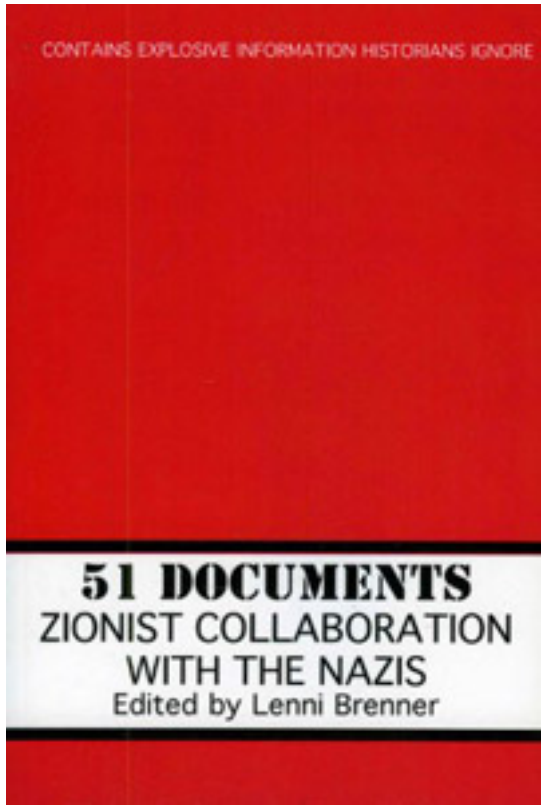
Given the complexity and exceptionally controversial nature of this subject matter, I would urge readers who find this topic of interest to spend three or four hours reading Shahak's very short book, and then decide for themselves whether his claims seem plausible and whether I may have inadvertently misunderstood them. Aside from the copies on Amazon, the work may also be found at Archive.org and a very convenient HTML copy is also freely available on the Internet.

My encounter a decade ago with Shahak's candid description of the true doctrines of traditional Judaism was certainly one of the most world-altering revelations of my entire life. But as I gradually digested the full implications, all sorts of puzzles and

disconnected facts suddenly became much more clear. There were also some remarkable ironies, and not long afterward I joked to a (Jewish) friend of mine that I'd suddenly discovered that Nazism could best be described as "Judaism for Wimps" or perhaps Judaism as practiced by Mother Teresa of Calcutta.

There may actually be a deeper historical truth behind that irony. I think I've read here and there that some scholars believe that Hitler may have modeled certain aspects of his racially-focused National Socialist doctrine upon the Jewish example, which really makes perfect sense. After all, he saw that despite their small numbers Jews had gained enormous power in the Soviet Union, Weimar Germany, and numerous other countries throughout Europe, partly due to their extremely strong ethnic cohesion, and he probably reasoned that his own Germanic people, being far greater in numbers and historical achievements could do even better if they adopted similar practices.

It's also interesting to note that quite a number of the leading racialist pioneers of 19th century Europe came from a particular ethnic background. For example, my history books had always disapprovingly mentioned Germany's Max Nordau and Italy's Cesare Lombroso as two of the founding figures of European racism and eugenics theories, but it was only very recently that I discovered that Nordau had also been the joint founder with Theodor Herzl of the world Zionist movement, while his major racialist treatise *Degeneration*, was dedicated to Lombroso, his Jewish mentor.



Even as late as the 1930s and afterward, international Zionist groups closely cooperated with the Third Reich on their economic projects, and during the world war itself one of the smaller rightwing factions, led by future Israeli Prime Minister Yizhak Shamir, actually offered a military alliance to the Axis Powers, denouncing the decadent Western democracies and hoping to collaborate against their mutual British enemies. *The Transfer Agreement* by Edwin Black, *51 Documents* by Lenni Brenner, and other writings have documented all these facts in detail, though for obvious reasons they have generally been ignored or mischaracterized by most of our media outlets.

Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming majority of Jewish adults had Orthodox grand-

parents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of "Love Thy Neighbor" may or may not be workable in practice, but a religion based upon "Hate Thy Neighbor" might have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

## Understanding Anti-Semitism

As might be expected, the extremely hostile and exclusionary aspects of the traditional Jewish religion often led to fraught relations between small Jewish minorities and the large Gentile populations that hosted them. These days, such resulting conflicts are often explained by "anti-Semitism," a descriptive term first coined in the late nineteenth century that has gradually been transformed into an exceptionally powerful accusation in today's Western world.

A couple of weeks after my article exploring the true tenets of traditional Judaism, I published another major piece attempting to carefully analyze the phenomenon of anti-Semitism, heavily relying upon the important books of Prof. Albert S. Lindemann, an eminent academic scholar.

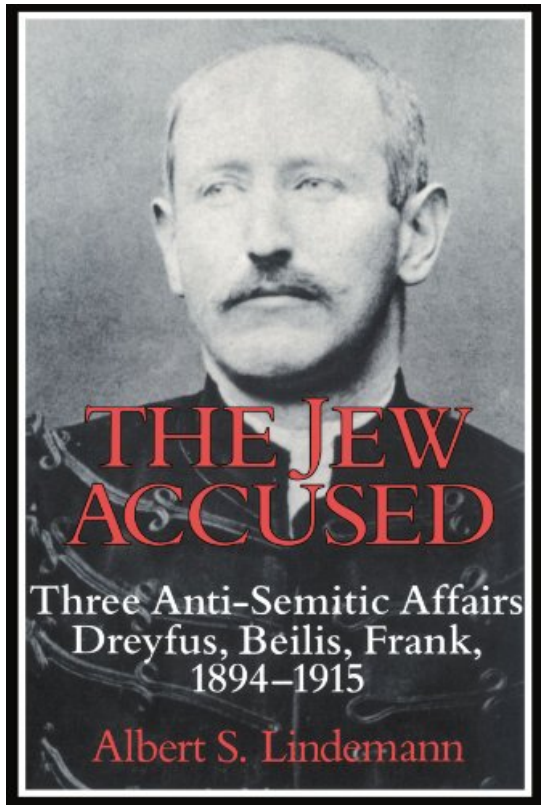
> All of us obtain our knowledge of the world by two different channels. Some things we discover from our own personal experiences and the direct evidence of our senses, but most information comes to us via external sources such as books and the media, and a crisis may develop when we discover that these two pathways are in sharp conflict. The official media of the old USSR used to endlessly trumpet the tremendous achievements of its collectivized agricultural system, but when citizens noticed that there was never any meat in their shops, "Pravda" became a watchword for "Lies" rather than "Truth."

Now consider the notion of "anti-Semitism." Google searches for that word and its close variants reveal over 24 million hits, and over the years I've surely seen that term tens of thousands of times in my books and newspapers, and heard it endlessly reported in my electronic media and entertainment. But thinking it over, I'm not sure I can ever recall a single real-life instance that I've personally encountered, nor have I heard of almost any such cases from my friends or acquaintances. Indeed, the only persons I've ever come across making such claims were individuals who bore unmistakable signs of serious psychological imbalance. When the daily newspapers are brimming with lurid tales of hideous demons walking among us and attacking people on every street corner, but you yourself have never actually seen one, you may gradually grow suspicious.

Over the years some of my own research has uncovered a sharp contrast between image and reality. As recently as the late 1990s, leading mainstream media outlets such as *The New York Times* were still denouncing a top Ivy League school such as Princeton for the supposed anti-Semitism of its college admissions policy, but a few years ago when I carefully investigated that issue in quantitative terms for my lengthy Meritocracy analysis I was very surprised to reach a polar-opposite conclusion. According to the best available evidence, white Gentiles were over 90% less likely to be enrolled at Harvard and the other Ivies than were Jews of similar academic performance, a truly remarkable finding. If the situation had been reversed and Jews were 90% less likely to be found at Harvard than seemed warranted by their test scores, surely that fact would be endlessly cited as the absolute smoking-gun proof of horrendous anti-Semitism in present-day America.

It has also become apparent that a considerable fraction of what passes for "anti-Semitism" these days seems to stretch that term beyond all recognition. A few weeks ago an unknown 28-year-old Democratic Socialist named Alexandria Ocasio-Cortez scored a stunning upset primary victory over a top House Democrat in New York City, and naturally received a blizzard of media coverage as a result. However, when it came out that she had denounced the Israeli government for its recent massacre of over 140 unarmed Palestinian protesters in Gaza, cries of "anti-Semite" soon appeared, and according to Google there are now over 180,000 such hits combining her name and that harsh accusatory term. Similarly, just a few days ago the *New York Times* ran a major story reporting that all of Britain's Jewish newspapers had issued an "unprecedented" denunciation of Jeremy Corbyn's

Labour Party, describing it as an “existential threat” to the Jewish community for the anti-Semitism it was fostering; but this apparently amounted to nothing more than its willingness to sharply criticize the Israeli government for its long mistreatment of the Palestinians.

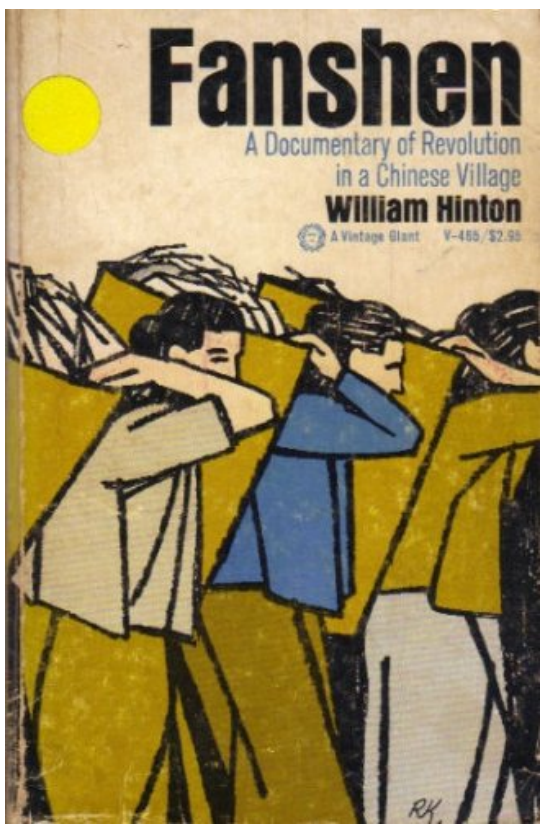


In 1991 Cambridge University Press published *The Jew Accused* by Albert Lindemann, a noted scholar of European ideological movements, and his book focused on exactly that era and those sorts of incidents. Although the text is quite short, running less than 300 pages, Lindemann built his discussion upon a huge foundation of secondary literature, with his footnotes drawn from the 200 works included in his extensive bibliography. As far as I could tell, he seems a very scrupulous scholar, generally providing the multiple, often conflicting accounts of a given incident, and coming to his own conclusions with considerable hesitation.

As Lindemann candidly describes the tension between Russia’s very rapidly growing Jewish population and its governing authorities, he cannot avoid mentioning the notorious Jewish

reputation for bribery, corruption, and general dishonesty, with numerous figures of all political backgrounds noting that the remarkable Jewish propensity to commit perjury in the courtroom led to severe problems in the effective administration of justice. The eminent American sociologist E.A. Ross, writing in 1913, characterized the regular behavior of Eastern European Jews in very similar terms.

The remarkable ferocity with which some Jewish writers attacked Lindemann's meticulous attempt to provide an accurate history of anti-Semitism may carry more significance than merely an exchange of angry words in low-circulation academic publications. If our mainstream media shapes our reality, scholarly books and articles based upon them tend to set the contours of that media coverage. And the ability of a relatively small number of agitated and energetic Jews to police the acceptable boundaries of historical narratives may have enormous consequences for our larger society, deterring scholars from objectively reporting historical facts and preventing students from discovering them.



The undeniable truth is that for many centuries Jews usually constituted a wealthy and privileged segment of the population in nearly all the European countries in which they resided, and quite frequently they based their livelihood upon the heavy exploitation of a downtrodden peasantry. Even without any differences in ethnicity, language, or religion, such conditions almost invariably provoke hostility. The victory of Mao's Communist forces in China was quickly followed by the brutal massacre of a million or more Han Chinese landlords by the Han Chinese poor peasants who regarded them as cruel oppressors, with William Hinton's classic *Fanshen* describing the unfortunate history that unfolded in one particular village. When similar circumstances led to violent clashes in Eastern Europe between Slavs and Jews, does it really make logical sense to employ a specialized term such as "anti-Semitism" to describe that situation?

Furthermore, some of the material presented in Lindemann's rather innocuous text might also lead to potentially threatening ideas. Consider, for example, the notorious *Protocols of the Learned Elders of Zion*, almost certainly fictional, but hugely popular and influential during the years following World War I and the Bolshevik Revolution. The fall of so many longstanding Gentile dynasties and their replacement by new regimes such as Soviet Russia and Weimar Germany, which were heavily dominated by their tiny Jewish minorities, quite naturally fed suspicions of a worldwide Jewish plot, as did the widely discussed role of Jewish international bankers in producing those political outcomes.

Over the decades, there has been much speculation about the possible inspiration for the *Protocols*, but although Lindemann makes absolutely no reference to that document, he does provide a very intriguing possible candidate. Jewish-born British Prime Minister Benjamin Disraeli certainly ranked as one of the most influential figures of the late 19th century, and in his novel *Coningsby*, he has the character representing Lord Lionel Rothschild boast about the existence of a vast and secret network of powerful international Jews, who stand near the head of almost every major nation, quietly controlling their governments from behind the scenes. If one of the world's most politically well-connected Jews eagerly promoted such notions, was Henry Ford really so unreasonable in doing the same?

Lindemann also notes Disraeli's focus on the extreme importance

of race and racial origins, a central aspect of traditional Jewish religious doctrine. He reasonably suggests that this must surely have had a huge influence upon the rise of those political ideas, given that Disraeli's public profile and stature were so much greater than the mere writers or activists whom our history books usually place at center stage. In fact, Houston Stewart Chamberlain, a leading racial theorist, actually cited Disraeli as a key source for his ideas. Jewish intellectuals such as Max Nordau and Cesare Lombroso are already widely recognized as leading figures in the rise of the racial science of that era, but Disraeli's under-appreciated role may have actually been far greater. The deep Jewish roots of European racialist movements are hardly something that many present-day Jews would want widely known.

These important examples may help to explain the puzzling contrast between the behavior of Jews in the aggregate and Jews as individuals. Observers have noticed that even fairly small Jewish minorities may often have a major impact upon the far larger societies that host them. But on the other hand, in my experience at least, a large majority of individual Jews do not seem all that different in their personalities or behavior than their non-Jewish counterparts. So how does a community whose individual mean is not so unusual generate what seems to be such a striking difference in collective behavior? I think the answer may involve the existence of information choke-points, and the role of relatively small numbers of particularly zealous and agitated Jews in influencing and controlling these.

We live our lives constantly immersed in media narratives, and these allow us to decide the rights and wrongs of a situation. The vast majority of people, Jew and Gentile alike, are far more likely to take strong action if they are convinced that their cause is a just one. This is obviously the basis for war-time propaganda.

Now suppose that a relatively small number of zealous Jewish partisans are known to always attack and denounce journalists or authors who accurately describe Jewish misbehavior. Over time, this ongoing campaign of intimidation may cause many important facts to be left on the cutting-room floor, or even gradually expel from mainstream respectability those writers who refuse to conform to such pressures. Meanwhile, similar small numbers of Jewish partisans frequently exaggerate the misdeeds committed against Jews, sometimes piling their exaggerations upon past exaggerations already produced by a previous round of such

zealots.

Eventually, these two combined trends may take a complex and possibly very mixed historical record and transform it into a simple morality-play, with innocent Jews tremendously injured by vicious Jew-haters. And as this morality-play becomes established it deepens the subsequent intensity of other Jewish-activists, who redouble their demands that the media "stop vilifying Jews" and covering up the supposed evils inflicted upon them. An unfortunate cycle of distortion following exaggeration following distortion can eventually produce a widely accepted historical account that bears little resemblance to the reality of what actually happened.

So as a result, the vast majority of quite ordinary Jews, who would normally behave in quite ordinary ways, are misled by this largely fictional history, and rather understandably become greatly outraged at all the horrible things that had been done to their suffering people, some of which are true and some of which are not, while remaining completely ignorant of the other side of the ledger.

Furthermore, this situation is exacerbated by the common tendency of Jews to "cluster" together, perhaps representing just one or two percent of the total population, but often constituting 20% or 40% or 60% of their immediate peer-group, especially in certain professions. Under such conditions, the ideas or emotional agitation of some Jews probably permeates others around them, often provoking additional waves of indignation.

As a rough analogy, a small quantity of uranium is relatively inert and harmless, and entirely so if distributed within low-density ore. But if a significant quantity of weapons-grade uranium is sufficiently compressed, then the neutrons released by fissioning atoms will quickly cause additional atoms to undergo fission, with the ultimate result of that critical chain-reaction being a nuclear explosion. In similar fashion, even a highly agitated Jew may have no negative impact, but if the collection of such agitated Jews becomes too numerous and clusters together too closely, they may work each other into a terrible frenzy, perhaps with disastrous consequences both for themselves and for their larger society. This is especially true if those agitated Jews begin to dominate certain key nodes of top-level control, such as the central political or media organs of a society.

Whereas most living organisms exist solely in physical reality, human beings also occupy an ideational space, with the interaction of human consciousness and perceived reality playing a major role in shaping behavior. Just as the pheromones released by mammals or insects can drastically affect the reactions of their family members or nest-mates, the ideas secreted by individuals or the media-emitters of a society can have an enormous impact upon their fellows.

A cohesive, organized group generally possesses huge advantages over a teeming mass of atomized individuals, much like a disciplined Macedonian Phalanx could easily defeat a vastly larger body of disorganized infantry. Many years ago, on some website somewhere I came across a very insightful comment regarding the obvious connection between "anti-Semitism" and "racism," which our mainstream media organs identify as two of the world's greatest evils. Under this analysis, "anti-Semitism" represents the tendency to criticize or resist Jewish social cohesion, while "racism" represents the attempt of white Gentiles to maintain a similar social cohesion of their own. To the extent that the ideological emanations from our centralized media organs serve to strengthen and protect Jewish cohesion while attacking and dissolving any similar cohesion on the part of their Gentile counterparts, the former will obviously gain enormous advantages in resource-competition against the latter.

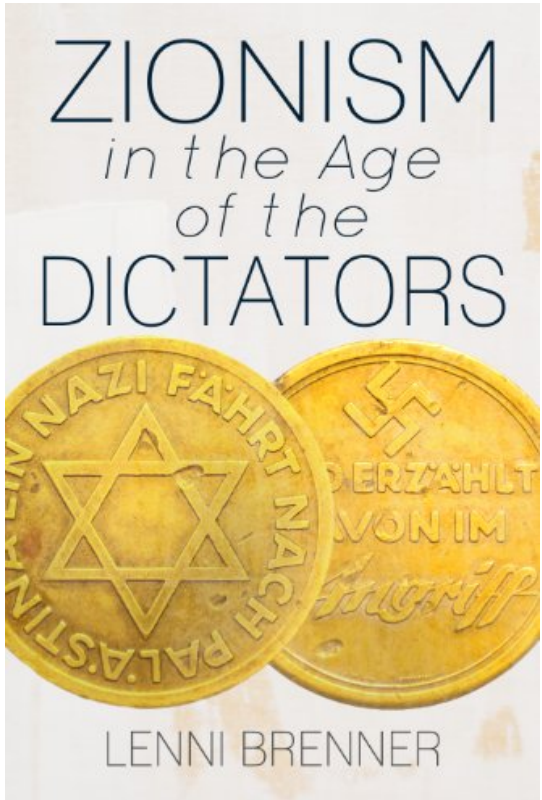
## The Hidden History of Zionism and Nazi Germany

Today most Westerners would automatically point to Adolf Hitler's Nazi Germany as representing the most extreme and murderous example of anti-Semitism in modern times. But as I discussed in a long article published a week later, the true history of that era was actually far more complex than most might suspect, especially with regard to the nascent Zionist movement.

Forty years ago the *New York Times* and other mainstream newspapers had published some astonishing revelations regarding the wartime activities of Yitzhak Shamir, who was then serving as Israel's Prime Minister.

Apparently, during the late 1930s, Shamir and his small Zionist

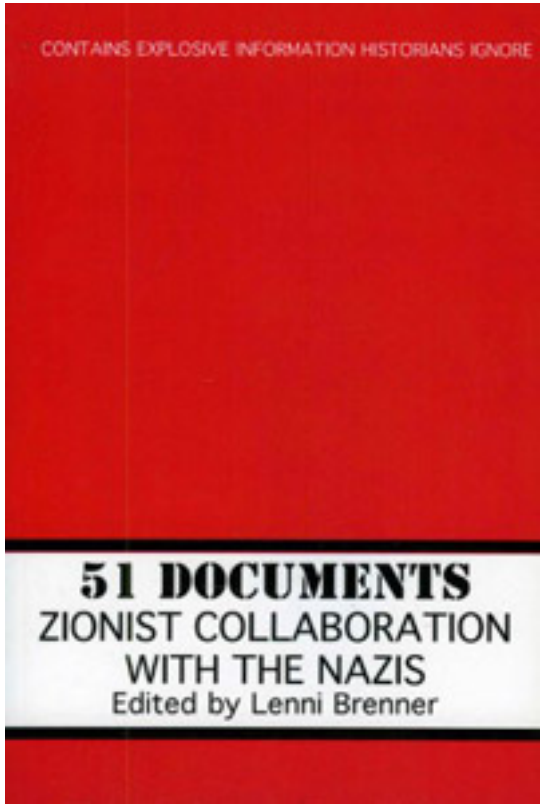
faction had become great admirers of the Italian Fascists and German Nazis, and after World War II broke out, they had made repeated attempts to contact Mussolini and the German leadership in 1940 and 1941, hoping to enlist in the Axis Powers as their Palestine affiliate, and undertake a campaign of attacks and espionage against the local British forces, then share in the political booty after Hitler's inevitable triumph.



Among other things, there were long excerpts from the official letters sent to Mussolini ferociously denouncing the "decadent" democratic systems of Britain and France that he was opposing, and assuring *Il Duce* that such ridiculous political notions would have no future place in the totalitarian Jewish client state they hoped to establish under his auspices in Palestine.

As it happens, both Germany and Italy were preoccupied with larger geopolitical issues at the time, and given the small size of Shamir's Zionist faction, not much seems to have ever come of those efforts. But the idea of the sitting Prime Minister of the Jewish State having spent his early wartime years as an unrequited Nazi ally was certainly something that sticks in one's

mind, not quite conforming to the traditional narrative of that era which I had always accepted.



Most remarkably, the revelation of Shamir's pro-Axis past seems to have had only a relatively minor impact upon his political standing within Israeli society. I would think that any American political figure found to have supported a military alliance with Nazi Germany during the Second World War would have had a very difficult time surviving the resulting political scandal, and the same would surely be true for politicians in Britain, France, or most other western nations. But although there was certainly some embarrassment in the Israeli press, especially after the shocking story reached the international headlines, apparently most Israelis took the whole matter in stride, and Shamir stayed in office for another year, then later served a second, much longer term as Prime Minister during 1986-1992. The Jews of Israel apparently regarded Nazi Germany quite differently than did most Americans, let alone most American Jews.

These remarkable historical disclosures had been the product of extensive research by Lenni Brenner, an anti-Zionist of the Trotskyite

persuasion and Jewish origins, which he had published in his 1983 book *Zionism in the Age of the Dictators*, as well as his later companion volume, *51 Documents: Zionist Collaboration with the Nazis*.

> Among other things, Brenner provides considerable evidence that the larger and somewhat more mainstream right-wing Zionist faction later led by future Israeli Prime Minister Menachem Begin was almost invariably regarded as a Fascist movement during the 1930s, even apart from its warm admiration for Mussolini's Italian regime. This was hardly such a dark secret in that period given that its main Palestine newspaper carried a regular column by a top ideological leader entitled "Diary of a Fascist." During one of the major international Zionist conferences, factional leader Vladimir Jabotinsky entered the hall with his brown-shirted followers in full military formation, leading the chair to ban the wearing of uniforms in order to avoid a riot, and his faction was soon defeated politically and eventually expelled from the Zionist umbrella organization. This major setback was largely due to the widespread hostility the group had aroused after two of its members were arrested by British police for the recent assassination of Chaim Arlosoroff, one of the highest-ranking Zionist officials based in Palestine.
>
> Indeed, the inclination of the more right-wing Zionist factions toward assassination, terrorism, and other forms of essentially criminal behavior was really quite remarkable. For example, in 1943 Shamir had arranged the assassination of his factional rival, a year after the two men had escaped together from imprisonment for a bank robbery in which bystanders had been killed, and he claimed he had acted to avert the planned assassination of David Ben-Gurion, the top Zionist leader and Israel's future founding-premier. Shamir and his faction certainly continued this sort of behavior into the 1940s, successfully assassinating Lord Moyne, the British Minister for the Middle East, and Count Folke Bernadotte, the UN Peace Negotiator, though they failed in their other attempts to kill American President Harry Truman and British Foreign Minister Ernest Bevin, and their plans to assassinate Winston Churchill apparently never moved past the discussion stage. His group also pioneered the use of terrorist car-bombs and other explosive attacks against innocent civilian targets, all long before any Arabs or Muslims had ever thought of using similar tactics; and Begin's larger and more "moderate" Zionist faction did much the same. Given that background, it was hardly surprising that Shamir later served as director of assassinations at the Israeli Mossad during 1955-1965,

so if the Mossad did indeed play a major role in the assassination of President John F. Kennedy, he was very likely involved.

The cover of the 2014 paperback edition of Brenner's book displays the commemorative medal struck by Nazi Germany to mark its Zionist alliance, with a Star-of-David on the front face and a Swastika on the obverse. But oddly enough, this symbolic medallion actually had absolutely no connection with the unsuccessful attempts by Shamir's small faction to arrange a Nazi military alliance during World War II.

Although the Germans paid little attention to the entreaties of that minor organization, the far larger and more influential mainstream Zionist movement of Chaim Weizmann and David Ben-Gurion was something else entirely. And during most of the 1930s, these other Zionists had formed an important economic partnership with Nazi Germany, based upon an obvious commonality of interests. After all, Hitler regarded Germany's one percent Jewish population as a disruptive and potentially dangerous element which he wanted gone, and the Middle East seemed as good a destination for them as any other. Meanwhile, the Zionists had very similar objectives, and the creation of their new national homeland in Palestine obviously required both Jewish immigrants and Jewish financial investment.

LATE NEWS

After Hitler had been named Chancellor in 1933, outraged Jews worldwide had quickly launched an economic boycott, hoping to bring Germany to its knees, with London's *Daily Express* famously running the banner headline "Judea Declares War on Germany." Jewish political and economic influence, then just like now, was very considerable, and in the depths of the Great Depression, impoverished Germany needed to export or die, so a large scale boycott in major German markets posed a potentially serious threat. But this exact situation provided Zionist groups with an excellent opportunity to offer the Germans a means of breaking that trade embargo, and they demanded favorable terms for the export of high-quality German manufactured goods to Palestine, together with accompanying German Jews. Once word of this major *Ha'avara* or "Transfer Agreement" with the Nazis came out at a 1933 Zionist Convention, many Jews and Zionists were outraged, and it led to various splits and controversies. But the economic deal was too good to resist, and it went forward and quickly grew.

The importance of the Nazi-Zionist pact for Israel's establishment is difficult to overstate. According to a 1974 analysis in *Jewish Frontier* cited by Brenner, between 1933 and 1939 over 60% of all the investment in Jewish Palestine came from Nazi Germany. The worldwide impoverishment of the Great Depression had drastically reduced ongoing Jewish financial support from all other sources, and Brenner reasonably suggests that without Hitler's financial backing, the nascent Jewish colony, so tiny and fragile, might easily have shriveled up and died during that difficult period.

Such a conclusion leads to fascinating hypotheticals. When I first stumbled across references to the *Ha'avara* Agreement on websites here and there, one of the commenters mentioning the issue half-jokingly suggested that if Hitler had won the war,

statues would surely have been built to him throughout Israel and he would today be recognized by Jews everywhere as the heroic Gentile leader who had played the central role in reestablishing a national homeland for the Jewish people in Palestine after almost 2000 years of bitter exile.

This sort of astonishing counter-factual possibility is not nearly as totally absurd as it might sound to our present-day ears. We must recognize that our historical understanding of reality is shaped by the media, and media organs are controlled by the winners of major wars and their allies, with inconvenient details often excluded to avoid confusing the public. It is undeniably true that in his 1924 book *Mein Kampf*, Hitler had written all sorts of hostile and nasty things about Jews, especially those who were recent immigrants from Eastern Europe, but when I read the book back in high school, I was a little surprised to discover that these anti-Jewish sentiments hardly seemed central to his text. Furthermore, just a couple of years earlier, a vastly more prominent public figure such as British Minister Winston Churchill had published sentiments nearly as hostile and nasty, focusing on the monstrous crimes being committed by Bolshevik Jews. In Albert Lindemann's *Esau's Tears*, I was surprised to discover that the author of the famous Balfour Declaration, the foundation of the Zionist project, was apparently also quite hostile to Jews, with an element of his motivation probably being his desire to exclude them from Britain.

Once Hitler consolidated power in Germany, he quickly outlawed all other political organizations for the German people, with only the Nazi Party and Nazi political symbols being legally permitted. But a special exception was made for German Jews, and Germany's local Zionist Party was accorded complete legal status, with Zionist marches, Zionist uniforms, and Zionist flags all fully permitted. Under Hitler, there was strict censorship of all German publications, but the weekly Zionist newspaper was freely sold at all newsstands and street corners. The clear notion seemed to be that a German National Socialist Party was the proper political home for the country's 99% German majority, while Zionist National Socialism would fill the same role for the tiny Jewish minority.

In 1934, Zionist leaders invited an important SS official to spend six months visiting the Jewish settlement in Palestine, and upon his return, his very favorable impressions of the growing Zionist enterprise were published as a massive 12-part series in Joseph

Goebbel's *Der Angriff*, the flagship media organ of the Nazi Party, bearing the descriptive title "A Nazi Goes to Palestine." In his very angry 1920 critique of Jewish Bolshevik activity, Churchill had argued that Zionism was locked in a fierce battle with Bolshevism for the soul of European Jewry, and only its victory might ensure amicable future relations between Jew and Gentile. Based on available evidence, Hitler and many of the other Nazi leaders seemed to have reached a somewhat similar conclusion by the mid-1930s.

The very uncomfortable truth is that the harsh characterizations of Diaspora Jewry found in the pages of *Mein Kampf* were not all that different from what was voiced by Zionism's founding fathers and its subsequent leaders, so the cooperation of those two ideological movements was not really so totally surprising.

Also quite ironic was the role of Adolf Eichmann, whose name today probably ranks as one of the most famous half-dozen Nazis in history, due to his postwar 1960 kidnapping by Israeli agents, followed by his public show-trial and execution as a war-criminal. As it happens, Eichmann had been a central Nazi figure in the Zionist alliance, even studying Hebrew and apparently becoming something of a philo-Semite during the years of his close collaboration with top Zionist leaders.

Brenner is a captive of his ideology and his beliefs, accepting without question the historical narrative with which he was raised. He seems to find nothing so strange about Eichmann being a philo-Semitic partner of the Jewish Zionists during the late 1930s and then suddenly being transformed into a mass-murderer of the European Jews in the early 1940s, willingly committing the monstrous crimes for which the Israelis later justly put him to death.

This is certainly possible, but I really wonder. A more cynical observer might find it a very odd coincidence that the first prominent Nazi the Israelis made such an effort to track down and kill had been their closest former political ally and collaborator. After Germany's defeat, Eichmann had fled to Argentina and lived there quietly for a number of years until his name resurfaced in a celebrated mid-1950s controversy surrounding one of his leading Zionist partners, then living in Israel as a respected government official, who was denounced as a Nazi collaborator, eventually ruled innocent after a celebrated trial, but later assassinated by former members of Shamir's

faction.

Following that controversy in Israel, Eichmann supposedly gave a long personal interview to a Dutch Nazi journalist, and although it wasn't published at the time, perhaps word of its existence may have gotten into circulation. The new state of Israel was just a few years old at that time, and very politically and economically fragile, desperately dependent upon the goodwill and support of America and Jewish donors worldwide. Their remarkable former Nazi alliance was a deeply-suppressed secret, whose public release might have had absolutely disastrous consequences.

According to the version of the interview later published as a two-part story in *Life Magazine*, Eichmann's statements seemingly did not touch upon the deadly topic of the 1930s Nazi-Zionist partnership. But surely Israeli leaders must have been terrified that they might not be so lucky the next time, so we may speculate that Eichmann's elimination suddenly became a top national priority, and he was tracked down and captured in 1960. Presumably, harsh means were employed to persuade him not to reveal any of these dangerous pre-war secrets at his Jerusalem trial, and one might wonder if the reason he was famously kept in an enclosed glass booth was to ensure that the sound could quickly be cut off if he started to stray from the agreed upon script. All of this analysis is purely speculative, but Eichmann's role as a central figure in the 1930s Nazi-Zionist partnership is undeniable historical fact.

## Controlling the Narrative While the World Changes

Napoleon famously quipped that "history is a set of lies that people have agreed upon." But there is always the danger that those who created those lies or their heirs may come to believe them and act accordingly.

The State of Israel was established in the immediate aftermath of the Second World War and its existence has been deeply intertwined with the official narrative of that conflict, a narrative that is largely false, as I outlined in several long pieces earlier this year:

- Why Everything You Know About World War II Is Wrong
  Ron Unz • ***The Unz Review*** • June 12, 2023 • 12,600 Words
- More Falsehoods of World War II
  Ron Unz • ***The Unz Review*** • June 19, 2023 • 7,500 Words
- Hitler, Churchill, the Holocaust, and the War in Ukraine
  Ron Unz • ***The Unz Review*** • July 17, 2023 • 9,700 Words

Today that narrative is uniformly promoted by our Western media and almost entirely accepted by Western populations and political elites, but with the growth of social media and the rise or resurrection of powerful states such as China and Russia outside our media orbit, the ground may be shifting.

The shocking success of lightly-armed Hamas militants against Israel's formidable armed forces a couple of weeks ago captured the imagination of the world's two billion Muslims. Meanwhile, the brutal retaliatory strikes employed by the Israelis have produced gripping images of dead or suffering Palestinian civilians that rapidly spread across the relatively uncensored information channels of social media, stoking outrage in those same Muslim populations and propelling their governments in that direction.

Many of the most important Muslim nations have now united behind the Palestinian cause, with the top leaders of once bitterly hostile Iran and Saudi Arabia joining together to coordinate their support. Some prominent figures in Pakistan have suggested that the country might offer Turkey its nuclear weapons to deter Israel's own arsenal, thereby allowing the Turks to deploy their very powerful conventional armed forces on behalf of the Palestinians.  In a recent interview, Col. Douglas Macgregor, a highly-regarded military analyst, argued that Israel may have created a broad regional coalition that could threaten its survival.

Meanwhile, in the West severe ideological repression has been used to quash any dissent from the pro-Israel narrative. Universities unwilling to wholeheartedly endorse Israel's actions have been publicly threatened by their Jewish billionaire donors. When a collection of Harvard student organizations issued a public statement supporting the Palestinian cause, the names of their members were publicized amid demands that they be blacklisted from any desirable future employment. Paddy Cosgrave, the CEO and co-founder of Web Summit, the world's largest tech conference, merely declared that he was opposed to all war crimes, regardless of who was committing them—hardly an extremist position—and he was forced to resign as a consequence.

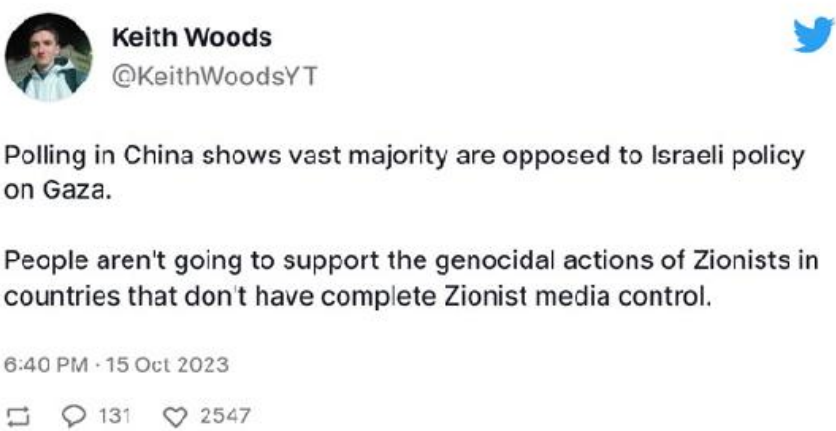
Yet although our media and our political leadership has remained in absolute lock-step behind Israel, with their support approaching the 99% level, I was very surprised to see that an outright majority of the American public currently opposes providing any additional weapons to the Jewish State, while supporting aid to Gaza. I wonder if this sort of striking disconnect between leaders and led may have been common during the last years of the decaying USSR.

There exist some telling indications of what a less one-sided presentation of the facts might produce. Chinese media has been relatively neutral on the conflict, and when a leading Chinese influencer polled his followers on Weibo, some 98% were opposed to Israel's current actions in Gaza.



Keith Woods
@KeithWoodsYT
Polling in China shows vast majority are opposed to Israeli policy on Gaza.
People aren't going to support the genocidal actions of Zionists in countries that don't have complete Zionist media control.

Russia has also largely remained neutral, though strongly supporting a

cease-fire and opposing Israel's starvation and slaughter of Palestinian civilians, but such even-handedness has provoked spittle-flecked outrage from some Israeli leaders. Consider the recent angry rant of Amir Weitmann, a top leader in Israel's ruling Likud Party and Netanyahu's possible successor, who denounced Russia on *KremlinTV* for being insufficiently pro-Israel in the current conflict and outrageously threatened the country possessing the world's largest nuclear arsenal.

Towards the end of my long article exploring the nature of the Jewish religion, I summarized some of my disturbing conclusions.

> Most of these disheartening facts that have so completely upended my understanding of reality over the last decade could not possibly have come to my attention until the rise of the Internet, which partially broke centralized control over the distribution of information. But many other people must surely have known large portions of this important story long before that, and recognized the very serious consequences these matters might have for the future of our society. Why has there been so little public discussion?
>
> I believe one factor is that over the years and the decades, our dominant media organs of news and entertainment have successfully conditioned most Americans to suffer a sort of mental allergic reaction to topics sensitive to Jews, which leads to all sorts of issues being considered absolutely out of bounds. And with America's very powerful Jewish elites thereby insulated from almost all public scrutiny, Jewish arrogance and misbehavior remain largely unchecked and can increase completely without

limit.

I've also sometimes suggested to people that one under-emphasized aspect of a Jewish population, greatly magnifying its problematical character, is the existence of what might be considered a biological sub-morph of exceptionally fanatical individuals, always on hair-trigger alert to launch verbal and sometimes physical attacks of unprecedented fury against anyone they regard as insufficiently friendly towards Jewish interests. Every now and then, a particularly brave or foolhardy public figure challenges some off-limits topic and is almost always overwhelmed and destroyed by a veritable swarm of these fanatical Jewish attackers. Just as the painful stings of the self-sacrificing warrior caste of an ant colony can quickly teach large predators to go elsewhere, fears of provoking these "Jewish berserkers" can often severely intimidate writers or politicians, causing them to choose their words very carefully or even completely avoid discussing certain controversial subjects, thereby greatly benefiting Jewish interests as a whole. And the more such influential people are thus intimidated into avoiding a particular topic, the more that topic is perceived as strictly taboo, and avoided by everyone else as well.

For example, about a dozen years ago I was having lunch with an especially eminent Neoconservative scholar with whom I'd become a little friendly. We were bemoaning the overwhelmingly leftward skew among America's intellectual elites, and I suggested it largely seemed a function of our most elite universities. Many of our brightest students from across the nation entered Harvard and the other Ivies holding a variety of different ideological perspectives, but after four years departed those halls of learning overwhelmingly in left-liberal lock-step. Although he agreed with my assessment, he felt I was missing something important. He nervously glanced to both sides, shifted his head downward, and lowered his voice. "It's the Jews," he said.

# War Crimes and Atrocity-Hoaxes in the Israel/Gaza Conflict

***The Unz Review*** • November 6, 2023 • 6,400 Words

Perhaps more out of habit than anything else, I still read the print edition of the *New York Times* every morning, something I've done for well over forty years, though given its sharp decline in quality that may not long continue. But while it does, the editorial selection of the front-page stories provides some important insight into the thinking of the individuals who shape the coverage of America's national newspaper of record.

Last Thursday, most of the world was still reeling from the televised devastation in Gaza, as a densely-populated portion of one of its largest refugee camps was demolished by multiple 2,000-pound Israeli bombs, apparently killing hundreds of helpless Palestinian civilians, most of them women and children.

Source: *The New York Times*

Soon afterward on *CNN*, pro-Israel former AIPAC staffer Wolf Blitzer questioned an Israeli military spokesman about the horrific loss of human life and was told that the massive attack had been completely justified because the Israelis believed that a Hamas commander was in

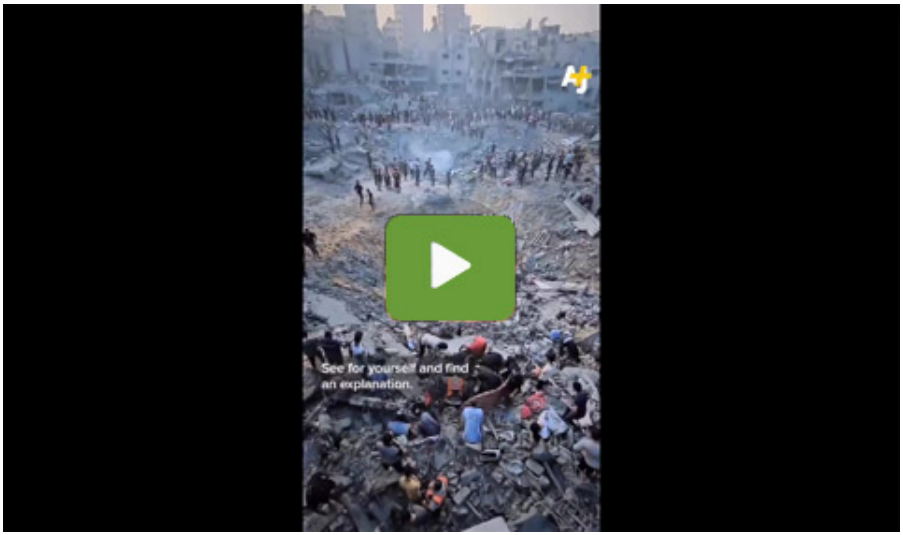
the vicinity.

These are blatant war crimes, probably the worst ever televised in the history of the world, or at least I can't recall anything comparable. Admittedly there have been far larger modern massacres, such as in 1994 Rwanda where according to Wikipedia the Hutus butchered many hundreds of thousands of their Tutsi neighbors with machetes; but both the Hutu killers and their Tutsi victims were mostly primitive African villagers, so none of those dark deeds were ever broadcast live on global television.

In sharp contrast, the grim events of the last four weeks have been widely watched around the world on electronic and social media. In just one month some 10,000 civilians have been killed in Gaza, a total larger than the combined losses on both sides in the past twenty months of the Ukraine war. Despite the fulminations of Western media outlets, since early 2022 only about 550 children have been killed in Ukraine, while after just a few weeks the total in Gaza has passed 4,000. Moreover, while the Ukraine war was fought between powerful, well-equipped modern armies on both sides, the defenseless civilians of Gaza are being relentlessly pounded by one of the world's most lavishly-armed military forces.

This is merely the tiniest sliver of the horrifying Gaza video footage being constantly broadcast all around the world but only very rarely

shown on American television.



Yet despite all this terrible carnage, the front page of Thursday's *Times* instead chose to focus upon a somewhat-related but rather different topic, running an article describing the "climate of fear" now gripping the Jews of Europe:

- For Europe's Jews, a World of Fear
  *The Oct. 7 Hamas assault on Israel and a surge in acts of antisemitism have awakened a repressed horror in Jewish populations across the continent.*
  Roger Cohen et al. • ***The New York Times*** • October 31, 2023 • 1,700 Words

Apparently, the enormous ongoing massacre of innocent men, women, and children by the Jews of Israel has led to a sharp rise in hostility and public anger directed toward the Jews of Europe, especially those among them who are enthusiastic supporters of Israel and its current policies. The lead author was Pulitzer Prize-winner Roger Cohen, a longtime European correspondent of the *Times*, and his effort was backed by the work of nine additional *Times* staffers, underscoring the tremendous importance assigned to that project. According to these writers, numerous top European political leaders regarded this sudden rise of anti-Semitism as a huge social crisis, which they promised to stamp out by all possible means.

Given the alarmist title and opening of that long article produced by ten *Times* journalists, I naturally expected to find numerous examples of European Jews having recently been killed or severely injured in

violent assaults, but no such cases were mentioned. Indeed, after carefully reading the piece twice, I couldn't find a single instance of a physical attack against Jews anywhere in the entire continent of Europe. Nonetheless, the upsurge of anti-Semitism was characterized as massive and rampant—with total recorded incidents numbering in the many hundreds. But all of these apparently involved merely verbal abuse or threats, graffiti, and petty vandalism, with many of these narrowly focused on the Jewish State and its supporters.

For example, publications in Britain have been horrified that British Muslims have torn down or defaced pro-Israel propaganda posters. The Jewish President of the French National Assembly, that country's parliament, said she was terrified by the hostility she had encountered in her own country; perhaps as a consequence, fourteen French senators have proposed new legislation criminalizing "anti-Zionist" activity, which would now be explicitly considered "anti-Semitic," including five-year prison sentences for inciting hatred of Israel.

In all fairness, the *Times* has also run articles on the massive ongoing slaughter of civilians in Gaza, deeds being committed by Israeli Jews. But there seems a strangely suspicious even-handedness between the extreme concern of the *Times* and various European government over verbal insults towards Jews and Israelis as against the brutal killing of so many thousands of defenseless Palestinian women and children.

Moreover, although almost entirely ignored by the mainstream news media, the Palestinians in Gaza and the West Bank had regularly been killed for many years prior to last month's Hamas attack, as was discussed in a long recent interview with film-maker Abby Martin, who had produced a widely-praised 2019 documentary on Gaza:

Naive Americans have sometimes suggested that the Palestinians should embrace the strategy of non-violence. But as she explained, several years ago the Palestinians of Gaza had begun staging a long series of completely unarmed protest marches, during which many thousands were killed or wounded by Israeli army snipers. Just yesterday I discovered that her full documentary had become available on Youtube a few months ago, and after watching it, I can highly recommend the work as providing the crucial background information to the current conflict.

Martin noted that the Israeli snipers had deliberately targeted the journalists and medics who were present during those large, unarmed protest marches, an obvious war crime. But these events were scarcely acknowledged by the global media let alone prosecuted by international courts, so perhaps the ultimate failure of this sustained non-violent effort finally convinced the militants of Hamas that more forceful measures were required to attract world attention.

Moreover, such Israeli attempts to suppress contrary media coverage using lethal means have continued over time. A few months ago, one of the world's most prominent Arab broadcast journalists, a Palestinian-American named Shireen Abu Akleh, was shot and killed by an Israeli army sniper while reporting from the West Bank; and although the Israel's government first denied responsibility then claimed the killing was accidental, the circumstances leave little doubt that she was deliberately targeted for death, with the single precisely-aimed round striking her in the back of the head just above her flak-jacket marked "Press."

Similarly, the Israelis last week repeatedly complained about what they regarded as the harshly negative tone of the ongoing *Al Jazeera* broadcasts from devastated Gaza, coverage led by its Palestinian bureau chief Wael al-Dahdouh. But these complaints were disregarded, so a couple of days later an Israeli missile strike hit his home in supposedly safe South Gaza while he was reporting on-air,

annihilating his entire family, including wife, son, daughter, and grandson.

This sort of Israeli behavior really seems quite extraordinary in the modern world, especially when juxtaposed with the related coverage in the *Times* and in most of the rest of the Western media. Indeed, taken together, these facts suggest that a mere Jewish fingernail is generally considered more valuable than multiple Palestinian lives.

I suspect that it is more than mere coincidence that such controversial notions have been central tenets of traditional Judaism for the last thousand or two thousand years. As I explained back in 2018:

> If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.
>
> Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver, it would be perfectly fine and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.
>
> As a further illustration of the seething hatred traditional Judaism radiates towards all those of a different background, saving the life of a non-Jew is generally considered improper or even prohibited, and taking any such action on the Sabbath would be an absolute violation of religious edict. Such dogmas are certainly ironic given the widespread presence of Jews in the medical

> profession during recent centuries, but they came to the fore in Israel when a religiously-minded military doctor took them to heart and his position was supported by the country's highest religious authorities.
>
> Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming majority of Jewish adults had Orthodox grandparents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of "Love Thy Neighbor" may or may not be workable in practice, but a religion based upon "Hate Thy Neighbor" might have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

Most conservative American Christians and Christian Zionists in particular are fiercely supportive of Israel, so some of them may have been a bit surprised by the recent Israeli airstrikes against Gaza's Christian hospitals and churches, which killed hundreds of civilians sheltering there. Indeed, the American-supplied munitions that struck the 1,600-year-old Saint Porphyrius Church, one of the oldest in the world, killed seventeen Palestinians, including several relatives of a former U.S. Congressman. But for reasons that I had explained in my 2018 article, all of this was only to be expected, given the increasingly religious character of Israel's political leadership class:

> And while religious Judaism has a decidedly negative view towards all non-Jews, Christianity in particular is regarded as a total abomination, which must be wiped from the face of the earth.
>
> Whereas pious Muslims consider Jesus as the holy prophet of God and Muhammed's immediate predecessor, according to the Jewish

Talmud, Jesus is perhaps the vilest being who ever lived, condemned to spend eternity in the bottommost pit of Hell, immersed in a boiling vat of excrement. Religious Jews regard the Muslim Quran as just another book, though a totally mistaken one, but the Christian Bible represents purest evil, and if circumstances permit, burning Bibles is a very praiseworthy act. Pious Jews are also enjoined to always spit three times at any cross or church they encounter, and direct a curse at all Christian cemeteries. Indeed, many deeply religious Jews utter a prayer each and every day for the immediate extermination of all Christians.

Over the years prominent Israeli rabbis have sometimes publicly debated whether Jewish power has now become sufficiently great that all the Christian churches of Jerusalem, Bethleham, and other nearby areas can finally be destroyed, and the entire Holy Land completely cleansed of all traces of its Christian contamination. Some have taken this position, but most have urged prudence, arguing that Jews needed to gain some additional strength before they should take such a risky step. These days, many tens of millions of zealous Christians and especially Christian Zionists are enthusiastic advocates for Jews, Judaism, and Israel, and I strongly suspect that at least some of that enthusiasm is based upon ignorance.

- American Pravda: Oddities of the Jewish Religion
  Ron Unz • ***The Unz Review*** • July 16, 2018 • 7,800 Words

The Internet was abuzz a few days ago when Israeli Prime Minister Benjamin Netanyahu explicitly identified the Palestinians with the tribe of Amalek, which the Israelites of the Old Testament were ordered by divine mandate to completely exterminate, down to the last newborn baby.  Netanyahu himself is quite secular but his political base is zealously religious, so this explicit call for a total Palestinian genocide naturally alarmed many observers.

Indeed, sharp critics of Israel's ongoing slaughter in Gaza have been regularly condemning it as "genocide." However, I've always been very leery of using that term, which in recent years has become so grossly inflated and misused in the political rhetoric of Western governments and their media allies.

Still, fair is fair, and less than three years ago both the Trump and the

Biden Administrations had officially declared that China was committing "genocide" against the Uighurs of its Xinjiang province, a charge widely echoed in the *Times* and across the rest of our media. Yet oddly enough, none of those horrific accusations ever pointed to the killing of a single Uighur by the Chinese government, and there is also a very notable contrast between the shining Uighur cities, with their modern, unblemished office buildings and residential towers, and the current ruins of devastated Gaza. So if the West could claim that China was committing a Uighur "genocide," the Israelis certainly stand massively convicted of that monstrous charge, even made explicit by Netanyahu's public statements.

Scenes from the Uighur "Genocide" Compared to Those of the Palestinian "Genocide"

Consider also the far more appropriate accusation of "war crimes." Soon after the outbreak of the Ukraine war, the Russians took the very reasonable step of evacuating several hundred ethnic Russian children from the combat zone, allowing them to be temporarily educated in Russian schools until the fighting ended and they could safely return to their homes.

Indicted War Criminal Maria Lvova-Belova

But as a result of this sensible humanitarian policy, both Russian President Vladimir Putin and Maria Lvova-Belova, the Russian Commissioner for Children's Rights, were indicted as war criminals by Europe's International Criminal Court (ICC) in the Hague, which issued international arrest warrants against them, an act of total lunacy.

Naturally, no such action will ever be taken against Netanyahu and his Israeli government, who instead of safeguarding children are slaughtering them in the many thousands. This unspeakable hypocrisy led one of the ethnic Russian commenters on our website to angrily suggest that all the ICC justices themselves should be sent to the gallows, a penalty that seems quite appropriate to me.

The obvious reason for this unprecedented Israeli slaughter of the helpless Palestinian civilians of Gaza is as retaliation for the stunning defeat Israel had suffered a few weeks earlier at the hands of lightly-armed Hamas militants, a national humiliation perhaps greater than anything in the country's entire history.

For decades, Israeli boastfulness had led most observers to regard its Mossad intelligence service as one of the world's best, matched by the combat effectiveness of its vaunted military.

During this same period, Gaza's two million residents had become inmates of what was widely described as the world's largest open-air prison, with their personal movements and imports under tight Israeli control, and even their food supplies reduced to the bare minimum necessary for survival. The Israeli government spent hundreds of millions of dollars on the walls and fences surrounding Gaza, fortifications featuring extensive banks of advanced sensors and automatically-firing machine-guns, so both Prime Minister Benjamin Netanyahu and all of his military commanders arrogantly regarded any successful Hamas raid as totally impossible.

Given such over-confidence, when Hamas circumvented these formidable defenses using cheap drones and innovative tactics, the nearby Israeli garrison bases were caught completely unprepared, with their sentries asleep or away from their posts, and they were quickly overrun by the 1,500 Hamas fighters that attacked.

As a result, Israel suffered enormous military casualties, by some estimates losing up to 600 soldiers killed within the first 24 hours, probably more single-day fatalities than in any of Israel's previous wars and greater than the combined total of all the wars fought during nearly the last half-century.  According to an early partial listing, these dead included many of Israel's most elite officers, including dozens of colonels and majors, while many other soldiers were captured alive and taken as prisoners back to Gaza.

Scott Ritter is a former Military Intelligence officer, who had served as UN Chief Weapons Inspector and subsequently became a leading opponent of the Iraq War. In a portion of a recent interview, he explained that even after the Hamas fighters had lost the initial advantage of surprise, they still performed very well on the battlefield, severely mauling a couple of Israel's most elite infantry battalions and inflicting considerable additional Israeli casualties.

Many of the Hamas militants then safely returned to Gaza with the hundreds of Israelis they had captured, hoping to exchange them for the many thousands of Palestinians held captive for years in Israeli prisons, usually without charges and often under brutal conditions. Back in 2011, the Israelis had released more than 1,000 such Palestinian prisoners in exchange for a single captured Israeli soldier.

But rapidly arriving Israeli forces successfully surrounded other Hamas fighters and their prisoners at the bases and kibbutzim captured in the initial assault. Attempting to storm the buildings held by Hamas would have been very difficult, resulting in heavy additional IDF casualties, so the Israeli leadership eventually concluded that rescuing the prisoners was impossible. Therefore, under the notorious Hannibal Directive of 1986, they used the massive firepower of their tanks and attack-helicopters to destroy the structures, killing both the Hamas fighters and the Israelis they held captive.

Ritter noted that although Israeli government spokesmen claimed that the resulting destruction and deaths had been due to Hamas, the destroyed ruins displayed the unmistakable signs of high-explosive tank rounds and Hellfire missiles. Max Blumenthal's detailed analysis came to the same conclusion, and this also matched the testimony of several Israeli eye-witnesses who were lucky enough to survive the attacks. In an interview late last week, Larry Johnson, a former CIA

analyst with extensive military experience, described much the same thing:

Blumenthal explained that in the first few hours of confusion following the Hamas attack, Israeli forces had extreme difficulty distinguishing friend from foe, and the attack-helicopters and tanks blasted anything that moved, sometimes firing on Israeli civilians or even their own troops; he noted that many of the charred corpses of Israelis pulled from cars bore the unmistakable signs of Hellfire missiles. An Israeli general commanding one of the bases seized by Hamas described how he quickly hid in a blast-proof bomb-shelter, then called in massive air strikes on his own base, killing any of his own surviving troops as well as the Hamas militants guarding them.

Meanwhile, surviving Israeli hostages have uniformly reported the excellent treatment they had received from their Hamas captors.

Given all of these facts, it seems quite possible that a majority even a large majority of all the slain Israeli civilians had died at the hands of their own military forces, either from deliberate or accidental friendly-fire, and even many Israeli soldiers may have suffered that same fate.

The total number of Israeli deaths remains uncertain. The government has claimed around 1,400 fatalities, a figure universally reported across the entire global media, but nearly a month after the

fighting ending, fewer than 1,100 names have been published, raising large doubts about the reality of the larger total. Indeed, Blumenthal noted that when Israel's UN Ambassador distributed horrifying images of the corpses of Israeli civilians killed by Hamas, many of them turned out to be the bodies of Hamas fighters killed by the Israelis. So it seems quite possible that several hundred dead Hamas militants were originally included in that 1,400 total, with the Israeli government being too embarrassed to admit its original mistake.

A couple of days ago, Blumenthal Tweeted out a chart showing the contrasting age distribution of Israeli and Palestinian casualties. It's rather notable that there were scarcely any Israeli deaths either among children or the elderly, hardly consistent with the government claims of random, brutal Hamas terrorism, and extremely different from the age-distribution of Palestinian victims:

Max Blumenthal
@MaxBlumenthal · Follow
Israeli and Palestinian death counts from Oct 7 - 30 are very revealing.
Most Israelis killed on Oct 7 were of military age. By my last count, nearly 50% were uniformed soldiers on base and/or actively engaged in maintaining the siege of Gaza. That does not include those who... Show more

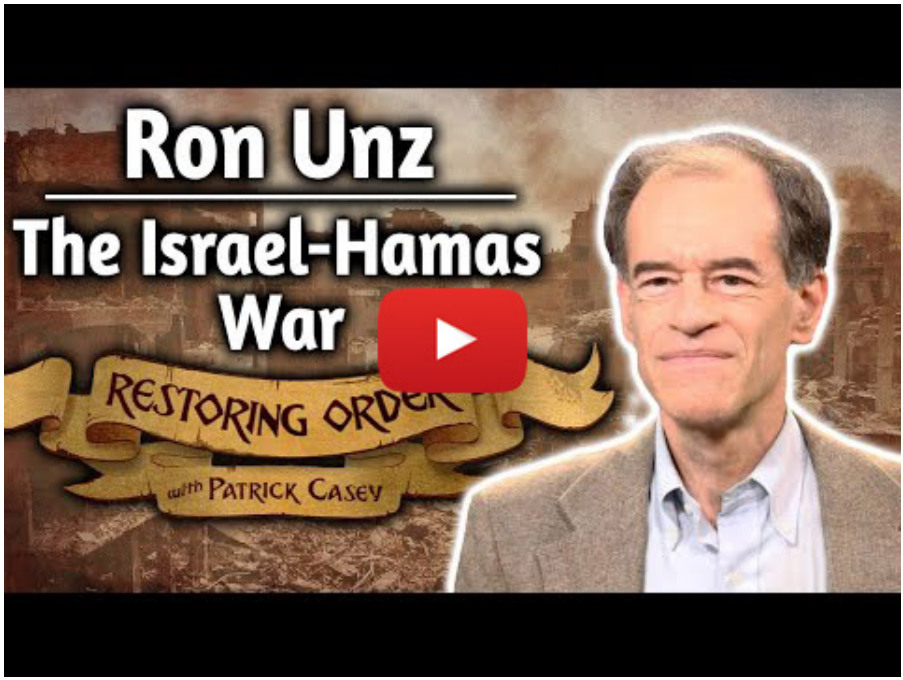
A week or two ago I'd given a long podcast interview in which I discussed various aspects of the surprisingly successful Hamas attack, the roots of the conflict, and its broader implications for the future of the region.



Given these facts, the Israeli government was faced with a challenging dilemma in the initial aftermath of the Hamas attack. The national humiliation of the successful surprise assault and the heavy military losses suffered seemingly required a massive retaliatory campaign against Gaza, both to reestablish Israel's deterrent credibility and to satisfy the outrage of its citizens. However, since such a large fraction of the civilian deaths had actually been at the hands of the trigger-happy Israeli military, any real justification for such an overwhelming response was lacking.

But although both the Israeli military and the Israeli Mossad had demonstrated their ineffectiveness, one of Israel's greatest strategic assets has been the stranglehold that it and its pro-Israel allies enjoy over the entire Western media landscape. So a vast wave of powerful propaganda was unleashed, intended to distract attention from the military debacle while demonizing the victorious Hamas fighters as brutal terrorists and killers.

Most of this was rather typical wartime atrocity propaganda, with Israeli spokesmen claiming that the Hamas fighters had committed numerous massacres and rapes, charges that were widely reported in uncritical fashion by our media echo chamber. But while it was certainly true that the Hamas militants had killed many Israeli

civilians in their initial attack, I had already seen the eyewitness accounts by several surviving captives stating that they were treated very well and even respectfully, leading me to be quite skeptical of these grave Israeli charges. However, since I had made little effort to seek out atrocity-videos on the Internet, I couldn't really be sure.

Our very lightly-moderated website represents one of the relatively few venues on the Internet where anti-Israel sentiments can flourish so it naturally attracts its share of energetic pro-Israel activists, who often present themselves as something else. One of these declared that there were numerous Hamas webcam videos showing their rape, torture, and massacre of Israeli civilians. When I challenged those claims, he provided links to a half-dozen such videos, which I watched, but none of them contained the scenes that he had claimed. Indeed, the bloodiest ones seemed to show the bodies of numerous dead Israeli soldiers, images that would certainly be horrifying to pro-Israel partisans, but hardly constitute evidence of any Hamas war crimes. Considering that pro-Israel activists apparently can't locate any such atrocity-videos, they probably don't exist, and the media is merely repeating dishonest propaganda disseminated by Israeli government spokesmen.

But far more effective than these mundane accusations have been the claims of exceptionally outrageous atrocities, deeds that established the Hamas fighters as the greatest monsters since Adolf Hitler's Nazis had made lampshades out of Jewish skin and rendered Jewish bodies into soap.

One early story that quickly swept across the world was that the Hamas militants had beheaded forty Israeli babies, a grisly atrocity that even reached the lips of President Joseph Biden.

That ridiculous story had come from a fanatic Jewish settler and even Israeli military spokesmen refused to damage their credibility by endorsing the hoax, which was quickly debunked and vanished from pro-Israel media outlets, especially since almost no Israeli babies had actually died in the Hamas attack. But even so, the grotesque and gripping image apparently embedded itself in many Western minds.

For example, former CIA analyst Larry Johnson has a strong military background, and he has been an important voice sharply critical of Israel's actions, helping to confirm that it was indeed an Israeli missile that killed hundreds of Palestinian civilians sheltering at Gaza's largest Christian hospital. I regularly visit his independent blogsite for his astute commentary on the current conflict.

But last week, I was absolutely shocked to discover that some of Johnson's military friends apparently believed in the "beheaded babies" hoax, forcing Johnson to still defensively insist that there was no evidence for it.

Although that particular atrocity-hoax has disappeared from the media, just a couple of days ago an equally outrageous story emerged, as an Israeli activist suddenly declared—four weeks after the alleged

event—that the Hamas fighters had roasted Israeli babies in an oven, with his account quickly reaching the tabloid headlines and easily eclipsing coverage of the enormous Palestinian death-toll at a bombed refugee camp.

An Israeli first responder to the October 7 terror attack has claimed that Hamas terrorists roasted a baby in an oven, having seen corpses in the aftermath of the attack

By his appearance, the originator of this bizarre tale once again seemed to be a fanatic Jewish settler, perhaps even a friend of the one who had launched the previous beheading hoax. But in this particular case, there might actually be a nugget of truth behind the claim. As mentioned above, the Israelis had blasted the homes occupied by

Hamas militants and their Israeli hostages with Hellfire missiles, reducing all the occupants to charred corpses, and perhaps one of these had been a baby. But if so, Israeli missiles rather than a kitchen oven had been responsible for the roasting.

Given the rapid collapse of the previous beheaded-babies hoax, I had assumed that the media would dismiss and ignore this new one, especially since it had suddenly been "remembered" so many weeks after the fighting had ended; but I was mistaken. My local Palo Alto newspaper is as mainstream and respectable as can be imagined, but relies upon wire services for all of its foreign news, and it headlined the story, treating it with complete credibility. As a consequence, many of America's top technologists and billionaire venture capitalists —who may normally pay little attention to foreign policy issues—are probably now convinced that Hamas has been roasting babies, an entirely imaginary atrocity, while scarcely being aware that so many thousands of Gazan children and infants have been killed—sometimes even being roasted alive—by Israeli bombs and missiles.

No. 1 in Palo Alto and the Mid-Peninsula

Hamas roasted baby in oven, first responder says

As Israeli troops encircled Gaza City yesterday, an Israeli first responder to the Oct. 7 terror attack claimed that Hamas terrorists roasted a baby in an oven.

Asher Moskowitz, of the United Hatzalah first responder group, published a video of himself speaking to a camera, delivering his witness account, which was reported by the London Daily Mail.

In it, he claimed he saw the remains of a baby

[See BABY, page 34]

Daily Post

Locally owned, independent

Perhaps partly as a result of that horrifying front-page story in our local newspaper, the following day Palo Alto witnessed one of its largest political demonstrations in decades. Hundreds staged a pro-Israel rally just outside City Hall, waving a sea of Israeli flags and demanding the release of the Israeli captives, sentiments endorsed by numerous speakers, including the Mayor. For generations, famously liberal Palo Alto has been in the forefront of every progressive cause, and just a couple of years ago a huge Black Lives Matter street-mural glorifying a convicted cop-killer had spent weeks blocking downtown traffic near that same location. Perhaps a few of the residents have begun feeling a little uneasy about the ongoing slaughter of so many

children in Gaza by American-supplied bombs and missiles. But if so, the massive display of pro-Israel sentiment will probably suppress any such public concerns in this small city of 60,000.

Although sensible people might expect that the promotion of outrageous atrocity-hoaxes would backfire, this seems not to be the case. Indeed, the surprising effectiveness of this shameless propaganda technique was noted nearly a century ago by Hitler in *Mein Kampf*, in which he fiercely denounced Jews for their regular use of the "Big Lie" technique. The future German dictator shrewdly explained that while most ordinary people may occasionally tell ordinary lies, they cannot conceive of anyone ever telling a lie so monstrously gigantic, and therefore they tend to assume that stories of "beheaded babies" or "babies roasted in ovens" must probably be true.

In a 2016 article focused upon the scholarly research of Prof. Albert S. Lindemann, a distinguished intellectual historian, I had noted that this pattern of remarkable Jewish dishonesty had been widespread across numerous different countries and time periods:

> As Lindemann candidly describes the tension between Russia's very rapidly growing Jewish population and its governing authorities, he cannot avoid mentioning the notorious Jewish reputation for bribery, corruption, and general dishonesty, with numerous figures of all political backgrounds noting that the remarkable Jewish propensity to commit perjury in the courtroom led to severe problems in the effective administration of justice. The eminent American sociologist E.A. Ross, writing in 1913, characterized the regular behavior of Eastern European Jews in very similar terms.
>
> Religion obviously constitutes an important unifying factor in human social groups and we cannot ignore the role of Judaism in this regard. Traditional Jewish religious doctrine seems to consider Jews as being in a state of permanent hostility with all non-Jews, and the use of dishonest propaganda is an almost inevitable aspect of such conflict. Furthermore, since Jews have invariably been a small political minority, maintaining such controversial tenets required the employment of a massive framework of subterfuge and dissimulation in order to conceal their nature from the larger society surrounding them. It has often been said that truth is the first casualty in war, and surely the cultural influences of over a thousand years of such intense

religious hostility may continue to quietly influence the thinking of many modern Jews, even those who have largely abandoned their religious beliefs.

- American Pravda: The Nature of Anti-Semitism
  Ron Unz • ***The Unz Review*** • July 30, 2018 • 5,500 Words

Unfortunately, the widespread public acceptance of such outrageous atrocity-hoaxes as beheaded or roasted Israeli babies has now provided the Israeli government with the political cover it requires for its ongoing massacre of Gaza's Palestinians, including many babies and infants. And sadly enough, such extreme atrocity propaganda had probably also played an important role in past generations as well.

Henry Morgenthau Jr. was a wealthy Jewish dilettante, who never graduated high school nor college, and instead set himself up as a gentleman-farmer in Upstate New York. Although lacking any knowledge of economics or finance, as the friend and neighbor of Franklin Roosevelt, he was appointed Treasury Secretary in early 1934, then allowed the actual operations of his very important department to be run by his trusted subordinate, Harry Dexter White, a notorious Communist spy.

And as I explained in 2016, Morgenthau's ignorance and gullibility led to other tragic developments.

> The notorious Jewish tendency to shamelessly lie or wildly exaggerate has sometimes had horrifying human consequences. I very recently discovered a fascinating passage in Peter Moreira's 2014 book *The Jew Who Defeated Hitler: Henry Morgenthau Jr., FDR, and How We Won the War*, focused on the important political role of that powerful Secretary of the Treasury.
>
> > A turning point in Henry Morgenthau Jr.'s relationship with the Jewish community came in November 1942, when Rabbi Stephen Wise came to the corner office to tell the secretary what was happening in Europe. Morgenthau knew of the millions of deaths and the lampshades made from victims' skin, and he asked Wise not to go into excessive details. But Wise went on to tell of the barbarity of the Nazis, how they were making soap out of Jewish flesh. Morgenthau, turning paler, implored him, "Please, Stephen, don't give me the gory details." Wise went on with his list of horrors and Morgenthau repeated his plea over and over again. Henrietta Klotz was afraid her boss would keel over. Morgenthau later

said the meeting changed his life.

While I was growing up, I'd sometimes heard those media stories of Nazis making soap and lampshades from Jewish bodies and skin, and had vaguely assumed that they were probably true. But in recent decades, all mainstream Holocaust scholars have admitted they had no reality, merely being grotesque examples of dishonest wartime propaganda, much like Israeli babies beheaded or roasted in ovens.

But although those particular Nazi atrocities had never occurred, they did have deadly real-world consequences. Morgenthau believed they were true and that led him to lend his name and support to the notorious Morgenthau Plan, which was intended to exterminate half of Germany's surviving population after the end of the war. Although that extreme proposal was later officially repudiated by the American government, it was still substantially implemented in practice, and according to reasonable estimates, perhaps ten million or more German civilians died of hunger or privation during the first few years after the close of hostilities, suffering a fate not entirely dissimilar from what might soon befall the blockaded and embargoed inhabitants of miserable Gaza.

- American Pravda: Post-War France and Post-War Germany
  Ron Unz • ***The Unz Review*** • July 9, 2018 • 6,600 Words

Gripping accounts of horrific atrocities can easily become embedded in established public narratives even if there exist undeniable facts that seem to completely challenge their reality.

Thus, although there are several eyewitness accounts by surviving Israeli hostages describing their very good and respectful treatment at the hands of their Hamas captors, nevertheless all our mainstream outlets portray those militants as unspeakably brutal terrorists, who may even have beheaded or roasted Israeli babies. And few in the media seem to even recognize this strange discordance.

Meanwhile, Anne Frank surely ranks as the most famous victim of the Nazi Holocaust. That latter historical event was a central theme in Roger Cohen's *Times* story on the desperate current fears of Europe's Jews, so naturally the fate of that iconic young girl was mentioned in his piece.

Cohen and his nine *Times* co-authors must obviously have put a great deal of effort and care into producing their lengthy front-page article,

which surely was also thoroughly reviewed and vetted by several *Times* editors. Yet when I read the piece in my morning print edition, one particular sentence immediately jumped out at me. Anne Frank was described as:

> the Jewish girl murdered at the Bergen-Belsen concentration camp in Germany during World War II.

Yet as all historians know and accept, she actually died of Typhus after suffering perhaps six months of serious illness and spending most of that time in German-run hospitals, a rather strange element of the traditional Holocaust narrative.

Apparently, someone contacted the *Times* and informed them of their mistake, so the online version of the article now describes her as:

> the young Jewish girl who died at the Bergen-Belsen concentration camp in Germany during World War II

And although the bottom of the *Times* article acknowledges that a correction was made in the text, it misstates the nature of that correction, perhaps to avoid drawing too much attention to that rather puzzling historical detail.

The unfortunate current events in Gaza as well as others that took place generations ago in Europe brought to mind my 2016 description of the enormous distortions of reality produced by our American media.

> We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional. Our standard histories have always criticized the ludicrous Soviet propaganda during the height of Stalin's purges or the Ukrainian famine, but in its own way, our own media organs sometimes seem just as dishonest and absurd in their own reporting. And until the availability of the Internet, it was difficult for most of us to ever recognize the enormity of this

problem.

Based upon the available evidence, I think that our American media is portraying the realities of the current conflict in Gaza upside-down and backwards.  Earlier this year I had argued that much the same had been the case for previous conflicts of vastly greater magnitude:

# Gaza and the Anti-Semitism Hoax

*The Unz Review* • November 27, 2023 • 9,000 Words

Over 14,000 Gazans have died from the relentless Israeli bombardment of the last few weeks, two-thirds of them women and children and almost none of them members of Hamas. That total represents the official figures of identified bodies, and with most of the local medical system destroyed and so many thousands more missing, buried under the rubble of the tens of thousands of demolished buildings, the true death toll probably already exceeds 20,000.

We are certainly witnessing the greatest televised slaughter of helpless civilians in the history of the world, with nothing even remotely comparable coming to mind. Over the last two years of the bitter war in Ukraine, a Russian missile fired at a military target occasionally caused twenty or forty civilian deaths as accidental collateral damage, and the resulting story spent days dominating the global headlines, then sometimes suddenly vanished once evidence appeared that an errant Ukrainian missile had actually been responsible.

By contrast, what we are now seeing is the deliberate massacre of civilians, aimed at driving out the Palestinians living in Gaza and rendering their enclave uninhabitable. Most of Gaza's hospitals and medical facilities have been eliminated, and when the Jordanians established field hospitals in South Gaza, those too were bombarded. Schools, bakeries, and other facilities necessary for continued human existence have also been deliberately destroyed, along with the bulk of the housing stock, while the Israelis have blocked the inhabitants from any access to food, water, and fuel.

Prime Minister Benjamin Netanyahu has publicly identified his Palestinian adversaries as the tribe of Amalek, whom the Hebrew God had commanded be exterminated down to the last newborn baby, and many of his country's other political leaders have used equally genocidal language, with one Cabinet minister suggesting that Israel utilize its illegal nuclear arsenal to eradicate Gaza and its population. Polls show that more than 80% of Israeli Jews support their government's extremely harsh military measures, hoping to see all the Palestinians killed or expelled.

More and more evidence has steadily accumulated that a majority,

perhaps even a large majority of the Israeli civilians killed in the Hamas attack died at the hands of their own country's trigger-happy military, the victims of tank shells and Hellfire missiles. So the actual number of unarmed Israeli civilians killed by Hamas fighters might have been as low as just 100 to 200, suggesting that the body-count of Palestinian civilians is at least 100 times larger. Yet despite this 100-to-1 casualty ratio, a recent front-page article in the *New York Times* by longtime correspondent Roger Cohen treated the tragedy in less than even terms, with a decided tilt towards the Israelis.

In recent years, public life in America and the rest of the West has become inordinately sensitive to the nuances of political correctness, with many regarding the misuse of pronouns as morally unconscionable. Therefore, the widespread graphic images on social media of the public slaughter of so many thousands of helpless babies and children has produced considerable unease, with well over half of Democrats being critical of these developments along with a substantial minority of Republicans.

Back in 2015, the widely broadcast image of a single, accidentally-drowned Syrian toddler led European governments to open their borders to millions of migrants, both from Syria and from everywhere else in the world, mostly young men in the prime of health. Greater Syria had traditionally encompassed Palestinian Gaza, so if a single accidental victim from the former had such enormous, nation-transforming political impact throughout Europe, surely the images of the many thousands deliberately killed in the latter must at least be raising a few personal concerns, though since some of these countries

have prohibited expressions of pro-Palestinian sentiment, it's difficult to be sure.

Many European Jews have wholeheartedly backed the Jewish State even as it commits this gigantic public massacre, and this

has naturally provoked a certain amount of popular criticism. Deeply concerned by this latter situation, the *New York Times* last week ran yet another major article on the desperate need to combat such "anti-Semitic" sentiments in Europe, obviously one of the world's most dreadful problems.

A few days ago, I'd asked an American academic friend of mine how his colleagues were reacting to this astonishing situation and he replied:

> People are too scared to broadcast their views, I think…But I think a good fraction of even normie academics realize there is something monstrous going on.

This sounds plausible to me, and another senior academic I know reported a roughly similar situation. Fear stalks the land.

Students at our most elite universities have been threatened with permanent employment blacklisting if they supported the Palestinian cause, and a long list of Jewish billionaires have mounted similar attacks against the academic institutions themselves, something I cannot recall ever happening in the past. As a result, a legal analysis article commissioned and approved for publication in the prestigious *Harvard Law Review* was scrapped at the last moment.

From its earliest roots in the terroristic Irgun, Israel's ruling Likud party has always endorsed the creation of a Greater Israel—"From the River to the Sea"—proclaiming that territory must be placed under Jewish rule, with all non-Jews subjugated, expelled, or killed. But in recent decades, progressive anti-Zionists have co-opted that same ambiguous slogan, using it to symbolize their goal of a unified country of Palestine, a secular democratic state providing equal rights for both Jews and non-Jews, two populations of similar size. This would naturally involve the dissolution of the existing Jewish state, absolute anathema to committed Zionists.

Propelled by the horrific images of dead babies in Gaza, this controversial phrase soon began trending among anti-Zionists on Twitter along with talk of "decolonizing" the Israeli settler-state. Wilting under intense Zionist attacks, owner Elon Musk—the world's wealthiest man—declared that these rather vague and innocuous progressive slogans constituted incitement to "genocide," with their use being grounds for an immediate ban from his platform. By contrast, I haven't heard that Musk has banned any of the Israeli politicians or activists publicly calling for the total annihilation of all

Palestinians.

Famed Hollywood actress Susan Sarandon had spent decades as a prominent progressive activist, involved in a very wide range of political causes, many of them denounced as "anti-American" by her conservative opponents, and she earned the enthusiastic praise of her peers for her commitment. Yet when she recently showed some public sympathy for the Palestinians, a helpless people now being butchered by the thousands and perhaps soon by the tens of thousands, she was summarily "cancelled" by her longtime talent agency, and others have suffered a similar fate. Around the same time, Maha Dahkil, one of Hollywood's top talent agents, was demoted and nearly fired for similar reasons. Even before the current fighting began, 80-year-old leftist rockstar Roger Waters of Pink Floyd had been vilified in the international media for supporting Palestinian rights and even bizarrely threatened with a German arrest warrant for supposedly glorifying Nazism.

The lethal accusation of "anti-Semitism" is the charge leveled against all of these individuals, and fear of suffering a similar fate surely keeps a vast number of their like-minded peers silent. In our current Western world, that indictment carries the same weight as "congress with Lucifer" might have held in the Old Salem of the Witch-Trials era.

I discovered that such timidity even extends to many alternative websites and left-liberal bloggers. Although the horrific events in the Israel/Gaza conflict have totally dominated the global headlines during the last few weeks, I'd become rather disappointed that the coverage of such matters had seemed relatively subdued and circumspect.

The *Moon of Alabama* blogger had fearlessly reported so many controversial facts about the Ukraine war and other important matters, but a few days ago he ran a rather apologetic post entitled "There Are Certain Things I Can Not Write About," opening with:

> I have tried to write about Gaza. But I am too aghast, outraged and depressed to create a sensible piece.
>
> So instead of coming up with something by myself I will leave you with a few links…

Given that the blogger is a German living in Germany, he may have also reasonably feared a knock on the door and a prison cell if he were

too candid in his views.

Although the *Naked Capitalism* blogsite was originally launched with a heavy economics focus, other topics regularly constitute a substantial majority of the total content, and I'd therefore been disappointed at the lack of heavy Gaza coverage. However, its proprietor Yves Smith finally published a good post last Wednesday, arguing that the proposed truce and prisoner exchange might merely represent a bump in the road for Israel's success in achieving its extreme objectives, with her closing sentences reading:

> Perhaps enough international pressure could eventually be brought on the US to get us to finally pull Israel's choke chain. But by then, it seems highly likely that Israel will have established facts on the ground in Gaza (deaths plus built environment destruction) for Israel to have decisively won in its aim of removing substantial numbers of Palestinians from Israel permanently.

I only very rarely glance at the resulting discussion-threads, but for some reason I did so this time, and I noticed this exchange between a commenter and Lambert Strether, one of the bloggers:

> **cnchal:** The choke chain runs the other way. Since the "globalists" sit at the top of the economic heap they could induce an instantaneous world wide depression with a capital strike. Now, where would Biden be if that happened?
>
> Fifteen to twenty thousand dead Palestinians so far and another million, nine hundred and eighty five thousand to go, then off to the West Bank for moar is the trajectory. Peace in the desert will be achieved eventually on the globalist's terms.
>
> **Lambert Strether:** The only way that your "choke chain" comment makes sense to me is if "'globalist'" (your quotes) is a euphemism for (capitalist) Jews, since in general, global capital is doing very well for itself right now. Therefore, there's no reason for capitalists qua capitalists to stage a strike. Since this euphemism is both analytically false and politically destructive, please clarify your usage of the term.
>
> **cnchal:** Yes, my use of the word globalist in this context is a substitute for the word Jew…
>
> **Lambert Strether:** Your statement is anti-semitic. We can't have that here. We're not entertaining it. (It's also just analytically

> terrible and destructive, positing as it does that the first loyalty of capitalists is not to capital, absurd on its face.)
>
> Go away.
>
> And that goes for anyone else with the same view.
>
> UPDATE And if anyone's thinking of sneaking this false construct through using artful language, don't even try it. Our moderators are good at doping out things like that, and we'll whack you, too.

The Jews of Israel are currently committing one of the worst public massacres in the history of the world, with the actions of their government loudly cheered on by many or most of the Jewish elites and populations of Europe and America, but taking notice of that obvious fact even using euphemistic constructs is regarded as a mortal sin. In a 2018 article, I described this sort of bizarre reaction now so widespread across the West:

> I believe one factor is that over the years and the decades, our dominant media organs of news and entertainment have successfully conditioned most Americans to suffer a sort of mental allergic reaction to topics sensitive to Jews, which leads to all sorts of issues being considered absolutely out of bounds. And with America's very powerful Jewish elites thereby insulated from almost all public scrutiny, Jewish arrogance and misbehavior remain largely unchecked and can increase completely without limit.

This distressing media landscape also exemplifies a very shrewd aphorism widely misattributed to Voltaire:

> To know who rules over you, simply find out who you are not allowed to criticize.

As these examples suggest, the accusation of "anti-Semitism" has become an enormously powerful political weapon in today's West, wielded by Jewish and pro-Israel groups as a trump card that still seems to carry the day against all others. So the historical reality of that concept is an important and interesting topic, one that I had discussed at length in a pair of 2018 articles.

The first of these explained how my discovery twenty years ago of a crucial historical fact regarding the true history of the Bolshevik

Revolution led to a complete upheaval in my understanding of the issue.

Obviously, this entire landscape was totally transformed by the Bolshevik Revolution of 1917, which swept the old order from power, massacring much of its leadership and forcing the remainder to flee, thereby ushering in the modern world era of ideological and revolutionary regimes. I grew up during the final decades of the long Cold War, when the Soviet Union stood as America's great international adversary, so the history of that revolution and its aftermath always fascinated me. During college and graduate school I probably read at least one hundred books in that general topic, devouring the brilliant works of Solzhenistyn and Sholokhov, the thick historical volumes of mainstream academic scholars such as Adam Ulam and Richard Pipes, as well as the writings of leading Soviet dissidents such as Roy Medvedev, Andrei Sakharov, and Andrei Amalrik. I was fascinated by the tragic story of how Stalin outmaneuvered Trotsky and his other rivals, leading to the massive purges of the 1930s as Stalin's growing paranoia produced such gigantic loss of life.

I was not so totally naive that I did not recognize some of the powerful taboos surrounding discussion of the Bolsheviks, particularly regarding their ethnic composition. Although most of the books hardly emphasized the point, anyone with a careful eye for the occasional sentence or paragraph would surely know that Jews were enormously over-represented among the top revolutionaries, with three of Lenin's five potential successors—Trotsky, Zinoviev, and Kamenev—all coming from that background, along with many, many others within the top Communist leadership. Obviously, this was wildly disproportionate in a country having a Jewish population of perhaps 4%, and surely helped explain the large spike in worldwide hostility towards Jews soon afterward, which sometimes took the most deranged and irrational forms, such as the popularity of *The Protocols of the Learned Elders of Zion* and Henry Ford's notorious publication of *The International Jew*. But with Russian Jews so much more likely to be educated and urbanized, and suffering from fierce anti-Semitic oppression under the Czars, everything seemed to make reasonable sense.

Then perhaps fourteen or fifteen years ago, I encountered a rip in

my personal space-time continuum, among the first of many to come.

In this particular instance, an especially rightwing friend of evolutionary theorist Gregory Cochran had been spending long days browsing the pages of *Stormfront*, a leading Internet forum for the Far Right, and having come across a remarkable factual claim, asked me for my opinion. Allegedly Jacob Schiff, America's leading Jewish banker, had been the crucial financial supporter of the Bolshevik Revolution, providing the Communist revolutionaries with \$20 million in funding.

My first reaction was that such a notion was utterly ridiculous since a fact so enormously explosive could not have been ignored by the many dozens of books I had read on the origins of that revolution. But the source seemed extremely precise. The *Knickerbocker* columnist in the February 3, 1949 edition of *The New York Journal-American*, then one of the leading local newspapers, wrote that "Today it is estimated by Jacob's grandson, John Schiff, that the old man sank about 20,000,000 dollars for the final triumph of Bolshevism in Russia."

Once I checked around a little, I discovered that numerous mainstream accounts described the enormous hostility of Schiff towards the Czarist regime for its ill-treatment of Jews, and these days even so establishmentarian a source as Wikipedia's entry on Jacob Schiff notes that he played a major role financing the Russian Revolution of 1905, as was revealed in the later memoirs of one of his key operatives. And if you run a search on "jacob schiff bolshevik revolution" numerous other references come up, representing a wide variety of different positions and degrees of credibility. One very interesting statement appears in the memoirs of Henry Wickham Steed, editor of *The Times of London* and one of the foremost international journalists of his era. He very matter-of-factly mentioned that Schiff, Warburg and the other top Jewish international bankers were among the leading backers of the Jewish Bolsheviks, through whom they hoped to gain an opportunity for the Jewish exploitation of Russia, and he described their lobbying efforts on behalf of their Bolshevik allies at the 1919 Paris Peace Conference following the end of the First World War.

Even the very recent and highly skeptical analysis in Kenneth D. Ackerman's 2016 book *Trotsky in New York, 1917* notes that U.S. Military Intelligence reports of the period directly made that

astonishing claim, pointing to Trotsky as the conduit for the heavy financial backing of Schiff and numerous other Jewish financiers. In 1925 this information was published in the British *Guardian* and was widely discussed and accepted throughout the 1920s and 1930s by numerous major media publications, long before Schiff's own grandson provided a direct confirmation of those facts in 1949. Ackerman rather cavalierly dismisses all of this considerable contemporaneous evidence as "anti-Semitic" and a "conspiracy story," arguing that since Schiff was a notorious conservative who had never shown any sympathy for socialism in his own American milieu, he surely would not have funded the Bolsheviks.

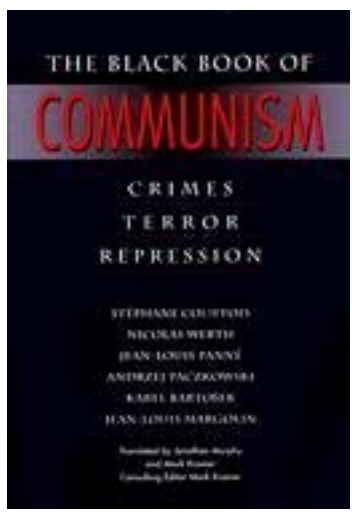
Now admittedly, a few details might easily have gotten somewhat garbled over time. For example, although Trotsky quickly became second only to Lenin in the Bolshevik hierarchy, in early 1917 the two men were still bitterly hostile over various ideological disputes, so he certainly was not then considered a member of that party. And since everyone today acknowledges that Schiff had heavily financed the failed 1905 Revolution in Russia, it seems perfectly possible that the \$20 million figure mentioned by his grandson refers to the total invested over the years supporting all the different Russian revolutionary movements and leaders, which together finally culminated in the establishment of Bolshevik Russia. But with so many seemingly credible and independent sources all making such similar claims, the basic facts appear almost indisputable.

Consider the implications of this remarkable conclusion. I would assume that most of Schiff's funding of revolutionary activities was spent on items such as stipends for activists and bribes, and adjusted for the average family incomes of that era, \$20 million would be as much as \$2 billion in present-day money. Surely without such enormous financial support, the likelihood of any Bolshevik victory would have been far lower, perhaps almost impossible.

When people casually used to joke about the total insanity of "anti-Semitic conspiracy theories" no better example was ever tossed around than the self-evidently absurd notion that the international Jewish bankers had created the worldwide Communist movement. And yet by any reasonable standard, this statement appears to be more or less true, and apparently was widely known at least in rough form for decades after the Russian Revolution, but had never been mentioned in any of the

numerous more recent histories that shaped my own knowledge of those events. Indeed, none of these very comprehensive sources had ever even mentioned Schiff's name, although it was universally acknowledged that he had funded the 1905 Revolution, which was often discussed in enormous detail in many of those very weighty books. What other astonishing facts might they similarly be concealing?

When someone encounters remarkable new revelations in an area of history in which his knowledge was rudimentary, being little more than introductory textbooks or History 101 courses, the result is a shock and an embarrassment. But when the same situation occurs in an area in which he had read tens of thousands of pages in the leading authoritative texts, which seemingly explored every minor detail, surely his sense of reality begins to crumble.



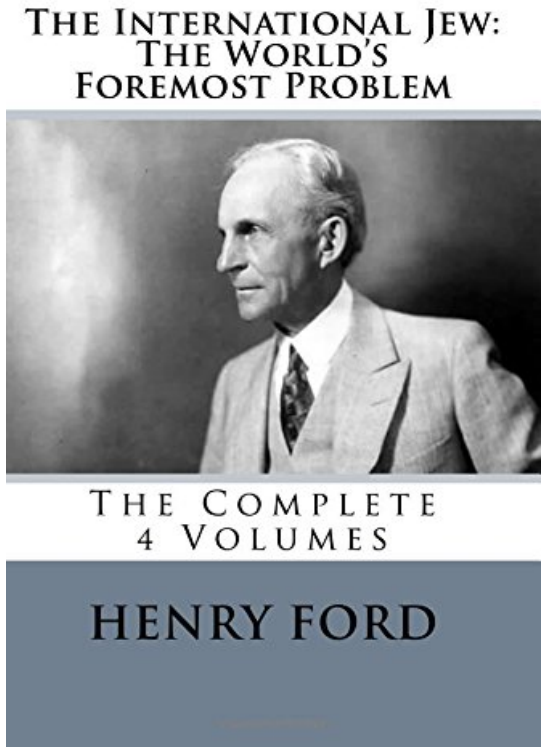
In 1999, Harvard University published the English edition of *The Black Book of Communism*, whose six co-authors devoted 850 pages to documenting the horrors inflicted upon the world by that defunct system, which had produced a total death toll they reckoned at 100 million. I have never read that book and I have often heard that the alleged body-count has been widely disputed. But for me the most remarkable detail is that when I examine the 35 page index, I see a vast profusion of entries for totally obscure individuals whose names are surely unknown to all but the most erudite specialist. But there is no entry for Jacob Schiff, the world-famous Jewish banker who apparently financed the creation of the whole system in the first place. Nor one for Olaf Aschberg, the powerful Jewish banker in Sweden, who played

such an important role in providing the Bolsheviks a financial life-line during the early years of their threatened regime, and even founded the first Soviet international bank.

When one discovers a tear in the fabric of reality, there is a natural tendency to nervously peer inside, wondering what mysterious objects might dwell within. The Ackerman book denounced the notion of Schiff having funded the Bolsheviks as "a favorite trope of Nazi anti-Jewish propaganda" and just prior to those words he issued a similar denunciation of Henry Ford's *Dearborn Independent*, a publication which once would have meant almost nothing to me. Although Ackerman's particular book had not yet been published when I first began considering the Schiff story a dozen years ago, many other writers had similarly conjoined those two topics, so I decided to explore the matter.

Ford himself was a very interesting individual, and his world-historical role certainly received very scanty coverage in my basic history textbooks. Although the exact reasons for his decision to raise his minimum wage to \$5 per day in 1914—double the existing average pay for industrial workers in America—can be disputed, it certainly seems to have played a huge role in the creation of our middle class. He also adopted a highly paternalistic policy of providing good company housing and other amenities to his workers, a total departure from the "Robber Baron" capitalism so widely practiced at that time, thereby establishing himself as a world-wide hero to industrial workers and their advocates. Indeed, Lenin himself had regarded Ford as a towering figure in the world's revolutionary firmament, glossing over his conservative views and commitment to capitalism and instead focusing on his remarkable achievements in worker productivity and economic well-being. It is a forgotten detail of history that even after Ford's considerable hostility to the Russian Revolution became widely known, the Bolsheviks still described their own industrial development policy as "Fordism." Indeed, it was not unusual to see portraits of Lenin and Ford hanging side-by-side in Soviet factories, representing the two greatest secular saints of the Bolshevik pantheon.

Copyrighted Material



As for *The Dearborn Independent*, Ford had apparently launched his newspaper on a national basis not long after the end of the war, intending to focus on controversial topics, especially those related to Jewish misbehavior, whose discussion he believed was being ignored or suppressed by nearly all mainstream media outlets. I had been aware that he had long been one of the wealthiest and most highly-regarded individuals in America, but I was still astonished to discover that his weekly newspaper, previously almost unknown to me, had reached a total national circulation of 900,000 by 1925, ranking it as the second largest in the country and by far the biggest with a national distribution. I found no easy means of examining the contents of a typical issue, but apparently the anti-Jewish articles of the first couple of years had been collected and published as short books, together constituting the four volumes of *The International Jew: The World's Foremost Problem*, a notoriously anti-Semitic work occasionally mentioned in my history textbooks. Eventually my curiosity got the best of me, so I clicked a few buttons on Amazon.com, bought the set, and wondered what I would discover.

Based on all my pre-suppositions, I expected to read some

foaming-at-the-mouth screed, and doubted I would be able to get past the first dozen pages before losing interest and consigning the volumes to gather dust on my shelves. But what I actually encountered was something entirely different.

Over the last couple of decades, the enormous growth in the power of Jewish and pro-Israel groups in America has occasionally led writers to cautiously raise certain facts regarding the untoward influence of those organizations and activists, while always carefully emphasizing that the vast majority of ordinary Jews do not benefit from these policies and actually might be harmed by them, even leaving aside the possible risk of eventually provoking an anti-Jewish backlash. To my considerable surprise, I found that the material in Ford's 300,000 word series seemed to follow this exact same pattern and tone.

The individual 80 chapter-columns of Ford's volumes generally discuss particular issues and events, some of which were well-known to me, but with most totally obscured by the passage of almost a hundred years. However, as far as I could tell, almost all the discussions seemed quite plausible and factually-oriented, even sometimes overly cautious in their presentation, and with one possible exception I can't recall anything that seemed fanciful or unreasonable. As an example, there was no claim that Schiff or his fellow Jewish bankers had funded the Bolshevik Revolution since those particular facts had not yet come out, only that he had seemed to be strongly supportive of the overthrow of Czarism, and had worked toward that end for many years, motivated by what he regarded as the hostility of the Russian Empire towards its Jewish subjects. This sort of discussion is not all that different from what one might find in a modern Schiff biography or in his Wikipedia entry, though many of the important details presented in the Ford books have disappeared from the historical record.

Although I somehow managed to plow through all four volumes of *The International Jew*, the unrelenting drum-beat of Jewish intrigue and misbehavior became somewhat soporific after a while, especially since so many of the examples provided may have loomed quite large in 1920 or 1921 but were almost totally forgotten today. Most of the content was a collection of rather monotonous complaints regarding Jewish malfeasance, scandals, or clannishness, the sort of mundane matters which might have normally appeared in the pages of an ordinary newspaper or magazine, let alone one of the muckraking type.

However, I cannot fault the publication for having such a narrow focus. A consistent theme was that because of the intimidating fear of Jewish activists and influence, virtually all of America's regular media outlets avoided discussion of any of these important matters, and since this new publication was intended to fill that void, it necessarily provided coverage overwhelmingly skewed toward that particular subject. The articles were also aimed at gradually expanding the window of public debate and eventually shaming other periodicals into discussing Jewish misbehavior. When leading magazines such as *The Atlantic Monthly* and *Century Magazine* began running such articles, this result was hailed as a major success.

Another important goal was to make ordinary Jews more aware of the very problematical behavior of many of their community leaders. Occasionally, the publication received a letter of praise from a self-proclaimed "proud American Jew" commending the series and sometimes including a check to purchase subscriptions for other members of his community, and this achievement might become the subject of an extended discussion.

And although the details of these individual stories differed considerably from those of today, the pattern of behavior being criticized seemed remarkably similar. Change a few facts, adjust the society for a century of progress, and many of the stories might be exactly the same ones that well-meaning people concerned about the future of our country are quietly discussing today. Most remarkably, there were even a couple of columns about the troubled relationship between the earliest Zionist settlers in Palestine and the surrounding native Palestinians, and deep complaints that under Jewish pressure the media often totally misreported or hid some of the outrages suffered by the latter group.

I cannot vouch for the overall accuracy of the contents of these volumes, but at the very least they would constitute an extremely valuable source of "raw material" for further historical investigation. So many of the events and incidents they recount seem to have been entirely omitted from the major media publications of that day, and certainly were never included in later historical narratives, given that even such widely known stories as Schiff's major financial backing for the Bolsheviks were completely tossed down George Orwell's "memory hole."

- American Pravda: The Bolshevik Revolution and Its Aftermath
  Ron Unz • ***The Unz Review*** • July 23, 2018 • 6,900 Words

I found these revelations shocking, both with regard to the crucial role of Jacob Schiff in the Bolshevik Revolution and the rather mundane and plausible contents of Ford's notorious work *The International Jew*. This forced me to completely reassess my framework of assumptions, and in my next article, I carefully investigated the historical reality of "anti-Semitism."

> I recently published a couple of long essays, and although they primarily focused on other matters, the subject of anti-Semitism was a strong secondary theme. In that regard, I mentioned my shock at discovering a dozen or more years ago that several of the most self-evidently absurd elements of anti-Semitic lunacy, which I had always dismissed without consideration, were probably correct…
>
> When one discovers that matters of such enormous moment not only apparently occurred but that they had been successfully excluded from nearly all of our histories and media coverage for most of the last one hundred years, the implications take some time to properly digest. If the most extreme "anti-Semitic canards" were probably true, then surely the whole notion of anti-Semitism warrants a careful reexamination.
>
> All of us obtain our knowledge of the world by two different channels. Some things we discover from our own personal experiences and the direct evidence of our senses, but most information comes to us via external sources such as books and the media, and a crisis may develop when we discover that these two pathways are in sharp conflict. The official media of the old USSR used to endlessly trumpet the tremendous achievements of its collectivized agricultural system, but when citizens noticed that there was never any meat in their shops, "Pravda" became a watchword for "Lies" rather than "Truth."
>
> Now consider the notion of "anti-Semitism." Google searches for that word and its close variants reveal over 24 million hits, and over the years I've surely seen that term tens of thousands of

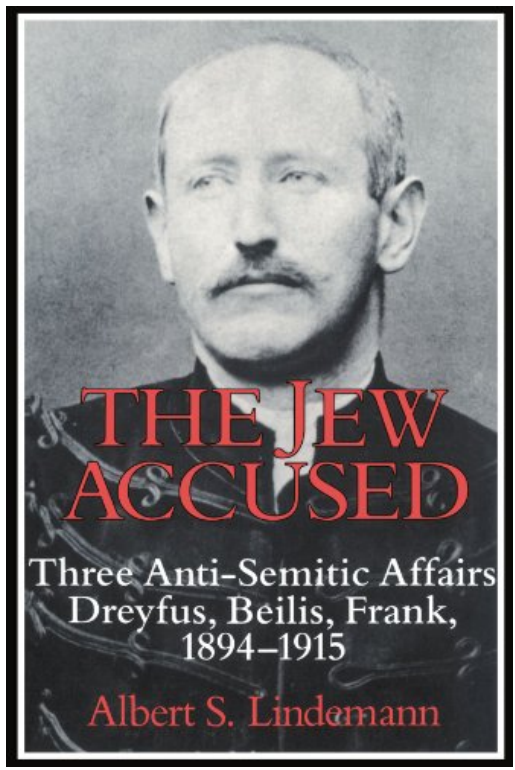
times in my books and newspapers, and heard it endlessly reported in my electronic media and entertainment. But thinking it over, I'm not sure I can ever recall a single real-life instance that I've personally encountered, nor have I heard of almost any such cases from my friends or acquaintances. Indeed, the only persons I've ever come across making such claims were individuals who bore unmistakable signs of serious psychological imbalance. When the daily newspapers are brimming with lurid tales of hideous demons walking among us and attacking people on every street corner, but you yourself have never actually seen one, you may gradually grow suspicious.

Over the years some of my own research has uncovered a sharp contrast between image and reality. As recently as the late 1990s, leading mainstream media outlets such as *The New York Times* were still denouncing a top Ivy League school such as Princeton for the supposed anti-Semitism of its college admissions policy, but a few years ago when I carefully investigated that issue in quantitative terms for my lengthy Meritocracy analysis I was very surprised to reach a polar-opposite conclusion. According to the best available evidence, white Gentiles were over 90% less likely to be enrolled at Harvard and the other Ivies than were Jews of similar academic performance, a truly remarkable finding. If the situation had been reversed and Jews were 90% less likely to be found at Harvard than seemed warranted by their test scores, surely that fact would be endlessly cited as the absolute smoking-gun proof of horrendous anti-Semitism in present-day America.

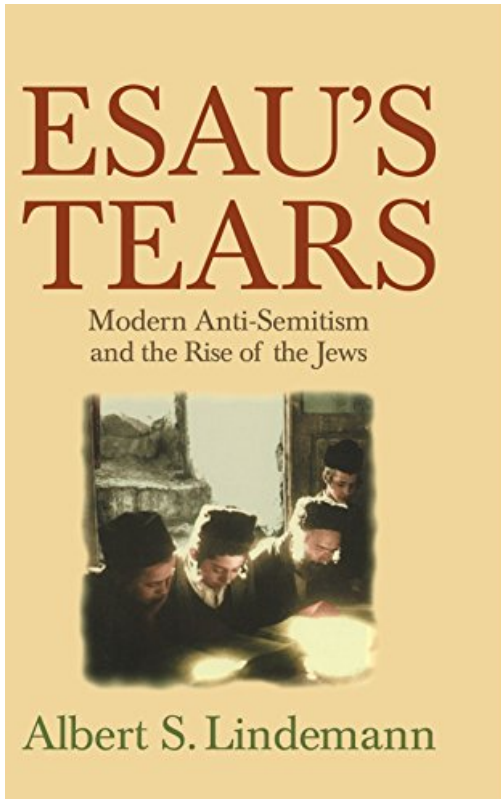
It has also become apparent that a considerable fraction of what passes for "anti-Semitism" these days seems to stretch that term beyond all recognition. A few weeks ago an unknown 28-year-old Democratic Socialist named Alexandria Ocasio-Cortez scored a stunning upset primary victory over a top House Democrat in New York City, and naturally received a blizzard of media coverage as a result. However, when it came out that she had denounced the Israeli government for its recent massacre of over 140 unarmed Palestinian protesters in Gaza, cries of "anti-Semite" soon appeared, and according to Google there are now over 180,000 such hits combining her name and that harsh accusatory term. Similarly, just a few days ago the *New York Times* ran a major story reporting that all of Britain's Jewish newspapers had issued an "unprecedented" denunciation of Jeremy Corbyn's Labour Party, describing it as an "existential threat" to the Jewish community for the anti-Semitism it was fostering; but this apparently amounted to nothing more than its willingness to

sharply criticize the Israeli government for its long mistreatment of the Palestinians.

It was obvious that in today's political world, "anti-Semitism" had become a wildly-exaggerated, even meaningless accusation. So I decided to carefully explore its historical reality in the past, especially in the years prior to the Bolshevik Revolution, given that the very heavy involvement of Jews in the event had subsequently produced a popular backlash in other countries.



In 1991 Cambridge University Press published *The Jew Accused* by Albert Lindemann, a noted scholar of European ideological movements, and his book focused on exactly that era and those sorts of incidents. Although the text is quite short, running less than 300 pages, Lindemann built his discussion upon a huge foundation of secondary literature, with his footnotes drawn from the 200 works included in his extensive bibliography. As far as I could tell, he seems a very scrupulous scholar, generally providing the multiple, often conflicting accounts of a given incident, and coming to his own conclusions with considerable hesitation.



A few years later, Lindemann expanded his examination of historical anti-Semitism into a much broader treatment, *Esau's Tears*, which appeared in 1997 and was nearly twice as long, providing comparative studies of the social landscape in numerous additional countries, including Germany, Britain, and Italy. Taken together the two volumes ran nearly 900 pages and constituted a very thorough and meticulously objective discussion of a social phenomenon so heavily covered in our media.

Lindemann's major focus and the centerpiece of his first book were three of the world's most notorious examples of anti-Semitism prior to the First World War, all of which had had fateful, long-term consequences while receiving attention in my introductory textbooks.

> This approach is certainly demonstrated in the first of his major cases, the notorious Dreyfus affair of late 19th century France, probably one of history's most famous anti-Semitic incidents. Although he concludes that Captain Alfred Dreyfus was very likely innocent of the charge of espionage, he notes the seemingly strong evidence that initially led to his arrest and conviction and finds—contrary to myth-making by numerous later writers—

absolutely no indications that his Jewish origins played any role whatsoever in his predicament.

However, he does note some of the underlying social context to this fierce political battle. Although only one Frenchman in a thousand was Jewish, just a few years earlier a group of Jews had been the leading culprits behind several huge financial scandals that had impoverished large numbers of small investors, and the swindlers afterward escaped any punishment by means of political influence and bribery. Given this history, much of the outrage of the anti-Dreyfusards probably arose from their fears that a Jewish military spy from a very wealthy family might be able to walk free using similar tactics, and the public claims that Dreyfus's brother was offering enormous bribes to win his release certainly strengthened this concern.

Lindemann's discussion of the 1913 Leo Frank Affair, in which a wealthy Northern Jew working in Atlanta was accused of sexually-assaulting and murdering a young girl, is even more interesting. Once again, he notes that contrary to the traditional narrative, there seems absolutely no hint that Frank's Jewish background played any role in his arrest or conviction. Indeed, at his trial it was instead his very highly-paid defense attorneys who unsuccessfully sought to "play the race card" with the jurors by crudely attempting to deflect suspicion upon a local black worker by means of racially-charged invective.

Although Lindemann regards Frank as probably innocent, my own reading of the evidence he presents suggests the overwhelming likelihood of his guilt. Meanwhile, it seems undeniable that the outpouring of popular anger against Frank was produced by the vast ocean of outside Jewish money—at least \$15 million or more in present-day dollars—that was committed to the legal efforts to save the life of someone widely regarded as a brutal murderer. There are strong suggestions that far more improper means were also employed, including bribery and influence-peddling, so that after Frank was convicted by a jury of his peers and thirteen separate legal appeals were denied, a governor with strong personal ties to the defense lawyers and Jewish interests chose to spare Frank's life a few months before leaving office. Under these circumstances, the lynch-mob that hung Frank was viewed by the community as merely enforcing his official death sentence by extra-judicial means.

I also discovered that the leading figures in the anti-Frank

movement had views far nuanced than I had expected. For example, populist writer Tom Watson had previously been a strong defender of Jewish anarchist Emma Goldman, while ferociously denouncing the Rockefellers, Morgans, and Goulds as the "true destroyers" of Jeffersonian democracy, so his outrage that Frank might escape punishment for murder seemed motivated by the extreme wealth of Frank's family and his supporters rather than any pre-existing anti-Semitic sentiments.

After some additional research and reading, I eventually concluded that the evidence for Frank's guilt was absolutely overwhelming and even discovered that the traditional understanding of the case was actually inverted. Frank and his Jewish allies had desperately played upon the notorious racist sentiments of the Old South, attempting to orchestrate the lynching of various totally innocent black men in order to hide Frank's guilt. But the white Southern jury saw through their scheme and Frank was the one sentenced to hang, as I recapitulated in an article earlier this year:

- American Pravda: The Leo Frank Case and the Origins of the ADL
  Ron Unz • ***The Unz Review*** • March 27, 2023 • 5,300 Words

  The unmistakable conclusion of Lindemann's analysis is that if the defendants in both the Dreyfus and Frank cases had not been Jewish, they would have suffered identical arrests and convictions, but lacking any wealthy and politically mobilized Jewish community to rally around them, they would have received their punishments, just or unjust, and immediately been forgotten. Instead, Theodor Herzl, the founding father of Zionism, later claimed that the massive anti-Semitism revealed by the Dreyfus Affair was the basis of his personal ideological awakening, while the Frank Affair led to the establishment of America's Anti-Defamation League. And both these cases have entered our history books as among the most notorious examples of pre-World War I anti-Semitism.

  Lindemann's discussion of the often difficult relations between Russia's restive Jewish minority and its huge Slavic majority is also quite interesting, and he provides numerous instances in which major incidents, supposedly demonstrating the enormously strong appeal of vicious anti-Semitism, were quite different than has been suggested by the legend. The famous Kishinev Pogrom of 1903 was obviously the result of severe ethnic tension in that city, but contrary to the regular accusations of later writers, there

seems absolutely no evidence of high-level government involvement, and the widespread claims of 700 dead that so horrified the entire world were grossly exaggerated, with only 45 killed in the urban rioting. Chaim Weizmann, the future president of Israel, later promoted the story that he himself and some other brave Jewish souls had personally defended their people with revolvers in hand even as they saw the mutilated bodies of 80 Jewish victims. This account was totally fictional since Weizmann happened to have been hundreds of miles away when the riots occurred.

Although a tendency to lie and exaggerate was hardly unique to the political partisans of Russian Jewry, the existence of a powerful international network of Jewish journalists and Jewish-influenced media outlets ensured that such concocted propaganda stories might receive enormous worldwide distribution, while the truth followed far behind, if at all.

For related reasons, international outrage was often focused on the legal confinement of most of Russia's Jews to the "Pale of Settlement," suggesting some sort of tight imprisonment; but that area was the traditional home of the Jewish population and encompassed a landmass almost as large as France and Spain combined. The growing impoverishment of Eastern European Jews during that era was often assumed to be a consequence of hostile government policy, but the obvious explanation was extraordinary Jewish fecundity, which far outstripped that of their Slavic fellow countrymen, and quickly led them to outgrow the available spots in any of their traditional "middleman" occupations, a situation worsened by their total disinclination to engage in agriculture or other primary-producer activities. Jewish communities expressed horror at the risk of losing their sons to the Czarist military draft, but this was simply the flip-side of the full Russian citizenship they had been granted, and no different from what was faced by their non-Jewish neighbors.

Certainly the Jews of Russia suffered greatly from widespread riots and mob attacks in the generation prior to World War I, and these did sometimes have substantial government encouragement, especially in the aftermath of the very heavy Jewish role in the 1905 Revolution. But we should keep in mind that a Jewish plotter had been implicated in the killing of Czar Alexander II, and Jewish assassins had also struck down several top Russian ministers and numerous other government officials. If the last decade or two had seen American Muslims assassinate a sitting

> U.S. President, various leading Cabinet members, and a host of our other elected and appointed officials, surely the position of Muslims in this country would have become a very uncomfortable one.
>
> As Lindemann candidly describes the tension between Russia's very rapidly growing Jewish population and its governing authorities, he cannot avoid mentioning the notorious Jewish reputation for bribery, corruption, and general dishonesty, with numerous figures of all political backgrounds noting that the remarkable Jewish propensity to commit perjury in the courtroom led to severe problems in the effective administration of justice. The eminent American sociologist E.A. Ross, writing in 1913, characterized the regular behavior of Eastern European Jews in very similar terms.

These cases are widely regarded as three of the most egregious examples of anti-Semitism in all of human history, and they separately gave birth to the Zionist movement, led to the founding of the ADL, and inspired the revolutionary, anti-Czarist fervor and funding that ultimately resulted in the Bolshevik Revolution. Yet when viewed in the cold light of reality, it was not clear to me whether any of them actually constituted "anti-Semitism" in any legitimate sense of the word, and the same was generally true for the long list of far lesser incidents that fill the remainder of Lindemann's 900 pages of careful historical analysis. All of this suggested that "anti-Semitism" had always been more of an ideological phantasm deployed as a political weapon rather than any sort of meaningful concept in the real world, not merely today but also in the historical past.

Some Jewish scholars, loathe to accept that possibility, seemed to immediately recognize the potential political threat posed by Lindemann's objective scholarship and they reacted accordingly, though their harsh attacks were rebutted by other, apparently less ideologically-driven academics:

> But although I found his analysis quite useful and interesting, the extraordinarily harsh attacks his text provoked from some outraged Jewish academics seemed even more intriguing.
>
> For example, Judith Laikin Elkin opened her discussion in *The American Historical Review* by describing the book as a "545-page polemic" a strange characterization of a work so remarkably even-handed and factually-based in its scholarship. Writing in *Commentary*, Robert Wistrich was even harsher, stating that

merely reading the contents had been a painful experience for him, and his review seemed filled with spittle-flecked rage. Unless these individuals had somehow gotten copies of a different book, I found their attitudes simply astonishing.

I was not alone in such a reaction. Richard S. Levy of the University of Illinois, a noted scholar of anti-Semitism, expressed amazement at Wistrich's seemingly irrational outburst, while Paul Gottfried, writing in *Chronicles*, mildly suggested that Lindemann had "touched raw nerves." Indeed, Gottfried's own evaluation quite reasonably criticized Lindemann for perhaps being a little too even-handed, sometimes presenting numerous conflicting analyses without choosing between them. For those interested, a good discussion of the book by Alan Steinweis, a younger scholar specializing in the same topic, is conveniently available online.

The remarkable ferocity with which some Jewish writers attacked Lindemann's meticulous attempt to provide an accurate history of anti-Semitism may carry more significance than merely an exchange of angry words in low-circulation academic publications. If our mainstream media shapes our reality, scholarly books and the articles they influence tend to set the contours of that media coverage. And the ability of a relatively small number of agitated and energetic Jews to police the acceptable boundaries of historical narratives may have enormous consequences for our larger society, deterring scholars from objectively reporting historical facts and preventing students from discovering them.

- American Pravda: The Nature of Anti-Semitism
  Ron Unz • ***The Unz Review*** • July 30, 2018 • 5,500 Words

Jews as a people have existed for thousands of years and their often bitter conflict against others around them certainly stretches back that far, with Wistrich having published a book entitled *Antisemitism: the Longest Hatred*. The Wikipedia entry on the History of Anti-Semitism runs 18,000 words, containing a multitude of references and well over 200 footnotes.

But while the term "Anti-Semitism" is so powerful in today's political debate, it was only first coined in the late nineteenth century by journalist Wilhelm Marr, a German nationalist writer and former radical. Although his first three wives were all of Jewish ancestry,

Marr became alarmed by the growing control over finance and industry exercised by his country's tiny Jewish minority, which he viewed in racial rather than religious terms, and he therefore founded the League of Anti-Semites to combat such encroachments. Thus, over the course of a century, Jewish media control has successfully transformed a term originally intended to challenge Jewish power and influence into one of the ideological weapons used to maintain it.

As we have seen above, the historical evidence for the existence of "anti-Semitism" in any meaningful sense really seems rather meager, and such apparent hostility was usually either fabricated by heavily distorted accounts or else appeared in direct response to very serious Jewish provocations. With perhaps 20,000 Gazan Palestinians having now been slaughtered by Jews, I don't doubt that the miserable survivors currently feel a great deal of hostility towards the group responsible, but how could we possibility expect anything else? Do we gain any extra insight by labeling this animosity "anti-Semitism"?

Meanwhile, in sharp contrast, the fundamental tenets of traditional Judaism have always included an enormous amount of inherent hostility towards all non-Jews, something that has been widely remarked upon for thousands of years. As I discussed in 2018:

> Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming majority of Jewish adults had Orthodox grand-parents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of "Love Thy Neighbor" may or may not be workable in practice, but a religion based upon "Hate Thy Neighbor" might have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

Despite these facts, the reifying power of the term “anti-Semitism” has helped ensure that any hostility displayed by Gentiles towards Jews enjoys an enormously higher profile than any reciprocal hostility in the other direction, with the latter lacking any name to give the concept solid meaning. Indeed, over the years I’ve occasionally seen some anti-Jewish activists attempt to fill that gap by inventing new terms such as “anti-Goyism” or “loxism,” but given their lack of media power, none of these have caught on.

Yet named or not, the phenomenon is certainly real, with bits of evidence occasionally seeping out. Despite the current 100-to-1 civilian casualty ratio, tendentious pro-Israel propaganda has currently stoked enormous levels of Jewish hatred towards Palestinians, Arabs, and Muslims, which sometimes leads to striking real-world incidents. Just a few days ago, a Jewish former State Department official, a senior figure who had been responsible for Israel/Palestine relations in the Obama Administration, was caught on video berating a random Egyptian immigrant food cart vendor in New York City, promising to use his powerful political connections to have the poor man’s family brutally tortured and killed.

That astonishing video clip together with its longer versions received well over 10 million impressions on Twitter, and provoked such a furor that it led to the man's arrest on charges of "harassment." Because the victim was Muslim, the outrageous behavior was described as "Islamophobic." But under slightly different circumstances, I'm sure the target of his wrath could have just as easily been a German or an Anglo-Saxon or any other Gentile group,

with the behavior then lacking any identifying name. Indeed, the same perpetrator had reportedly been similarly accosting and insulting ethnic Russians earlier this year.

Just a few weeks ago, a top Israeli political figure interviewed on *KremlinTV* had denounced Russia for being insufficiently pro-Israel in the current conflict and outrageously threatened the country possessing the world's largest nuclear arsenal:

Copies of this striking song video remain in circulation and have been viewed many millions of times around the world, perhaps providing an important insight into the thinking of Israeli Jews, and this telling incident was discussed on the *Grayzone*.

In his sharp criticism, Max Blumenthal characterized this Israeli video as “Nazi-esque” but I think he is almost certainly mistaken. If any such official propaganda project had ever been undertaken in Adolf Hitler’s Third Reich, it surely would have subsequently become the centerpiece of every American documentary seeking to demonstrate the unspeakable evil of Nazi Germany. Indeed, I suspect that the notion of the German government coaching young German children into singing songs calling for the total annihilation of Jews or any other group would have been utterly unimaginable in that society. As I half-jokingly suggested in a 2018 article, Nazism might reasonably be characterized as “Judaism for wimps.”

I have explained that decades ago a small handful of shocking discoveries caused me to completely reassess my understanding of the world and begin considering ideas that I previously would have dismissed. I suspect that the graphic images coming out of destroyed Gaza and some of the surprising behavior of Israel’s governmental leaders and its committed advocates may now be having a similar effect upon hundreds of millions of individuals around the world, including some in our own country. And this may be the most important long-term consequence of the sanguinary events that were triggered by the Hamas attack last month.

We must carefully distinguish between the realities of the world and the extreme beliefs that agitated Jewish propagandists have often

projected upon their various adversaries, both past and present. I touched upon this issue in several of my pieces from earlier this year, published prior to the outbreak of the current Israel/Gaza conflict.

# The *Nakba* and the Holocaust

*Eliminating the Entire Palestinian People*

***The Unz Review*** • December 11, 2023 • 14,600 Words

## The Mainstream Media Recognizes the *Nakba*

Two weeks ago the Sunday *New York Times Magazine* published a long cover-story on thirty years of failed Middle East peace efforts between Israelis and Palestinians, a tragedy that resulted in the enormous bloodshed and destruction of the last couple of months. The discussion featured three Israeli and three Palestinian academics, moderated by staff writer Emily Bazelon, and the overall tone—for better or for worse—probably reflected the historical and ideological assumptions of the liberal Zionists who dominate the editorial leadership of the *Times* and most other major American media outlets.

Bazelon's introduction ran a few paragraphs, summarizing the history of the conflict, which was portrayed as a struggle between right and right, with two unfortunate peoples battling over the same small piece of land. An early sentence stated that the Israelis saw the 1948 war as "an existential fight for survival, one that came just a few years after the Holocaust," and that latter event, so endlessly covered in our media, obviously required no explanation for *Times* readers. But in the following sentence we were told that for three generations, Palestinians have similarly regarded 1948 as the year of their *Nakba*. That Arabic word was far less familiar to most Westerners, so Bazelon went on to explain that it meant "catastrophe," the tragic circumstances under which 700,000 Palestinians fled or were forcibly expelled from their ancient homeland.

The following Wednesday, another *Times* article on the Israel/Gaza conflict similarly conjoined the Holocaust and the *Nakba*, this time in a single sentence, as had a different *Times* story a week earlier. These days there is even a Wikipedia entry running 3,300 words on those two interlinked historical traumas, so separately meaningful to Israeli Jews and Palestinian Arabs, and in 2018 an entire book was published with that title.

The increasing appearance of the term *Nakba* in elite mainstream publications such as the *Times* represents an important ideological

victory for the Palestinian cause. Our media creates our reality, so concepts or historical events that lack an identifying name are far less likely to be considered important and remembered. Thus, the growing use of that one word may carry greater political weight than the actual historical fact that 700,000 pitiful refugees were expelled from their homes in Palestine.

There are now widespread suspicions that the current Israeli military attacks in Gaza are intended to drive all its Palestinians into the Sinai desert of Egypt, and will be followed by attempts to do the same to the Palestinians of the West Bank. Indeed, after decades of denying the reality of the 1948 *Nakba*, some top Israeli leaders are now proclaiming their plans for a new and far greater *Nakba*, finally ridding the Greater Israel they control of its unwanted Palestinian inhabitants.

I'm not sure when I first encountered the word *Nakba* in any of my publications. It might have been during the late 1980s when the first *Intifada* or "uprising" became a widely featured story regarding the Middle East, describing the Palestinian protests, violent and non-violent, in the West Bank and Gaza against what was then two decades of Israeli occupation. Or perhaps it was a few years later during the early 1990s, when the Oslo Peace negotiations between Israel and the PLO seemed set to finally resolve the conflict and move the region towards a reasonable peace agreement, one that included the establishment of an independent Palestinian state.

I had already often seen the phrase "Palestinian refugees" in many news stories, with the UN camps of the West Bank, Gaza, Lebanon, and elsewhere holding well over a million of those people, and I was vaguely aware that they'd fled from their former homes in Israel during the first Arab-Israeli war of 1948.

The media accounts that I casually absorbed over the years had been rather vague and sketchy, and they often presented severe distortions or outright falsehoods about those important events, being heavily shaped by the propaganda of Israel and its legion of partisans. We were often told that the flight of the Palestinians had been promoted by radio broadcasts of three or four neighboring Arab countries, which urged them to clear the ground for the invading armies that were expected to snuff out the newly-founded Jewish State. Those departures had been intended as very temporary, but after the professional Arab armies were unexpectedly defeated by the

desperate, untrained Zionist militias, a Palestinian sojourn expected to last days or weeks ultimately stretched into years and decades. The unfortunate hardships of refugee life were worsened by the cruel refusal of the Arab states to integrate the Palestinians into their own societies, a failure that sharply contrasted with Israel's rapid and successful assimilation of the many hundreds of thousands of Jews who had been expelled from Arab countries around the same time. Indeed, those neighboring Arab regimes sought to use the Palestinian refugees merely as political pawns against the newly established State of Israel, whose existence they viewed with such unremitting hostility. But little of this narrative was true, and crucial legal and historical facts were completely omitted.

As might be expected, the difficult existence of those many hundreds of thousands of Palestinians in refugee camps eventually fostered the rise of violent militant organizations such as the PLO, which sought to capture the world's attention through high-profile terrorist attacks. By the early 1970s, their plane hijackings drew widespread attention and this was followed by the infamous seizure and killing of Israeli athletes at the 1972 Munich Olympic Games. Other terrorist groups such as Germany's notorious Baader-Meinhof gang often cooperated with the PLO, and in 1976 their joint hijacking operation had been foiled by a bold Israeli commando raid at Entebbe airport in Uganda.

Prior to those incidents, the plight of the Palestinians had largely been ignored. But within a few years, the term "Palestinian terrorist" and "Palestinian refugee" both became widespread across our media, though the latter still included very little discussion of the circumstances that had originally created their predicament.

Far more typical was their villainous portrayal in Hollywood fare, such as the popular 1977 film *Black Sunday*, in which American FBI and Israeli Mossad agents together foiled a Palestinian terrorist plot to kill 80,000 Americans by blowing up the Goodyear Blimp over the Superbowl stadium, with our own President being one of the intended victims.

## The Near Triumph of the *Nakba* Denial Movement

Although bombs and bullets have been weapons widely used during the 75 years of Israeli-Palestinian conflict, I think that the role of media coverage has been far more crucial to its trajectory, with the Israelis enjoying an enormous advantage in that regard given the

massive pro-Israel bias of Western journalists and publications, let alone Hollywood productions. In evaluating both current and past events, thoughtful analysts should always account for that extreme bias—and the very sharply tilted playing field it creates—if they wish to correctly determine the reality of events.

I think that the first substantial wave of sympathetic media coverage the Palestinians ever received may have come in the wake of the 1982 Israeli invasion of Lebanon, culminating in the long, brutal siege of Beirut. Ariel Sharon, the hardline Defense Minister of Menachem Begin's right-wing Israeli government, had been the mastermind of that project, which resulted in the deaths of perhaps 20,000 Palestinians and Lebansese civilians and his actions were roundly condemned by *Times* correspondent Thomas Friedman. The endless Israeli references to Palestinian "terrorists" were even ridiculed in Doonesbury:

Doonesbury by Garry Trudeau for August 26, 1982
WHAT IS IT NOW, SERGEANT?
WE JUST GOT THE FINAL COUNT ON THE TERRORIST EVACUEES, SIR.
DOES THIS INCLUDE THE TERRORIST WOUNDED FROM THE TERRORIST HOSPITALS?
YES, SIR. ALONG WITH THE TERRORIST DOCTORS AND TERRORIST NURSES.
WAIT A MINUTE. WHAT IS ALL THIS "TERRORIST" BUSINESS? AREN'T BEGIN ONCE A "TERRORIST" TOO?
MR. BEGIN WAS NOT A TERRORIST. HE WAS A FREEDOM FIGHTER.
OH.
HOW MANY TERRORIST RELATIVES?
3,000 TERRORIST WIVES AND 7,000 BABY TERRORISTS.

Back then, invading an Arab country and the besieging its capital city was an almost unprecedented event, and with American and international diplomatic pressure mounting, the PLO military forces who were the purported targets of Israel's assault were evacuated under UN auspices. But once those fighters were removed, Sharon soon afterwards orchestrated a grisly massacre of the defenseless Palestinian women and children left behind at the Sabra and Shatila refugee camps. That unfortunate event produced a major public relations debacle for the Israelis and a renewed international focus upon the Palestinians. There was growing global sympathy for their plight and some possibility that the American media would focus on the circumstances of their original expulsion, although I don't recall the discussion of any specifics at that time, let alone the appearance of the term *Nakba*.

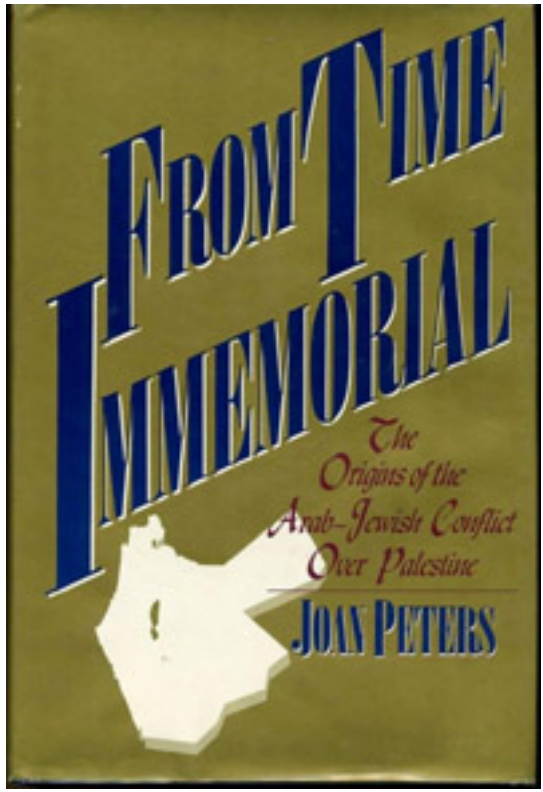
Given that serious crack in the previously overwhelming pro-Israel media tilt, it's hardly surprising that Israel's partisans would soon

launch a sudden, concerted counter-attack, a bold attempt to permanently remove the *Nakba* from world history even before that term made any appearance on the political stage.

As a Stanford physics graduate student, I remember that in 1984 or 1985 the subject of the Middle East conflict once happened to come up and one of my fellow grad students—a pro-Israel Gentile—declared that the entire "Palestinian refugee problem" was largely a hoax. To my considerable surprise, he explained that most Palestinians were actually not native to the area, instead being relatively recent immigrants from neighboring Arab countries who had arrived during the decade or two preceding the 1948 war, drawn by the economic opportunities produced from the growing Jewish settlement.

I'd never devoted a great deal of time to the Middle East conflict, but that claim seemed very surprising to me, contrary to everything that I'd read, and although I was hardly convinced, I vaguely wondered whether it might be true to some extent. Obviously, if many or most of the so-called "Palestinians" weren't actually natives of Palestine displaced by the Zionist Jewish settlers who had created Israel but were instead themselves recent immigrants who had arrived around the same time or later, the entire political landscape of the bitter regional conflict would be transformed.

Some years later, I discovered that those striking claims had been presented in a lengthy, extremely controversial 1984 book, glowingly praised in mainstream and pro-Israel circles but condemned as fraudulent by its critics, with the latter eventually gaining the upper hand and the arguments gradually disappearing from the media. But it was only about a decade ago that I finally looked into the matter, and discovered a fascinating story.



Joan Peters had been a college drop-out and free-lance writer, with interest in the Middle East but having little historical expertise. Then in 1984, her name suddenly appeared as the author of *From Time Immemorial*, a remarkably scholarly volume, running 600 pages with nearly 2,000 footnotes, a book that made the revolutionary claim that the Palestinians did not really exist as a people. According to her Introduction, she had begun the research project years earlier quite sympathetic to the plight of the Palestinian refugees and intending to focus on their miserable condition, but she gradually encountered more and more clues that they were largely a propaganda-concoction fabricated by Israel's Arab enemies. So she then spent years digging in musty archives, carefully researching the underlying demographic data and finally producing her masterwork, which was eagerly released by a leading New York publisher.

A gigantic wave of almost uniformly glowing reviews praised her exhaustive scholarship, propelling her book onto all the bestseller lists. Even more importantly, she soon became the darling of the electronic media, reaching a vastly larger national audience through her 200 or 300 radio and television interviews, in which she exploded the widespread myth that the so-called "Palestinian refugees" had

been longtime occupants of Palestine. Her monumental discovery was glowingly endorsed by top academic scholars, Pulitzer Prize-winning historians, and even the odd Nobel Laureate or two.

Back then, the media landscape was far more hierarchical and unified than today, with the Western prestige press lacking any significant global rivals or Internet critics. With such strong backing, her surprising conclusions seemed likely to become deeply embedded in the accepted narrative, permanently relegating any doubters to the conspiratorial fringes. And if the "Palestinians" did not actually exist as a people, any notion that they had a legitimate claim to the land obviously evaporated.

This might easily have happened except for the determination of a young Princeton graduate student named Norman Finkelstein, having a strong interest in Zionist history. He became curious about this widely-praised new book, which seemed to contradict everything he knew about the subject, so he began checking some of Peters' scholarly references, and discovered that many of them were severely distorted or even falsified. Notwithstanding her legion of prestigious endorsements, he concluded that her book constituted "a spectacular fraud," with important sections apparently even plagiarized from a Zionist propaganda tract published decades earlier that no one had ever taken seriously.

Unlike the political world, academia is largely run on the honor-system, and very few individuals bother critically checking the footnotes in a text released by a major press and strongly endorsed by many important figures. So absent Finkelstein's personal efforts, it's quite possible that the entire Palestinian people might have vanished from recognized existence without the need for the Israelis to fire a single shot. The gigantic, blatant hoax of "*Nakba* Denial" would have hardened into concrete, with no one in the political mainstream being willing to publicly challenge it.

As Finkelstein and others tell the story, uncovering that massive fraud in a very high-profile bestseller was easy enough, but bringing those facts to wider attention proved extremely difficult, especially since so many influential Jewish intellectuals had already invested their reputations in praising and endorsing the work, along with so many important publications. Finkelstein's letters to journalists and editors were completely ignored, and of the many academics he contacted, only Noam Chomsky of MIT bothered responding. Chomsky, a strong critic of Israeli policies, encouraged Finkelstein's efforts but warned that he might be severely damaging his own academic career, a

concern that unfortunately proved correct.

Finkelstein wrote up his detailed critique as a long article, which he submitted everywhere but it was similarly ignored, until Chomsky helped him place a shortened version in a tiny Midwestern leftist magazine. Gradually word of Finkelstein's analysis began circulating, with journalists and scholars realizing that it was probably only a matter of time until the intellectual scandal exploded, but no publication was willing to be the first to expose the plagiarized fraud. The prestigious *New York Review of Books* solicited an evaluation from a leading Israeli demographic historian, who ridiculed Peters' book as "sheer forgery," merely amounting to regurgitated Zionist propaganda that no one in Israel took seriously, but the editors refused to allow his devastating review to appear in print. However, in those days, British intellectuals were less beholden to Zionist influence and they were alerted by Chomsky to Finkelstein's detailed criticism, so the appearance of the book's British edition quickly unleashed a wave of ridicule in leading London publications, which finally forced most of their shamefaced American counterparts to acknowledge those same facts.

The book and the controversy it provoked were sufficiently important that it has become the subject of a lengthy Wikipedia article that effectively summarizes the story, helpfully providing numerous links and quotations. I'd also strongly recommend a 2002 essay by Chomsky that is available online, along with a 2015 article in *Mondoweiss* on the occasion of Peters' death:

- The Fate of an Honest Intellectual
  Noam Chomsky • ***Understanding Power*** • 2002 • 1,900 Words
- The legacy of Joan Peters and 'From Time Immemorial'
  David Samel • ***Mondoweiss*** • January 17, 2015 • 2,100 Words

In his discussion, Chomsky even suggested that Peters' pseudo-scholarly tome had probably been concocted by some intelligence agency or pro-Israel activist organization, with her name as author merely slapped upon that fraudulent work. This seems quite plausible to me, given that she'd never before nor afterwards published any serious writings in history nor other academic research. Indeed, I think the primary asset she contributed to the project may have been the Gentile last name of her first husband, along with her reasonably telegenic appearance.

So if not for the efforts of one determined grad student, a massive historical hoax likely would have carried the day and become

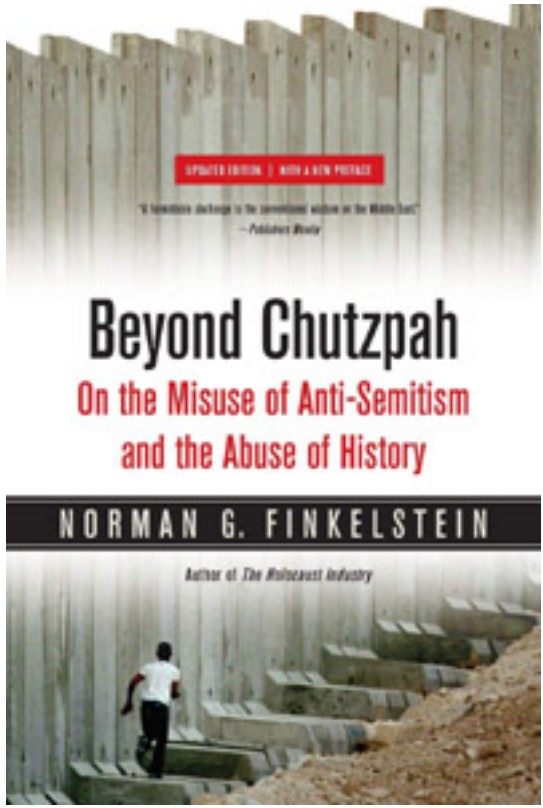
established in the media. Probably after a few years, Hollywood would have eagerly clambered on board, soon releasing a wealth of films and documentaries telling the story of the forlorn, almost empty land of Palestine, eventually revived by an influx of idealistic Jewish immigrants, whose economic success naturally drew in Arabs from all the neighboring countries of the Middle East. Perhaps some of those screenplays would have centered upon the heroic efforts of Peters herself, a brilliant independent scholar who labored for years to reveal a truth long concealed by a biased and arrogant academic establishment. And the entire Palestinian people, now numbering in the many millions, would have been completely erased from the official Western record, with only a few dissenting voices on the fringes of today's Internet still stubbornly claimed otherwise and being endlessly hectored by the ADL for espousing such "anti-Semitic" beliefs. As I've emphasized in the past, what we regard as the reality of the world is probably far less solid than most of use believe.

> We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional. Our standard histories have always criticized the ludicrous Soviet propaganda during the height of Stalin's purges or the Ukrainian famine, but in its own way, our own media organs sometimes seem just as dishonest and absurd in their own reporting. And until the availability of the Internet, it was difficult for most of us to ever recognize the enormity of this problem.

I recently reread Finkelstein's excellent 1995 book *Image and Reality of the Israel-Palestine Conflict*, which devoted a chapter to the Joan Peters case, and similarly deconstructed several other major examples of the massively biased scholarship and media coverage that have severely distorted American perceptions of the Middle East conflict. The Peters book itself has long been out of print and used copies available for sale quickly vanished following the outbreak of the recent Gaza violence, but fortunately a PDF version was temporarily available at Archive.org, which I downloaded and read. The contents seeming to confirm Finkelstein's very harsh verdict, especially since none of his detailed charges were ever rebutted.

However, that hardly marked the end of the strange story. In the wake of the Second Intifada of the early 2000s, Israel's public image in the West took another beating, so in 2003 Alan Dershowitz, a leading Harvard Law professor and fervent Zionist advocate, published *The Case for Israel*, which became a huge bestseller and repeated many of the same arguments about the non-existence of the Palestinians. Indeed, as Finkelstein soon demonstrated, that esteemed academic scholar—or more likely, his lazy ghostwriters—had extensively borrowed without credit large portions of Peters' long-discredited

book from two decades earlier.  In a widely-discussed joint appearance on *Democracy Now!*, Dershowitz desperately tried to filibuster away Finkelstein's devastating charges of academic fraud, and the resulting Dershowitz-Finkelstein affair even has a 4,500 word Wikipedia page of its own, as does the book itself.



Beyond Chutzpah
On the Misuse of Anti-Semitism
and the Abuse of History
NORMAN G. FINKELSTEIN
Author of The Holocaust Industry

Dershowitz was hardly pleased at the humiliating revelation that he had signed his name to the plagiarism of an already plagiarized fraud, thereby committing the sort of academic transgressions that would have gotten any freshman undergraduate expelled. Therefore, he launched a fierce campaign of retaliation, deploying his prestigious Harvard position and influential Jewish backers to drive his accuser from the academic world. Finkelstein had spent seven years as a faculty member at DePaul University, but although he was overwhelmingly recommended for tenure both by his own department and the entire College of Arts and Sciences, the backers mobilized by Dershowitz—and probably the wealthy donors they represented—exercised their veto, and he lost his appointment, leading to a bitter public lawsuit.

The story of Dershowitz's fraudulent pro-Israel bestseller constitutes a major part of Finkelstein's 2005 book *Beyond Chutzpah*, published by the University of California press, a prestigious academic imprint, and Dershowitz mobilized all his supporters to block its release, even recruiting Gov. Arnold Schwarzenegger to unsuccessfully lobby the UC Regents to ban the book. I had originally purchased that text more than a dozen years ago, but only now finally read its devastating

critique of the dishonest propaganda so widely deployed on behalf of the history and activities of the Jewish State. His updated 2008 edition includes a very lengthy summary of the overwhelming evidence of Dershowitz's plagiarism by a third party researcher who investigated the case, portions of which are also available online at *Counterpunch*.

So the academic plagiarist escaped any consequences, while the scholar who revealed that plagiarism was permanently exiled from the academic community.

## The Hundred Years' War on Palestine

Dershowitz had become a tenured Harvard professor at the age of 28, among the youngest in that university's history, and Jeffrey Sachs was one of his former colleagues who shared that same distinction. Sachs, like Dershowitz, came from a Jewish background, but was quite different in his temperament and personality, and over the last year or two he has become one of our most prominent public intellectuals, first with regard to the origins of Covid and the Nord Stream pipeline attacks, and soon afterward with his analysis of the Ukraine war and its political roots.

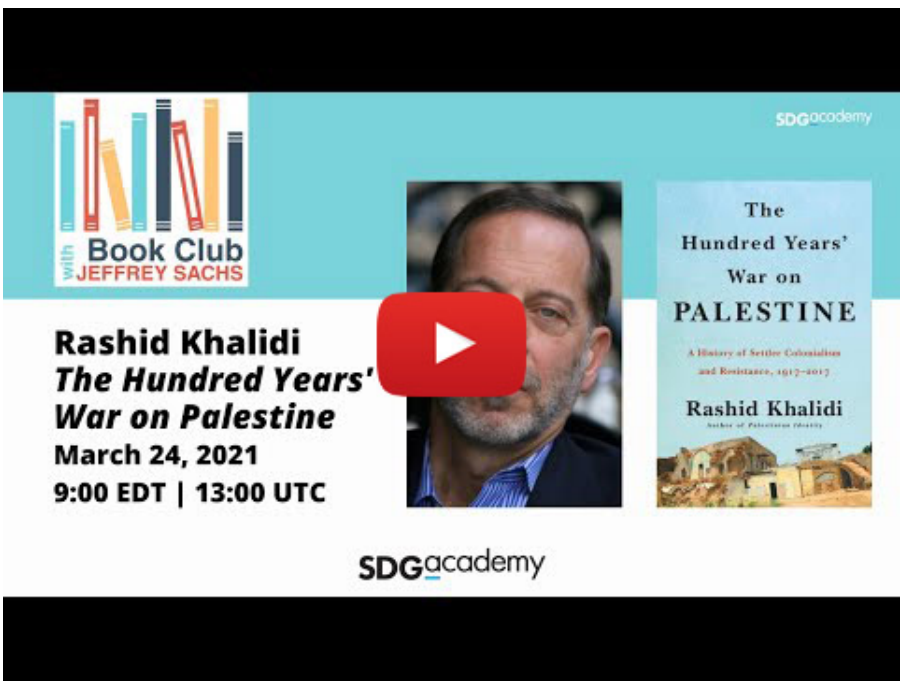
His extremely rare combination of topmost credentials in elite establishment circles together with a remarkable candor in challenging official narratives has propelled him into the media stratosphere, and his numerous interviews have often accumulated hundreds of thousands of views on Youtube, sometimes reaching a million or more. Two of his very early appearances in that rising media arc were with the *Gray Zone* and Steve Hsu's *Manifold*, and these have become the most popular videos in the history of those channels, with the former now approaching a half-million views. Indeed, last year ago I'd suggested that the Columbia University academic had probably become a "rogue elephant" in the minds of his establishmentarian opponents:

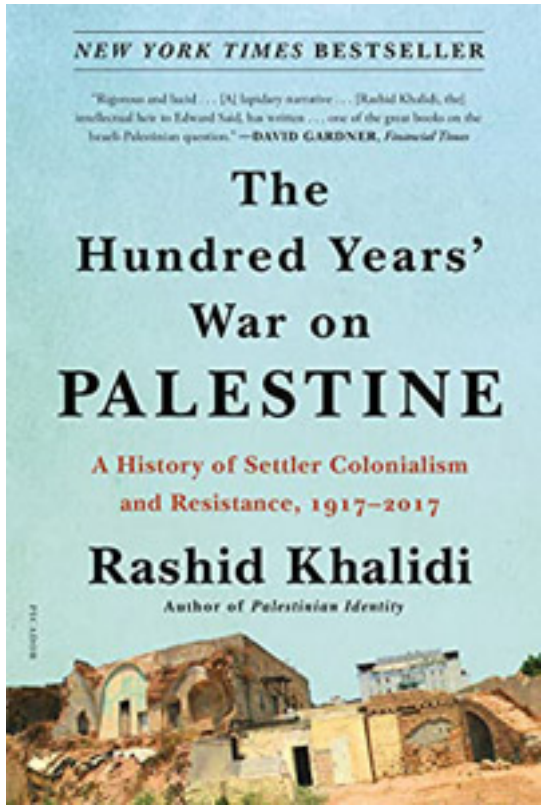
- Jeffrey Sachs as Righteous Rogue Elephant
  Ron Unz • ***The Unz Review*** • October 10, 2022 • 3,500 Words

Different scholars have different fields of expertise, and Sachs is an international economist, whose regions of focus have been the former Soviet Bloc countries, Latin America, and China, but apparently without much emphasis upon the Middle East. However, during the long Covid lock-downs, he expanded his knowledge of the Israeli-

Palestinian conflict by reading a recently published book by Prof. Rashid Khalidi, one of his Columbia University colleagues, then joined the author for a very interesting hour-long discussion available on Youtube.

By purest chance, I stumbled across that video several months ago, not long before the region suddenly erupted in unexpected violence, and found it an excellent presentation of the important historical facts, many of them previously unknown to me, while Sachs similarly emphasized that he was forced to "unlearn" much of the history that he had casually absorbed over the years. Although many of Sachs' more recent videos have attracted hundreds of thousands of views or more, after two years this one hadn't even reached 900, and despite the dramatic events of the last two months, it only finally broke 1,000 views a few days ago. Given the academic stature of the two participants and the current importance of the topic, I hope this may change once more of the world discovers it.





NEW YORK TIMES BESTSELLER
"Rigorous and lucid . . . [A] lapidary narrative . . . [Rashid Khalidi, the] intellectual heir to Edward Said, has written . . . one of the great books on the Israeli-Palestinian question." —DAVID GARDNER, Financial Times
The Hundred Years' War on PALESTINE
A History of Settler Colonialism and Resistance, 1917–2017
Rashid Khalidi
Author of Palestinian Identity

This interesting discussion prompted me to read the author's excellent book, which segmented the century-long struggle between Zionists and Palestinians into six separate conflicts. Although I found his detailed accounts of this history very helpful, I'd already been aware of the general outlines of most of the later portions of the history, so I gained the most from the first two in the list, especially his discussion of the earliest stages of the Zionist colonization project, which greatly accelerated during the two decades of Mandatory Palestine that followed the British conquest of the territory in the First World War.

The story the author tells is a simple one, but rather different from what has been presented in America's mainstream media. The early Zionist leaders were mostly Central European Jews, and when they focused on Palestine, they explicitly envisioned the establishment of a Jewish nation-state, with most of them believing that the native Palestinians, living there for many centuries, must necessarily be induced to leave or forcibly expelled. Since the Zionist Jews were at first only a tiny minority, entirely consisting of newcomers to the country, such intentions were hardly broadcast, but instead planned for the future.

So in the early years of the twentieth century a small number of ideologically-zealous Central and Eastern Europeans plotted to seize a distant, already heavily-settled land and displace its many hundreds of thousands of longtime, existing inhabitants, a proposal of astonishing audacity, made more so by the fact that they ultimately succeeded. No obvious historical parallel comes to mind.

Although its origins have been disputed, Britain's 1917 Balfour Declaration had somewhat ambiguously proclaimed that Palestine should become a national homeland for the Jewish people while also maintaining the rights of the existing inhabitants. So soon after Britain captured the country from the Ottoman Empire in 1918, conflicts naturally arose.

In 1921 a prominent American academic visited Palestine and he published his eyewitness account in a leading periodical, documenting the severe hostility between the fanatic Zionist settlers and the huge majority of native Palestinians, with large portions of his report subsequently reprinted in Henry Ford's national newspaper. Back in those days, the mainstream American media was less totally one-sided than it eventually became, and the following year a long article appeared in a major newspaper syndicate describing those same facts, including the violence and extremism of the Zionists, with that fascinating time-capsule reprinted and discussed in one of our own recent articles.

- Destination 1922: A Return to Claims of the Arabs in Palestine
  Sigurd Kristensen • ***The Unz Review*** • October 24, 2023 • 5,000 Words

These contemporaneous reports by American journalists and academics seemed to fully corroborate Khalidi's historical narrative, but I also noticed a further, interesting detail.

For decades, Lord Northcliffe had reigned as Britain's most powerful media mogul, the imperious owner of the *Times of London* and other publications, whose bombastic nationalist sentiments and political clout made him the William Hearst or Rupert Murdoch of his era. According to that 1922 news story, during his visit to Palestine, he became outraged over the violent Zionist attacks against both the local majority of non-Zionist Jews and the native Palestinians, and planned to orchestrate a media campaign against Zionism after his return to Britain. Instead, Northcliffe died soon afterwards, claiming to have been poisoned according to the later memoirs of Douglas Reed, his young personal assistant at the time, and the latter was

convinced that the Zionists had used lethal means to protect their political project. We should note that in Ronen Bergman's authoritative 2018 history of Zionist assassinations, one of the earliest victims was a prominent anti-Zionist Jewish leader, killed in 1924 for planning to lobby the British government against the Zionist enterprise.

Having successfully removed various political obstacles to their scheme, the Zionists focused during the 1920s and 1930s on Jewish immigration, seeking to raise their numbers to the point at which they could gain control of the country. The native Palestinians naturally suspected exactly this plan, and conflicts escalated, culminating in an Arab general strike and large scale revolt against foreign rule that began in 1936 and lasted until 1939, harshly suppressed by the British military assisted by Zionist militias. According to Khalidi, an estimated 14 to 17 percent of the entire adult male population of Palestinians was killed, wounded, imprisoned, or exiled during the conflict, severely weakening that community and especially its political leadership for the future military struggle against the Zionists that followed a decade later.

However, after quelling the Arab Revolt, the British sought to reduce future unrest by issuing a White Paper in 1939, sharply curtailing Jewish immigration and promising other restrictions. This provoked bitter Zionist resentment, culminating a few years later in their assassination of Lord Moyne, the British Minister for the Middle East. Indeed, although Khalidi is careful to avoid these very delicate subjects, once World War II broke out, one of the smaller right-wing Zionist factions led by a future prime minister of Israel unsuccessfully sought a military alliance with Hitler and Mussolini, just as the mainstream Zionist movement had heavily relied upon its crucial economic partnership with Nazi Germany throughout the 1930s.

Britain's wartime leader Prime Minister Winston Churchill was very strongly pro-Zionist, and near the end of the war, he authorized the formation of a Jewish Brigade, allowing the militias of the nascent Zionist state to gain crucial military experience for the coming struggle over Palestine. Meanwhile, the Zionist forces strengthened their political ties to both of the newly emerging superpowers of the United States and the USSR, in the case of the former relying upon America's influential Jewish community and in the latter upon Palestine's local Communist Party, which was almost entirely Jewish.

By the end of the Second World War in 1945, Britain was bankrupt and exhausted, retreating from its imperial holdings across much of

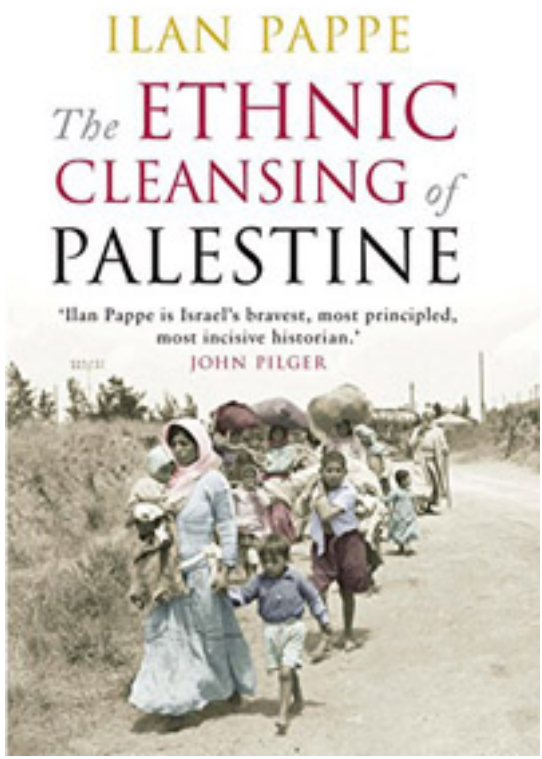
the world, and even about to lose control of India after more than a century. So the Zionists now sought to drive the British out of Palestine by unleashing a massive wave of violence against them, notably including the 1946 bombing of the King David Hotel, one of the greatest terrorist attacks in the history of the world to that date. Meanwhile, they also worked to bring in as much of Europe's displaced Jewish population as possible, increasing their numbers for their looming struggle with the Arabs over Palestine.

Finally, in 1947 the British gave up and dumped their Palestine problem into the lap of the newly formed United Nations, which proposed resolving the Zionist-Arab dispute by partitioning the land into two new states. Jews then constituted one-third of the Palestinian population, with most of them having only arrived in the previous three years, while they only owned about 6% of the land. Nonetheless, effective Zionist lobbying persuaded the UN to allocate 55% of Palestine to the majority-Jewish state, with only 45% going to the native Arabs, a decision that the latter naturally regarded as outrageous and an obvious violation of the democratic principles supposedly enshrined in the UN Charter. Meanwhile, the Zionists viewed the glass as half-empty, and intended to gain control of most or all of Palestine while clearing out the existing Arab inhabitants. Therefore, violence soon escalated on both sides.

Backed by both the US and the USSR, the Zionists declared their new State of Israel on May 14, 1948, while the armies of Egypt, Transjordan, Syria, and various other nearby Arab states quickly intervened in support of the beleaguered and outgunned Palestinians. But with the exception of Transjordan's British-officered Arab Legion, those militaries were puny and had little training, so the far larger and better-organized Zionist forces gained the upper hand, especially after they illegally received a huge shipment of Czech arms from Stalin's Soviet Bloc during a temporary UN truce in the fighting. Count Folke Bernadotte, the head of the Swedish Red Cross, was appointed UN Peace Negotiator, but some of his proposals were viewed unfavorably by the Zionists, who expressed their displeasure by assassinating him, after which his American successor proved much less disagreeable.

Fighting eventually resumed and the Zionists won a sweeping victory, seizing almost 80% of Palestine and expelling a similar percentage of the Palestinians, who became refugees in the remainder of their territory or in neighboring Arab states.

## The Ethnic Cleansing of Palestine



ILAN PAPPE
The ETHNIC CLEANSING of PALESTINE
'Ilan Pappe is Israel's bravest, most principled, most incisive historian.'
JOHN PILGER

One of the major sources on the expulsion of the Palestinians from their homeland was the ground-breaking research by Ilan Pappe, an Israeli historian, and over the years I'd sometimes seen favorable mention of his 2006 book *The Ethnic Cleansing of Palestine*. So prompted by Khalidi's much briefer account, I finally read it, finishing the last page just a few days before the unexpected attack by Hamas suddenly propelled the Israel-Palestine conflict back to the center of world attention. Pappe's work seemed to warrant all the critical praise it had received, with the scholar relying upon exhaustive archival research to reconstruct and document the plans of the Zionist leadership to remove all the Palestinians and create the purely Jewish state that they had always desired.

The term "ethnic cleansing" became widespread in the Western media during the bitter Balkan Wars of the 1990s. The blatant war crimes represented by that term were used to justify NATO bombing attacks against the perpetrators, and some of the leading architects were later brought to trial in the Hague, ending their lives in prison cells. So one very effective framing technique employed by Pappe is to open most

of his chapters by quoting a short passage describing some of those Balkan outrages, followed by pages of text demonstrating that the same crimes or far worse ones had also been committed by the Zionist forces a few decades earlier. In those 1990s conflicts, Gen. Wesley Clark, a Supreme NATO commander of Jewish ancestry, had famously declared "There is no place in modern Europe for ethnically pure states." But a certain Middle Eastern country had earlier received strong American support in its military efforts to achieve exactly that same objective.

One important point emphasized by the author was that from the beginning the Zionist leadership was quite confident of their comfortable military superiority over the forces they might face, not merely the almost unarmed Palestinian civilians whose towns and villages they planned to destroy, but even the armies of the neighboring Arab states that might eventually intervene. According to the myth of later Israeli propaganda, the local Palestinians only began fleeing after the State of Israel was declared and Arab armies invaded, but in actuality by that date some 200 Palestinian villages had already been attacked, with their inhabitants killed or expelled, and this brutal ethnic cleansing was what provoked the Arab military intervention.

Whether or not a local Palestinian village had amicable relations with nearby Zionist settlers was irrelevant and all were targeted for destruction. According to Pappe, the circumstances surrounding the notorious Deir Yassin massacre were particularly disreputable. That village had concluded a formal non-aggression pact with the main Zionist movement, so the leaders of the latter legalistically arranged for the Irgun and Stern Gang forces to launch the attack, which resulted in a brutal massacre of the inhabitants, with word of the horrific atrocities putting many other Palestinians to flight. Ultimately, more than 500 villages were attacked, usually with some of their men summarily executed and the remainder of the population expelled, while the buildings were destroyed and the entire village razed to the ground.

The population of all the Palestinian towns and cities were treated in similar fashion, with one subsection of the book entitled "The Urbicide of Palestine." Sometimes the inhabitants of nearby villages were deliberately massacred in order to terrorize the urban population and precipitate their flight, which was further encouraged by a bombardment of mortar shells or other high explosives. Any Palestinian property was casually looted, while rapes and gang-rapes also occurred, sometimes culminating with murder, although the true numbers of those incidents cannot be determined.

The year 1948 had begun with only 6% of Palestine's land under Jewish ownership, but the UN assigned 55% of the territory to the new Jewish state and its victorious military forces soon seized half of the proposed Palestinian state as well, only disappointed because they failed to seize the other half as they had hoped. Their original intent had been to expel all non-Jews from the territory under their control, and although they were ultimately 80% successful in this effort, their failure to dislodge the last 20% before the war ended led to later recriminations. But as Pappe explains, since 1948 Israel's remaining Palestinian minority has been legally confined to just 2% of the land compared to the 94% they had owned prior to the Zionist seizures and expulsions of that year.

One important point that Pappe makes is that the British had spent nearly three decades maintaining law and order in Palestine, and their military and police forces were still present in very large numbers even after the disposition of the territory had been put into the hands of the UN. As a result, Palestinian civilians had naively assumed that they would be protected from unprovoked attacks by the Zionist militias, and they were therefore shocked and unprepared when the British forces instead stood by and did nothing, placing them at the complete mercy of violent groups who stole their property or killed them with complete impunity.

Although I have never paid much attention to fashion or celebrity magazines, sisters Gigi and Bella Hadid are American supermodels whose images have graced the covers of many of those publications. Their paternal ancestry is Palestinian, and their elderly father recently told the painful story of how his parents had willingly taken in a family of pitiful Jewish refugees who arrived in their country from Europe. But then his mother traveled to a neighboring town for a few days to be with relatives during the birth of her child and when she returned, that Jewish family had seized their home and dispossessed them, refusing to allow them entrance to take any of their family photographs or even a blanket for their new-born baby.

The United Nations had legally created the State of Israel and in late 1948 after the end of the fighting, UN General Assembly Resolution 194 required the unconditional return of the Palestinian refugees, something that typically happened after the end of every military conflict. But although many of the families had fled their homes only days or weeks earlier, the Israeli government refused to comply, leading to the threat of American sanctions, though these were never imposed. Meanwhile, the Israelis sought to forestall any such possibility by accelerating their destruction of the emptied Palestinian villages and quickly resettling Jews in the abandoned homes of the towns and cities they had seized. For years afterward, the Israelis

would regularly shoot as “infiltrators” any Palestinians who tried to return to their homes and land, incidents that gradually set the stage for future wars.

Although I’d strongly recommend reading Pappe’s heavily documented book, those who prefer to absorb his important information in a different format can watch a long 2018 interview of the author, viewed nearly 300,000 times on Youtube, followed by Part Two of that interview or a shorter discussion of the book by a British blogger a few weeks ago.

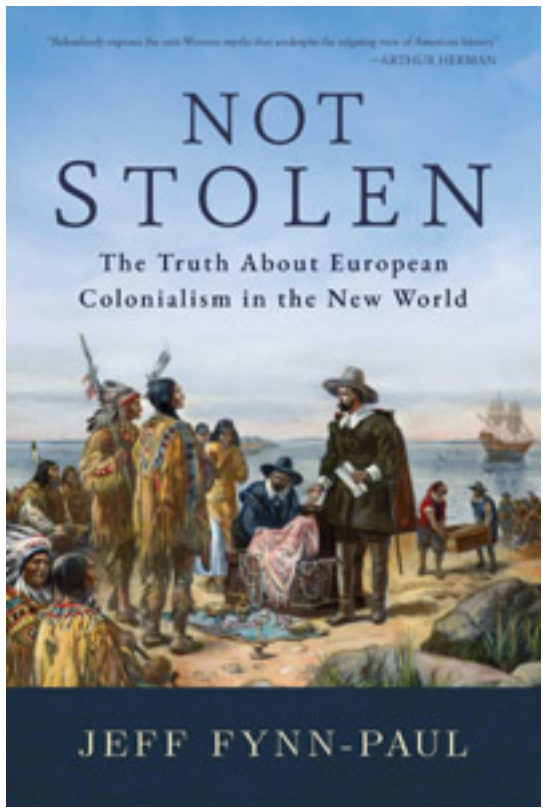
## Historical Analogies, False and True

As demonstrated in his interviews, Pappe is a deeply humanitarian individual of progressive sympathies and an outstanding scholar focused intensely upon the Middle East.  So on other matters outside his area of professional expertise, he naturally shares views that are widespread in his ideological circles.  For example, although his central theme is the appalling dispossession of the native Palestinians by Zionist settlers, he freely admits that the process was not so very different from what had previously happened in the United States, as European settlers dispossessed and ethnically cleansed the native Amerindians, and Finkelstein has sometimes made the same point. But I think that this historical analogy, so widely promoted both by

Israel's strongest defenders and its fiercest progressive critics, is based upon an extreme misrepresentation of the underlying facts.

Although the Amerindian societies of the Mexican Aztecs and Peruvian Incas were very large and heavily urbanized at the time of the Spanish Conquest, that was not at all the case for North America, which was thinly populated by numerous small tribes, many or most of which still maintained a hunter-gatherer lifestyle. No cities nor urban centers existed and the population was completely pre-literate, though some tribes did adopt civilized lifestyles and the use of a written language after a century or two of European contact.

The overwhelming majority of native deaths were due to the unintentional spread of European diseases for which they possessed no immunity, and most of these victims probably died before they had ever seen a white man or even heard that they existed. According to best estimates, perhaps no more than ten or twenty thousand Amerindians were killed by American whites across nearly three centuries of wars and massacres, a tiny fraction of those who fell in the constant inter-tribal warfare of that same period.



By the time the U.S. government began its successive waves of "Indian removals" during the nineteenth century, the white settler population had grown exponentially and outnumbered the natives by as much as 100-to-1. Furthermore, intermarriage had hardly been unknown, with the First Families of Virginia all proudly tracing their ancestry to an Indian princess, and many ordinary Americans also often made similar claims of having an Amerindian or two in their family tree.

During most of the 1920s, the Republican Senate Majority Leader was Charles Curtis, three-eighths Amerindian by ancestry and an enrolled member of the Kaw Nation. In 1929 Curtis became Herbert Hoover's Vice President, with his political elevation merely regarded as a minor curiosity instead of something provoking any sort of racial controversy. Most of these important historical facts were effectively presented in *Not Stolen* by historian Jeff Fynn-Paul, published earlier this year.

Needless to say, if the Jewish settlers in Palestine had already constituted 99% of the local population on the eve of the 1948 war, the situation would have been very different, and the same would be true today if most Israelis proudly boasted of their real or imagined Palestinian ancestry, with a top Israeli political leader having been half-Palestinian. The settlement histories of Israel and America have almost nothing in common.

However, although the histories of the two countries are totally dissimilar, aspects of their current historiographies do share an interesting connection. From its earliest days, American society had been governed by its traditional Anglo-Saxon ruling elite, descendants of the earliest settlers and together with assimilated ethnic groups, constituting a large majority of the national population. But during the twentieth century, their dominance was challenged by rising Jewish elites in a quiet struggle in which schools and universities became a key battlefield. So it is interesting that Howard Zinn and other Jewish academics spearheaded the effort to promote a tendentious or even fraudulent history of American settlement, perhaps regarding it as an ideological weapon that could destroy the political legitimacy of their Gentile rivals, much like Joan Peters unsuccessfully sought to do against the Palestinians.

Although the story of America's European settlement has little similarity to the unfortunate events that Pappe recounts, there does exist a strikingly close historical analogy, but one that receives no

mention in his text. A couple of sentences on the back cover of the paperback edition accurately summarized the contents:

> The 1948 Israeli War of Independence involved one of the largest forced migrations in modern history. Around a million people were expelled from their homes at gunpoint, civilians were massacred, and hundreds of Palestinian villages destroyed.

In reading his book, I had the sense that the author was shocked by the horrifying events he was describing, as were the Palestinian victims themselves, and he found it difficult to understand how the Zionist leadership believed that they could get away with crimes of such enormous magnitude, especially in the aftermath of the idealistic principles enshrined in the United Nations Charter by the victorious Allies of the Second World War. The opening pages of his book mention several previous ethnic cleansings, such as the 1913 case of the 200,000 Bulgarians expelled from Turkey. Yet he seems completely unaware that the largest ethnic cleansing in the history of the world, vastly greater in scale than the one he recounts, had taken place just a couple of years earlier, implemented with the full political support of the international organizations he admires.

Although Pappe probably shared the humanitarian sentiments of Freda Utley, it's possible that he has never heard of that prominent mid-twentieth century journalist. Born an Englishwoman, Utley had married a Jewish Communist and moved to the Soviet Union, then fled to America after her husband fell in one of Stalin's purges. Following the end of World War II, she traveled to Occupied Germany and described the horrific conditions she saw there, also including mention of events parallel to the subject of Pappe's book, but more than a dozen times larger, as I discussed in a 2018 article.

> Her book also gave substantial coverage to the organized expulsions of ethnic Germans from Silesia, the Sudatenland, East Prussia, and various other parts of Central and Eastern Europe where they had peacefully lived for many centuries, with the total number of such expellees generally estimated at 13 to 15 million. Families were sometimes given as little as ten minutes to leave the homes in which they had resided for a century or more, then forced to march off on foot, sometimes for hundreds of miles, towards a distant land they had never seen, with their only possessions being what they could carry in their own hands. In some cases, any surviving menfolk were separated out and shipped off to slave-labor camps, thereby producing an exodus consisting solely of women, children, and the very elderly. All

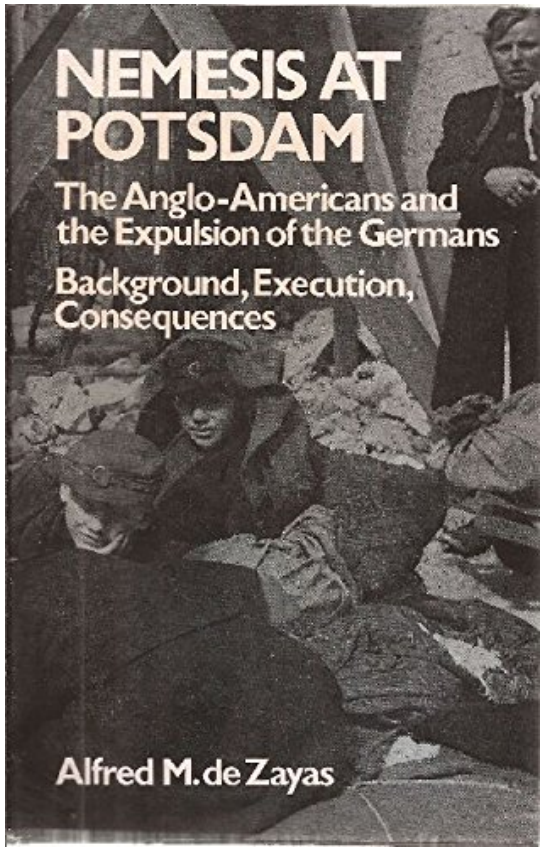
estimates were that at least a couple million perished along the way, from hunger, illness, or exposure.

These days we endlessly read painful discussions of the notorious "Trail of Tears" suffered by the Cherokees in the distant past of the early 19th century, but this rather similar 20th Century event was nearly a thousand-fold larger in size. Despite this huge discrepancy in magnitude and far greater distance in time, I would guess that the former event may command a thousand times the public awareness among ordinary Americans. If so, this would demonstrate that overwhelming media control can easily shift perceived reality by a factor of a million or more.

The population movement certainly seems to have represented the largest ethnic-cleansing in the history of the world, and if the Germany had ever done anything even remotely similar during its years of European victories and conquests, the visually-gripping scenes of such an enormous flood of desperate, trudging refugees would surely have become a centerpiece of numerous World War II movies of the last seventy years. But since nothing like that ever happened, Hollywood screenwriters lost a tremendous opportunity.

- American Pravda: Post-War France and Post-War Germany
  Ron Unz • ***The Unz Review*** • July 9, 2018 • 6,600 Words

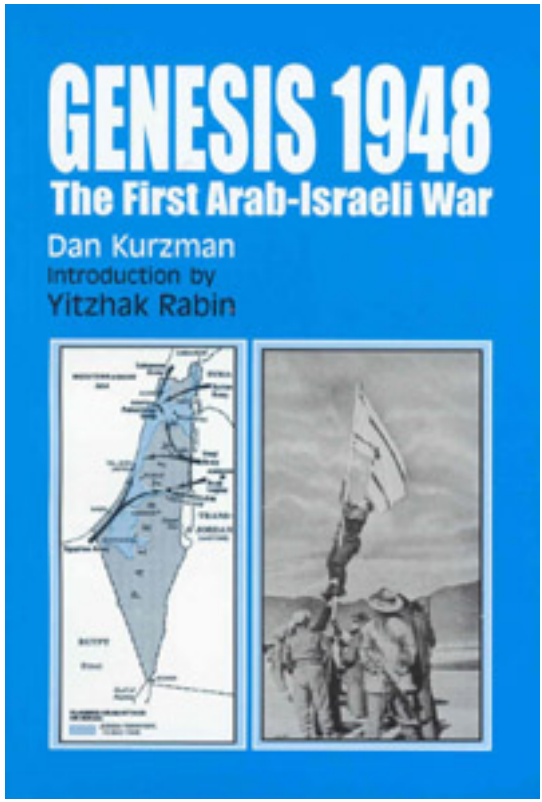
Although exact figures are unclear, my impression from Pappe's book is that several thousand Palestinian civilians probably died or were killed during the brutal events he describes, which began in 1947. But according to all estimates, ***two to three million*** German civilians had perished during a very similar process that had taken place just two years earlier, as they were expelled from lands they had peacefully occupied for many centuries. Surely the fact that those earlier ethnic expulsions had been ignored or endorsed by the Western governments provided the Zionist leaders with the confidence that their considerable political influence would allow them to do the same in Palestine, a confidence that proved completely warranted.



NEMESIS AT POTSDAM
The Anglo-Americans and the Expulsion of the Germans
Background, Execution, Consequences
Alfred M. de Zayas

The Wikipedia article on Ethnic Cleansing runs 6,000 words and includes scores of footnotes and references, but as might be expected, it never mentions the case of the *Nakba* suffered by the Palestinians, although it was one of the largest such examples in history and is much in the news these days. And for very similar reasons, it barely hints at the German expulsions from that same time period, although these may have been larger than all the other ethnic cleansings in the history of the world combined. Moreover, while the Palestinian tragedy has now finally acquired the identifying name of *Nakba* in the Western media, no such term has ever lent reality to the contemporaneous, vastly larger expulsions of the Germans, which instead have almost entirely vanished from public memory. For those interested in exploring the topic, I would recommend the important books by Alfred-Maurice de Zayas, a longtime human rights lawyer and historian, who spent decades working for the UN.

Some Other Books on the Israel/Palestine Conflict

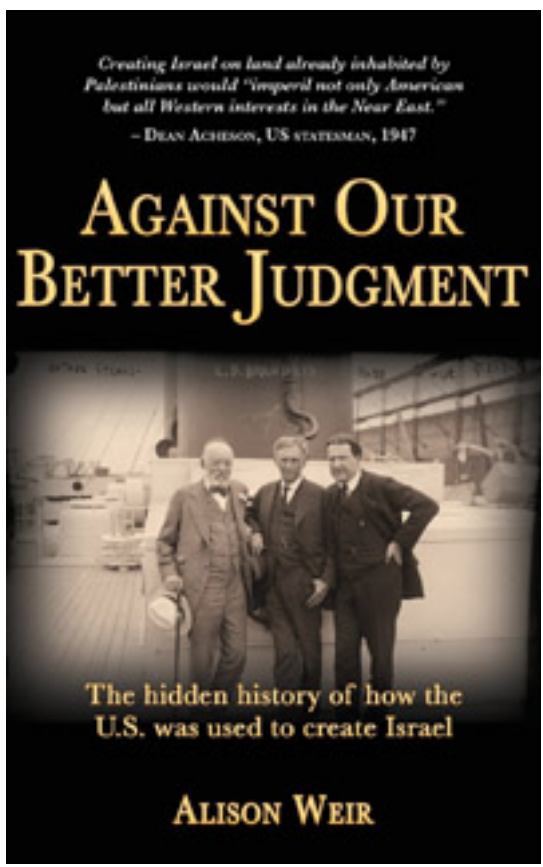


The books by Khalidi and Pappe greatly fortified my understanding of the 1948 war that had established the State of Israel and simultaneously created a vast number of Palestinian refugees. During the early 1980s I'd read Dan Kurzman's classic 1970 bestseller *Genesis 1948*, an entirely mainstream work that had formed my earliest understanding of the conflict. So with my knowledge of the facts now greatly expanded, the sudden outbreak of horrific violence in early October led me to reread that work again after more than 40 years. To my considerable surprise, it actually held up quite well, with the 800 pages of its paperback edition providing a gripping and reasonably even-handed account of the first Arab-Israeli war.

Kurzman was not an academic scholar, but as a prize-winning former *Washington Post* journalist he drew heavily upon the memoirs and books by some of the leading participants, supplemented by nearly 1,000 interviews with figures on all sides of the conflict. Although his emphasis might slightly favor the Israelis, he actually provided basic facts very different from the standard media narrative, mentioning the considerable superiority in size of the trained Zionist forces over the Arab armies, and the large quantity of new Soviet Bloc weapons the former had illegally received during a lengthy truce in the fighting.

The notorious Zionist massacre of the Deir Yassin villagers was described at length, along with the deliberate efforts to expel Palestinians from a number of other communities. The stories of the internal political conflicts within both camps were also told, with the various Arab states often at bitter odds with each other; the same was also true of the different Zionist factions, with the right-wing Zionists actually staging a bloody attempted coup in the middle of the war, with many lives lost as Jew killed Jew. Both Arabs and Zionists made numerous tactical and sometimes strategic blunders, and top military commanders of each side were killed by their own troops under rather suspicious circumstances.

Kurzman's book was very widely praised at the time it appeared, and although it cannot be considered a scholarly history of the conflict, after more than a half-century I think it still constitutes an excellent journalistic account of the first war, much less biased than the vast majority of everything else written at that time and afterward.

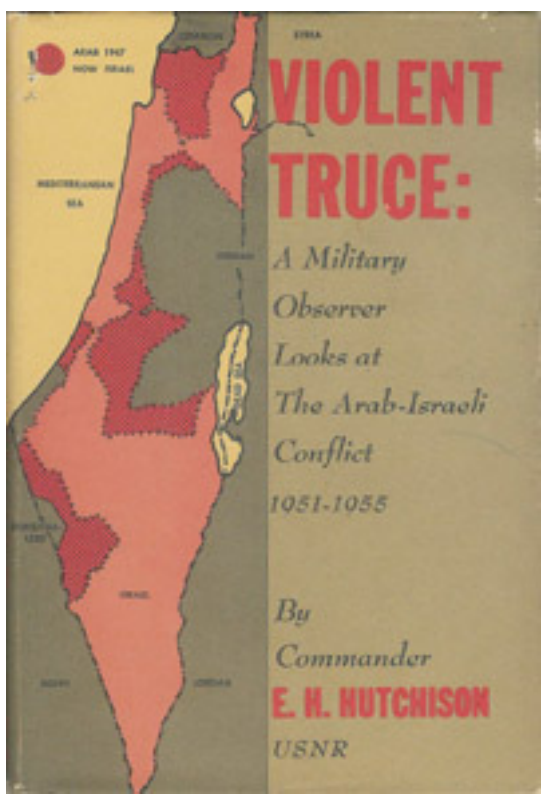


Creating Israel on land already inhabited by Palestinians would "imperil not only American but all Western interests in the Near East."
– Dean Acheson, US statesman, 1947
Against Our Better Judgment
The hidden history of how the U.S. was used to create Israel
Alison Weir

A very different sort of book that I'd strongly recommend is *Against*

*Our Better Judgment*, self-published in 2014 by Alison Weir, a journalist and anti-Zionist activist. Just as indicated by the subtitle, her work very succinctly summarizes the "hidden history" of Israel's creation, providing important facts ignored or severely distorted by the mainstream Western media. In her Preface, the author explains that what had originally begun as a long summary article ultimately became a very short book, with the main text running less than 100 small paperback pages, easily readable in just a couple of hours, but also including extensive notes and copious references for those who wish to dig deeper.

Although it contains some serious typos—in present-day terms the dollar value of the Palestinian property seized by the new Israeli state obviously totaled in the billions rather than the trillions—and makes one or two historical claims I find doubtful, Weir is generally a very careful writer and almost everything in her book seems quite solid and reliable, certainly far more so than some lavishly-promoted bestsellers issued by leading publishers and carrying the glowing blurbs of famous literati. If all educated Americans read this short book as an corrective to decades of skewed media propaganda, I think our Middle East policies would be in far better shape.

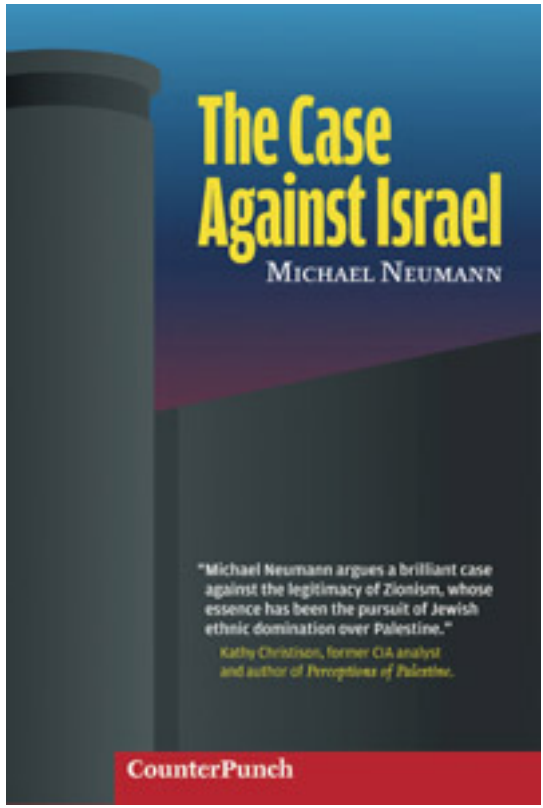


Evidence that America's extremely one-sided treatment of the Middle East conflict stretches back for generations is provided by *Violent Truce*, a short 1956 book that I recently reread several years after first encountering it. The author was Cmdr. E.H. Hutchison, a professional American naval officer who had been assigned to serve as a leader of the UN-authorized international peace-keeping force stationed between Israelis and Arabs in the aftermath of the original 1949 truce agreement.

Near the beginning of the text, the author explained that due to the coverage of the conflict in the American media, he had begun with a strongly favorable impression of Israelis, believing that they were fully in the right on the particulars of the conflict and he was suspicious of their Arab opponents. But once he was on the scene, the day-to-day incidents he encountered quickly led him to a polar-opposite conclusion. Virtually all the illegal actions and truce violations were on the Israeli side, even including a number of potentially deadly incidents directed at the international peace-keepers, not to mention poor Palestinian civilians. Such conclusions obviously differed very sharply from what was presented at the time in most American publications, but his account was fully endorsed and corroborated by several other UN military officers, including the top commanding general, and these individuals provided three separate Forwards to his book.

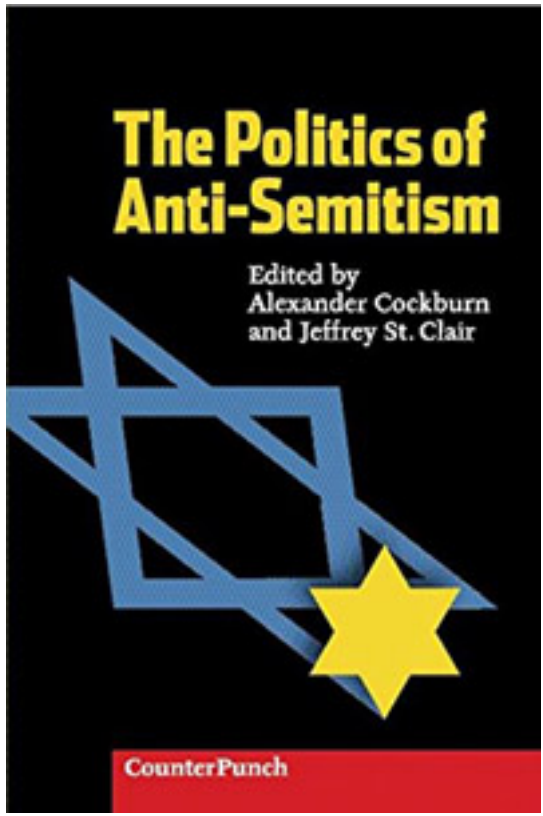
This first-hand eye-witness account by an American military officer failed to secure any major publisher and was only released by Devin-Adair, a small Irish-American press willing to publish such controversial material. Despite its appearance shortly after the 1956 Suez Crisis and Arab-Israeli war, it attracted little attention and readership compared to subsequent best-sellers glorifying Israel in propagandist terms, such as *Exodus* by Leon Uris. The manuscript had been finalized in late 1955, and anyone reading it would hardly have been surprised that the following year Israel embarked on a war of aggression against several of its neighbors.

Then as now, major publishers almost invariably shut their doors to books critical of Israel, which could only be released by tiny, often ideological presses or even be self-published. The terrible violence of the Second Intifada during the early 2000s led *Counterpunch Press* to publish several short books along these lines, which I recently reread after a few years.



The Case Against Israel
Michael Neumann
"Michael Neumann argues a brilliant case against the legitimacy of Zionism, whose essence has been the pursuit of Jewish ethnic domination over Palestine."
Kathy Christison, former CIA analyst and author of Perceptions of Palestine.
CounterPunch

*The Case Against Israel* by Canadian political philosopher Michael Neumann appeared in 2005 and was obviously intended as a response to Dershowitz's 2003 best-seller of the opposite title. The author effectively laid out the blatant immorality of the creation of the State of Israel as well as the unwarranted political and financial support it has continued to receive despite its harsh oppression of the Palestinians. But even leaving aside such philosophical matters of right and wrong, the text usefully provided a large quantity of important factual and historical information packed into its short length, which can easily be read in just a few hours.



Anyone who strongly criticizes Israeli policies let alone describes its origins and current status as immoral is certain to face bitter accusations of anti-Semitism, a word most recently extended to include criticism of the ongoing slaughter of Gaza's civilians. *The Politics of Anti-Semitism*, edited by Alexander Cockburn and Jeffrey St. Clair, was released in 2003 and covered exactly these recurring issues very thoroughly, containing essays by Finkelstein and Neumann along with more than a dozen others who have faced the same charges, notably including Prof. Edward Said of Columbia University. Nothing much has really changed in the last twenty years, except that the media censorship has become far more severe, necessitated by Israel's far greater recent war crimes.

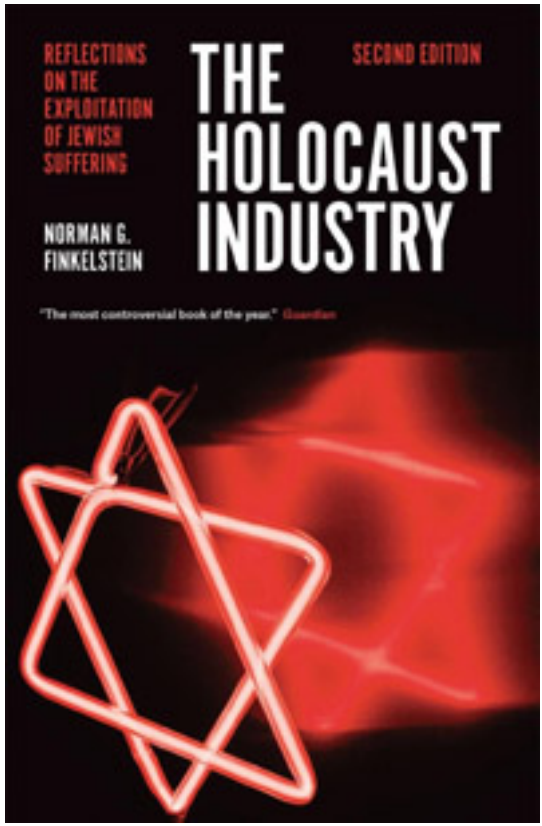
## The "Holocaust Industry" and Israel

There is a close and obvious connection between the Holocaust—the planned extermination of six million European Jews during the Second World War—and the creation of the State of Israel, which followed just three years later. Indeed, in 1993 Israeli historian Tom Segev published *The Seventh Million*, discussing that exact cause-and-

effect relationship, with the meaning of the title clear to everyone. So we should not be surprised that references to the Holocaust appear in almost all of the books discussed above, providing much of the explanation and justification for Israel's creation. That former historical event has served as an extremely powerful ideological weapon for the Zionists, insulating them from any major repercussions for their conquest and expulsion of the Palestinians.

Without the reality of the Holocaust, the decades-long Zionist project to create a Jewish State almost certainly would have failed. For example, Pappe emphasizes that although the British maintained an enormous military force in Palestine, with 100,000 troops garrisoning a country of less than two million, the political aftermath of the Holocaust left them unable to suppress widespread Zionist attacks using the same harsh methods they had successfully employed a decade earlier to crush the Arab Revolt.

This close connection between Holocaust and *Nakba* had some ironic consequences. In 1999 Peter Novick published *The Holocaust in American Life*, a seminal work noting that during the years immediately following the end of World War II, the Holocaust had been almost totally absent from public awareness in America, even among American Jews, and it was only during the 1960s that it gradually became a major topic of public discussion and media coverage, as well as a central issue for American Jewry. In an angry review, Norman Finkelstein argued that the 1967 Arab-Israeli war explained that transformation, as the Zionists desperately resurrected that forgotten history to justify and excuse their war of conquest and the oppression of the Palestinians that followed, while also using that narrative of threat and victimization to cement the loyalty of their wavering American supporters.



REFLECTIONS ON THE EXPLOITATION OF JEWISH SUFFERING
THE HOLOCAUST INDUSTRY
SECOND EDITION
NORMAN G. FINKELSTEIN
"The most controversial book of the year." Guardian

The following year Finkelstein expanded some of those same ideas into a short but blistering book entitled *The Holocaust Industry*, and he is best known for that work, which I'd originally read about a dozen years ago and now reread. According to the first paragraph of his Introduction, the Holocaust has become "an indispensable ideological weapon" that Israel uses to defend its "horrendous human rights record" against the Palestinians, and in the pages that follow he documented the massive corruption and dishonesty of the Jewish organizations involved in Holocaust activism, shaking down countries around the world for many billions of dollars based upon totally fraudulent claims. He also emphasized that many of the highest-profile Holocaust victims were outright fabricators and frauds, with his second chapter entitled "Hoaxers, Hucksters, and History."

Part of Finkelstein's outrage came from his personal connection to those historical events, given that both of his parents suffered in the German camps and most of his extended family perished during those wartime years. But he is a specialist on the Middle East rather than the Second World War or the Nazi era, and his overall perspective on the Holocaust seemed absolutely mainstream and conventional, with

his work winning the praise of Raul Hilberg, the founder and dean of Holocaust Studies.

Although his book was blacklisted and almost totally ignored by American publications, Europe's press was much less controlled in that era, and *The Holocaust Industry* became a huge publishing sensation there and across much of the rest of the world, reaching the top of many national bestseller lists and being translated into at least sixteen different languages.

Finkelstein was certainly correct in arguing that the Holocaust had become one of Israel's most powerful ideological weapons over the last half-century, a universal get-out-of-jail-free card that allowed the Jewish State to regularly violate all established principles of international law without incurring any serious penalty, while tightly binding the loyalty of Diaspora Jewry in America and the rest of the world. But even the most powerful propaganda tool has an eventual expiration date, and more than three generations have passed since the events in question, so over the years Israel's advocates have naturally sought out some effective replacement.

Under different circumstances, the Joan Peters theory later revived by Alan Dershowitz might have successfully established itself, with Western societies falling for the blatant hoax that the Palestinians were not native to Palestine, a "Big Lie" that Hollywood would have endlessly echoed in its productions. If so, the genre of "*Nakba* Denial" films might have gradually succeeded those commemorating the horrors of the Holocaust, thereby completely undercutting any public support for Zionism's millions of Palestinian victims. It's hardly surprising that Peters' ridiculous fraud was strongly endorsed by a towering figure of Holocaust scholarship such as Lucy Dawidowicz, along with Walter Reich, the founding director of the U.S. Holocaust Museum, and 1986 Nobel Laureate Elie Weisel. But Finkelstein himself successfully exposed that hoax before it could grow too deeply entrenched to be challenged.

Therefore, during the current Gaza conflict, the Israelis and their numerous media allies have been forced to rely upon a series of totally grotesque and unsubstantiated atrocity-hoaxes to deflect any criticism of their ongoing slaughter of tens of thousands of helpless Palestinian civilians. First, we were told that Hamas militants had beheaded forty Israeli babies, a story that soon faded away only to be replaced by the tale of a Jewish baby roasted in an oven. Most recently, the

mainstream media has been awash with the sudden discovery that Hamas had committed numerous brutal gang-rapes and horrific sexual mutilations on October 7th, events that apparently so traumatized all the victims and witnesses that no mention had ever been made until anonymous sources finally came forward to reveal those stunning facts almost two months later.

Some of these grisly reports of Hamas atrocities seem to echo past Holocaust claims involving Jews rendered into human-skin lampshades and bars of soap, fiendish Nazi atrocities that served as the lurid centerpiece of the Nuremberg Trials and other Allied propaganda, but which were eventually admitted to be total fabrications.

Just a few days ago *Grayzone* editor Max Blumenthal published an outstanding expose of the utterly disreputable sources of these current Hamas atrocity claims, an article that should be required reading for all journalists

- Scandal-stained Israeli 'rescue' group fuels October 7 fabrications
  Max Blumenthal • ***The Grayzone*** • December 6, 2023 • 4,600

Words

He also discussed the same material in a segment of his recent podcast.

The willingness of all our political and media elites to accept and regurgitate most of those current Hamas atrocity-hoaxes has enabled the continuing slaughter of tens of thousands of helpless Palestinians in Gaza. Reading Blumenthal's lengthy article describing the actual individuals behind those stories brought to mind a harsh verdict I'd rendered in a 2018 article:

> Anyone who reads serious history books knows that Jews have generally enjoyed a reputation for producing many of the world's greatest swindlers and frauds, hardly surprising given their notorious tendency to lie and dissemble. Meanwhile, the Jewish community also seems to contain far more than its fair share of the emotionally disturbed and the mentally ill, and perhaps as a consequence has served as a launching-pad for many of the world's religious cults and fanatic ideological movements.

## Holocaust Denial, Explicit and Implicit

I think that Blumenthal and others are completely correct in regarding

these current atrocity stories as highly implausible propaganda, obviously concocted in support of Israeli policies. But they might be very surprised to discover that soon after Israel's creation, knowledgeable individuals had condemned the entire traditional Holocaust narrative in very similar terms.

In his bestseller *The Holocaust Industry*, Finkelstein documented the massive dishonesty and self-serving corruption permeating so many of the most prominent aspects of that supposed historical event, but he never questioned his deeper underlying assumptions and casually dismissed so-called "Holocaust deniers" in just a couple of sentences. However, when I carefully investigated that same issue, I arrived at very different conclusions:

> Some years ago, I came across a totally obscure 1951 book entitled *Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.
>
> Beaty also sharply denounced American support for the new state of Israel, which was potentially costing us the goodwill of so many millions of Muslims and Arabs. And as a very minor aside, he also criticized the Israelis for continuing to claim that Hitler had killed six million Jews, a highly implausible accusation that had no apparent basis in reality and seemed to be just a fraud concocted by Jews and Communists, aimed at poisoning our relations with postwar Germany and extracting money for the Jewish State from the long-suffering German people.
>
> Furthermore, he was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which

> numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.
>
> Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty's book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk's iconic classic, *The Conservative Mind*.
>
> Moreover, although Jewish groups including the ADL harshly condemned the book, especially in their private lobbying, those efforts provoked a backlash, and numerous top American generals, both serving and retired, wholeheartedly endorsed Beaty's work, denouncing the ADL efforts at censorship and urging all Americans to read the volume. Although Beaty's quite explicit Holocaust Denial might shock tender modern sensibilities, at the time it seems to have caused barely a ripple of concern and was almost totally ignored even by the vocal Jewish critics of the work.

Thus, Beaty's huge 1951 national bestseller attracted enormous attention as well as massive criticism from Jews and liberals, yet although he was bitterly attacked on every other issue, none of them challenged him when he dismissed the Holocaust as merely a wartime propaganda-hoax that few still believed. Furthermore, a long list of our top World War II military commanders strongly endorsed Beaty's book making that claim.

As Novick has documented, during the decade or two following the end of the Second World War, the Holocaust seemed to have almost entirely disappeared from Western consciousnesses, a very strange development for an event of such supposedly enormous magnitude. In support of this conclusion, one of the very few books discussed above that made no mention of it in the context of Israel was Hutchinson's mid-1950s account of his experience as a UN truce inspector in that region. No one reading his story would have ever suspected that the Jews of Israel were "the seventh million," the pitiful remnant that had survived the annihilation of nearly all of European Jewry. The corresponding postwar chapters of an exhaustive investigation of the U.S. military by Holocaust scholar Joseph Bendersky provided a very similar absence of any such awareness.

As I went on to explain during my 2018 analysis of “Holocaust denial”:

> Beaty’s very brief 1951 discussion has been the earliest instance of explicit Holocaust Denial I have managed to locate, but the immediate postwar years seem absolutely rife with what might be described as “implicit Holocaust Denial,” especially within the highest political circles.
>
> Over the years, Holocaust scholars and activists have very rightfully emphasized the absolutely unprecedented nature of the historical events they have studied. They describe how some six million innocent Jewish civilians were deliberately exterminated, mostly in gas chambers, by one of Europe’s most highly cultured nations, and emphasize that monstrous project was often accorded greater priority than Germany’s own wartime military needs during the country’s desperate struggle for survival. Furthermore, the Germans also undertook enormous efforts to totally eliminate all possible traces of their horrifying deed, with huge resources expended to cremate all those millions of bodies and scatter the ashes. This same disappearance technique was even sometimes applied to the contents of their mass graves, which were dug up long after initial burial, so that the rotting corpses could then be totally incinerated and all evidence eliminated. And although Germans are notorious for their extreme bureaucratic precision, this immense wartime project was apparently implemented without benefit of a single written document, or at least no such document has ever been located.
>
> Lipstadt entitled her first book “Beyond Belief,” and I think that all of us can agree that the historical event she and so many others in academia and Hollywood have made the centerpiece of their lives and careers is certainly one of the most extremely remarkable occurrences in all of human history. Indeed, perhaps only a Martian Invasion would have been more worthy of historical study, but Orson Welles’s famous *War of the Worlds* radio-play which terrified so many millions of Americans in 1938 turned out to be a hoax rather than real.
>
> The six million Jews who died in the Holocaust certainly constituted a very substantial fraction of all the wartime casualties in the European Theater, outnumbering by a factor of 100 all the British who died during the Blitz, and being dozens of times more numerous than all the Americans who fell there in battle. Furthermore, the sheer monstrosity of the crime against

innocent civilians would surely have provided the best possible justification for the Allied war effort. Yet for many, many years after the war, a very strange sort of amnesia seems to have gripped most of the leading political protagonists in that regard.

Robert Faurisson, a French academic who became a prominent Holocaust Denier in the 1970s, once made an extremely interesting observation regarding the memoirs of Eisenhower, Churchill, and De Gaulle:

> Three of the best known works on the Second World War are General Eisenhower's *Crusade in Europe* (New York: Doubleday [Country Life Press], 1948), Winston Churchill's *The Second World War* (London: Cassell, 6 vols., 1948-1954), and the *Mémoires de guerre* of General de Gaulle (Paris: Plon, 3 vols., 1954-1959). In these three works not the least mention of Nazi gas chambers is to be found.
>
> Eisenhower's *Crusade in Europe* is a book of 559 pages; the six volumes of Churchill's *Second World War* total 4,448 pages; and de Gaulle's three-volume *Mémoires de guerre* is 2,054 pages. In this mass of writing, which altogether totals 7,061 pages (not including the introductory parts), published from 1948 to 1959, one will find no mention either of Nazi "gas chambers," a "genocide" of the Jews, or of "six million" Jewish victims of the war.

Given that the Holocaust would reasonably rank as the single most remarkable episode of the Second World War, such striking omissions must almost force us to place Eisenhower, Churchill, and De Gaulle among the ranks of "implicit Holocaust Deniers."

Many others seem to fall into that same category. In 1981, Lucy S. Dawidowicz, a leading Holocaust scholar, published a short book entitled *The Holocaust and the Historians*, in which she denounced so many prominent historians for having totally ignored the reality of the Holocaust for many years following World War II. Indeed, discussion of that topic was almost entirely confined to the Jewish Studies programs which committed ethnic activists had newly established at numerous universities throughout the country. Although Lipstadt's poor scholarly habits and hysterical style hardly impressed me, she appears to have been among the most successful academics who began a career in

those ethnic studies departments, which suggests that their average quality was far below her own.

Meanwhile, Dawidowicz emphasized that mainstream histories often entirely omitted the Holocaust from their presentations:

> But it is plain from the most cursory review of textbooks and scholarly works by English and American historians that the awesome events of the Holocaust have not been given their historic due. For over two decades some secondary school and college texts never mentioned the subject at all, while others treated it so summarily or vaguely as to fail to convey sufficient information about the events themselves or their historical significance.

With regard to serious scholarship, she notes that when Friedrich Meinecke, universally acknowledged as Germany's most eminent historian, published *The German Catastrophe* in 1946, he harshly denounced Hitler as the leader of "a band of criminals" but made absolutely no mention of the Holocaust, which surely would have represented the height of such criminality. Major British accounts of Hitler and World War II by leading historians such as A.J.P. Taylor, H.R. Trevor-Roper, and Alan Bullock were almost as silent. A similar situation occurred in America as late as 1972 when the massive 1,237 page *Columbia History of the World*, having a Jewish co-editor, devoted a full chapter to World War II but confined its discussion of the Holocaust to just two short and somewhat ambiguous sentences. One almost gets a sense that many of these experienced professional historians regarded discussion of the Holocaust as a considerable embarrassment, a subject that they sought to avoid or at least completely minimize.

Dawidowicz even castigates *Slaughterhouse-Five*, the 1969 fictional masterpiece by Kurt Vonnegut, for its bald assertion that the firebombing of Dresden was "the greatest massacre in European history," a claim that seems to reduce the Holocaust to non-existence.

I myself had noticed something similar just a couple of years before Dawidowicz's book appeared. The English translation of German journalist Joachim Fest's widely praised *Hitler* had been published in 1974 and I had read it a few years later, finding it just as excellent as the critics had indicated. But I remember being a little puzzled that the 800 page book contained no more than a couple of pages discussing the Nazi death camps and the

word “Jews” never even appeared in the index.

The vast majority of Hitler’s Jewish victims came from Russia and the Eastern European nations included in the Soviet Bloc. That was also the location of all the extermination camps that are the central focus of Holocaust scholars, and therefore the Soviets were the source of most of the key evidence used at the Nuremberg Trials. Yet Dawidowicz notes that after Stalin grew increasingly suspicious of Jews and Israel a few years after the end of the war, virtually all mention of the Holocaust and German wartime atrocities against Jews vanished from the Soviet media and history books. A similar process occurred in the Warsaw Pact satellites, even while the top Communist Party leadership of many of those countries often remained very heavily Jewish for some years. Indeed, I recall reading quite a number of newspaper articles mentioning that after the Berlin Wall fell and the sundered halves of Europe were finally reunited, most Eastern Europeans had never even heard of the Holocaust.

These days, my morning newspapers seem to carry Holocaust-related stories with astonishing frequency, and probably no event of the twentieth century looms so large in our public consciousness. According to survey data, even as far back as 1995, some 97% of Americans knew of the Holocaust, far more than were aware of the Pearl Harbor attack or America’s use of the atomic bombs against Japan, while less than half our citizenry were aware that the Soviet Union had been our wartime ally. But I’d suspect that anyone who drew his knowledge from the mainstream newspapers and history books during the first couple of decades after the end of the Second World War might never have even been aware that any Holocaust had actually occurred.

The late scholar Raul Hilberg is universally acknowledged as the founder of modern Holocaust studies, which began with the 1961 publication of his massive volume *The Destruction of the European Jews.* In his very interesting 2007 Hilberg obituary, historian Norman Finkelstein emphasizes that prior to Hilberg’s work, there had been virtually no writing on the Holocaust, and discussion of the topic was considered almost “taboo.” For a recent event of such apparent enormity to have been so completely wiped away from public discussion and the consciousness of historians and political scientists can be explained in several different ways. But once I began to investigate the circumstances behind Hilberg’s ground-breaking work, I encountered all sorts of strange ironies.

According to Wikipedia, Hilberg's family of Austrian Jews coincidentally arrived in the United States on the exact day in 1939 that war broke out, and in his early teens he was soon horrified to read all the news reports of the ongoing extermination of his fellow Jews in the continent his family had left behind, even telephoning Jewish leaders asking why they were doing so little to save their kinsmen from annihilation. He subsequently served in the U.S. military in Europe, then majored in Political Science at Brooklyn College after the end of the conflict. The inspiration for his future scholarly focus seems to have come when he was shocked by a remark made by one of his lecturers, Hans Rosenberg:

> The most wicked atrocities perpetrated on a civilian population in modern times occurred during the Napoleonic occupation of Spain.

When Hilberg asked how Rosenberg, himself a German-Jewish refugee, could have so totally ignored the murder of 6 million Jews, a monstrous crime committed just a couple of years earlier, Rosenberg sought to deflect the question, saying that "it was a complicated matter" and "history doesn't teach down into the present age." Since Rosenberg was a student of Meinecke, whom Lipstadt has bitterly denounced as an implicit Holocaust Denier, one wonders whether Rosenberg may have shared the beliefs of his mentor but was reluctant to admit that fact to his overwhelmingly Jewish students in emotionally-charged postwar Brooklyn.

Later, Hilberg conducted his doctoral research at Columbia under Franz Neumann, another German-Jewish refugee scholar. But when Hilberg indicated he wanted his research to focus on the extermination of Europe's Jews, Neumann strongly discouraged that topic, warning Hilberg that doing so would be professionally imprudent and might become "his academic funeral." When he attempted to publish his research in book form, it received numerous negative reviews, with Israel's Yad Vashem fearing it would encounter "hostile criticism," and over a six year period, it was rejected by several major publishing houses along with Princeton University, based on the advice of the influential Jewish intellectual Hannah Arendt. One naturally wonders whether all these established scholars may have quietly known something that a naive young doctoral candidate such as Hilberg did not. His book only appeared in print because a Jewish immigrant whose business had suffered under the Nazis funded

the entire publication.

Consider the interesting case of Field Marshal Erhard Milch, Hermann Goering's very powerful number-two in the German Luftwaffe. His father was certainly a Jew, and according to researchers Robert Wistrich and Louis Snyder, there is archival evidence that his mother was Jewish as well. Now it is certainly not impossible that a Third Reich supposedly dedicated with grim fanaticism to the extermination of each and every Jew might have spent the entire war with a full- or half-Jew near the absolute top of its military hierarchy, but surely that puzzling anomaly would warrant careful explanation, and Milch's apparent Jewish background was certainly known during the Nuremberg Trials.

Indeed, the fascinating and widely-praised 2002 book *Hitler's Jewish Soldiers* by Bryan Mark Rigg notes that aside from Milch, Hitler's military contained over a dozen half-Jewish generals and admirals and another dozen quarter-Jews of that same high rank, plus a total of roughly 150,000 additional half- or quarter-Jewish soldiers, with a large fraction of these being officers. All of these individuals would have had some fully-Jewish parents or grand-parents, which seems decidedly odd behavior for a regime supposedly so focused on the total eradication of the Jewish race.

My belief is that anyone who carefully reads the books of leading Holocaust scholars such as Peter Novick, Deborah Lipstadt, Lucy Dawidowicz, and Joseph Bendersky with an open mind and a skeptical eye will inevitably come to the same conclusion that I did:

I think it far more likely than not that the standard Holocaust narrative is at least substantially false, and quite possibly, almost entirely so.

- American Pravda: Holocaust Denial

## Inversions of Reality, Now and in the Past

For more than two months, Israeli forces have relentlessly bombarded Gaza, committing the greatest televised massacre of helpless civilians in the history of the world. Israeli leaders have regularly used genocidal language to describe their plans, even suggesting that nuclear weapons be used to completely annihilate Gaza's population of more than two million. Many tens of thousands of buildings have been destroyed, including hospitals, schools, universities, and all the

other civilian facilities whose deliberate targeting during military conflicts have always been regarded as war crimes.

Yet when the chief prosecutor of the International Criminal Court recently visited Israel, his primary focus was upon preparing charges against Hamas and other Palestinian groups for the deaths of Israeli civilians in early October.

And even in that regard, there is growing evidence that many or most of the unarmed Israeli civilians killed in the original Hamas attack actually died at the hands of trigger-happy Israeli forces, suggesting that the true ratio of such victims may now be greater than 100-to-1 against the Palestinians.

All these facts are easily available to anyone who investigates the matter. But the vast majority of Americans who derive their knowledge of the world from our mainstream broadcast media probably continue to see the Israelis as the helpless, suffering victims, a remarkable inversion of reality. As I had explained in 2018, the unfortunate history of the twentieth century provides even greater examples of such strange reversals of reality:

> Indeed, the topic of Communism raises a far larger issue, one having rather touchy implications. Sometimes two simple compounds are separately inert, but when combined together may possess tremendous explosive force. From my introductory history classes and readings in high school, certain things had always seemed glaringly obvious to me even if the conclusions remained unmentionable, and I once assumed they were just as apparent to most others as well. But over the years I have begun to wonder whether perhaps this might not be correct.
>
> Back in those late Cold War days, the death toll of innocent civilians from the Bolshevik Revolution and the first two decades of the Soviet Regime was generally reckoned at running well into the tens of millions when we include the casualties of the Russian Civil War, the government-induced famines, the Gulag, and the executions. I've heard that these numbers have been substantially revised downwards to perhaps as little as twenty million or so, but no matter. Although determined Soviet apologists may dispute such very large figures, they have always been part of the standard narrative history taught within the West.
>
> Meanwhile, all historians know perfectly well that the Bolshevik leaders were overwhelmingly Jewish, with three of the five

revolutionaries Lenin named as his plausible successors coming from that background. Although only around 4% of Russia's population was Jewish, a few years ago Vladimir Putin stated that Jews constituted perhaps 80-85% of the early Soviet government, an estimate fully consistent with the contemporaneous claims of Winston Churchill, *Times of London* correspondent Robert Wilton, and the officers of American Military Intelligence. Recent books by Alexander Solzhenitsyn, Yuri Slezkine, and others have all painted a very similar picture. And prior to World War II, Jews remained enormously over-represented in the Communist leadership, especially dominating the Gulag administration and the top ranks of the dreaded NKVD.

Both of these simple facts have been widely accepted in America throughout my entire lifetime. But combine them together with the relatively tiny size of worldwide Jewry, around 16 million prior to World War II, and the inescapable conclusion is that in per capita terms Jews were the greatest mass-murderers of the twentieth century, holding that unfortunate distinction by an enormous margin and with no other nationality coming even remotely close. And yet, by the astonishing alchemy of Hollywood, the greatest killers of the last one hundred years have somehow been transmuted into being seen as the greatest victims, a transformation so seemingly implausible that future generations will surely be left gasping in awe.

Our false image of historical reality is constructed and maintained on a daily basis by journalists, but I suspect that most of them remain just as unaware of the true facts as the rest of our society.

Consider the case of Emily Bazelon, whose *New York Times Magazine* cover-story described the tragic, three-decade failure of Israeli and Palestinians to achieve a just peace in their bitter conflict.

Based upon her background, I would assume that she is a staunch liberal, enormously proud of her grand-father David L. Bazelon, who reigned for more than two decades as the Chief Justice of America's most important Appellate court, a jurist whose enormous influence on civil libertarian matters had established him as one of the most influential judicial figures of the twentieth century, a towering hero of American progressives. In that role, he had also served as a mentor to Alan Dershowitz, who had clerked for him, and surely helped shape the latter's notions of honesty and justice.

I had never questioned those facts. But several years ago I read a pair of very thick volumes on the history of organized crime by Gus Russo, one of our leading investigative reporters on that subject and discovered that important elements had been airbrushed out of Bazelon's celebrated background. Bazelon had been elevated to the bench at the age of 40, becoming the youngest Appellate justice in American history. But prior to that, his personal legal activities had been of a rather different type.

After beginning his career as a young mob-lawyer for Al Capone's Chicago Syndicate, he had then played a central role in looting the property of the dispossessed Japanese-Americans of California and distributing their billions of dollars worth of seized assets to other Jewish families with Syndicate ties on extremely favorable terms, while becoming very wealthy through the huge kickbacks he collected. Thus, during exactly the same years that Zionist settlers were dispossessing and looting the property of the unfortunate inhabitants of Palestine on racial grounds, their Jewish cousins in America were doing much the same thing to a different group within the United States:

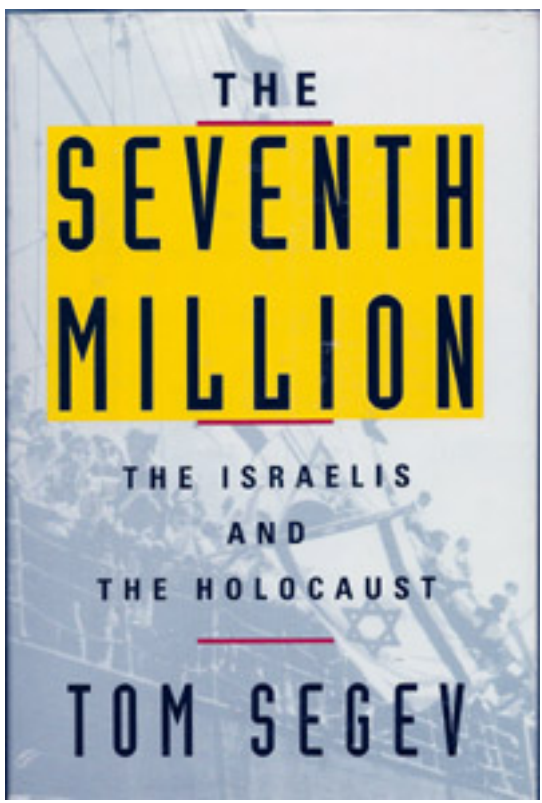
# Israel and the Holocaust Hoax

***The Unz Review*** • January 8, 2024 • 8,200 Words

Last month I explored the historical origins of the State of Israel and the intertwined expulsion of the Palestinian refugees from their ancient homeland. During this discussion, I emphasized the crucial role that the Jewish Holocaust had played in justifying and facilitating those momentous events of three generations ago.

- American Pravda: The *Nakba* and the Holocaust
  Ron Unz • ***The Unz Review*** • December 11, 2023 • 14,600 Words



I read or reread more than a dozen books for my long review article, and also glancingly mentioned an additional one, which I've now digested as well. My main focus had been on the Israeli/Palestinian conflict, and *The Seventh Million* by Tom Segev only slightly touched on that topic. But his descriptive subtitle "The Israelis and the Holocaust" suggested a related subject of inquiry that proved quite

fruitful.

Born in 1945, Segev is generally regarded as one of Israel's leading journalists, the author of numerous widely-praised histories regarding Israel's origins and its various wars. Although his 1991 bestseller was controversial, the back cover carried glowing praise from such top Israeli figures as Abba Eban and Amos Elon, as well as important Holocaust scholars such as Prof. George L. Mosse and leaders of the Jewish diaspora such as Nobel Laureate Elie Wiesel. I found it quite enlightening, though perhaps not entirely in the way the author intended.

Even aside from its main theme, the first chapter provided some extremely useful information. Back in 2018, I'd drawn upon the shocking research found in the books of maverick leftist Lenni Brenner to publish a long article on the surprising relationship between the various Zionist factions and Nazi Germany, which spent most of the 1930s working together in a close economic partnership that laid the basis for the creation of the State of Israel.

- American Pravda: Jews and Nazis
  Ron Unz • ***The Unz Review*** • August 6, 2018 • 6,800 Words

Although Brenner's documentary research seemed rock-solid and had never been seriously challenged, I'd always had a few slight doubts at the back of my mind. I had wondered whether such utterly astonishing facts could really be true and yet remained totally concealed for generations by virtually all of our journalists and academics, but Segev's brief discussion completely put those concerns to rest. Segev is a very mainstream pro-Zionist Israeli writer and he probably despised Brenner, a radical anti-Zionist Trotskyite, never mentioning the name of the latter anywhere in his nearly 600 pages of text. But Segev drew upon the same underlying archival sources to fully confirm all of Brenner's most incendiary historical claims and even added a few additional ones, though all of this similar material was obviously presented in a very different fashion.

By the 1920s the mainstream leftist Zionist movement was heavily influenced by Marxism and led by Russian-born David Ben-Gurion, who modeled himself after Lenin, but those Zionists still eagerly formed a 1930s economic partnership with Nazi Germany based upon an obvious commonality of interests. Hitler was eager to encourage the departure of Germany's problematical 1% Jewish minority while the Zionists were just as eager to receive them, along with the huge infusion of financial and industrial capital they could provide. During

this period, important SS leaders including Adolf Eichmann were invited to Palestine as honored Zionist guests and then published their flattering accounts of the successful development activities of their Zionist partners in Joseph Goebbels' leading Berlin Nazi newspaper. Some Zionist leaders reciprocated, traveling to Germany for very friendly meetings with their Nazi counterparts, and they reported how well the Jews of that country seemed to be doing despite Hitler's supposedly harsh new regime.

Indeed, Segev's figures demonstrate the enormous prosperity of German Jews, explaining why the Zionists were so eager to arrange for them to relocate to impoverished Palestine. The Nazis agreed that every such Jewish emigrant could take with him the present-day equivalent of \$200,000 in foreign currency, plus another \$250,000 or more in German merchandise. These were huge sums for what had been the desperately poor society of Weimar Germany, and such Jewish wealth had obviously been one of the major sources of anti-Semitic resentment in that country.

If the main Zionist groups cooperated with Nazi Germany on purely utilitarian grounds, their right-wing Zionist rivals had more ideological motives since they had modeled their movement after that of Mussolini, and always regarded themselves as fascists as did their bitter opponents. Many of these Zionists even considered Hitler's notorious anti-Semitism as a mere political blemish rather than as an insupportable obstacle preventing their admiration. In 1933 a leading Zionist writer ranked the German dictator among the world's "shining names," alongside Mussolini, Ataturk, and the various other right-wing heroes of his movement, while another Zionist figure had loudly declared that "Hitler saved Germany." Even after World War II began, one of these Zionist factions led by a future prime minister of Israel repeatedly sought to enlist in the Axis Powers, hoping to join the military alliance led by Hitler and Mussolini.

One of the interesting points made by Segev is that although a large majority of ordinary Jews around the world were intensely hostile to Hitler's regime, the leadership of most of the different Zionist factions quietly became fierce competitors for German patronage, with those that lost out then sometimes hypocritically denouncing the Nazi affiliations of their more successful rivals. These bitter words led to the 1933 assassination of one of the top mainstream Zionist leaders in Palestine at the hands of his right-wing critics.

Although this Nazi-Zionist partnership was controversial at the time, it obviously became much more so following the Axis defeat and the

concerted Allied effort to demonize the Nazis through the Nuremberg show trials and other propaganda spectaculars, so the newly established State of Israel made every effort to hide this dark secret of its recent past. When those 1930s historical facts later threatened to leak out in the mid-1950s due to the legal problems of an important Israeli political figure, the man was assassinated, and Segev suggested that Israel's government had probably arranged the killing in order to permanently shut his mouth.

After that rather surprising first chapter, the bulk of Segev's narrative shifts to a very different topic, namely Israel's tangled relationship with the Holocaust, the deliberate extermination of some six million helpless Jewish civilians by Nazi Germany, mostly in the gas chambers of various World War II concentration camps. On these basic facts, the author's views seem absolutely conventional ones, and at several points he notes the bestial cruelty of the diabolical Nazi plan to erase all Jews from the world. But although references to the Holocaust, gas chambers, or the most famous concentration camps such as Auschwitz, Treblinka, Sobibor, and Dachau are sprinkled across a large fraction of all these pages, Segev largely avoids discussing the details of that industrial slaughter, apparently assuming that all of his readers are thoroughly familiar with the standard narrative account produced by modern Holocaust scholarship, which began in the wake of Raul Hilberg's seminal 1961 volume. Ironically enough, Segev notes that as of the date of his writing, Hilberg's classic work still remained untranslated into Hebrew, probably because it had reported that all those many millions of Jews had willingly gone to their deaths, shepherded by their own community leadership and without ever showing any signs of active resistance.

However, Israeli society is unusual in that such a substantial fraction of its founding population consisted of postwar Holocaust survivors, "the seventh million" of Segev's title, individuals who had themselves passed through the various Nazi death camps. Therefore, their gripping personal accounts seem to have provided much of the understanding of those momentous events for the Israeli public, including Segev himself, who was born just weeks before Hitler's suicide and the collapse of his German regime.

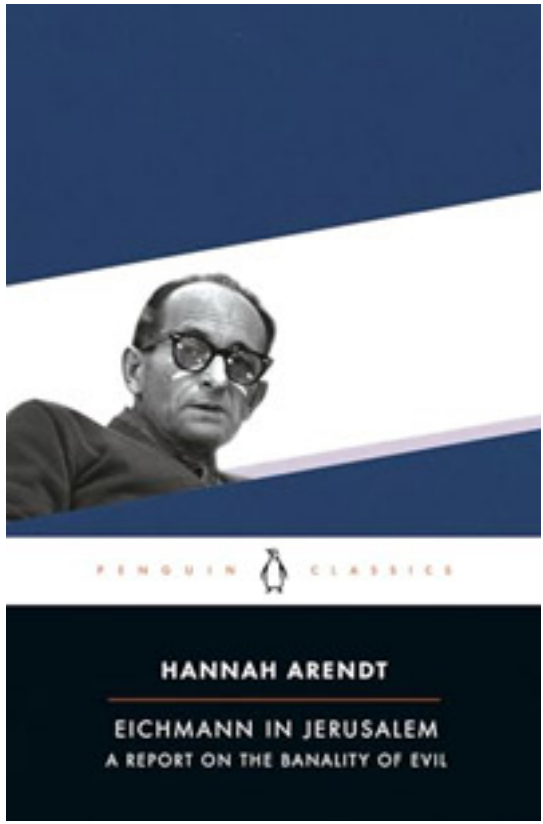
Perhaps because Segev's first chapter documented the close Nazi-Zionist partnership of the 1930s, which might disconcert his readers, he preceded this discussion with a Prologue that recounted the utter horrors of the Holocaust that soon followed chronologically. He

focused upon the books of a particular Auschwitz survivor named Yehiel De-Nur, who had spent two years at that notorious death camp, and although the name of that writer means little in America these days, he became a celebrated postwar author in Israel.

Although all of De-Nur's several autobiographical volumes were published under a pseudonym and his true identity remained concealed for many years, his works constituted some of the earliest Holocaust literature in Israel and were hugely influential in bringing the horrifying details of that catastrophe to Israeli popular attention, with a special literary prize established in his honor, awarded every two years by Israel's president.

Indeed, Segev explained that he and most other Israeli teenagers of his generation first learned the extremely disturbing details of the Holocaust from De-Nur's books, so when he managed to arrange a personal interview with the author, he did so with great trepidation. De-Nur's writing had always emphasized the sadistic acts that were a daily part of life at Auschwitz, including the widespread sexual abuse of young Jewish boys and girls by their Nazi captors, and Segev describes the works as considerably pornographic.

According to Segev, De-Nur had been a young Yeshiva student in pre-war Poland with huge literary pretensions, desperately trying to get his writing into print when the war came along and he ended up at Auschwitz.  De-Nur later claimed that Eichmann had personally condemned him to that fate so he served as a leading witness at the 1961 Eichmann trial, with his testimony ended in a fainting spell, supposedly reflecting the unspeakable personal memories that still haunted him even decades later.



As it happens, I also recently read Hannah Arendt's 1963 classic *Eichmann in Jerusalem*, and De-Nur was one of the few witnesses whom she also focused upon, treating his testimony far less gently than did Segev. According to her account, De-Nur's bizarre, rambling monologue included a heavy focus upon astrology and all sorts of other strange things, considerably embarrassing the serious legal proceedings. When the prosecutor finally interrupted to ask a couple of basic, factual questions, De-Nur immediately collapsed in a hysterical fit, allowing the judge to salvage the situation by ordering the witness permanently removed from the stand. Arendt suggested that De-Nur's testimony demonstrated the tremendous difficulty that emotional eyewitnesses sometimes have in distinguishing between their actual memories of events from many years earlier and the products of their own vivid imagination.

Indeed, Segev seemed to confirm Arendt's observation, explaining that De-Nur had been so emotionally broken by his experiences at Auschwitz that he required many years of psychiatric counseling and also began a series of LSD treatment-sessions, in which he recalled visions of his days in the camp. Eventually, he produced a new

Holocaust manuscript that included presumably imaginary scenes of such brutal events as an SS guard murdering the Jewish boy who had been the victim of his sexual perversions, then grilling the boy's body on a spit and devouring the flesh piece by piece.

These bizarre pages of the Prologue apparently represent much of the Holocaust narrative as understood by most Israelis and I found it rather disconcerting that they were immediately followed by the chapter describing the mundane details of the Nazi-Zionist partnership of just a few years earlier, an extremely odd juxtaposition of such radically different situations. Thus, according to Segev's apparent reconstruction, the friendly and respectful business arrangements between German Nazis and Zionist Jews of the late 1930s were suddenly replaced in the early 1940s by a diabolical and sadomasochistic effort by the Nazis to totally exterminate all of the world's Jews, an extremely strange transformation that raised serious questions in my mind.

A DIFFERENT KIND OF

She committed crimes so terrible
even the SS feared her!
ILSA
She Wolf of the SS
DYANNE THORNE as ILSA
WARNING: SOME MEMBERS OF THE PUBLIC MAY FIND CERTAIN SCENES IN THIS FILM OFFENSIVE AND SHOCKING - the Management

As far as I know, the mainstream Holocaust narrative in America has never portrayed the German concentration camps as hotbeds of rampant sadomasochistic sexual perversion. However, such themes

were found in a series of popular 1970s exploitation films beginning with *Ilsa, She-Wolf of the SS*. This leads me to wonder if many of those survivor-based accounts in Israel might fall into that same category. And indeed, according to De-Nur's Wikipedia page, a Holocaust organization in Israel has denounced De-Nur's books as merely pornographic fiction, not least because Nazi law absolutely prohibited any sexual relations between Aryans and Jews.

Equally bizarre and scatological stories had also been found in *The Painted Bird* by writer Jerzy Kosinski, which in 1976 became America's first widely popular Holocaust memoir. But that huge bestseller was later revealed to be totally fraudulent, and the plagiarizing author eventually committed suicide. Indeed, there have been so many fake Holocaust memoirs over the years that they nearly constitute a literary genre of their own. Probably the most world's most famous Holocaust survivor was Elie Wiesel, who parlayed the stories of his wartime suffering into becoming an enormous political celebrity, capping his career with a Nobel Peace Prize in 1986, whose announcement declared him "a messenger to mankind." Yet journalist Alexander Cockburn has persuasively argued that Wiesel was simply a fraud, and his famous autobiographical work *Night* just another literary hoax.

According to Segev, one odd element of Israeli Holocaust dogma has been the widespread, almost universal conviction that the Nazis had rendered Jewish bodies into soap, with even top government leaders firmly describing that atrocity as fact. Not only was this a notorious hoax, but Segev explained that Yad Vashem, Israel's most authoritative center of Holocaust research has fully debunked it as totally fraudulent.

Meanwhile, even some of the less gruesome stories that Segev passes along seem rather doubtful. According to a prominent Israeli attorney who later claimed to have liberated death camps as a Jewish officer during the war, a large group of men, women, and children were herded into one of the gas chambers, but because their numbers were insufficient, the penny-pinching Germans didn't want to waste a full dose of gas on them, so they were forced to stand there naked for a day and a night awaiting additional victims, only to be rescued from death when their camp was suddenly liberated.

In reading Segev's account of the role of the Holocaust in Israeli society and the sort of outrageous Holocaust stories that dominated

the narrative in that country, I couldn't avoid noticing a strong connection to much more recent events.

The surprisingly successful Hamas attack on October 7th was deeply embarrassing to the Israelis, and pro-Israel propagandists soon began heavily emphasizing ridiculous hoaxes such as the claims of forty beheaded babies or a baby roasted in an oven. All of these frauds were provided by extremely disreputable characters, but eagerly accepted and promoted by leading Western political elites and media outlets.

The latest wave of very doubtful claims has focused upon second-hand stories of Hamas gang-rapes and sexual mutilations. These accounts only came to light two months after the events in question and lacked any supportive forensic evidence, with many of the claims coming from the same individuals behind the beheaded babies hoax, suggesting that they are equally desperate propaganda ploys. Journalists Max Blumenthal, Aaron Mate, and others have discussed the extreme credulity of the *Times* and other media outlets in promoting these blatantly fraudulent stories. Many of these points are summarized in a brief video discussion:

Meanwhile, consider the very strong evidence from silence. According

to news reports, small GoPro cameras were worn by the attacking Hamas militants, which recorded all their activities, and the Israelis recovered many of these from their bodies and began carefully examining hundreds of hours of this extensive video footage. They surely would have soon released a video compilation providing any incriminating evidence that they found, yet I'm not aware of a single public clip that shows any such brutal atrocities or mass killings, strongly suggesting that very little of that occurred. Indeed, the *Gray Zone* demonstrated that the main photograph provided of an allegedly raped and murdered Israeli woman actually turned out to be that of a female Kurdish fighter from years earlier that had been plucked off the Internet, demonstrating the apparent desperation and dishonesty of the pro-Israel propagandists promoting these stories.

These developments bring to mind a couple of paragraphs I'd published in 2018 on similar matters:

> Anyone who reads serious history books knows that Jews have generally enjoyed a reputation for producing many of the world's greatest swindlers and frauds, hardly surprising given their notorious tendency to lie and dissemble. Meanwhile, the Jewish community also seems to contain far more than its fair share of the emotionally disturbed and the mentally ill, and perhaps as a consequence has served as a launching-pad for many of the world's religious cults and fanatic ideological movements.
>
> Although a tendency to lie and exaggerate was hardly unique to the political partisans of Russian Jewry, the existence of a powerful international network of Jewish journalists and Jewish-influenced media outlets ensured that such concocted propaganda stories might receive enormous worldwide distribution, while the truth followed far behind, if at all.

The *Gray Zone* editors noted that any skeptical analysis of those outrageous Hamas atrocity stories has prompted pro-Israel advocates to fiercely denounce such critics while stubbornly refusing to provide any solid evidence.

This is obviously correct. However, I think an equally skeptical approach must also be applied to the conventional narrative of the Holocaust, which constitutes the central ideological pillar of the Jewish State, its political leadership, and its committed supporters, both Jewish and Gentile alike. Unfortunately, applying such

analytical methods may be quite psychologically difficult for many Westerners because over the last couple of generations Hollywood has elevated that historical event of the 1940s into something resembling a quasi-religion. As I wrote in 2018:

> All three of America's television networks were under Jewish ownership or control, so it was hardly surprising that two years later *ABC* decided to repeat this process with the 1978 television miniseries *Holocaust*, which also achieved an audience of 100 million and generated enormous profits…
>
> The following year, William Styron published *Sophie's Choice*, a heart-rending tale involving deeply buried memories of the extermination of Christian Polish children in the Auschwitz gas chambers. Although such an occurrence was absolutely contrary to the doctrines of all Jewish Holocaust scholars, the novel became a huge national best-seller anyway, and a 1982 film of the same name soon followed, with Meryl Streep winning an Oscar for Best Actress. A decade later, Steven Spielberg's 1993 *Schindler's List* won a remarkable seven Oscars, while grossing nearly \$100 million.
>
> With Hollywood so overwhelmingly Jewish, the consequences were hardly surprising, and a huge cinematic genre soon developed. According to Finkelstein, Hollywood produced some 180 Holocaust films just during the years 1989-2004. Even the very partial subset of Holocaust films listed on Wikipedia has grown enormously long, but fortunately the Movie Database has winnowed down the catalog by providing a list of the 50 Most Moving Holocaust Films.
>
> Many billions of dollars have surely been invested over the years on the total production costs of this ongoing business enterprise. For most ordinary people, "seeing is believing," and how could anyone seriously doubt the reality of the Holocaust after having seen all the gas chambers and mounds of murdered Jewish corpses constructed by highly-paid Hollywood set designers? Doubting the existence of Spiderman and the Incredible Hulk would be almost as absurd.
>
> Some 2% of Americans have a Jewish background, while perhaps 95% possess Christian roots, but the Wikipedia list of Christian films seems rather scanty and rudimentary by comparison. Very few of those films were ever widely released, and the selection is stretched to even include *The Chronicles of Narnia*, which contains

no mention of Christianity whatsoever. One of the very few prominent exceptions on the list is Mel Gibson's 2004 *The Passion of the Christ,* which he was forced to personally self-fund. And despite the enormous financial success of that movie, one of the most highly profitable domestic releases of all time, the project rendered Gibson a hugely vilified pariah in the industry over which he had once reigned as its biggest star, especially after word got around that his own father was a Holocaust Denier.

In many respects, Hollywood and the broader entertainment media today provide the unifying spiritual basis of our deeply secular society, and the overwhelming predominance of Holocaust-themed films over Christian ones has obvious implications. Meanwhile, in our globalized world, the American entertainment-media complex totally dominates Europe and the rest of the West, so that the ideas generated here effectively shape the minds of many hundreds of millions of people living elsewhere, whether or not they fully recognize that fact.

In 2009, Pope Benedict XVI sought to heal the long-standing Vatican II rift within the Catholic Church and reconcile with the breakaway Society of St. Pius X faction. But this became a major media controversy when it was discovered that Bishop Richard Williamson, one of the leading members of that latter organization, had long been a Holocaust Denier and also believed that Jews should convert to Christianity. Although the many other differences in Catholic doctrinal faith were fully negotiable, apparently refusing to accept the reality of the Holocaust was not, and Williamson remained estranged from the Catholic Church. Soon afterward he was even prosecuted for heresy by the German government.

Internet critics have suggested that over the last couple of generations, energetic Jewish activists have successfully lobbied Western nations into replacing their traditional religion of Christianity with the new religion of Holocaustianity, and the Williamson Affair certainly seems to support that conclusion.

Consider the French satirical magazine *Charlie Hebdo.* Funded by Jewish interests, it spent years launching vicious attacks against Christianity, sometimes in crudely pornographic fashion, and also periodically vilified Islam. Such activities were hailed by French politicians as proof of the total freedom of thought allowed in the land of Voltaire. But the moment that one of its leading cartoonists made a very mild joke related to Jews, he was immediately fired, and if the publication had ever ridiculed the Holocaust, it surely would have been immediately shut down, and its entire staff possibly thrown into prison.

Western journalists and human rights advocates have often expressed support for the boldly transgressive activities of the Jewish-funded Femen activists when they desecrate Christian churches all around the world. But such pundits would certainly be in an uproar if anyone were to act in similar fashion toward the growing international network of Holocaust Museums, most of them built at public expense.

Indeed, one of the underlying sources of bitter Western conflict with Vladimir Putin's Russia seems to be that he has restored

> Christianity to a favored place in a society where the early Bolsheviks had once dynamited churches and massacred many thousands of priests. Western intellectual elites held far more positive feelings toward the USSR while its leaders retained a stridently anti-Christian attitude.

In the same very long 2018 article, I described how I'd become curious about the evidentiary basis of the Holocaust, and after careful investigation concluded that the Holocaust was largely, perhaps almost entirely a hoax.

In particular, I found strong indications that during the years immediately following World War II, most of America's mainstream journalists and academics seem to have quietly recognized that the stories claiming that millions of Jews had been killed in gas chambers by the Nazis were merely crude wartime propaganda, not dissimilar to the First World War accusations that the Germans had raped Belgian nuns and eaten Belgian children.

One important piece of evidence was my discovery of a book written by Prof. John Beaty, who had served as a colonel in Military Intelligence during the war.

> Some years ago, I came across a totally obscure 1951 book entitled *Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.
>
> As a zealous anti-Communist, he regarded much of America's Jewish population as deeply implicated in subversive activity, therefore constituting a serious threat to traditional American freedoms. In particular, the growing Jewish stranglehold over publishing and the media was making it increasingly difficult for discordant views to reach the American people, with this regime of censorship constituting the "Iron Curtain" described in his title. He blamed Jewish interests for the totally unnecessary war with Hitler's Germany, which had long sought good relations with America, but instead had suffered total destruction for its strong opposition to Europe's Jewish-backed Communist menace.

Beaty also sharply denounced American support for the new state of Israel, which was potentially costing us the goodwill of so many millions of Muslims and Arabs. And as a very minor aside, he also criticized the Israelis for continuing to claim that Hitler had killed six million Jews, a highly implausible accusation that had no apparent basis in reality and seemed to be just a fraud concocted by Jews and Communists, aimed at poisoning our relations with postwar Germany and extracting money for the Jewish State from the long-suffering German people.

Furthermore, he was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty's book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk's iconic classic, *The Conservative Mind*.

Moreover, although Jewish groups including the ADL harshly condemned the book, especially in their private lobbying, those efforts provoked a backlash, and numerous top American generals, both serving and retired, wholeheartedly endorsed Beaty's work, denouncing the ADL efforts at censorship and urging all Americans to read the volume. Although Beaty's quite explicit Holocaust Denial might shock tender modern sensibilities, at the time it seems to have caused barely a ripple of concern and was almost totally ignored even by the vocal Jewish critics of the work.

Given his crucial wartime role, there probably would have been few Americans better informed of our Intelligence information than Prof. Beaty, and his huge 1951 bestseller casually dismissed the Jewish Holocaust stories as nonsense. His book was strongly endorsed by many of our leading generals, and although the ADL and other Jewish groups ferociously attacked him on every other point, none of them ever challenged his statements on the Holocaust.

I went on to explore the striking absence of any significant mention of the Holocaust during those years:

> Beaty's very brief 1951 discussion has been the earliest instance of explicit Holocaust Denial I have managed to locate, but the immediate postwar years seem absolutely rife with what might be described as "implicit Holocaust Denial," especially within the highest political circles.
>
> Over the years, Holocaust scholars and activists have very rightfully emphasized the absolutely unprecedented nature of the historical events they have studied. They describe how some six million innocent Jewish civilians were deliberately exterminated, mostly in gas chambers, by one of Europe's most highly cultured nations, and emphasize that monstrous project was often accorded greater priority than Germany's own wartime military needs during the country's desperate struggle for survival. Furthermore, the Germans also undertook enormous efforts to totally eliminate all possible traces of their horrifying deed, with huge resources expended to cremate all those millions of bodies and scatter the ashes. This same disappearance technique was even sometimes applied to the contents of their mass graves, which were dug up long after initial burial, so that the rotting corpses could then be totally incinerated and all evidence eliminated. And although Germans are notorious for their extreme bureaucratic precision, this immense wartime project was apparently implemented without benefit of a single written document, or at least no such document has ever been located.
>
> Lipstadt entitled her first book "Beyond Belief," and I think that all of us can agree that the historical event she and so many others in academia and Hollywood have made the centerpiece of their lives and careers is certainly one of the most extremely remarkable occurrences in all of human history. Indeed, perhaps only a Martian Invasion would have been more worthy of historical study, but Orson Welles's famous *War of the Worlds* radio-play which terrified so many millions of Americans in 1938

> turned out to be a hoax rather than real.
>
> The six million Jews who died in the Holocaust certainly constituted a very substantial fraction of all the wartime casualties in the European Theater, outnumbering by a factor of 100 all the British who died during the Blitz, and being dozens of times more numerous than all the Americans who fell there in battle. Furthermore, the sheer monstrosity of the crime against innocent civilians would surely have provided the best possible justification for the Allied war effort. Yet for many, many years after the war, a very strange sort of amnesia seems to have gripped most of the leading political protagonists in that regard.

On that matter, I quoted a very interesting passage by Prof. Robert Faurisson, who became one of France's leading Holocaust Deniers in the 1970s:

> Three of the best known works on the Second World War are General Eisenhower's *Crusade in Europe* (New York: Doubleday [Country Life Press], 1948), Winston Churchill's *The Second World War* (London: Cassell, 6 vols., 1948-1954), and the *Mémoires de guerre* of General de Gaulle (Paris: Plon, 3 vols., 1954-1959). In these three works not the least mention of Nazi gas chambers is to be found.
>
> Eisenhower's *Crusade in Europe* is a book of 559 pages; the six volumes of Churchill's *Second World War* total 4,448 pages; and de Gaulle's three-volume *Mémoires de guerre* is 2,054 pages. In this mass of writing, which altogether totals 7,061 pages (not including the introductory parts), published from 1948 to 1959, one will find no mention either of Nazi "gas chambers," a "genocide" of the Jews, or of "six million" Jewish victims of the war.

Consider the full implications of these facts.

As Faurisson emphasized, during the years 1948-1959, Eisenhower, Churchill, and de Gaulle published their memoirs and histories, which totaled more than 7,000 pages. These individuals were the greatest victorious heroes of World War II and the massive works they had published were intended to permanently establish their places in history, not merely for the next few years, but for many decades and even centuries to come.

Mainstream Holocaust scholars have reasonably argued that the event

they study was probably the greatest crime ever committed in the history of the world, the rapid extermination of six million innocent victims by one of the world's most highly-educated countries using diabolically advanced scientific means.

Those three leaders had led the global campaign to defeat the country responsible for the Holocaust, which had only occurred about a decade earlier.

Yet no one reading those 7,000 pages of text would have ever suspected that any Holocaust had even occurred. How can that possibly be explained under the standard historical narrative?

My own contrary explanation is a very simple one. All three of those top leaders knew perfectly well that the Holocaust was merely a hoax, a ridiculous concoction of wartime propaganda. They were sure that within another five or ten years, twenty at the most, the Holocaust hoax would have been completely debunked and universally recognized as absurd, just as had happened with the atrocity-hoaxes of the First World War. So they believed that if they mentioned it in their books, they would be endlessly ridiculed by future generations, and they wanted to avoid that embarrassing fate.

I've never looked into it, but I assume that all the prominent Allied leaders who published their histories and memoirs after WWI were very careful to avoid including any claims that the Germans had raped Belgian nuns or eaten Belgian children.

The "rediscovery" of the Holocaust in Western historiography only occurred at the beginning of the 1960s, and some of those very ironic circumstances seem to point towards the same controversial conclusion. As I wrote in my 2018 article:

> The late scholar Raul Hilberg is universally acknowledged as the founder of modern Holocaust studies, which began with the 1961 publication of his massive volume *The Destruction of the European Jews*. In his very interesting 2007 Hilberg obituary, historian Norman Finkelstein emphasizes that prior to Hilberg's work, there had been virtually no writing on the Holocaust, and discussion of the topic was considered almost "taboo." For a recent event of such apparent enormity to have been so completely wiped away from public discussion and the consciousness of historians and political scientists can be explained in several different ways. But

once I began to investigate the circumstances behind Hilberg's ground-breaking work, I encountered all sorts of strange ironies.

According to Wikipedia, Hilberg's family of Austrian Jews coincidentally arrived in the United States on the exact day in 1939 that war broke out, and in his early teens he was soon horrified to read all the news reports of the ongoing extermination of his fellow Jews in the continent his family had left behind, even telephoning Jewish leaders asking why they were doing so little to save their kinsmen from annihilation. He subsequently served in the U.S. military in Europe, then majored in Political Science at Brooklyn College after the end of the conflict. The inspiration for his future scholarly focus seems to have come when he was shocked by a remark made by one of his lecturers, Hans Rosenberg:

> The most wicked atrocities perpetrated on a civilian population in modern times occurred during the Napoleonic occupation of Spain.

When Hilberg asked how Rosenberg, himself a German-Jewish refugee, could have so totally ignored the murder of 6 million Jews, a monstrous crime committed just a couple of years earlier, Rosenberg sought to deflect the question, saying that "it was a complicated matter" and "history doesn't teach down into the present age." Since Rosenberg was a student of Meinecke, whom Lipstadt has bitterly denounced as an implicit Holocaust Denier, one wonders whether Rosenberg may have shared the beliefs of his mentor but was reluctant to admit that fact to his overwhelmingly Jewish students in emotionally-charged postwar Brooklyn.

Later, Hilberg conducted his doctoral research at Columbia under Franz Neumann, another German-Jewish refugee scholar. But when Hilberg indicated he wanted his research to focus on the extermination of Europe's Jews, Neumann strongly discouraged that topic, warning Hilberg that doing so would be professionally imprudent and might become "his academic funeral." When he attempted to publish his research in book form, it received numerous negative reviews, with Israel's Yad Vashem fearing it would encounter "hostile criticism," and over a six year period, it was rejected by several major publishing houses along with Princeton University, based on the advice of the influential Jewish intellectual Hannah Arendt. One naturally wonders whether all these established scholars may have quietly known

> something that a naive young doctoral candidate such as Hilberg did not. His book only appeared in print because a Jewish immigrant whose business had suffered under the Nazis funded the entire publication.

Yet another strange element, thoroughly documented but rather difficult to square with the traditional Holocaust narrative is that large numbers of part-Jewish Germans served loyally in Hitler's armies, with some of them holding very high military ranks:

> Consider the interesting case of Field Marshal Erhard Milch, Hermann Goering's very powerful number-two in the German Luftwaffe. His father was certainly a Jew, and according to researchers Robert Wistrich and Louis Snyder, there is archival evidence that his mother was Jewish as well. Now it is certainly not impossible that a Third Reich supposedly dedicated with grim fanaticism to the extermination of each and every Jew might have spent the entire war with a full- or half-Jew near the absolute top of its military hierarchy, but surely that puzzling anomaly would warrant careful explanation, and Milch's apparent Jewish background was certainly known during the Nuremberg Trials…
>
> Indeed, the fascinating and widely-praised 2002 book *Hitler's Jewish Soldiers* by Bryan Mark Rigg notes that aside from Milch, Hitler's military contained over a dozen half-Jewish generals and admirals and another dozen quarter-Jews of that same high rank, plus a total of roughly 150,000 additional half- or quarter-Jewish soldiers, with a large fraction of these being officers. All of these individuals would have had some fully-Jewish parents or grandparents, which seems decidedly odd behavior for a regime supposedly so focused on the total eradication of the Jewish race.

I discussed all of these issues and many others as well in my very long 2018 article, as well as a related piece published the following year:

- American Pravda: Holocaust Denial
  Ron Unz • ***The Unz Review*** • August 27, 2018 • 17,600 Words
- American Pravda: Secrets of Military Intelligence
  Ron Unz • ***The Unz Review*** • June 10, 2019 • 12,500 Words

For those who prefer to absorb some of this same information in a different format, I was interviewed last year by Iranian broadcast television on a number of the highly-controversial topics excluded from the Western media, and two of the half-hour segments focused on the Holocaust.  Channel Four of the Iran Broadcasting Corporation

is one of the country's largest, having a potential audience of ten million, and after the segments were put online, I had them video-captured and uploaded to a Rumble channel:

**Analyzing the Holocaust, Part I** • 25m

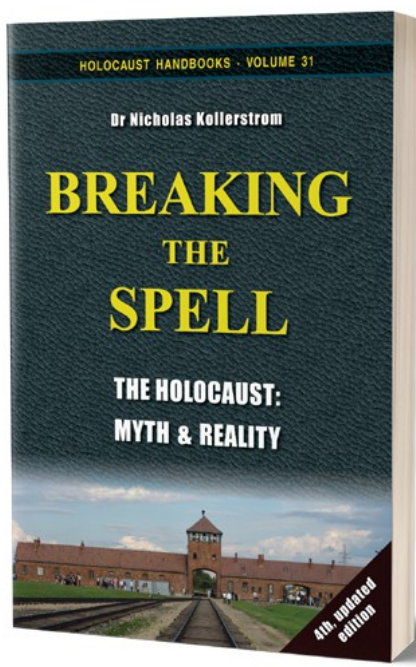
**Analyzing the Holocaust, Part II** • 32m

Although totally ignored by our dishonest Western media, over the last two generations principled Holocaust investigators have uncovered and accumulated an enormous volume of persuasive evidence, demonstrating the utter and complete falsehood of the traditional historical narrative on a very wide range of different grounds.

One of the earliest major works was originally published in 1976 by Prof. Arthur R. Butz of Northwestern and after having been updated several times since then, his volume still constitutes one of the most comprehensive introductions to the subject. The book bears the very appropriate title of "The Hoax of the Twentieth Century" and although it was purged by Amazon several years ago, it is still easily available here and elsewhere.

- The Hoax of the Twentieth Century
  *The Case Against the Presumed Extermination of European Jewry*
  Arthur R. Butz • 1976/2015 • 225,000 Words • PDF • ePub Format

As I discussed in my 2018 article, the most important recent addition to this extensive collection of material was probably published about a decade ago by a respected science historian.



Most recently, Dr. Nicholas Kollerstrom, who had spent eleven years as a historian of science on the staff of University College, London, suffered this same fate in 2008. His scientific interests in the Holocaust provoked a media firestorm of vilification, and he was fired with a single day's notice, becoming the first member of his research institution ever expelled for ideological reasons. He had previously provided the Isaac Newton entry for a massive

biographical encyclopedia of astronomers, and America's most prestigious science journal demanded that the entire publication be pulped, destroying the work of over 100 writers, because it had been fatally tainted by having such a villainous contributor. He recounted this unfortunate personal history as an introduction to his 2014 book *Breaking the Spell*, which I highly recommend.

Kollerstrom's text effectively summarizes much of the more recent Holocaust Denial evidence, including the official Auschwitz death books returned by Gorbachev after the end of the Cold War, which indicate that Jewish fatalities were some 99% lower than the widely-believed total. Furthermore, Jewish deaths actually showed a sharp decline once plentiful supplies of Zyklon B arrived, exactly contrary to what might have been expected under the conventional account. He also discusses the interesting new evidence contained in the British wartime decrypts of all German communications between the various concentration camps and the Berlin headquarters.

Dr. Kollerstrom's excellent book was purged from Amazon, but is freely available on the the Internet or can be easily downloaded in various formats, and I would highly recommend it to those interested in the topic.

- Breaking the Spell
  *The Holocaust: Myth & Reality*
  Nicholas Kollerstrom • 2014/2023 • 110,000 Words • PDF • ePub Format

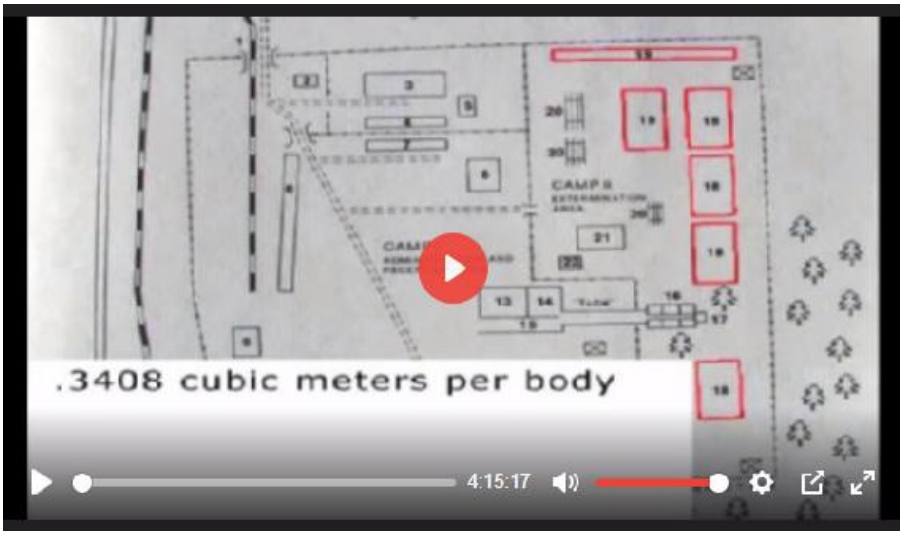
Much of his important material was presented in an interesting two hour interview on *Red Ice Radio*, eventually purged from Youtube but still available elsewhere on the Internet:

A couple of decades earlier, German chemist Germar Rudolf had been similarly purged and later imprisoned for his skeptical investigation of the scientific evidence for the Holocaust. Rudolf eventually created the most comprehensive published collection of Holocaust Denial literature, one that includes the works of Butz and Kollerstrom as well as dozens of other books by various scholars, nearly all of them freely available for downloading;

- Holocaust Handbooks • 51 Volumes

For those who prefer to receive their information in video format, that same website has a considerable collection of such video documentaries and I would particularly recommend the following three very long ones, all produced around 15 years ago by a San Francisco resident. Although they lack the lavish production values of a big budget Hollywood film and the quality of the narration is only so-so, I think the volume of factual material presented in these videos is extremely comprehensive and persuasive, just as I had remembered from originally watching them four or five years ago.

**One-Third of the Holocaust** • 4h15m



**Buchanwald, a Dumb, Dumb Portrayal of Evil** • 2h21m

**The Auschwitz Hoax – Why the Gas Chambers are a Myth** • 50m

I think that anyone who has carefully investigated the subject would soon conclude that there is an overwhelming volume of strong factual evidence against the reality of the Holocaust, which appears to be almost entirely fictional, just as fraudulent as the recent claims of forty beheaded babies. But that Holocaust myth has nonetheless remained in place and steadily grown for more than three generations, having seemingly become a lie too enormous to ever be challenged.

One likely reason for such impunity has been the successful transformation of the historical Holocaust into the quasi-religion of Holocaustianity, which in many respects reigns as the dominant faith of much of today's deeply secular West. I have noted that although Pope Benedict XVI and his successor had been willing to accept deviations from the canonical doctrines of their Catholic Church on numerous questions, no skepticism towards the Holocaust could possibly be tolerated. Many otherwise courageous individuals are very reluctant to challenge such a religious faith, especially one in which they themselves have been immersed from their early childhood, perhaps without even recognizing that process.

However, belief in such pernicious falsehoods may sometimes prompt acts of the most dreadful nature, just as the recent Israeli atrocity-hoaxes have been used to enable the horrific ongoing massacre in Gaza.

According to Segev's book, the widespread postwar belief among the Jews of Palestine that the Germans had exterminated six million of

their people provoked a group of Zionist militants to plot the extermination of six million German civilians in retaliation, spending months infiltrating the water supply facilities of Occupied Germany and securing large quantities of the deadly poison that they planned to introduce. Fortunately, their project failed and although Segev seems convinced that the plot was real and came close to success, I am personally more skeptical. But the mere possibility that the most enormous mass-murder in all of human history might have been prompted in retaliation for an imaginary Holocaust crime is a sobering one.

Soon afterward, the Zionists leveraged the same Holocaust story to provide themselves the political cover they required for their brutal war of aggression and expulsion towards the native inhabitants of Palestine, seizing nearly 80% of the land and forcing 80% of the longstanding Arab population to flee as pitiful refugees.

During the many decades that followed, that same get-out-of-jail-free Holocaust card has been endlessly played, invoked by Israel's leaders and its fierce advocates to justify every naked violation of international law and every grisly war crime, culminating now in the destruction of defenseless Gaza. Over the last three months, more than 22,000 bodies of dead civilians have been identified by the Gaza Health Ministry, and with so many thousands more still missing, their bodies buried in the rubble of 100,000 destroyed buildings, the true death-toll is probably well above 30,000.

Without doubt, this is the greatest televised slaughter of helpless civilians in the history of the world, and some of Israel's top leaders have used explicitly genocidal language to describe their plans for the millions of Palestinians. Meanwhile, the rest of the world watches, either unwilling or unable to halt the killing. After more than three months of this unending massacre, the government of South Africa has now filed an 84-page legal brief condemning Israel for this ongoing "genocide."

In our own country, popular progressive slogans advocating for a single unified secular democratic state of Palestine have been demonized as calling for "Jewish genocide." When several elite college presidents refused to suppress criticism of Israeli policy on their campuses, they were browbeaten by Congressional interrogators and billionaire Jewish donors, with two of them already forced to resign.

The Israel Lobby appears to possess near total control of our political

system, government, and media organs, and most observers see no prospect of change, agreeing that it would take an unprecedented ideological earthquake to dislodge such control. But surely the collapse of the Holocaust narrative would constitute exactly that sort of unprecedented ideological earthquake, perhaps causing the total disintegration of the entire Zionist project built upon it. For most pro-Israel partisans, the reality of the Holocaust is the fundamental cornerstone of their understanding of the world, and calling it into question would threaten the complete annihilation of their entire system of beliefs.

Those who wish to end what they regard as the ongoing genocide of the Palestinians must recognize that one of their best and only chances to achieve that goal may involve their courageous willingness to challenge a purported genocide from eight decades ago, a genocide that never took place, but has subsequently been used to justify an enormous catalog of war crimes and massacres.

I can only repeat the closing paragraphs of my original 2018 article on Holocaust Denial:

> Despite this situation, the powerful media focus in support of the Holocaust over the last few decades has elevated it to a central position in Western culture. I wouldn't be surprised if it currently occupies a larger place in the minds of most ordinary folk than does the Second World War that encompassed it, and therefore possesses greater apparent reality.
>
> However, some forms of shared beliefs may be a mile wide but an inch deep, and the casual assumptions of individuals who have never actually investigated a given subject may rapidly change. Also, the popular strength of doctrines that have long been maintained in place by severe social and economic sanctions, often backed by criminal penalties, may possibly be much weaker than anyone realizes.
>
> Until thirty years ago, Communist rule over the USSR and its Warsaw Pact allies seemed absolutely permanent and unshakable, but the roots of that belief had totally rotted away, leaving behind nothing more than a hollow facade. Then one day, a gust of wind came along, and the entire gigantic structure collapsed. I wouldn't be surprised if our current Holocaust narrative eventually suffers that same fate, perhaps with unfortunate consequences for those too closely associated with having maintained it.

And the Holocaust is merely one of many enormous falsehoods regarding the central shaping events of the twentieth century that I had discussed in several pieces last year:

# Gaza, Jewish Power, and the Holocaust

*The Unz Review* • February 19, 2024 • 10,400 Words

## Media Conditioning and Gentile Submission to Jewish Power

Last week I published an article noting that although technology industrialist Elon Musk probably ranks as the most powerful and influential individual in the Western world, he recently humbled himself, deeply apologizing for some of his casual criticism of Jewish activities and pledging to mend his ways.

Traveling to Israel, he met with that country's president and posed for photo-ops with Prime Minister Benjamin Netanyahu, promising to combat "antisemitism" on his Twitter platform. A few weeks later he undertook a pilgrimage to Auschwitz, making even stronger commitments to Jewish leaders, denying that he harbored any antisemitism in his own heart, and publicly declaring that he regarded himself as "aspirationally Jewish."

These remarkable events reminded me of that famous incident of the Middle Ages in which Emperor Henry IV of the Holy Roman Empire had "gone to Canossa" and prostrated himself before Pope Gregory VII, seeking forgiveness for his challenge to the supreme authority of the Catholic Church:

- Elon Musk Goes to Canossa
  Ron Unz • *The Unz Review* • February 12, 2024 • 5,400 Words

Musk was only the latest and most extreme example of the many wealthy and powerful Gentiles who have publicly bent their knees in submission to Jewish power. Even if totally spurious, accusations of "antisemitism" have often proven fatal to the careers of even the highest-ranking individuals, and shortly before Musk's submission, two presidents of Ivy League universities were politically brow-beaten and then forced to resign over their unwillingness to prohibit pro-Palestinian protests on their campuses, a sudden purge that was absolutely unprecedented in the history of American academia.

This is certainly an odd situation, warranting careful analysis and explanation. The word "antisemitism" merely means criticizing or disliking Jews, and in recent years, Israel's partisans have demanded with some success that the term should be extended to encompass anti-Zionism as well, namely hostility to the Jewish state.

But let us suppose that we concede the latter point and agree with pro-Israel activists that "anti-Zionism" is indeed a form of "antisemitism." Over the last few months, the Israeli government has brutally slaughtered tens of thousands of helpless civilians in Gaza, committing the greatest televised massacre in the history of the world, with its top leaders using explicitly genocidal language to describe their plans for the Palestinians. Indeed, the South African government submitted a 91 page legal brief to the International Court of Justice cataloging those Israeli statements, prompting a near-unanimous ruling by the jurists that millions of Palestinians faced the prospect of genocide at Israeli hands.

These days most Westerners claim to regard genocide in a decidedly negative light. So does this not syllogistically require them to embrace and endorse "antisemitism"? Surely a visitor from Mars would be very puzzled by this strange dilemma and the philosophical and psychological contortions it seems to require.

It is rather surprising for the extremely "politically correct" ruling elites of America and the rest of the Western world to be loudly cheering on the racially-exclusivist State of Israel even as it kills enormous numbers of women and children and works very hard to starve to death some two million civilians in its unprecedented genocidal rampage. After all, the far milder and more circumspect regime of Apartheid South Africa was universally condemned, boycotted, and sanctioned for merely the tiniest sliver of such misdeeds.

I think that part of the answer to this puzzle may be found in a famous literary work from a couple of generations ago. In 1962 British writer Anthony Burgess published his dystopian black comedy novel *A Clockwork Orange*, which was soon made into an Oscar-nominated film of the same name directed by Stanley Kubrick. The protagonist was Alex, a violent young hoodlum, and according to the plot government operatives subjected the miscreant to aversion therapy, severely conditioning him to avoid certain thoughts and behaviors lest he become physically ill.

As I wrote in a 2018 article, generations of Jewish media control and strident Jewish political activism have successfully subjected the 99% Gentile populations of the Western world to exactly this same sort of psychological process, with enormous social and political consequences, as we are now seeing unfold during the astonishing slaughter in Gaza:

> I believe one factor is that over the years and the decades, our dominant media organs of news and entertainment have successfully conditioned most Americans to suffer a sort of mental allergic reaction to topics sensitive to Jews, which leads to all sorts of issues being considered absolutely out of bounds. And with America's very powerful Jewish elites thereby insulated from almost all public scrutiny, Jewish arrogance and misbehavior remain largely unchecked and can increase completely without limit.
>
> I've also sometimes suggested to people that one under-emphasized aspect of a Jewish population, greatly magnifying its problematical character, is the existence of what might be considered a biological sub-morph of exceptionally fanatical individuals, always on hair-trigger alert to launch verbal and sometimes physical attacks of unprecedented fury against anyone they regard as insufficiently friendly towards Jewish interests. Every now and then, a particularly brave or foolhardy public

> figure challenges some off-limits topic and is almost always overwhelmed and destroyed by a veritable swarm of these fanatical Jewish attackers. Just as the painful stings of the self-sacrificing warrior caste of an ant colony can quickly teach large predators to go elsewhere, fears of provoking these "Jewish berserkers" can often severely intimidate writers or politicians, causing them to choose their words very carefully or even completely avoid discussing certain controversial subjects, thereby greatly benefiting Jewish interests as a whole. And the more such influential people are thus intimidated into avoiding a particular topic, the more that topic is perceived as strictly taboo, and avoided by everyone else as well.
>
> For example, about a dozen years ago I was having lunch with an especially eminent Neoconservative scholar with whom I'd become a little friendly. We were bemoaning the overwhelmingly leftward skew among America's intellectual elites, and I suggested it largely seemed a function of our most elite universities. Many of our brightest students from across the nation entered Harvard and the other Ivies holding a variety of different ideological perspectives, but after four years departed those halls of learning overwhelmingly in left-liberal lock-step. Although he agreed with my assessment, he felt I was missing something important. He nervously glanced to both sides, shifted his head downward, and lowered his voice. "It's the Jews," he said.

One especially troublesome aspect of this near-total Jewish domination lies in the nature of the Jewish religion, especially in its traditional Talmudic form. As I explained in the same article:

> If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.

Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver, it would be perfectly fine and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.

As a further illustration of the seething hatred traditional Judaism radiates towards all those of a different background, saving the life of a non-Jew is generally considered improper or even prohibited, and taking any such action on the Sabbath would be an absolute violation of religious edict.

Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming majority of Jewish adults had Orthodox grand-parents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of “Love Thy Neighbor” may or may not be workable in practice, but a religion based upon “Hate Thy Neighbor” might have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

## Jewish Behavior in Gaza and Bolshevik Russia

Throughout nearly their entire history in the Western world, Jews have existed as relatively small and weak minorities, so these troublesome aspects of traditional Jewish doctrine and belief were

never able to manifest themselves except in the most secretive or attenuated fashion. But with Jews being the dominant, fully-empowered majority in the lands of Greater Israel, the world is seeing those attitudes expressed in their full force upon the hapless Palestinians.

As has been thoroughly documented, a very substantial fraction, perhaps even an outright majority of all the Israelis who died on October 7th were killed by their own trigger-happy military forces, in many cases becoming the deliberate victims of the notorious "Hannibal Directive." Many others were IDF soldiers, security personnel, or armed civilian militiamen, and therefore perfectly legitimate targets of warfare. Putting all these elements together, I think that the number of unarmed Israelis killed by Hamas fighters may have been as low as 100 to 200, with many or most of those deaths being accidental, a conclusion supported by the statements of released hostages, who emphasized their decent and respectful treatment by their Hamas captors. Indeed, the relatively small number of unwarranted killings by Hamas militants has forced pro-Israel propagandists to promote the most outrageous sort of atrocity-hoaxes, ranging from forty beheaded Israeli babies to babies baked in ovens to Hamas gang-rapes and sexual mutilations, none of which seem to have any reality.

So in retaliation for perhaps 100 to 200 killings of unarmed civilians, the Israeli government has now gleefully slaughtered tens of thousands of helpless Palestinian civilians while apparently seeking to raise that body-count into the millions.

According to Max Blumenthal, public opinion surveys indicate that up to 98% of the Israeli public supports these exceptionally brutal retaliatory measures or even regards them as insufficiently strong. Numerous personal videos on TikTok, Telegram, and other platforms show ordinary members of the Israeli public gleefully mocking dead or starving Palestinian civilians, while Israeli troops have been just as sadistic in their destruction of civilian infrastructure and brutal killing of unarmed Palestinians, including women and children. Examples of public torture or cold-blooded murders seem increasingly common. Given these facts, several *Grayzone* videos have reasonably described Israel as an extremely sick society.

Fyodor Dostoevsky of Czarist Russia ranked as one of the greatest European writers, author of the classic novels *Crime and Punishment*, *The Brothers Karamazov*, and many other works. But although nearly all of his writings were translated into English and made easily available, his *Diary of a Writer* has remained obscure, and some have speculated that the reason may have been his brief 1877 remarks regarding Russia's small Jewish minority. Although he recognized the plight of the Jews, who were sometimes oppressed or mistreated by the overwhelmingly Russian majority, he claimed that they greatly exaggerated their suffering and he also candidly speculated how they themselves would treat the Russians if the shoe were on the other foot and they were the ones with the upper hand.

> However, at times, I was fancying: now, how would it be if in Russia there were not three million Jews, but three million Russians, and there were eighty million Jews,—well into what would they convert the Russians and how would they treat them? Would they permit them to acquire equal rights? Would they permit them to worship freely in their midst? Wouldn't they convert them into slaves? Worse than that: wouldn't they skin them altogether? Wouldn't they slaughter them to the last man, to the point of complete extermination, as they used to do with alien peoples in ancient times, during their ancient history?

Dostoevsky died in 1881, but his prophetic words came to pass in

1917 when the Bolsheviks, whose leadership was overwhelmingly Jewish, seized power. Once they had established their new Soviet regime, they implemented an unprecedented slaughter of their Gentile subjects by bullets and starvation over the next couple of decades, a reality almost totally suppressed both at the time and subsequently by their ethnic cousins in overwhelmingly Jewish Hollywood and by Jewish political pressure across most of the rest of the media. As I wrote in 2018:

> Indeed, the topic of Communism raises a far larger issue, one having rather touchy implications. Sometimes two simple compounds are separately inert, but when combined together may possess tremendous explosive force. From my introductory history classes and readings in high school, certain things had always seemed glaringly obvious to me even if the conclusions remained unmentionable, and I once assumed they were just as apparent to most others as well. But over the years I have begun to wonder whether perhaps this might not be correct.
>
> Back in those late Cold War days, the death toll of innocent civilians from the Bolshevik Revolution and the first two decades of the Soviet Regime was generally reckoned at running well into the tens of millions when we include the casualties of the Russian Civil War, the government-induced famines, the Gulag, and the executions. I've heard that these numbers have been substantially revised downwards to perhaps as little as twenty million or so, but no matter. Although determined Soviet apologists may dispute such very large figures, they have always been part of the standard narrative history taught within the West.
>
> Meanwhile, all historians know perfectly well that the Bolshevik leaders were overwhelmingly Jewish, with three of the five revolutionaries Lenin named as his plausible successors coming from that background. Although only around 4% of Russia's population was Jewish, a few years ago Vladimir Putin stated that Jews constituted perhaps 80-85% of the early Soviet government, an estimate fully consistent with the contemporaneous claims of Winston Churchill, *Times of London* correspondent Robert Wilton, and the officers of American Military Intelligence. Recent books by Alexander Solzhenitsyn, Yuri Slezkine, and others have all painted a very similar picture. And prior to World War II, Jews remained enormously over-represented in the Communist leadership, especially dominating the Gulag administration and the top ranks of the dreaded NKVD.

> Both of these simple facts have been widely accepted in America throughout my entire lifetime. But combine them together with the relatively tiny size of worldwide Jewry, around 16 million prior to World War II, and the inescapable conclusion is that in per capita terms Jews were the greatest mass-murderers of the twentieth century, holding that unfortunate distinction by an enormous margin and with no other nationality coming even remotely close. And yet, by the astonishing alchemy of Hollywood, the greatest killers of the last one hundred years have somehow been transmuted into being seen as the greatest victims, a transformation so seemingly implausible that future generations will surely be left gasping in awe.

Although I have always generally accepted the mainstream scholarly account of the early decades of the Bolshevik regime and the enormous numbers of its human victims, a little hesitancy sometimes remained in the back of my mind. I had wondered if it could really have been possible for those heavily Jewish Bolshevik leaders to have willing slaughtered or starved to death so many millions, even tens of millions of their helpless fellow countrymen. But after seeing the unfortunate developments currently unfolding in Gaza, those slight nagging doubts have completely evaporated.

Similarly, anyone reading the contemporaneous accounts of Central Europeans describing the tumultuous first half of the twentieth century have sometimes encountered puzzled statements of how such seemingly meek and mild Jewish writers and intellectuals were suddenly transformed into bloodthirsty fiends once empowered by a Bolshevik uprising or ruling regime. I'd always wondered if those observations, mostly written in faded, long-forgotten works, were really true or were instead wildly exaggerated elements of anti-Jewish propaganda. But once again events in Gaza now seem to have completely vindicated and confirmed those widespread claims of the past.

As I emphasized in another 2018 article, such extreme Jewish behavior may also be a density-dependent phenomenon, with high concentrations of Jews working themselves into a terrible ideological frenzy, leading to extremely bloody actions that they might have been less willing to endorse under different circumstances.

> Furthermore, this situation is exacerbated by the common tendency of Jews to "cluster" together, perhaps representing just one or two percent of the total population, but often constituting 20% or 40% or 60% of their immediate peer-group, especially in

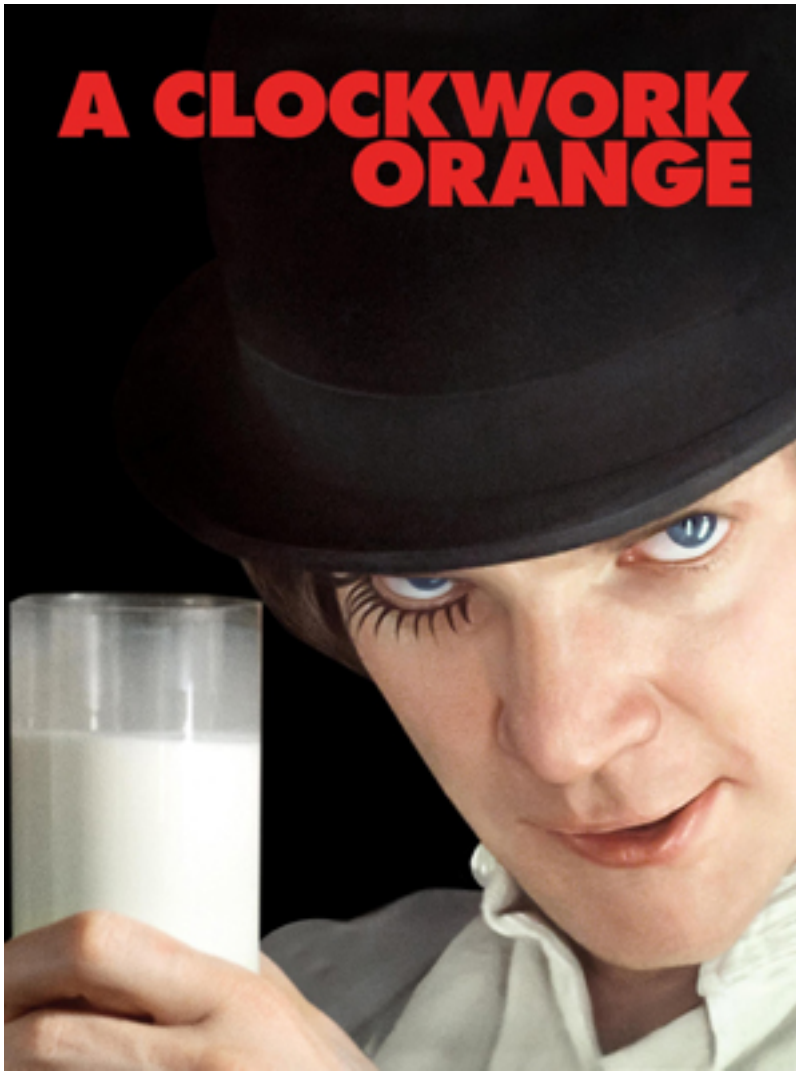
certain professions. Under such conditions, the ideas or emotional agitation of some Jews probably permeates others around them, often provoking additional waves of indignation.

As a rough analogy, a small quantity of uranium is relatively inert and harmless, and entirely so if distributed within low-density ore. But if a significant quantity of weapons-grade uranium is sufficiently compressed, then the neutrons released by fissioning atoms will quickly cause additional atoms to undergo fission, with the ultimate result of that critical chain-reaction being a nuclear explosion. In similar fashion, even a highly agitated Jew may have no negative impact, but if the collection of such agitated Jews becomes too numerous and clusters together too closely, they may work each other into a terrible frenzy, perhaps with disastrous consequences both for themselves and for their larger society. This is especially true if those agitated Jews begin to dominate certain key nodes of top-level control, such as the central political or media organs of a society.

Whereas most living organisms exist solely in physical reality, human beings also occupy an ideational space, with the interaction of human consciousness and perceived reality playing a major role in shaping behavior. Just as the pheromones released by mammals or insects can drastically affect the reactions of their family members or nest-mates, the ideas secreted by individuals or the media-emitters of a society can have an enormous impact upon their fellows.

A purely Jewish state such as Israel contains the highest density of Jews so as a consequence we are witnessing the most extreme form of such behavior.

## Conditioning Americans with the Nazi Holocaust



The film version of *A Clockwork Orange* was released in 1971 and when I watched the clip on Youtube I noticed something intriguing. According to the plot, Alex was psychologically-conditioned against violence by being forced to watch horrifically violent acts on the screen while being made ill with drugs. But although some of the images shown fell into that category—planes dropping bombs during wartime—many others merely showed Nazi parades and Adolf Hitler reviewing his huge array of German supporters at a public rally, scenes containing no visible violence whatsoever. So apparently in the America of the early 1970s, mere Nazi imagery was inherently considered "violent," either reflecting an earlier conditioning process or more likely intended to now produce exactly that result in the audience.

The director was Stanley Kubrick, widely acclaimed as one of history's greatest film-makers, whose credits include a long list of such landmark productions as *Spartacus*, *Dr. Strangelove*, *2001: A Space Odysesy*, *The Shining*, and *Full Metal Jacket*. As someone who spent decades near the top of the Hollywood talent hierarchy, Kubrick surely would have been privy to many important realities that never reached our mainstream newspapers or history books, with his insider knowledge perhaps further enhanced by his personal roots as a Jewish New Yorker.

In the 1990s Kubrick hired Frederic Raphael, also Jewish, to work with him on the screenplay to his last film. Given Kubrick's background, many were surprised when Raphael later reported that the famed director declared to him that Adolf Hitler had been "right about almost everything," while also disparaging the landmark Holocaust film *Schindler's List*, produced and directed by his good friend Steven Spielberg, a revelation that greatly shocked the latter when he learned of it.

That final 1999 film by Kubrick was *Eyes Wide Shut* starring Tom Cruise and Nicole Kidman. Despite the director's enormous stature and his two extremely bankable stars, he had encountered considerable difficulties in getting it produced, with the project consuming many years of effort and only reaching the theaters after Kubrick's sudden death from a heart-attack at the untimely age of 70, just days after he had shown his completed film to the studio executives. The plot was a strange and extremely conspiratorial one, telling the story of two affluent, successful New Yorkers who were suddenly drawn into a secretive hidden world, in which the ultra-rich and powerful regularly engaged in ritualistic sex orgies in enormous private mansions, with potentially deadly consequences for outsiders who revealed those facts. Ironically enough, some of the key scenes were filmed at the palatial estate of the British Rothschilds, themselves the subjects of many such notorious conspiratorial beliefs.

Despite featuring such top stars the box-office results suggest that the film lost money or barely broke even. But if *Eyes Wide Shut* had instead been released during the later Jeffrey Epstein scandal or the somewhat related QAnon/Pizzagate controversy, I suspect that enormous audiences might have flocked to it. During the last couple of decades, the notion that our world is controlled by hidden forces whose existence remains unreported in our mainstream media outlets has become far more widespread. The Epstein case certainly raised strong suspicions that many of the individuals at the top of our society were subject to sexual blackmail at the hands of secretive, nefarious

organizations.

Our memory sometimes plays tricks on us. I'd last watched *A Clockwork Orange* more than a decade ago and vaguely remembered that the horrifying visual images Alex had been forced to watch were those of the Nazi death camps. So I was surprised to discover that instead they only showed Hitler peacefully reviewing his massed Nazi supporters at a huge popular rally. But I suspect that if the 1971 film had been produced in the 1980s or later, Holocaust imagery would have dominated those scenes, perhaps even to the exclusion of anything else.

Over the last generation or two, the extent to which Hollywood and the broader media have conditioned the population of the Western world with the story and images of the Holocaust is absolutely extraordinary. As I explained in 2018:

> According to Finkelstein, Hollywood produced some 180 Holocaust films just during the years 1989-2004. Even the very partial subset of Holocaust films listed on Wikipedia has grown enormously long, but fortunately the Movie Database has winnowed down the catalog by providing a list of the 50 Most Moving Holocaust Films.
>
> Some 2% of Americans have a Jewish background, while perhaps 95% possess Christian roots, but the Wikipedia list of Christian films seems rather scanty and rudimentary by comparison. Very few of those films were ever widely released, and the selection is stretched to even include *The Chronicles of Narnia*, which contains no mention of Christianity whatsoever. One of the very few prominent exceptions on the list is Mel Gibson's 2004 *The Passion of the Christ,* which he was forced to personally self-fund. And despite the enormous financial success of that movie, one of the most highly profitable domestic releases of all time, the project rendered Gibson a hugely vilified pariah in the industry over which he had once reigned as its biggest star, especially after word got around that his own father was a Holocaust Denier.

It is important to recognize that the conditioning process controls the behavior of even those unaffected by it. Although Emperor Henry IV did not himself accept the supremacy of the Pope, most of his vassals and subjects did, so he was forced to submit. Similarly, the personal views of Elon Musk regarding antisemitism or the Holocaust are less

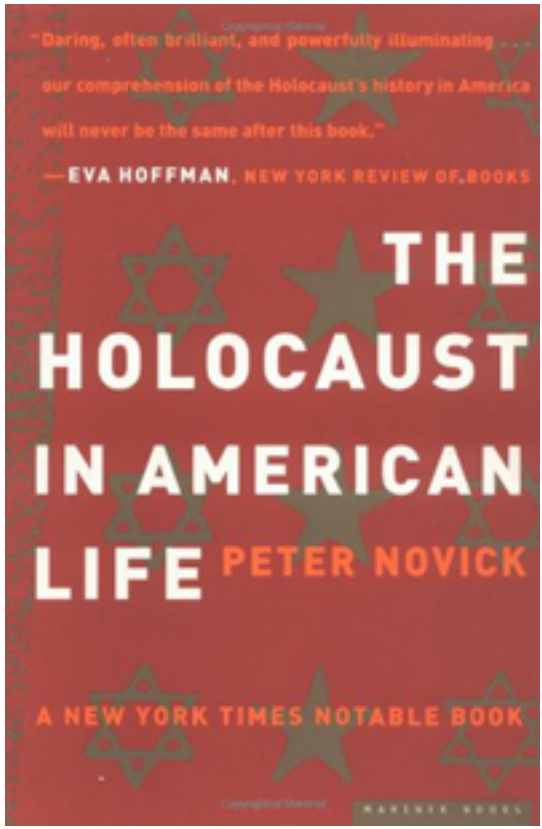
important than the power those notions seem to exert over so many of his customers, employees, and business associates.

*The Economist* is probably the world's most influential print publication and last week its cover focused on the tremendous importance of "Ending the Middle East's Agony." Yet its leader on that topic opened with the words "In the months since Hamas committed the worst atrocity against Jews since the Holocaust…" Constant, overwhelming media conditioning has ensured that the European events of more than three generations ago still remain central to the thinking of most of the Western world.

## Prof. Peter Novick and the Historiography of the Holocaust

I recently considered ordering some books from Amazon related to the Holocaust, and noticed that one of these, hardly obscure, was ranked by that website as roughly the 7,100th most popular title in that genre. This indicates the vast number of Holocaust works that have been published in English, probably totaling at least ten or twenty thousand and perhaps representing a substantial fraction of all the books relating to the events of World War II.

Yet this is a relatively new development. In a number of articles, I've emphasized that from soon after the end of World War II until the early 1960s the colossal events of the Holocaust—certainly the greatest crime ever committed in the history of the world—had received almost no mention anywhere from mainstream American journalists or historians and the same was apparently true for the rest of the Western world. Indeed, no intelligent, thoughtful individual who carefully read our major newspapers, magazines, and books from (say) 1947 to 1959 would probably have ever even suspected that any Holocaust had occurred, an absolutely extraordinary historical fact.



"Daring, often brilliant, and powerfully illuminating . . .
our comprehension of the Holocaust's history in America
will never be the same after this book."
—EVA HOFFMAN, NEW YORK REVIEW OF BOOKS
THE
HOLOCAUST
IN AMERICAN
LIFE
PETER NOVICK
A NEW YORK TIMES NOTABLE BOOK

This very striking point had originally been made to me years ago in the pages of *The Holocaust in American Life*, a widely-praised if controversial book published in 1999 by Prof. Peter Novick, a historian who founded the Jewish Studies program at the University of Chicago. Having recently focused once again on this issue, I decided to reread Novick's work for the first time in five or six years, and was well-rewarded for my effort, as it fully confirmed all my recollections.

Some of the facts that Novick raises near the beginning are remarkable. The 1938 German Kristallnacht riots in which dozens of Jews had been killed spent more than a full week on the front pages of the *New York Times*, yet America's Jewish-owned newspaper of record hardly gave even a sliver of that coverage to the Holocaust when it began a few years later, consigning reports of hundreds of thousands or millions of Jews being killed in very grotesque fashion to small items buried in the back pages. The Zionist movement in the Middle East took much the same position, with their flagship newspaper the *Palestine Post* treating those stories with equal disdain, relegating them to just a couple of paragraphs often on the inside pages and totally overshadowed by minor local political disputes. Given such obvious

Zionist disregard for those wartime claims of Jewish extermination, it is hardly surprising that in 1940 and 1941 a small right-wing Zionist faction, led by a future prime minister of Israel, made repeated attempts to join the Axis military alliance of Hitler and Mussolini.

Novick notes that even after the end of the war, when the Allies publicly declared at Nuremberg that the Nazis had brutally exterminated six million Jews, surveys taken of American Jewry revealed that around half of them regarded those figures as totally ridiculous, perhaps exaggerated by a factor of five or ten. Lt. Col. Leonard Weinstein served on Eisenhower's staff and was heavily involved in Jewish community activity, but when he was informed that a million or two million Jews had been killed at Auschwitz, he was absolutely astonished and said he'd never heard of such a thing. And Novick emphasizes that while Jewish awareness of the Holocaust was hardly substantial, Gentile awareness was totally negligible. Indeed, popular representations of Axis atrocities focused almost entirely upon those committed by the Japanese, including such incidents as the notorious "Bataan Death March," while relatively little attention was given to any German war-crimes.

According to Novick, an important reason that the mainstream media, whether Jewish or Gentile, treated those Holocaust stories with such tremendous disdain was that many of the senior editors remembered that during the First World War two decades earlier they had been completely deceived by the many ridiculous anti-German atrocity-hoaxes manufactured by Allied propagandists leaving them very reluctant to repeat that humiliating mistake. And as it happens, many of the major Holocaust stories did indeed fall into exactly that same category. For example, Novick reports that "the most important single report on the Holocaust that reached the West" during those years was provided by the World Jewish Congress, whose informant claimed to have "personal knowledge" that Jewish corpses were being rendered into soap, an assertion now uniformly dismissed as pure fiction.

Although by late 1944 three-quarters of the American public had been persuaded that the Germans "murdered many people in concentration camps," the most common estimate of that total was 100,000 or less.

Novick's extensive scholarship seemed to fully confirm my understanding of the pattern of coverage. The reality of the Holocaust was widely ignored or disregarded during the Second World War even as it was actually occurring. The Holocaust then received a major burst of public attention and media coverage around the time of the 1946 Nuremberg Tribunals at which the Allies tried, convicted, and

executed many of the defeated Nazi leaders, with the extermination of the Jews being one of the major charges against them. But soon afterwards, the Holocaust once again almost totally disappeared from Western media coverage and public attention until the beginning of the 1960s.

As Novick so forcefully puts it at the start of one of his postwar chapters:

> Between the end of the war and the 1960s, as anyone who has lived through those years can testify, the Holocaust made scarcely any appearance in American public discourse, and hardly more in Jewish public discourse—especially discourse directed to gentiles.

Although Jewish publications did still occasionally refer to the Holocaust during this period, they generally did so in a rather strange manner. For example, in 1952 Stalin executed the overwhelmingly Jewish Communist Party leadership of Czechoslovakia in one of his periodic purges, leading *Commentary* and the *New Leader* to describe the deaths of that handful of Jewish appartchiks as being very similar to Hitler's Holocaust: "He will finally wipe out the Jews of Central and Eastern Europe…The parallel to the policy of the Nazi extermination is almost complete." Apparently the difference between less than a dozen Jewish victims and six million deaths was not considered significant. Indeed, as a consequence of those events the ADL and other leading Jewish organizations publicly declared that Communism and Nazism were "basically identical" in their policies towards Jews. Organizations and publications that take such a cavalier attitude to factual realities hardly inspire great confidence in their other claims, whether past or future.

Perhaps the most substantive and influential Jewish treatment of the topic during this period came in *The Origins of Totalitarianism*, the classic 1951 work of political philosophy published by Hannah Arendt, a German-Jewish emigre scholar who had come to America in 1941 and spent the next decade heavily immersed in Jewish and Zionist circles. Given the very considerable length and depth of the book, she had probably begun working on it during the Nuremberg Tribunals or in their immediate aftermath, and she devoted several pages to the Holocaust, drawing upon the facts documented during those landmark war crime trials. However, her personal expertise and focus was philosophy and ideology rather than history, so she primarily emphasized that the fanatical Nazi project to exterminate all of Europe's Jews severely detracted from the German war effort, thereby demonstrating the utter "madness" of Hitler and his ruling

regime.

In a lengthy footnote, she also debunked some of the popular misconceptions surrounding that issue, pointing out that the gripping visual images of starved, emaciated corpses and survivors that had so horrified the American public at the end of the war were totally unrealistic and had nothing to do with the Holocaust since the Germans hadn't used starvation as their method of killing. Instead, she suggested those scenes reflected the total breakdown of German organization in the last days of the war due to America's strategic bombing campaign, a claim that many others have more recently made.

Rereading Novick's book did remind me of one important point that I'd previously forgotten. Raoul Hilberg's weighty 1961 volume *The Destruction of the European Jews* is universally acknowledged as having ignited the scholarly study of the Holocaust. But Novick suggests that the considerable success of Hilberg's book, which eventually launched an entire scholarly discipline, was probably due to its fortuitous timing.

During the 1930s the Zionist movement had forged an important economic partnership with Nazi Germany, which laid the basis for the eventual creation of the state of Israel. The Nazi liaison officer to the Zionists was Adolf Eichmann, who studied Hebrew and became known as something of a philo-Semite. After the resounding Allied victory in the war, those dangerous secrets of Zionist history were deeply suppressed, but during the mid-1950s they suddenly threatened to leak out again into the media, perhaps with very serious political repercussions for Israel's standing with America and the other Western nations. Possibly as a consequence, the Israeli government soon undertook a major effort to track down and eliminate their former close Nazi collaborator. After kidnapping Eichmann in 1960, the Israelis staged a high-profile show trial heavily focused upon the horrors of the Holocaust and culminating in Eichmann's 1962 execution. Novick plausibly argues that Hilberg's book owed much of its success to its release in the middle of that media extravaganza.

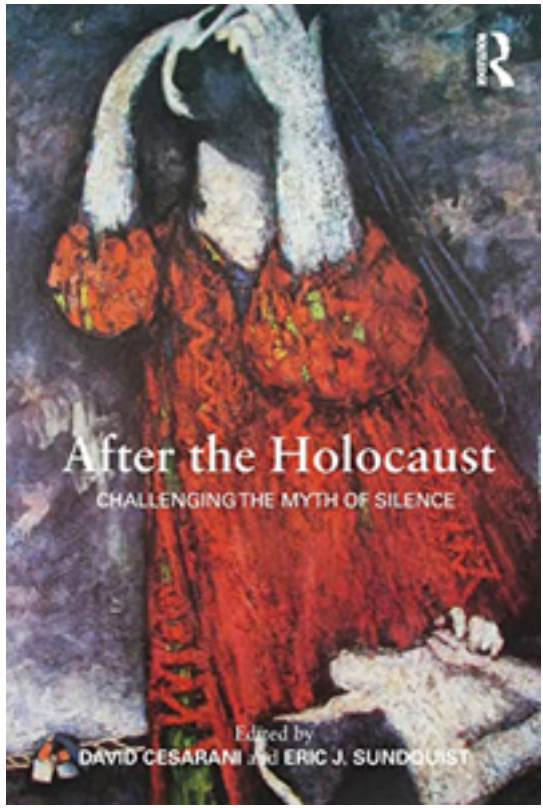
Thus, the combination of the Eichmann trial and Hilberg's book meant that during the early 1960s the Holocaust for the first time began receiving some attention in the mainstream media and also gradually became a topic of serious academic study. Many of those researchers had posts in the newly-established Jewish Studies programs that

proliferated at American universities as part of the broader ethnic studies movement of the late 1960s. But this media coverage was hardly enormous, and it may not have much penetrated into the American consciousness outside the Jewish community or Jewish activists.

According to Novick, the crucial development was the involvement of Hollywood, beginning in 1978 with the TV miniseries *Holocaust* starring James Woods and Meryl Streep, which for the first time firmly established that narrative in Western popular consciousness. Watched by nearly 100 million Americans, it was widely described as providing more information about that historical event to more Americans in four nights than the combined total of all past media coverage over the previous thirty years. I've sometimes suggested that television broadcast may have been the first time most Americans had ever heard of that enormous wartime crime. Novick notes that NBC's huge marketing campaign was dwarfed by a vastly larger effort undertaken by all the various Jewish organizations, leading to the inescapable conclusion that Hollywood and Jewish activists working together did indeed create the Holocaust.

With Hollywood dominating global entertainment, the effect was also felt far outside our own borders, notably in Germany. As Novick puts it, thirty years of German silence on Nazi war crimes was suddenly overturned by a lavish Hollywood production, based upon the important principle that seeing is believing.

## Other Perspectives on Holocaust Historiography



Novick's important historiographical analysis was glowingly praised by many leading Jewish scholars, but other researchers sharply disputed it, so I recently read one of the main academic rebuttals to get the other side of the story. *After the Holocaust* turned out to be a fairly short 2012 collection of essays edited by David Cesarani and Eric J. Sundquist, bearing the descriptive subtitle "Challenging the Myth of Silence."

I wasn't greatly impressed by the contents, and felt that the book actually seemed to reinforce Novick's case. The contributors included more than a dozen historians who had carefully scoured the media and literature of the period for evidence to refute Novick's thesis, but they seemed to come up almost totally empty. They described some some sharp denunciations of antisemitism, whether in Hitler's Germany or Truman's America, but except for a short spike right around the time of the Nuremberg Tribunals, there was almost no indication in the media that any Holocaust had ever occurred. There were occasional glancing references to the Nazis having killed Jews, but in nearly all these cases the implied death-toll could just as easily have been six hundred as six million, and indeed in the bitter postwar struggle over Palestine, some of the angry Zionists and their American

polemicist allies sometimes denounced the British for being almost as cruel to the Jews as the German Nazis had been.

The only major exception to this climate of near total silence was found in the newly created State of Israel, which featured a very widespread and popular Holocaust literature throughout this period. But most of this material consisted of bizarre accounts of sadomaschistic sexual perversion in Nazi death camps, and over the years these have gradually been recognized as merely being pornographic fiction.

Meanwhile, other academics of widely different ideological perspectives seem to reach conclusions very similar to those of Novick. Norman Finkelstein's lengthy review of Novick's work soon appeared in the *London Review of Books* and eventually led him to extend the latter author's analysis and publish *The Holocaust Industry* in 2000, which became an international bestseller. Although the two scholars diverged in their emphasis and their sharp ideological differences provoked some hostile exchanges—Novick was a mainstream liberal Zionist and Finkelstein a fervent anti-Zionist—I think that their descriptions were quite complementary.

Finkelstein's area of historical expertise is the Middle East and his brief foray into the subject of the Holocaust was probably inspired by what he regarded as its very pernicious political impact upon the Israel/Palestine conflict. But around the same time I'd originally read Novick's book, I also read those of Holocaust experts Deborah Lipstadt and Lucy Dawidowicz, and found that they fully confirmed and amplified Novick's conclusions, although they presented their findings in a very different tone and manner.

Lipstadt's 1986 book *Beyond Belief* demonstrated that despite the loud outcries of agitated Jewish activists, during the war years neither the major American media nor the American public seemed to believe that any Holocaust was actually occurring. She reported that as late as 1944:

> Writing in the Sunday *New York Times Magazine*, [Arthur] Koestler cited public opinion polls in the United States in which nine of ten average Americans dismissed the accusations against the Nazis as propaganda lies and flatly stated that they did not believe a word of them.

A few years earlier in 1981, Harvard University Press had published Dawidowicz's *The Holocaust and the Historians*, in which the author

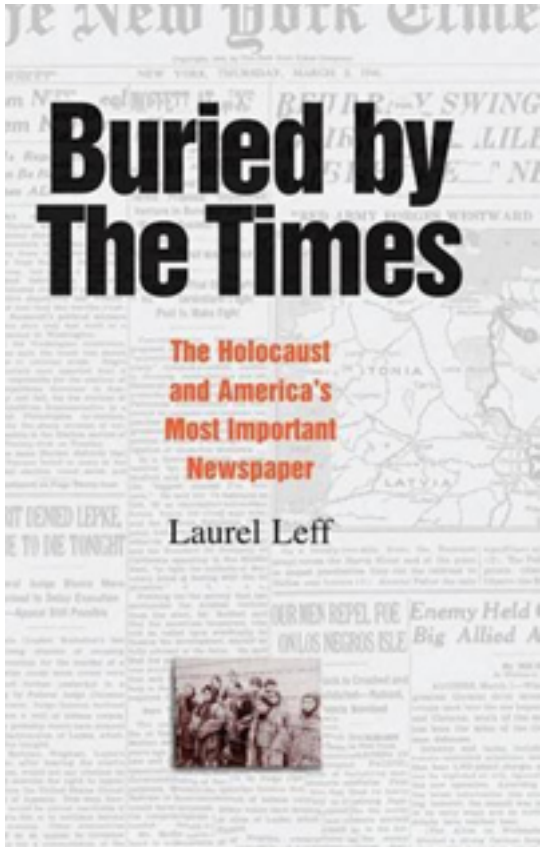
roasted nearly all our postwar mainstream historians for almost totally ignoring the Holocaust, writing their histories as if it had never occurred.

Her sharp condemnation even extended to Britain's Alan Bullock, although he seems to have been the only mainstream historian to have mentioned the Holocaust during this era. In 1952 while still in his thirties, he had published *Hitler: A Study in Tyranny*, the first comprehensive biography of the German dictator and hardly a flattering one as indicated by the title, with his treatment remaining the standard work during the decades that followed, greatly influencing those that came afterward. Yet although the Holocaust supposedly accounted for roughly 10% of all the wartime deaths and his book ran nearly 800 pages, he only apparently devoted three sentences to that topic, merely quoting the prosecution claims made at the Nuremberg Tribunals, whose trial transcripts had been a primary basis for his entire text. By the time of his revised 1962 edition, those three sentences had grown into several paragraphs among the 850 pages, and he now cited the testimony from Eichmann's recent show trial in Israel as well as the book published by a Jewish art historian.

Both Lipstadt and Dawidowicz came across as hard-edged Zionists, who probably despised Novick for his much more moderate views let alone Finkelstein's strident anti-Zionism, so these scholars presented their conclusions in a very different fashion, but they all provided essentially the same view of the underlying historical reality.

For those who would like to review some of these findings in convenient, online form, I'd strongly recommend a 2004 undergraduate research paper produced for a Holocaust Studies class taught by Prof. Harold Marcuse at UCSB. Apparently Marcuse considered the work sufficiently good that he decided to put it online at his own website:

- College Textbooks and the Holocaust, 1952-1968
  Carlos Magaña • UCSB History 133P • June 2004 • 7,700 Words



One additional book I read was much more narrowly focused, carefully exploring the wartime Holocaust coverage—or rather the lack thereof—of the Jewish owned *New York Times*, America's most influential newspaper. *Buried by the Times* was published in 2005 by Laurel Leff, who had spent 18 years as a reporter with the *Wall Street Journal* and other mainstream outlets before becoming a professor of Journalism at Northeastern University, and her exhaustive, scholarly study was released by Cambridge University Press. As implied by the title, she lambasted America's national newspaper of record for completely downplaying and minimizing the wartime reports they received of a massive ongoing Jewish extermination campaign, with many of the key editors apparently dismissing them as ridiculous fabrications. She analyzed the internal workings of the *Times* on that subject in great detail and her overall conclusions seemed broadly consistent with those of the other authors.

Finally, as further examples of this strange pattern of silence, I should mention the curious fact that the 1948-1959 postwar memoirs and histories by the three great Allied leaders, Churchill, Eisenhower, and

De Gaulle totaled more than 7,000 pages, but contained no mention of the Holocaust or any of its major elements. The same was also true of the voluminous, posthumously published diaries of Gen. George Patton and James Forrestal, our first Secretary of Defense.

## A Copernican Revolution on the Holocaust?

As I've repeatedly emphasized, the sole brief exception to the widespread pattern of minimizing or ignoring the Holocaust both during and after the Second World War came in the immediate postwar period, especially surrounding the 1946 Nuremberg Tribunals in which the top Nazi leaders were tried and executed for those crimes. But by the 1950s, more and more prominent Americans had come to regard those very high-profile legal proceedings as deeply shameful, a kangeroo court whose preordained verdicts had been based upon confessions extracted by torture, forged documents, and perjured testimony.

This was certainly the position taken by Prof. John Beaty, who had held a crucial position in our wartime Military Intelligence, and in 1951 he published *The Iron Curtain Over America*, which became a huge bestseller among conservatives:

> Furthermore, he was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

In his 1981 memoirs, Prof. Revilo Oliver, another important former figure in wartime Military Intelligence, had taken the same position, and Prof. Joseph Bendersky's ten years of archival research indicated that this was also the view of many or most of our top generals and Military Intelligence officers.

In 1962 American historian and philosopher Thomas Kuhn published his influential study *The Structure of Scientific Revolutions*. He introduced the notion of a "paradigm shift" in which the gradual accumulation of anomalous or unexplained facts eventually causes an established framework of understanding to suddenly be overturned and replaced by a radically different one, a process exemplified by the Copernican Revolution.

I think that any thoughtful readers who carefully digested the works of leading mainstream Holocaust scholars such as Novick, Lipstadt, Dawidowicz, and Bendersky, supplemented by a little additional material, would surely be primed for undergoing such an intellectual transformation on that subject, whether or not they were willing to recognize it.

Consider that almost none of our mainstream journalists or historians had acknowledged the reality of the Holocaust either during or after World War II, while the 1946 Nuremberg Tribunals that supposedly established those facts were heavily fraudulent. Therefore, it seems the height of arrogance to assume that all those very knowledgeable contemporaneous observers were wrong and we should instead rely upon authors publishing many years, sometimes many decades after those events.

Instead, we must consider the very real possibility that the Holocaust is merely a hoax, a half-forgotten residue of dishonest wartime propaganda that was eventually resurrected by gullible or biased researchers decades later, then afterwards transformed into a gigantic cultural icon by ignorant Hollywood producers and scriptwriters. Indeed, in his very popular 1951 book Prof. Beaty had casually ridiculed the Holocaust story in exactly those terms, and although he came under ferocious attack by the ADL and other groups on all other grounds, none of them had ever challenged his very explicit "Holocaust Denial."

To his considerable credit, near the very end of his excellent book Novick did note the existence of "Holocaust Deniers" but treated the subject in dismissive and very cursory fashion, giving it only a couple of pages in his lengthy book. He casually besmirched them as "cranks, kooks, and misfits," "screwballs," "fruitcakes," and "nuts," while giving no indication that he had ever bothered reading let alone seriously considering any of the material their movement had produced. In all fairness, a number of the persons whom he named did fall into exactly that very disreputable category, hardly surprising since marginal, severely anathematized ideological movements

naturally tend to attract more than their fair share of such crazy or anti-social individuals. But the validity of any doctrine should obviously be judged by the work of its most credible proponents rather than its weakest ones.

In discussing this issue, Novick briefly mentioned Lipstadt's 1993 book *Denying the Holocaust*, which was entirely devoted to that topic. I found that latter author almost hilarious in her dim-witted and self-defeating ideological blindness. As I described the contents in my 2018 article:

> Reading the book was certainly a tremendous revelation to me. Lipstadt is a professor of Holocaust Studies with an appointment in Emory University's Department of Theology, and once I read the opening paragraph of her first chapter, I decided that her academic specialty might certainly be described as "Holocaust Theology"…
>
> Lipstadt's absolute horror at having someone actually dispute the tenets of her academic doctrine could not have been more blatant. Surely no zealous theologian of the European Dark Ages would have reacted any differently.
>
> The second chapter of her book supported that impression. Since many of the individuals she castigates as Holocaust Deniers also supported the Revisionist perspective of the underlying causes of the First and Second World Wars, she harshly attacked those schools, but in rather strange fashion. In recent years, blogger Steve Sailer and others have ridiculed what they describe as the "point-and-sputter" style of debate, in which a "politically-incorrect" narrative is merely described and then automatically treated as self-evidently false without any accompanying need for actual refutation. This seemed to be the approach that Lipstadt took throughout her rather short book.
>
> For example, she provided a very long list of leading academic scholars, prominent political figures, and influential journalists who had championed Revisionist history, noted that their views disagree with the more mainstream perspective she had presumably imbibed from her History 101 textbooks, and thereby regarded them as fully debunked. Certainly a Christian preacher attempting to refute the evolutionary theories of Harvard's E.O. Wilson by quoting a passage of Bible verse might take much the same approach. But few evangelical activists would be so foolish as to provide a very long list of eminent scientists who all took

> the same Darwinist position and then attempt to sweep them aside by citing a single verse from Genesis. Lipstadt seems to approach history much like a Bible-thumper, but a particularly dim-witted one. Moreover, many of the authors she attacked had already become familiar to me after a decade of my content-archiving work, and I had found their numerous books quite scholarly and persuasive.

This last passage came from my very long 2018 article on that subject, and last month I revisited the same topic in a new article.

## Our World Turned Upside Down

Officially relegating the Holocaust to the category of discredited historical frauds would be a very momentous act, something not undertaken lightly and having far-reaching implications.

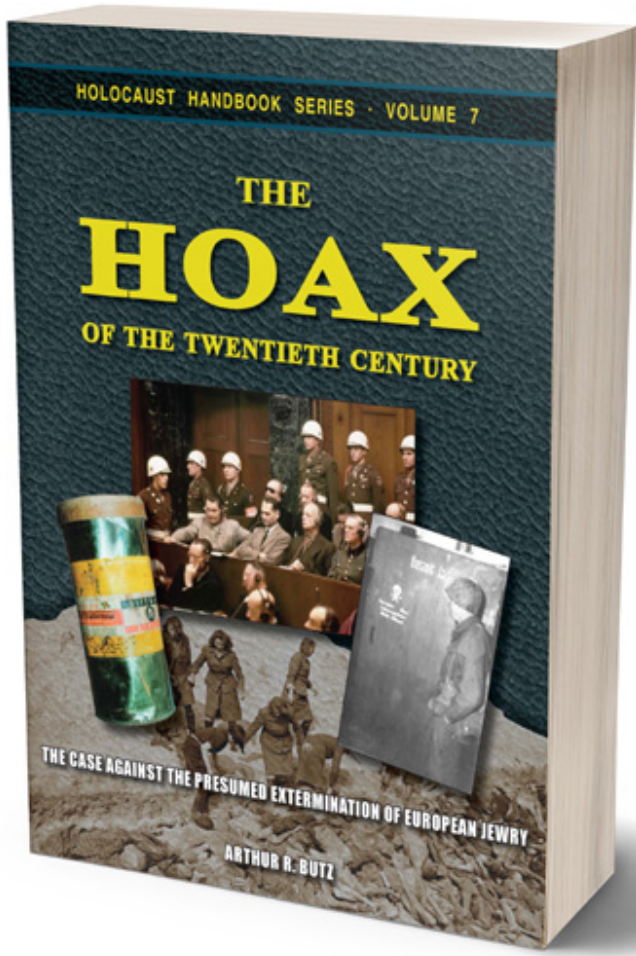
Among the lesser consequences would be that ten or twenty thousand books published in English over the last half-century would suddenly be rendered obsolete and their authors revealed to be gullible fools. A vast multitude of other books and articles would suffer serious injury as well, with future readers always snickering when they came across certain paragraphs or chapters, while our basic textbooks would necessarily be forced to reverse the same revisionary process on that subject they had experienced from the 1960s onward. But all the Ptolemaic astronomers who had devoted their lives to calculating increasingly complex epicycles in order to explain the motions of the heavenly bodies were similarly swept away by the Copernican Revolution, and the political ramifications of declaring that the Holocaust was merely a hoax would be far more dramatic, not least with regard to our current Middle East policy.

Indeed, given the extent to which most Western peoples have undergone a half-century of intensive Holocaust conditioning at the hand of our media and entertainment industries, perhaps the collapse of Soviet Communism would be a better historical analogy. But even that shattering event might fall short since in many respects the Holocaust has been transmuted into a quasi-religious faith —"Holocaustianity"—that serves as the reigning creed of much of our

deeply secular West, featuring its own venerated martyrs, sacred texts, and holy places, with Auschwitz being its chief pilgrimage site. The collapse of an established and powerful religious doctrine is fraught with huge difficulties.

Some figures now greatly celebrated would be cast down into ignominy, while others now obscure or reviled would be raised up to take their places. In my 2018 article I had briefly sketched out a few of those latter individuals:

> A professor of Electrical Engineering at Northwestern named Arthur R. Butz was casually visiting some libertarian gathering during this period when he happened to notice a pamphlet denouncing the Holocaust as a fraud. He had never previously given any thought to the issue, but such a shocking claim captured his attention, and he began looking into the matter early in 1972. He soon decided that the accusation was probably correct, but found the supporting evidence, including that presented in the unfinished and anonymous Hoggan book, far too sketchy, and decided it needed to be fleshed out in much more detailed and comprehensive fashion. He proceeded to undertake this project over the next few years, working with the methodical diligence of a trained academic engineer.



HOLOCAUST HANDBOOK SERIES · VOLUME 7
THE
HOAX
OF THE TWENTIETH CENTURY
THE CASE AGAINST THE PRESUMED EXTERMINATION OF EUROPEAN JEWRY
ARTHUR R. BUTZ

His major work, *The Hoax of the Twentieth Century*, first appeared in print late in 1976, and immediately became the central text of the Holocaust Denial community, a position it still seems to retain down to this present day, while with all the updates and appendices, the length has grown to well over 200,000 words. Although no mention of this forthcoming book appeared in the February 1976 issue of *Reason*, it is possible that word of the pending publication had gotten around within libertarian circles, prompting the sudden new focus upon historical Revisionism.

Butz was a respectable tenured professor at Northwestern, and the release of his book laying out the Holocaust Denial case soon became a minor sensation, covered by the *New York Times* and other media outlets in January 1977. In one of her books, Lipstadt devotes a full chapter entitled “Entering the Mainstream”

to Butz's work. According to a December 1980 *Commentary* article by Dawidowicz, Jewish donors and Jewish activists quickly mobilized, attempting to have Butz fired for his heretical views, but back then academic tenure still held firm and Butz survived, an outcome that seems to have greatly irritated Dawidowicz.

Another regular IHR participant was Robert Faurisson. As a professor of literature at the University of Lyons-2, he began expressing his public skepticism about the Holocaust during the 1970s, and the resulting media uproar led to efforts to remove him from his position, while a petition was signed on his behalf by 200 international scholars, including famed MIT professor Noam Chomsky. Faurisson stuck to his opinions, but attacks persisted, including a brutal beating by Jewish militants that hospitalized him, while a French political candidate espousing similar views was assassinated. Jewish activist organizations began lobbying for laws to broadly outlaw the activities of Faurisson and others, and in 1990, soon after the Berlin Wall fell and research at Auschwitz and other Holocaust sites suddenly became far easier, France passed a statute criminalizing Holocaust Denial, apparently the first nation after defeated Germany to do so. During the years that followed, large numbers of other Western countries did the same, setting the disturbing precedent of resolving scholarly disputes via prison sentences, a softer form of the same policy followed in Stalinist Russia.

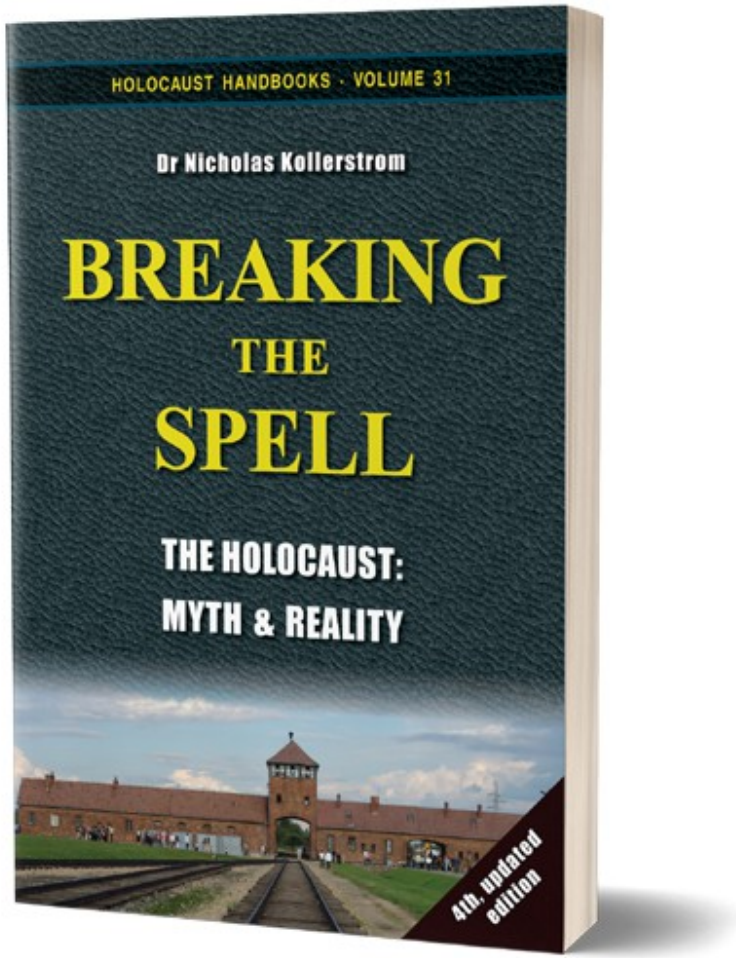
In exploring the history of Holocaust Denial, I have noticed this same sort of recurrent pattern, most typically involving individuals rather than institutions. Someone highly-regarded and fully mainstream decides to investigate the controversial topic, and soon comes to conclusions that sharply deviate from the official narrative of the last two generations. For various reasons, those views become public, and he is immediately demonized by the Jewish-dominated media as a horrible extremist, perhaps mentally-deranged, while being relentlessly hounded by a ravenous pack of fanatic Jewish-activists. This usually brings about the destruction of his career.

Fred Leuchter was widely regarded as one of America's leading expert specialists on the technology of executions, and a long article in *The Atlantic* treated him as such. During the 1980s, Ernst Zundel, a prominent Canadian Holocaust Denier, was facing trial for his disbelief in the Auschwitz gas chambers, and one of his expert witnesses was an American prison warden with some

experience in such systems, who recommended involving Leuchter, one of the foremost figures in the field. Leuchter soon took a trip to Poland and closely inspected the purported Auschwitz gas chambers, then published the *Leuchter Report*, concluding that they were obviously a fraud and could not possibly have worked in the manner Holocaust scholars had always claimed. The ferocious attacks which followed soon cost him his entire business career and destroyed his marriage.

David Irving had ranked as the world's most successful World War II historian, with his books selling in the millions amid glowing coverage in the top British newspapers when he agreed to appear as an expert witness at the Zundel trial. He had always previously accepted the conventional Holocaust narrative, but reading the *Leuchter Report* changed his mind, and he concluded that the Auschwitz gas chambers were just a myth. He was quickly subjected to unrelenting media attacks, which first severely damaged and then ultimately destroyed his very illustrious publishing career, and he later even served time in an Austrian prison for his unacceptable views.

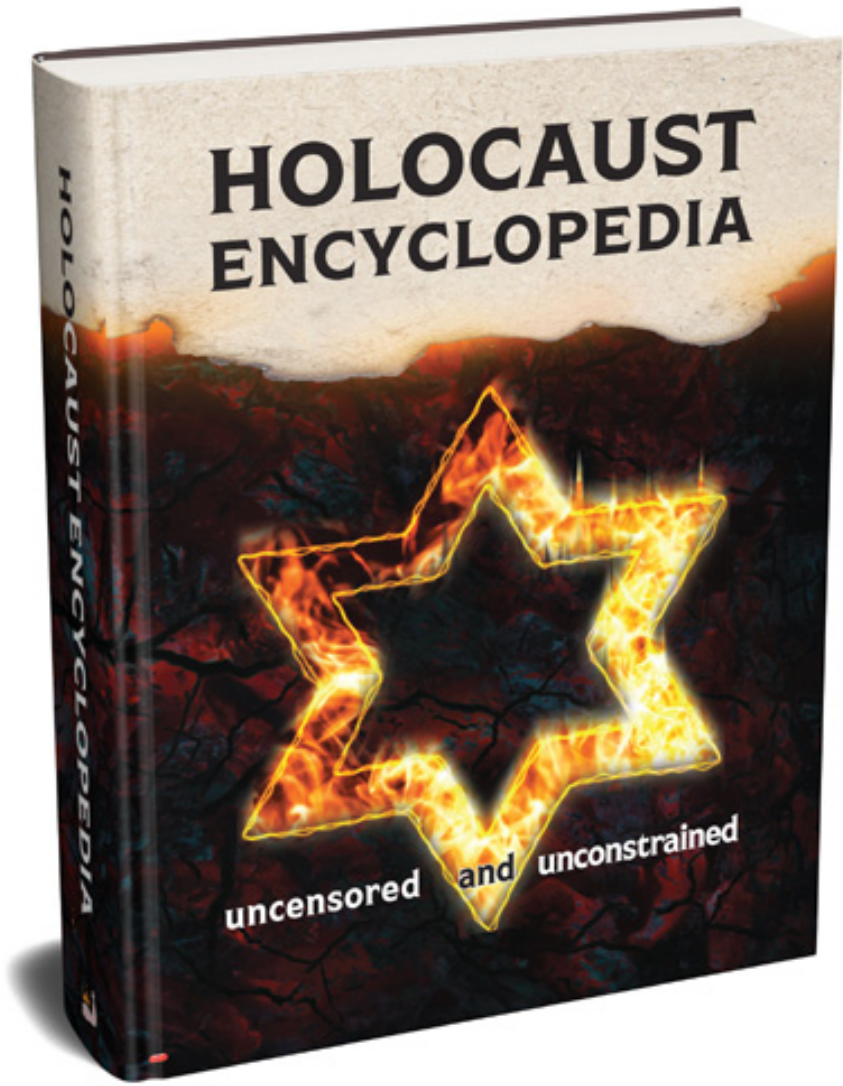
Dr. Germar Rudolf was a successful young German chemist working at the prestigious Max Planck Institute when he heard of the controversy regarding the *Leuchter Report,* which he found reasonably persuasive but containing some weaknesses. Therefore, he repeated the analysis on a more thorough basis, and published the results as the *Chemistry of Auschwitz*, which came to the same conclusions as Leuchter. And just like Leuchter before him, Rudolf suffered the destruction of his career and his marriage, and since Germany treats these matters in harsher fashion, he eventually served five years in prison for his scientific impudence.



Most recently, Dr. Nicholas Kollerstrom, who had spent eleven years as a historian of science on the staff of University College, London, suffered this same fate in 2008. His scientific interests in the Holocaust provoked a media firestorm of vilification, and he was fired with a single day's notice, becoming the first member of his research institution ever expelled for ideological reasons. He had previously provided the Isaac Newton entry for a massive biographical encyclopedia of astronomers, and America's most prestigious science journal demanded that the entire publication be pulped, destroying the work of over 100 writers, because it had been fatally tainted by having such a villainous contributor. He recounted this unfortunate personal history as an introduction to his 2014 book *Breaking the Spell*, which I highly recommend.

The lives and careers of a very sizable number of other

individuals have followed this same unfortunate sequence, which in much of Europe often ends in criminal prosecution and imprisonment. Most notably, a German lawyer who became a bit too bold in her legal arguments soon joined her client behind bars, and as a consequence, it has become increasingly difficult for accused Holocaust Deniers to secure effective legal representation. By Kollerstrom's estimates, many thousands of individuals are currently serving time across Europe for Holocaust Denial.



Despite suffering years of German imprisonment for his skeptical investigation of the scientific evidence for the Holocaust, Rudolf

perservered and eventually created the most comprehensive published collection of Holocaust Denial literature. This includes the works of Butz and Kollerstrom as well as dozens of other books by various scholars, nearly all of them freely available for downloading, and quite a number of video documentaries on the same subject.

- Holocaust Handbooks • 51 Volumes

Most recently, Rudolf has also released an exhaustive Holocaust encyclopedia, summarizing much of this mountain of research material into a series of manageable entries.

If Prof. Arthur Butz probably stands as the founding father of academic Holocaust Denial, I think that the late Ernst Zundel might hold similar honors with regard to Holocaust Denial activism and publishing, having launched his own efforts around the same time. But while Butz was shielded by our First Amendment and academic tenure, Zundel, a German national who had emigrated to Canada in 1958, had no such protections, so he eventually faced several public trials, deportations, and many years of imprisonment, both in Canada and in his native Germany, while his Toronto home was fire-bombed by Jewish militants. Although both his Canadian trials of the 1980s ended in convictions and subsequent incarceration, they actually played a very important role in advancing his broader efforts, prompting both Leuchter and Irving to become involved in the topic, as well as providing invaluable cross-examinations of leading academic scholars of the Holocaust.

At the time of his death in 2017, I was only very slightly familiar with Zundel or his history, and therefore was quite surprised to read his long and remarkably temperate obituary in the *New York Times*, which led me to suspect that some *Times* editors may have quietly held heretical views regarding the cause Zundel had long championed, or at least entertained a few serious doubts in that regard.

Although I'd been unaware at the time, during the 1980s and early 1990s the Holocaust Denial controversy had sometimes received substantial attention on various broadcast television shows. For example, in 1994 the theatrical success of *Schindler's List* prompted Mike Wallace to interview Zundel for *60 Minutes*, and I recently discovered the segment was available on Youtube:

s

With some of these current matters in the back of my mind, I closed one of my earliest 2018 American Pravda articles with the following reflections:

> The notion that the world is not only stranger than we imagine, it is stranger than we can imagine has often been misattributed to the British astronomer Sir Arthur Eddington, and over the last fifteen-odd years I've sometimes begun to believe that the historical events of our own era could be considered in a similar light. I've also sometimes joked with my friends that when the true history of our last one hundred years is finally written and told—probably by a Chinese professor at a Chinese university—none of the students in his lecture hall will ever believe a word of it.

# The Rwandan Genocide

***The Unz Review*** • March 4, 2024 • 7,400 Words

Although I sometimes fall short, I always try to be very accurate and careful in my writing, doing my best to avoid the mistakes that might be eagerly pounced upon by my legion of harsh critics. This is especially necessary when discussing the ultra-controversial topics that are so often the focus of my essays.

For example, a few weeks after Israel began its brutal military assault on Gaza in retaliation for the October 7th Hamas raid, one of my articles included the following passage:

> Last Thursday, most of the world was still reeling from the televised devastation in Gaza, as a densely-populated portion of one of its largest refugee camps was demolished by multiple 2,000-pound Israeli bombs, apparently killing hundreds of helpless Palestinian civilians, most of them women and children.
>
> Soon afterward on *CNN*, pro-Israel former AIPAC staffer Wolf Blitzer questioned an Israeli military spokesman about the horrific loss of human life and was told that the massive attack had been completely justified because the Israelis believed that a Hamas commander was in the vicinity.
>
> These are blatant war crimes, probably the worst ever televised in the history of the world, or at least I can't recall anything comparable. Admittedly there have been far larger modern massacres, such as in 1994 Rwanda where according to Wikipedia the Hutus butchered many hundreds of thousands of their Tutsi neighbors with machetes; but both the Hutu killers and their Tutsi victims were mostly primitive African villagers, so none of those dark deeds were ever broadcast live on global television.
>
> In sharp contrast, the grim events of the last four weeks have been widely watched around the world on electronic and social media. In just one month some 10,000 civilians have been killed in Gaza, a total larger than the combined losses on both sides in the past twenty months of the Ukraine war. Despite the fulminations of Western media outlets, since early 2022 only about 550 children have been killed in Ukraine, while after just a few weeks the total in Gaza has passed 4,000. Moreover, while

the Ukraine war was fought between powerful, well-equipped modern armies on both sides, the defenseless civilians of Gaza are being relentlessly pounded by one of the world's most lavishly-armed military forces.

- American Pravda: War Crimes and Atrocity-Hoaxes in the Israel/Gaza Conflict
  Ron Unz • ***The Unz Review*** • November 6, 2023 • 6,300 Words

My point was that although the 1994 genocide of Rwanda's Tutsis was obviously vastly larger in scale than anything the Israelis were doing in Gaza, the former had occurred out of sight, while the latter was currently being televised worldwide.

Since then, I've repeatedly described the ongoing attacks on Gaza as constituting "the greatest televised massacre of helpless civilians in the history of the world," making sure that I always include the word "televised" to maintain the accuracy of my statement. When we read a few sentences in a history book explaining that Tamerlane built mountains of skulls during his 1387 conquest of Persia, the psychological impact is far less than when we see a photo-laden magazine story of the few hundred Vietnamese villagers killed in the 1969 My Lai massacre, let alone the ongoing annihilation of Gaza's Palestinians live-streamed on social media.

For similar reasons, I'd been extremely reluctant to describe these ongoing events as a "genocide" even though that word is so widely used by other critics of Israel's actions. I had preferred to reserve that momentous term for events such as those in Rwanda, during which militant Hutus spent 100 days slaughtering the bulk of their Tutsi compatriots, seeking to completely exterminate that ethnic group with bullets and machete-blows.

But in my quoted passage I was also careful to include one additional disclaimer. I stated that my description of the notorious Rwanda genocide, one of the largest in all human history, was "according to Wikipedia," indicating that I was drawing my information from the 21,000 word article on that subject.

Until several years ago, I wouldn't have bothered to include that clarification given that the general facts of the horrific 1994 slaughter seemed so well known and universally accepted. I'd read the stories in my newspapers at the time, and subsequently seen them cited and

discussed in countless articles since then. Leading journalists had published numerous books on the subject, whose favorable reviews I'd read, while I'd also seen the Oscar-nominated 2004 film *Hotel Rwanda* dramatizing part of that story. I'd never had the slightest doubts about the reality and circumstances of those terrible events, nor had I realized that anyone else did. And if everyone agrees that a historical incident happened in a particular way, there's no need for even the most careful writer to hedge himself when he cites it.

But back in 2021 I'd republished a lengthy article that claimed the entire story I'd always accepted was almost totally false and largely inverted, and it seemed sufficiently detailed and sober that afterwards I felt I needed to be much more circumspect whenever I mentioned it.

It's probably worth briefly sketching out the background and history of what had happened in Rwanda, which I'd absorbed at the time from all my newspapers and magazines, later reinforced by the popular film and numerous subsequent references throughout the mainstream media.

Both Rwanda and neighboring Burundi were small African states, landlocked, impoverished, and densely-populated, each containing two distinct ethnic groups, the tall, slender Tutsis, who had traditionally been cattle herdsmen, and the shorter, stockier Hutu cultivators. For centuries prior to the appearance of the Europeans, both those countries had been feudal kingdoms, ruled by their 15% Tutsi minorities, and after the Germans assumed suzerainty in the late nineteenth century, the latter continued to exercise control through the Tutsis, as did the Belgians, who received the territory as spoils from the First World War. Although independence came in the wake of World War II, Tutsi rule continued, but in 1959 Rwanda's 85% Hutu majority overthrew its Tutsi monarchy, and the waves of resulting ethnic bloodshed and massacres during the 1960s led large numbers of its Tutsis to flee elsewhere, mostly into neighboring Uganda. Meanwhile, Burundi was also wracked by similar ethnic conflict and massacres, mostly inflicted by the ruling Tutsis against its large and restive Hutu majority.

The Tutsi exiles in Uganda eventually became a very substantial component of the leading rebel army, which successfully overthrew the Ugandan government in 1986, and in 1990 they launched a military campaign to overthrow Rwanda's Hutu government as well, gradually gaining ground over the next several years. Combined with international pressure in the aftermath of the Cold War, their efforts finally forced Rwanda's Hutu president to sign a peace agreement,

allowing the return of the Tutsi exiles, establishing power-sharing between the two groups, and arranging to hold democratic elections. A prominent local Tutsi was named prime minister and a couple of thousand UN peacekeepers were brought in to oversee the reconciliation process. However, on April 6, 1994, the plane carrying the returning Rwandan president together with his Burundian counterpart was shot down as it approached for landing, triggering a gigantic wave of ethnic bloodshed and massacres across that sharply divided society.

According to the conventional narrative, extremist Hutus unwilling to share power had been responsible for the assassination of the more accomodating Hutu president, and they quickly seized control, immediately unleashing a long-planned campaign of genocide against their hated Tutsi minority while also slaughtering any moderate Hutus. All prominent Tutsis were marked for death, with most of them killed, while the genocidal broadcasts of Hutu radio propaganda persuaded a large fraction of that population to join in those grisly massacres, even as the rest of the world stood by and did nothing, including the hugely outnumbered UN peacekeepers.

This massive killing rampage against Tutsis went on for several months, with a large majority of that population being annihilated, along with any Hutus deemed sympathetic to them. The bloodshed was only finally halted by the military victory of the Tutsi rebel army, which defeated the government forces and their genocidal militia allies and gained control of most of Rwanda. At that point, the Hutu leadership and many participants in the slaughter fled the country, along with ordinary Hutus fearful of Tutsi vengeance, so some 1.5 million Hutus became refugees in neighboring Congo. These Hutus and the larger number who remained behind now greatly suffered as well, with the victorious Tutsis committing some massacres of their own, but the Tutsi leader Paul Kagame did his best to restrain his men and try to restore ethnic coexistence between the two groups, while welcoming back many hundreds of thousands of Tutsi exiles who had been living for decades in Uganda and elsewhere.

Picador

An enormously influential account of that story was provided by journalist Philip Gourevitch, a staff writer for the *New Yorker* who spent much of his time in Rwanda during the years 1995 to 1998, writing a series of articles on the aftermath of the massacre, while also producing important pieces for the *New York Times Magazine* and the *New York Review of Books*. This original reporting then furnished the basis for his 1998 *New York Times* bestseller, *We wish to inform you that tomorrow we will be killed with our families*, which won numerous critical awards and attracted tremendously positive reviews all across the elite and mainstream media. I finally read it last week to refresh my memory of those events of nearly thirty years ago.

His subtitle "Stories from Rwanda" was very descriptive, and the author interviewed hundreds of Rwandans during his extensive visits, seeming to do a very good job of reporting their individual experiences during that horrifying period and weaving them together into a comprehensive narrative of what had transpired. Indeed, the first half of his book dealt with the period of the genocide itself and his narrative seemed so detailed that I'd initially assumed that the author himself must have been present around the time the events unfolded, but I then noticed that he had only arrived the following

year and was therefore relying upon his later interviews to describe the earlier sequence of events.

Most of the individuals with whom he spoke were Tutsi survivors, and some of these had seen nearly their entire families butchered by the Hutu death squads, which went house-to-house slaughtering their Tutsi neighbors while also setting up roadblocks, stopping and killing any Tutsis who crossed their path.

Although Hutus and Tutsis had had a long history of episodic bloody conflict and on average looked different enough that they could often be distinguished, they spoke the same language and prayed in the same Catholic churches, while intermarriage was hardly uncommon. Some of the most grisly stories involved the consequences of the latter situation, with a few of the Hutus most energetic in the death squads later claiming that they took that leadership role in order to protect their Tutsi wives from suffering the same fate, sometimes even killing the families of the latter to demonstrate their commitment. The offspring of such mixed marriages were usually considered sufficiently Tutsi to be worthy of death, and the author described how a Hutu mother watched in helpless horror as her half-Tutsi children were butchered by a mob.

I've never been to Rwanda and I'm not sure I've ever met a single Rwandan, so all I know about that country, its society and its people, has come from the words of Western journalists and researchers such as Gourevitch. But the mentality of the killers he interviewed struck me as rather strange and surprising.

Despite intermittent bloodshed, Hutus and Tutsis had lived together on reasonably friendly terms for decades, but then one day the former picked up their machetes and suddenly began chopping up the families of their next-door neighbors. When the author asked some of those imprisoned killers how they could have done such a monstrous thing, he was given answers such as "everyone else was doing it" or "the radio told us to kill all the Tutsis." This hardly seemed a very satisfying explanation for the most rapid campaign of mass extermination in modern history, occasionally using guns or grenades, but more often relying upon machetes or simple farm implements. Catholic priests and nuns also sometimes joined in the slaughter, assisting in the massacre of their own parishioners.

The social aftermath of the genocide also seemed quite difficult for Westerners to comprehend. According to Gourevitch, a large majority of all the Tutsis had been killed and a very substantial fraction of all

the adult male Hutus had been direct participants, so huge numbers of the brutal killers and the wretched survivors remained in close proximity. Many of those Tutsis were forced to live on the same street —or even share the same house!—with the Hutus whom they knew or suspected had slaughtered their families a few months earlier. Gourevitch described the anger and bitterness of some of those victims, but it still seemed just a small fraction of what one might expect, and although he mentioned some of the vigilante killings that occurred, I'm surprised that the number was not vastly greater.

One of the notable figures in Gourevitch's book was the brave Hutu manager of the leading foreign-owned luxury hotel in Rwanda, whose Tutsi wife inspired him to offer refuge to many hundreds of her desperate co-ethnics, and by a mixture of bluff, bribery, and pure luck, he managed to keep the mobs of killers at bay, allowing them all to survive. His remarkable story became the basis of the Hollywood film *Hotel Rwanda*, which probably provides most of what Americans and others know about that enormous genocide.

But by far the most heroic individual portrayed by the author was Paul Kagame, a child of Tutsi exiles raised in Uganda, who became the

military leader of the rebel army that overthrew Rwanda's murderous Hutu regime and thereby stopped the ongoing slaughter in its tracks, achieving that success while America and every other powerful Western country merely dithered. Without him and his small but determined army of Tutsi exiles, the genocide would surely have been carried to completion, resulting in the deaths of virtually every Rwandan Tutsi, whether man, woman, or child.

Once Kagame established his new government, he installed a Hutu president as a symbol of ethnic reconciliation in a country that was 85% Hutu. But he exercised the real power as vice president and defense minister, and according to the author's account, he did his best to minimize vengeance and retaliatory massacres in the aftermath of the genocide of his own people. Many of the ringleaders were killed and tens of thousands of their underlings were imprisoned under dreadful conditions, but compared to the hundreds of thousands of innocent Tutsis that they had so recently butchered, such retribution seemed remarkably mild.

Gourevitch's interviews with Kagame portrayed him as a remarkable individual, not only far more thoughtful and intellectual than anyone would expert in an African military commander, but also someone with a sense of humility and self-deprecating humor, seeking to restore normal life in his blood-drenched country. As a consequence of Kagame's very positive portrayal and the deep Western shame and guilt over permitting the Rwandan genocide, his regime became an important recipient of American aid. His efforts at ethnic reconciliation were widely portrayed in our media as sincere and surprisingly successful given the immense recent bloodshed, with Kagame presented as one of a new generation of enlightened African rulers, totally different than their corrupt, despotic, and bloodthirsty predecessors. Gourevitch praised Kagame as "the Abraham Lincoln" of Rwanda and most of the Western media took the same view.

As the author explained, many of the worst Hutu killers and their henchmen had fled across the border into neighboring Congo, accompanied by some 1.5 million ordinary Hutus, terrified of the vengeance that they expected to face in Rwanda at the hands of the newly victorious Tutsis. The Congo was a vast but very poorly governed country under the longtime misrule of its corrupt dictator Mobutu Sese Seko, who made little effort to enforce local order in the lands he controlled, a territory 90 times larger than Rwanda and having many times the population. As a consequence, the Hutu exiles established enclaves from which they regularly raided Rwanda, killing all the Tutsis they encountered, as well as massacring many of the

Congo's own ethnic Tutsi population.

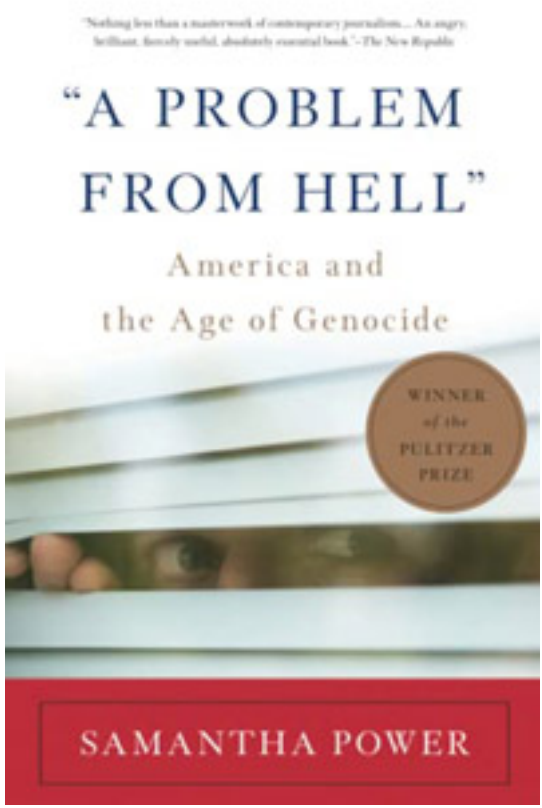
Repeated warnings and threats by Kagame and small counter-raids failed to halt these Hutu attacks, so after a couple of years, Kagame formed a military alliance with several other African nations including Uganda, and launched an invasion of his huge Congo neighbor. His forces easily defeated that country's ineffective army and he overthrew Mobutu's regime, installing a different Congolese leader whom he had recruited for the post. Although it received very little attention in the American media, this First Congo War was sometimes nicknamed Africa's First World War because it drew in more than a half-dozen different nations in confused and shifting alliances and replaced the government of a country as large as all of Western Europe. Although the death toll was considerable, with hundreds of thousands of civilians dead or "missing," these events came near the very end of Gourevitch's narrative and he marked it a triumph for Kagame, who destroyed the extremist Hutu forces while forcing the majority of the Hutu refugees to return to Rwanda, although many others died in massacres.

According to our standard narrative, the 1994 events in Rwanda were almost a textbook-perfect example of genocide, with a ruthless government seeking to totally exterminate the local Tutsi population and successfully killing a large majority of them. All this took place at the absolute peak of America's international power and prestige—our nation's "unipolar moment"—yet in obvious violation of all our anti-genocide conventions, neither Washington nor any other major powers took any forceful steps to stop it.

Rwanda had an extremely feeble military and most of the killings were carried out by local Hutu militias, often armed with nothing more formidable than machetes. The military commander of the UN peace-keeping force stationed in that country declared that if he were merely given 5,000 well-equipped troops, he could have immediately ended the slaughter, but instead he was prohibited from taking any action and the best troops under his command were withdrawn. The Clinton Administration was terrified of suffering political damage if it got bogged down in an obscure African conflict so it looked the other way, hoping that the ongoing Rwanda massacre would be limited to a few tens of thousands of victims as had been the case in the past. The killings only stopped when Kagame's rag-tag force of Tutsi exiles defeated the Rwandan army and seized control of the entire country.

Once the grim facts about the massive scale of the genocide became widely known, elite Western political and media circles felt tremendous shame that their governments had done nothing.

Samantha Power was then in her mid-20s, a naturalized Irish immigrant who had graduated from Yale and was working as an overseas war correspondent. She and many others were outraged that no American officials had resigned in protest over their government's lack of action over Rwanda, a personal sacrifice that might have provoked enough media attention to pressure the West into taking action, thereby saving hundreds of thousands of lives. Returning to America to attend Harvard law school, that simmering righteous anger—heightened as she realized that lack of timely government action had also occurred in other such situations—inspired her to write a paper on the subject.



That paper eventually grew into her first book, *"A Problem from Hell"* running 600 pages and carrying the subtitle "America and the Age of Genocide." Published in 2002 when Power was just 31, it quickly became an international sensation, glowingly reviewed almost

everywhere, a huge bestseller that won her a Pulitzer Prize and launched her career as a leading figure in human rights doctrine, someone who had seemingly shifted American national policy on an important global issue.

Although I'd certainly been aware of her book when it first appeared, I only just recently read it as part of my Rwanda investigation and discovered that it had attracted even more accolades than I'd ever realized. My 2013 paperback edition devoted a full page to listing the awards it won and another page to the many major newspapers and other publications that had named it one of the best books of the year. Seven additional pages contained excerpts from 63 glowing reviews and endorsements by a very long list of prominent intellectual and political figures, a list so extremely long that I noticed the careless editor had accidentally duplicated at least one of those entries. I can't recall the last time I'd seen a book that had attracted such seemingly near-universal praise.

As might be expected, the chapter on Rwanda was one of the longest, and the story it told seemed fully congruent with that of Gourevitch, though having a different focus. Power emphasized the top-level policy decision-making of the Clinton Administration and other international bodies rather than the grisly eyewitness accounts of the killers and their victims.

One important point that Power made was that just the previous year, Tutsi military officers in neighboring Burundi had assassinated that country's first freely-elected Hutu president, leading to widespread communal violence that cost some 50,000 lives. As a consequence, Western leaders including those in the Clinton Administration had vaguely assumed that Rwanda was merely undergoing "another flare-up" that would result in a similar level of "acceptable" total casualties. But she explains that instead:

> The Rwandan genocide would prove to be the fastest, most efficient killing spree of the twentieth century. In 100 days, some 800,000 Tutsis and politically moderate Hutus were murdered. The United States did almost nothing to try to stop it.

Power also emphasized some of the political background behind the total unwillingness of the Clinton Administration to become involved in Rwanda. In 1992, the preceding Bush Administration had deployed American military forces to Somalia as part of a UN humanitarian operation to manage and protect the delivery of food supplies amid a famine and an anarchic civil war. Then in 1993 Clinton had

authorized American forces to capture one of the local warlords deemed responsible for attacking UN troops, resulting in the disastrous "Battle of Mogadishu" in which determined Somali militiamen shot down three Black Hawk helicopters. Hundreds of Somali fighters and civilians died in the fighting along with eighteen members of our elite special forces, while many dozens more American troops were wounded, and the body of one of our fallen soldiers was dragged through the streets of the city before cheering crowds. The images of that last embarrassing incident were broadcast worldwide, giving America a huge political black-eye and persuading Clinton to completely withdraw our military from Somalia. Therefore, no one in his administration was very eager to risk repeating the same sort of debacle the following year in a different African country, especially with midterm elections only a few months away.

Meanwhile, the DC elected officials and lobbyists most strongly supportive of black and African issues were entirely focused upon the political disorders in Haiti, furious that Clinton had denied refugee status to all migrants from that country and ordered them repatriated. Busy staging hunger strikes and denouncing our government for its anti-Haitian racism, none of those individuals paid any attention to the distant events in East Africa even as the massacres began, with more than 10,000 killed each week. Firebrand Rep. Maxine Waters later admitted she had no knowledge of the Tutsis and Hutus, whom she "didn't know from crap." TransAfrica and other activist organizations were equally disengaged so media pressure for American intervention in Rwanda was minimal.

During this entire period, numerous warnings and red-flags went completely ignored. For example, Power claimed that just a couple of months before the massacres began, an anonymous Hutu informant, supposedly high in the ranks of the Rwandan government, had explicitly warned the local UN commander that the Hutu militias were being armed and trained, and compiling lists of all the Tutsis in the capital city, leading him to suspect that an extermination campaign was being prepared. This important message was passed along to the UN leadership in New York City, but no action was taken.

Power's bibliographic section on Rwanda contained some two dozen books, including the one by Gourevitch, and although her account differed in emphasis and a few details, both were fully consistent with the long Wikipedia article on the subject. Both provided the standard narrative of those events, entirely similar to what I'd absorbed from

all my newspaper and magazine articles at the time and afterwards, as well as the plot of the Hollywood film. Given such total agreement, I'd never seen fit to question that history from three decades ago, regarding the massacre of Rwanda's Tutsis as about as clear-cut a case of genocide as I'd ever encountered in modern times.

But this settled picture was suddenly disturbed in 2021 when I was contacted by an independent Canadian journalist named Antony Black, who suggested that I consider republishing several of his long essays on controversial historical events, mostly in the form of book reviews, and after reading through them, I was very impressed and did so. One of these, originally published in 2014, shocked me by arguing that everything I had been sure I'd known about those 1994 events in Rwanda was entirely wrong and completely inverted. It seemed very solidly put together and when I featured it, most of the comments were strongly supportive.

According to the standard story, the massive killings had been organized by Rwanda's Hutu Power extremists, who had spent months planning their genocidal project. Regarding their own Hutu president as overly moderate and compromising, they were livid when he had signed the 1993 peace agreement with the rebel army of Tutsi exiles from Uganda, agreeing to democratic elections and an ethnic power-sharing arrangement. Therefore, they shot down his plane and then immediately used the excuse of his death to unleash their campaign to completely exterminate the country's Tutsis.

Black presented a very different history. He noted that in an 85% Hutu country with sharp ethnic divisions, the Tutsi rebels had no chance of gaining power via a democratic vote, so they were the ones with the strongest motive to overturn the agreement by assassinating the Hutu president and seizing power militarily. Indeed, a lengthy later investigation by a French judge found that Paul Kagame and his Tutsi army had been responsible for that killing, with former members of his rebel forces also making those accusations, and suppressed reports by official international investigators coming to that same conclusion. Black further claimed that Kagame's army had abandoned the ceasefire and begun its march to the capital hours before the president had been killed, indicating the latter event was part of their plan, which amounted to a military assault and coup d'etat intended to seize the entire country. As part of this operation, they had infiltrated many thousands of rebel Tutsi fighters into the capital city, who quickly launched attacks on the Rwandan military.

The central element of the Rwanda genocide had been the near-total

extermination of Rwanda's Tutsis, but according to Black this was a complete falsehood. He claimed that American academics who carefully studied the evidence concluded that although many hundreds of thousands of civilian deaths occurred in Rwanda during those months, a large majority of these—at least two-thirds or more—were actually Hutus, killed by Kagame's rebel Tutsi army, with the number of Hutu victims possibly reaching a million or even approaching two million. Everyone agreed that a huge wave of Hutu refugees fled into the Congo, but he argued that their flight had been due to those Tutsi massacres rather than any fears of some hypothetical retaliation.

Black certainly admitted that large numbers of Tutsi civilians also died during those months, most of them at the hands of outraged and terrified Hutus who were retaliating in disorganized fashion for the huge slaughter they were suffering across much of the country. A million Hutu refugees fled into the capital to avoid the massacres of Kagame's advancing Tutsi army, and they participated in these attacks, but Black argued that the notion of any centrally-planned campaign of extermination was utterly false. The single strongest piece of evidence behind such a plan was the fax report forwarded in early 1994 to the UN, reporting the secrets provided by a high-ranking Hutu informant, and this was heavily emphasized in the books by Gourevitch and Power, but Black argued that it was an obvious forgery, a conclusion grudgingly admitted by the international tribunal organized to investigate and prosecute the Rwandan genocide.

So in the mainstream accounts, we had Hutu extremists killing the country's president, plotting to seize power, and exterminating huge numbers of Tutsi civilians, while Black's account was the mirror-image, with the Tutsi rebels responsible for the assassination, leading to their successful seizure of power in a military offensive, combined with their slaughter of Hutu civilians as part of that campaign. As an outsider with little knowledge of those events, I found it very difficult to judge between these polar-opposite accounts of what had really transpired during 1994 in that small African country. But I did see at least a point or two in favor of Black's alternative version.

Wikipedia heavily supported the mainstream narrative, but it did mention some of the evidence that Kagame had actually been behind the presidential assassination that touched off the crisis, and indeed it noted that the supposed mastermind of that project was later acquitted by an international tribunal in 2008. But if Kagame had been responsible, that would severely undercut the theory of an

extermination campaign long planned by Hutu extremists

My impression is that much of the standard media narrative of the genocide was formed by Gourevitch's early reporting, which also became the basis of his huge bestseller, and if he had been on the scene at the time, I would certainly credit his account, but he only arrived in Rwanda the following year. He then interviewed many eyewitnesses who told him the details of the horrific killings of Tutsi civilians and I'm sure that all of those incidents had occurred. But by that point the country was under the total control of Kagame and his victorious Tutsis, while a substantial fraction of all the terrified, defeated Hutus had already fled into the Congo. So it seems very possible that equally true accounts of huge 1994 massacres of civilian Hutus simply never reached his ears.

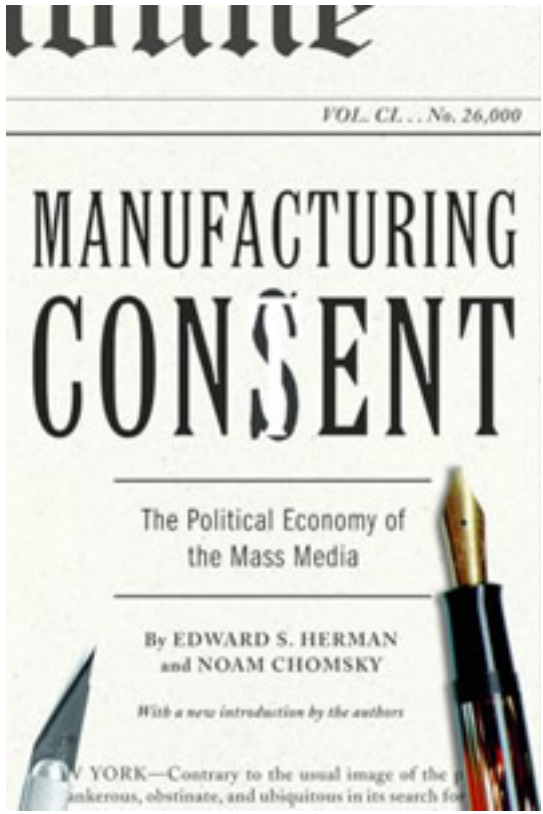
As mentioned above, one of the leading individuals portrayed in Gourevitch's story was Paul Rusesabagina, the Hutu hotel manager, who saved so many Tutsi lives and was glorified as the central hero in the subsequent big budget film. But as Black pointed out, he later became a leading opponent of Kagame and his Tutsi regime, blaming them for the bulk of the 1994 killings, and eventually was imprisoned for years before finally being freed. This hardly proved Black's case, but it did suggest that the facts might be much more complex than those provided in a simple black-and-white morality play concocted by a Hollywood screenwriter.

Black's long article unfortunately contained few links or citations for his underlying source material, but he sent me a personal addendum in which he explained that his brother Christopher had spent a decade in Africa serving on the international tribunal that investigated and adjudicated the genocide charges and had been the source of much of his information. I can only suggest that those interested should read his analysis with an open mind and decide for themselves.

- Hotel Propaganda
  Antony C. Black • ***Canadian Dimension*** • October 4, 2014 • 7,100 Words

Although I'd been quite impressed by Black's long article when I read it a couple of years ago, I only knew of him as an unknown Canadian writer and I hardly felt his lone contrarian analysis could outweigh absolutely everything else I'd read over the previous three decades, including the many glowing reviews of the award-winning books by

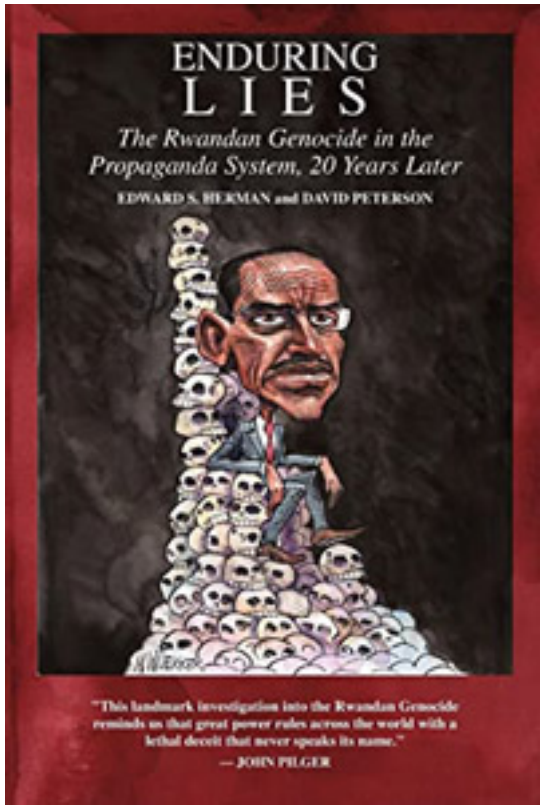
Gourevitch and Power. I had little time or interest in undertaking a detailed investigation of those events of the mid-1990s, so until recently, I still tended to accept the conventional story of the Rwandan genocide, while cautiously adding the phrase "according to Wikipedia" when I mentioned it in my November article. However, just a couple of weeks ago, a casual comment led me to another book that substantially shifted my views.



For decades famed MIT professor Noam Chomsky had reigned as one of the world's most prominent public intellectuals, totally blacklisted as a leftist by the American mainstream media, but greatly lionized almost everywhere else. One of his most influential works had been *Manufacturing Consent*, published in 1988, in which he argued that governments in America and other democratic societies regularly manipulated their national media in order to produce an artificial public consensus behind the policies they wished to pursue, thereby partially converting the approval of the electorate into a mere rubber-stamp. Some of those ideas may have influenced my own American Pravda series.

After having seen that book and its thesis mentioned countless times

on the Internet, I finally decided to read it a couple of years ago and was quite surprised to discover that the lead author was actually the late Prof. Edward Herman of the University of Pennsylvania, a longtime friend and ally of Chomsky, but possessing only a sliver of the latter's global fame. I've even seen some claims that Herman had been responsible for the bulk of the text.



ENDURING
LIES
The Rwandan Genocide in the Propaganda System, 20 Years Later
EDWARD S. HERMAN and DAVID PETERSON
"This landmark investigation into the Rwandan Genocide reminds us that great power rules across the world with a lethal deceit that never speaks its name."
— JOHN PILGER

I'd previously been unaware of Herman but henceforth took his views very seriously, and I recently discovered that in 2014 he had published *Enduring Lies*, a short work co-authored by independent journalist David Peterson that sharply challenged the standard Rwanda narrative, so I bought and read it.

Their slim volume carried a cover quote by the highly-regarded journalist John Pilger hailing their "landmark investigation," and it also was praised by numerous others, including the authors of two different books on the Rwanda disaster, while my own verdict was the same. Herman was a serious scholar and their book provided a devastating and very convincing refutation of what the authors call "the standard model" of the events in Rwanda.

They had apparently read and carefully analyzed all the main primary and secondary sources and their verdict was similar to Black's, but even a short book afforded them many times as much space to discuss and document the key issues, backing their analysis with more than 250 reference footnotes and a couple of appendices. As a rank outsider, who has spent little time or effort investigating this complex issue, I found their conclusions quite convincing. I was hardly surprised that the very lengthy Wikipedia article contained absolutely no mention of their important work.

For most reasonable people, any talk of "genocide" must focus on the numbers, and the authors argued that these had been completely obfuscated in the case of 1994 Rwanda. No one ever denied that huge numbers of innocent Tutsi civilians had been killed, often in very grisly ways, but drawing upon the quantitative research of a couple of University of Michigan academics, the authors argued that the figures and percentages casually mentioned by Gourevitch and so many others were wildly exaggerated. The latter had claimed that many hundreds of thousands of Tutsis were slain, representing a large majority of their total population, but instead probably only 100,000 to 200,000 had died while the number of Hutu victims was a multiple of that, perhaps even many, many times larger.

All the horrific individual stories told by Gourevitch were surely true and could even have been increased a thousand-fold; but he completely left out all the equally horrific stories of massacred Hutus, whose deaths had been vastly greater in number, and most other Western observers adopted the same technique. An ideological or narrative framework that features such selective omissions can promote total falsehoods just as easily as would outright lying.

One important point made by the authors is that the international tribunal later established to try those responsible for the Rwandan genocide deliberately avoided including any coverage of Hutu victims or Tutsi perpetrators, with Kagame and his fellows entirely protected from any legal investigation or sanction, thereby removing a very large majority of all the crimes from any consideration. Completely ignoring most of the killings and most of the victims might seem absurd, but it reflected the very strong political support that America, Britain, and other countries provided to the newly established Tutsi regime, and any prosecutors who tried to broaden that mandate were overruled or even removed from their positions.

An absolutely central theme of all the mainstream media coverage and books had been the planned nature of the genocide, but Herman and

Peterson noted that all the Hutu leaders tried on those charges were either acquitted or had their convictions reversed on appeal, thereby demonstrating that this element of the story had little basis in evidence or reality. One of their appendices argued in detail that the key early warning fax allegedly sent to the UN several months before the killings began was a blatant forgery, and the verdicts of the tribunal seemed to strongly support that conclusion. They also summarized the very convincing evidence that Kagame rather than any shadowy extremist Hutu leaders had been responsible for the assassination of Rwanda's Hutu president, the event that triggered the outbreak of violence.

According to their reckoning, the total number of Hutu civilians killed in Rwanda during 1994 was almost certainly in the hundreds of thousands and may have easily reached a million or more, while even larger numbers of Hutu refugees were slaughtered in the Congo during Kagame's subsequent invasion, which he claimed had been launched to root out "genocidal war criminals." That invasion led to the First and Second Congo Wars, which even the strictly establishmentarian Wikipedia admitted cost well over five million civilian lives, a body-count that utterly dwarfed the 1994 death toll in Rwanda.

Yet none of that horrendous bloodshed ever provoked any serious Western protests or even substantial media coverage, let alone outcries of "genocide" and international tribunals. Instead, Kagame, the central architect of those events, remained a great hero across most of our Western media. Herman and Peterson closed their last chapter by noting the extreme irony that although Kagame was widely celebrated as "the Abraham Lincoln" of Africa by Gourevitch and many of the journalists who followed his lead, the current Rwandan leader "is quite possibly the greatest mass murderer alive today."

The authors argued that this total inversion of historical reality had been maintained since 1994 by extremely selective media access. They produced a list of the twenty leading advocates of "the standard model" and the twenty leading dissenters, and by checking the Factiva database determined that the former had almost totally monopolized media access, especially if small French-language publications were excluded. When only one side of a story is told, the public can easily be persuaded to accept almost anything. I can certainly endorse those findings since despite my very extensive readings until a couple of years ago, I'd never even realized that there existed any significant dissent from the standard Rwanda narrative, let alone that the dissenters included highly-credible scholars.

This sort of situation is hardly without precedent. These days all of us are well aware that during the 1930s, the terrible Ukraine famine that killed many millions of Soviet citizens was almost totally ignored and discounted by the American media so that few individuals in our country had any real awareness of it. Instead, Walter Duranty of the *New York Times* was awarded the 1932 Pulitzer Prize for his Soviet coverage that dishonestly refuted any such circulating rumors.

Although I found the analysis of Herman and Peterson together with that of Black quite compelling, I do not feel capable of rendering any solid verdict on events so far distant and about which I lack any expertise. To do so, I would need to undertake a much larger investigation, reading many more books on both sides, and perhaps some of these might shift me back towards the "standard model" that those authors denounce. But although everyone agrees that enormous numbers of African civilians were slaughtered in 1994 Rwanda, at the very least I would now be reluctant to casually refer to the genocide of Rwanda's Tutsis, whose reality I had never questioned for nearly three decades.

If I'd come across the work of Herman, Peterson, and Black a dozen or more years ago, I might have been much less willing to consider the possibility that everything I'd always known about such an important historical event was false and actually inverted. But in recent years, a great deal of reading and investigation on my part has led me to render that same surprising verdict on the "standard model" of World War II and some of its central elements. So I was hardly surprised to discover that some of the foremost promoters of what Herman and Peterson might reasonably characterize as "the Tutsi Genocide Hoax" were Deborah Lipstadt and Daniel Jonah Goldhagen, leading scholars of the Jewish Holocaust, and that the U.S. Holocaust Memorial Museum was heavily involved in promoting that same story of East African events.

While I do not believe that a week or two of investigation is sufficient for me to determine what really happened in 1994 Rwanda, if the accounts of Herman, Peterson, and Black are indeed correct, they would certainly closely match my own firm conclusions regarding the true history of World War II:

- Why Everything You Know About World War II Is Wrong

- More Falsehoods of World War II
  Ron Unz • ***The Unz Review*** • June 19, 2023 • 7,500 Words
- Hitler, Churchill, the Holocaust, and the War in Ukraine

One broader claim made by Herman and Peterson seems particularly relevant given very recent events. They argued that the articles and books written by Gourevitch, Power, and many others were cynically used to "manufacture consent" for intended government policies, including the elevation of an American client such as Kagame and the overthrow of the government of the resource-rich Congo. They noted that although Gourevitch was always portrayed as a disinterested, independent-minded journalist, at the time his book came out in the late 1990s, he was the brother-in-law of James Rubin, a high-ranking Clinton State Department official, so he was obviously someone close to decision-making circles.

Or consider the case of Samantha Power, whose enormously influential book helped inspire the UN's "Responsibility to Protect" doctrine. That ideological construct furnished America and its allies with the political justification for military interventions in other countries in order to supposedly protect their civilian populations from possible massacres or looming genocides. A few years later in 2011, NATO used that excuse to successfully overthrow the government of Libya, producing a gigantic humanitarian disaster, and then nearly achieved the same result in Syria, destroying most of that country and leading to many hundreds of thousands of civilian deaths.

Yet today Israel's ongoing massacre of tens of thousands of helpless Palestinian civilians in Gaza while starving hundreds of thousands of others has been totally ignored by all those enlightened individuals, despite the explicitly genocidal language employed by most of Israel's political and military leaders. Power had famously declared she was outraged that no American officials had resigned in protest for their government's inaction during the 1994 slaughter in Rwanda, but a near-unanimous verdict of the International Court of Justice has declared that the population of Gaza is now facing a potential genocide at Israel's hands, and instead of mere inaction, today's American government is actually supplying the munitions used for that genocide. Despite these facts, Power still serves as head of USAID and she has expressed no public criticism of her own government's policy let alone resigned in angry protest.

Obviously, none of these very shameful developments conclusively prove that Herman and Peterson were correct in their reconstruction of what happened in 1994 Rwanda, but I think they do greatly

increase the credibility of those authors, while sharply diminishing that of some of the leading figures on the other side such as Gourevitch and Power.
